Hepatic impairment: Reduce total daily dose by 33%.

Oral

Pruritus in acute and chronic urticaria and dermatosis

Adult: Initially, 25 mg at night increased if required up to 25 mg 3-4 times daily.

Child: 6 mth-6 yr: 5-15 mg daily, increased to 50 mg/day in divided doses; >6 yr: Initially, 15-25 mg/day, increased up to 50-100 mg/day.

Renal impairment: Moderate-severe impairment: Reduce dose by 50%.

Hepatic impairment: Reduce total daily dose by 33%.

Oral

Adjunct to pre- or post-operative sedation

	Hepatic impairment: Reduce total daily dose by 33%. <i>Oral</i> Adjunct to pre- or post-operative sedation Adult: 50-100 mg. Child: 600 mcg/kg. Renal impairment: Moderate-severe impairment: Reduce dose by 50%. Hepatic impairment: Reduce total daily dose by 33%. <i>Intramuscular</i> Prompt control of anxiety or agitation Adult: Initially, 50-100 mg, may repeat every 4-6 hr if necessary. Renal impairment: Dose adjustment is required. Hepatic impairment: Dose adjustment is required. Incompatibility: Incompatible with aminophylline, benzylpenicillin salts, chloramphenicol sodium succinate, dimenhydrinate, liposomal doxorubicin hydrochloride, thioridazine and some soluble barbiturates.
Administration	May be taken with or without food.
Overdosage	Excessive sedation, hypotension (rare). Symptomatic and supportive treatment. Empty stomach immediately by inducing emesis or by gastric lavage. IV fluids and norepinephrine or metaraminol (do not use epinephrine) if hypotension. Haemodialysis or peritoneal dialysis is probably not effective.
Contraindications	Porphyria, neonates, pregnancy, lactation.
Special Precautions	Renal and hepatic impairment; narrow-angle glaucoma; epilepsy; prostatic hypertrophy; bladder neck obstruction; asthma; COPD. May impair ability to drive or operate machinery.

	epilepsy; prostatic hypertrophy; bladder neck obstruction; asthma; COPD. May impair ability to drive or operate machinery.
Adverse Drug Reactions	CNS depression, paradoxical CNS stimulation, dry mouth, thickened respiratory secretions, constipation, blurring of vision, tachycardia, GI disturbances, headache, hypotension, tinnitus.
Drug Interactions	Masks ototoxicity of aminoglycoside antibiotics. Potentially Fatal: Potentiates CNS depression by barbiturates, hypnotics, opioid analgesics, sedatives and neuroleptics. MAOIs, atropine, and TCAs potentiate antimuscarinic effects.
Food Interaction	Increased CNS depression with alcohol.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intramuscular: Store at 15-30°C. Oral: Store at 15-30°C.
Mechanism of Action	Hydroxyzine blocks histamine H ₁ -receptors on effector cells of the GI tract, blood vessels and respiratory tract; a sedating antihistamine with antimuscarinic and significant sedative properties. It also possesses skeletal muscle relaxing, bronchodilator, antiemetic and analgesic properties. Absorption: Absorbed rapidly from the GI tract (oral). Metabolism: Converted to cetirizine (has antihistaminic properties). Excretion: 20 hr (elimination half-life).
CIMS Class	Anxiolytics / Antihistamines & Antiallergics
ATC Classification	N05BB01 - hydroxyzine; Belongs to the class of

ATC Classification

N05BB01 - hydroxyzine; Belongs to the class of diphenylmethane derivatives anxiolytics. Used in the management of anxiety, agitation or tension.

related hyoscine information

Indication & Dosage	<i>Oral</i>
	Gastrointestinal tract spasm
	Adult: As butylbromide: 20 mg 4 times daily.
	Child: As butylbromide: 6-12 yr: 10 mg tid.
	<i>Oral</i>
	Genitourinary spasm
	Adult: As butylbromide: 20 mg 4 times daily.
	Child: As butylbromide: 6-12 yr: 10 mg tid.
	<i>Oral</i>
	Prophylaxis of motion sickness
	Adult: As hydrobromide: 300 mcg 30 min before a journey, then 300 mcg every 6 hr if required. Max: 3 doses in 24 hr.
	Child: As hydrobromide: 3-4 yr: 75 mcg 20 min before a journey, repeated if needed. Max dose: 150 mcg in 24 hr.
	4-10 yr: 75-150 mcg, >10 yr: 150-300 mcg.
	Max Dosage: 3 doses in 24 hrs.
	<i>Parenteral</i>

4-10 yr: 75-150 mcg, >10 yr: 150-300 mcg.

Max Dosage: 3 doses in 24 hrs.

Parenteral

Gastrointestinal tract spasm

Adult: As butylbromide: 20 mg IM/IV repeated after 30 min if needed. Max: 100 mg daily.

Max Dosage: 100 mg daily.

Parenteral

Genitourinary spasm

Adult: As butylbromide: 20 mg IM/IV repeated after 30 min if needed. Max: 100 mg daily.

Max Dosage: 100 mg daily.

Transdermal

Prophylaxis of motion sickness

Adult: As patch delivering 1 mg over 3 days: Apply 1 patch at least 4 hr before exposure to motion. To be applied behind the ear.

Subcutaneous

Prophylaxis of nausea and vomiting

Adult: As hydrobromide: 0.3-0.6 mg.

Child: As hydrobromide: 0.006 mg/kg.

Subcutaneous

Preoperative sedation

Adult: As hydrobromide: 0.6 mg 3-4 times daily.

Parenteral

Premedication before anaesthesia

Adult: As hydrobromide: 0.2-0.6 mg via SC or IM inj 30-60 minutes before induction of anesth.

Child: As hydrobromide: 15 mcg/kg via SC or IM inj, 30-60 minutes before induction of anesth.

Ophthalmic

Mydriasis and cycloplegia for refraction

Adult: As hydrobromide: Instil 1-2 drops of 0.25% soln to

	minimizes severe induction of anisocoria. <i>Ophthalmic</i> Mydriasis and cycloplegia for refraction Adult: As hydrobromide: Instil 1-2 drops of 0.25% soln to eye(s) 1 hr before procedure. Child: As hydrobromide: Instil 1 drop of 0.25% soln to eye(s) bid for 2 days before procedure. <i>Ophthalmic</i> Iridocyclitis Adult: As hydrobromide: Instil 1-2 drops of 0.25% solution to eye(s) up to 4 times daily. Child: As hydrobromide: Instil 1 drop of 0.25% soln to eye(s) up to tid.
Overdosage	Symptoms: Dilated pupils, flushed skin, tachycardia, hypertension, ECG abnormalities, acute psychosis, CNS depression, circulatory collapse, hyperpyrexia, respiratory failure. Management: Artificial respiration with oxygen. Manage fever with ice or alcohol sponges. For severe life-threatening symptoms, give physostigmine 1-2 mg SC or IV slowly; repeat administration after 2 hr as necessary.
Contraindications	Narrow-angle glaucoma, acute haemorrhage, paralytic ileus, tachycardia due to cardiac insufficiency, myasthenia gravis.
Special Precautions	Hepatic/renal disease, pyloric stenosis, urinary retention, prostatic hyperplasia, psychosis, seizure disorders, ulcerative colitis, coronary artery disease, tachyarrhythmias, heart failure, hypertension. Elderly, children, pregnancy, lactation.
Adverse Drug Reactions	Flushing, postural hypotension, tachycardia, fibrillation. Rarely psychotic reactions. Dizziness, drowsiness, fatigue, headache, memory loss. Dry skin, erythema, increased sensitivity to light, rash. Bloating, constipation, dry throat, dysphagia, nausea, vomiting, xerostomia. Dysuria, urinary retention. Tremor, weakness. Impaired accommodation,

	sensitivity to light, rash. Bloating, constipation, dry throat, dysphagia, nausea, vomiting, xerostomia. Dysuria, urinary retention. Tremor, weakness. Impaired accommodation, blurred vision, cycloplegia, dryness, narrow-angle glaucoma, increased intraocular pain, itching, photophobia, pupil dilation. Dry nose. Decreased diaphoresis, heat intolerance. Ophthalmic: Somnolence, dermatitis, oedema, exudate, follicular conjunctivitis, increased IOP, local irritation, photophobia, vascular and respiratory congestion. Potentially Fatal: CNS depression, coma, circulatory and respiratory failure.
Drug Interactions	Additive sedative effects with alcohol or other CNS depressants. Reduced effects with acetylcholinesterase inhibitors (donepezil, galantamine, rivastigmine, tacrine). Potentially Fatal: Effect potentiated by other anticholinergic drugs and TCAs.
Lab Interference	May interfere with the gastric secretion test.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Ophthalmic: Store at 8-27°C (46-80°F). Oral: Store at room temperature of 15-30°C (58-86°F). Parenteral: Store at room temperature of 15-30°C (58-86°F). Subcutaneous: Store at room temperature of 15-30°C (58-86°F). Transdermal: Store at 20-25°C (68-77°F).
Mechanism of Action	Hyoscine competitively blocks muscarinic receptors and has central and peripheral actions. It relaxes smooth muscle and reduces gastric and intestinal motility. Onset: Oral, IM: 0.5-1 hr; IV: 10 min. Duration: Oral, IM: 4-6 hr; IV: 2 hr.

	central and peripheral actions. It relaxes smooth muscle and reduces gastric and intestinal motility. Onset: Oral, IM: 0.5-1 hr; IV: 10 min. Duration: Oral, IM: 4-6 hr; IV: 2 hr. Absorption: Tertiary salts: Readily absorbed. Quaternary salts: Poorly absorbed. Distribution: Reversibly bound to plasma proteins. Metabolism: Hepatic. Excretion: Via urine (as metabolites); 4.8 hr (elimination half-life).
CIMS Class	Antispasmodics / Antivertigo Drugs / Mydriatic Drugs / Muscle Relaxants

ibuprofen

CIMS Class : (Other Cardiovascular Drugs) , (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
ibuprofen

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related ibuprofen information

Indication & Dosage

Oral

Pain and inflammation

Adult: 1.2-1.8 g/day in divided doses. Maintenance: 0.6-1.2 g daily. Max: 2.4 g/day.

Oral

Juvenile idiopathic arthritis

Child: ≥3 mth and weighing >5 kg: 30-40 mg/kg/day in 3-4 divided doses. Max: 2.4 g/day.

Oral

Fever

Adult: 200-400 mg every 4-6 hr. Max: 1.2 g/day.

Child: 1-6 mth: 5 mg/kg 3-4 times daily, 6-12 mth: 50 mg tid, 1-2 yr: 50 mg 3-4 times daily, 2-7 yr: 100 mg 3-4 times daily, >7 yr: 200 mg 3-4 times daily. Max: 40 mg/kg/day.

Intravenous

Closure of patent ductus arteriosus

Child: Given as three IV doses infused over 15 min at 24-hr

	<i>Intravenous</i> Closure of patent ductus arteriosus Child: Given as three IV doses infused over 15 min at 24-hr intervals. Initially 10 mg/kg followed by 2 doses of 5 mg/kg. A 2nd course may be given if ductus remains open after 48 hr. Surgery may be required if neonate is unresponsive to two courses of treatment. Dose should be based on birth weight. <i>Topical/Cutaneous</i> Pain and inflammation associated with musculoskeletal and joint disorders Adult: As 5% or 10% gel: Apply onto affected area.
Administration	Should be taken with food.
Overdosage	Symptoms: Apnoea, metabolic acidosis, coma, nystagmus, seizures, leukocytosis and renal failure. Management: Supportive and symptomatic. Multiple doses of charcoal may be required.
Contraindications	Active peptic ulcer; hypersensitivity. Neonates with congenital heart disease, suspected necrotising enterocolitis and active bleeding (parenteral).
Special Precautions	Asthma; renal or hepatic disorders; bleeding disorders; CV disease. Pregnancy, lactation.
Adverse Drug Reactions	Oral: Dyspepsia, vomiting, abdominal pain, heartburn, nausea, diarrhoea, epigastric pain, oedema, fluid retention, dizziness, rash, tinnitus. Parenteral: Intraventricular haemorrhage, skin irritation, hypocalcaemia, hypoglycaemia, GI disorders, anaemia, apnoea, respiratory infection, sepsis. Potentially Fatal: Severe CV thrombotic events. Severe GI bleeding, ulceration and perforation.
Drug Interactions	Reduces effects of antihypertensives. Enhanced effect with moclobemide. Increased risk of GI bleeding with warfarin.

	Reduces effects of antihypertensives. Enhanced effect with moclobemide. Increased risk of GI bleeding with warfarin. Potentially Fatal: Reduces antiplatelet effect of aspirin. Increases risk of methotrexate and lithium toxicity.
Food Interaction	Decreased peak serum levels if taken with food.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). in 3rd trimester or near delivery. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at room temperature of 20-25°C (68-77°F). Oral: Cap/Gelcap/Tab: Store at room temperature of 20-25°C (68-77°F). Susp/Drops: Store at room temperature of 15-30°C (59-86°F).
Mechanism of Action	Ibuprofen exhibits anti-inflammatory, analgesic and antipyretic activities. Its analgesic effect is independent of anti-inflammatory activity and has both central and peripheral effects. It potently inhibits the enzyme cyclooxygenase resulting in the blockage of prostaglandin synthesis. It also prevents formation of thromboxane A₂ by platelet aggregation. Onset: Analgesic: 30-60 min. Anti-inflammatory: =7 days. Duration: 4-6 hr.

	synthesis. It also prevents formation of thromboxane TX_2 by platelet aggregation. Onset: Analgesic: 30-60 min. Anti-inflammatory: =7 days. Duration: 4-6 hr. Absorption: Oral: Peak plasma concentrations after 1-2 hr. Topical: Minimal. Distribution: Protein-binding: 90-99%. Metabolism: Hepatic via oxidation. Excretion: Via urine (1% as free drug), some feces; 2 hr (plasma half-life).
CIMS Class	Other Cardiovascular Drugs / Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	C01EB16 - ibuprofen; G02CC01 - ibuprofen; Belongs to the class of antiinflammatory products for vaginal administration used in the treatment and prevention of inflammation. M01AE01 - ibuprofen; Belongs to the class of propionic acid derivatives of non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism. M02AA13 - ibuprofen; Belongs to the class of non-steroidal antiinflammatory preparations for topical use. Used in the treatment of joint and muscular pains.

ibuprofen + paracetamol

CIMS Class : (Analgesics (Non-Opioid) & Antipyretics) , (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
ibuprofen + paracetamol

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related ibuprofen + paracetamol information

Indication & Dosage	<i>Oral</i> Pain and inflammation associated with musculoskeletal and joint disorders Adult: (Ibuprofen 400 mg + Paracetamol 325/500 mg) 1 tab 3-4 times daily. Child: (Ibuprofen 100mg + Paracetamol 125mg) 1 dose tid or as required.
Contraindications	Active peptic ulcer, history of hypersensitivity to either component, recent GI bleeding, neonates.
Special Precautions	Bronchial asthma, renal or hepatic disorders, bleeding disorders, CV diseases, hypertension, patients on anticoagulants, aspirin/NSAIDs induced allergy, pregnancy & lactation.
Adverse Drug Reactions	Dyspepsia, heart burn, GI bleeding, rash, asthmatic attacks, thrombocytopenia, drug induced ulcer, drowsiness, hepatic necrosis, renal papillary necrosis, vision disturbances & disorientation; rarely nausea & vomiting can occur.

	Dyspepsia, heart burn, GI bleeding, rash, asthmatic attacks, thrombocytopenia, drug induced ulcer, drowsiness, hepatic necrosis, renal papillary necrosis, vision disturbances & disorientation; rarely nausea & vomiting can occur. Potentially Fatal: Hematemesis, agranulocytosis, severe allergic reaction.
Drug Interactions	Ibuprofen antagonises the effects of furosemide & thiazides. Pethidine & propanthelene reduce absorption of paracetamol. Aspirin displaces ibuprofen from binding sites. NSAIDs blunt the effects of antihypertensives. Potentially Fatal: Increased risk of GI ulceration & bleeding with anticoagulants. Paracetamol increases the risk of liver damage in chronic alcoholics. Ibuprofen increases the risk of methotrexate toxicity & lithium toxicity.
Food Interaction	Food interferes with the rate of ibuprofen absorption.
Mechanism of Action	Ibuprofen is a potent anti-inflammatory with analgesic and antipyretic action. Its analgesic and antipyretic effects are further reinforced by paracetamol.
CIMS Class	Analgesics (Non-Opioid) & Antipyretics / Nonsteroidal Anti-inflammatory Drugs (NSAIDs)

idoxuridine

CIMS Class : (Eye Anti-infectives & Antiseptics) , (Topical Antibiotics)
idoxuridine

P - Caution when used during pregnancy

L - Caution when used during lactation

related idoxuridine information

Indication & Dosage	<i>Ophthalmic</i> Herpes simplex keratitis Adult: As 0.1% soln: Instill 1 drop in the affected eye(s) every hr. Taper to every 2 hr or 4 times daily. Continue treatment for at least 7 days. <i>Topical/Cutaneous</i> Cutaneous herpes simplex and herpes zoster Adult: As 5% preparation: Paint onto the lesions 4 times daily for 4 days.
Contraindications	Hypersensitivity.
Special Precautions	Deep ulceration of the stromal layers of the cornea. Avoid prolonged use. Pregnancy and lactation.
Adverse Drug Reactions	Ophthalmic: Irritation; inflammation of the eye or eyelids; pain; photophobia; pruritus; conjunctivitis; oedema. Rarely, lachrymal duct occlusion and hypersensitivity reactions. Corneal damage (prolonged use). Topical: Irritation; stinging; hypersensitivity reactions; corneal punctate defects or skin maceration (when applied excessively).

	Corneal damage (prolonged use). Topical: Irritation; stinging; hypersensitivity reactions; corneal punctate defects or skin maceration (when applied excessively).
Drug Interactions	Corticosteroids may accelerate spread of viral infection.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Ophthalmic: Store between 36-80°F.
Mechanism of Action	Idoxuridine, a pyrimidine nucleoside structurally related to thymidine, inhibits viral replication by substituting itself for thymidine in viral DNA. It is active against herpes simplex and varicella zoster viruses, and has also been shown to inhibit vaccinia virus, cytomegalovirus and adenovirus. Absorption: Poor penetration into the skin and cornea. Metabolism: Metabolised rapidly in the body to iodouracil, uracil and iodide. Excretion: Metabolites are excreted in the urine.
CIMS Class	Eye Anti-infectives & Antiseptics / Topical Antibiotics
ATC Classification	D06BB01 - idoxuridine; Belongs to the class of topical antivirals used in the treatment of dermatological diseases. J05AB02 - idoxuridine; Belongs to the class of nucleosides and nucleotides excluding reverse transcriptase inhibitors. Used in the systemic treatment of viral infections. S01AD01 - idoxuridine; Belongs to the class of anti-infectives, antivirals. Used in the treatment of eye infections.

	<i>Intravenous</i>	
	Lymphoma	
	Adult: Different licensed dosage regimens are available. Regimen 1: 8-12 g/m ² divided over 3-5 days, repeat course every 2-4 wk. Regimen 2: 6 g/m ² divided over 5 days, repeat course every 3 wk. Regimen 3: 5-6 g/m ² (max: 10 g), give as a single 24-hr infusion, repeat course every 3-4 wkly.	
	CrCl (ml/min)	Dosage Recommendation
	<10	Administer 75% of dose.
	<i>Intravenous</i>	
	Germ cell testicular carcinoma	
	Adult: 1.2 g/m ² /day for 5 days via slow infusion over at least 30 minutes, repeat treatment every 3 wk or after recovery from haematological toxicity. To be given with mesna and adequate hydration of at least 2 L of oral or IV fluid per day.	
	CrCl (ml/min)	Dosage Recommendation
	<10	Administer 75% of dose.
	Reconstitution: Add 20 ml of sterile water for inj or sterile bacteriostatic water for inj containing benzyl alcohol or parabens for each 1 g of the drug to produce solutions of 50 mg/ml.	
	Incompatibility: Y-site admin: Cefepime, methotrexate. Admixture or in syringe: Mesna with epirubicin.	
Contraindications	Hypersensitivity; severe bone-marrow depression. Pregnancy, lactation.	
Special	Hepatic or renal dysfunction, compromised bone marrow	

Special Precautions	Hepatic or renal dysfunction, compromised bone marrow reserve. Use with mesna and ensure high oral/IV fluid intake to reduce urotoxic effects.
Adverse Drug Reactions	Confusion, alopecia, nausea, vomiting, phlebitis, somnolence, depression, hallucinations. Wound healing may be impaired during ifosfamide use. Potentially Fatal: Severe myelosuppression, haemorrhagic cystitis, nephrotoxicity, cardiotoxicity, coma.
Drug Interactions	Causes enhanced toxicity with allopurinol, cisplatin. Ifosfamide enhances the anticoagulant effect of warfarin. CYP2A6 inducers (e.g. amobarbital, pentobarbital, phenobarbital, rifampin and secobarbital) may reduce serum levels of ifosfamide while the inhibitors (e.g. isoniazid, methoxsalen and miconazole) may increase its serum levels. CYP3A4 inducers (e.g. aminoglutethimide, carbamazepine, nafcillin, nevirapine, phenobarbital, phenytoin, and rifamycins) may reduce serum levels of ifosfamide while the inhibitors (e.g. azole antifungals, clarithromycin, diclofenac, doxycycline, erythromycin, imatinib, isoniazid) may increase its serum levels.
Food Interaction	St John's wort may reduce its serum levels.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 20-25°C.
Mechanism of Action	Ifosfamide is converted to its active metabolites via hepatic microsomal enzymes. These active metabolites act as

	Ifosfamide is converted to its active metabolites via hepatic microsomal enzymes. These active metabolites act as alkylating agents, disrupting DNA and protein synthesis of the target cells. It is routinely given with mesna to reduce urothelial toxicity. Absorption: Well absorbed from the GI tract (oral). Metabolism: It is a prodrug that is extensively hepatically metabolised to a mixture of active and inactive metabolites. Excretion: Urine (as unchanged drug and metabolites).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01AA06 - ifosfamide; Belongs to the class of alkylating agents, nitrogen mustard analogues. Used in the treatment of cancer.

imatinib

CIMS Class : (Targeted Cancer Therapy)
imatinib

P - Caution when used during pregnancy

L - Contraindicated in lactation

related imatinib information

Indication & Dosage	<i>Oral</i>
	Chronic myeloid leukaemia
	Adult: Chronic phase: 400 mg daily, increased to 600 mg daily or 400 mg bid. Blast crisis or accelerated phase: 600 mg daily, increased to 400 mg bid as required.
	Child: Chronic or advanced phase: 340 mg/m ² daily. Max Dose: 600 mg. May be given once daily or divided into morning and evening doses.
	Hepatic impairment: Severe: Reduce dose by 25%.
	<i>Oral</i>
	Acute lymphoblastic leukaemia
	Adult: 600 mg daily with induction, consolidation or maintenance chemotherapy.
	Hepatic impairment: Severe: Reduce dose by 25%.
	<i>Oral</i>
	As monotherapy in relapsed or refractory acute lymphoblastic leukaemia
	Adult: 600 mg daily with induction, consolidation or maintenance chemotherapy.

As monotherapy in relapsed or refractory acute

lymphoblastic leukaemia

Adult: 600 mg daily with induction, consolidation or maintenance chemotherapy.

Hepatic impairment: Severe: Reduce dose by 25%.

Oral

Myelodysplastic disease

Adult: 400 mg daily. For eosinophilic syndrome: Start with 100 mg daily in patients with FIP1L1-platelet-derived growth factor receptor- α fusion kinase, may increase to 400 mg if response is insufficient.

Hepatic impairment: Severe: Reduce dose by 25%.

Oral

Hypereosinophilic syndrome

Adult: 400 mg daily. For eosinophilic syndrome: Start with 100 mg daily in patients with FIP1L1-platelet-derived growth factor receptor- α fusion kinase, may increase to 400 mg if response is insufficient.

Hepatic impairment: Severe: Reduce dose by 25%.

Oral

Unresectable, metastatic malignant gastrointestinal stromal tumours

Adult: 400 or 600 mg daily.

Hepatic impairment: Severe: Reduce dose by 25%.

Oral

Mastocytosis

Adult: 400 mg daily. Start with 100 mg daily if there is associated eosinophilia.

Hepatic impairment: Severe: Reduce dose by 25%.

Oral

Dermatofibrosarcoma protuberans

Adult: 400 mg bid.

Hepatic impairment: Severe: Reduce dose by 25%.

	Dermatofibrosarcoma protuberans Adult: 400 mg bid. Hepatic impairment: Severe: Reduce dose by 25%. Special Populations: Recommended dose in patients on potent CYP3A4 inducers: Increase dose by 50%; careful monitoring is recommended.
Administration	Should be taken with food.
Contraindications	Lactation.
Special Precautions	Cardiac disease or increased risk for CHF. Monitor for signs of severe fluid retention. Monitor CBC regularly. Renal and hepatic impairment. Monitor LFTs. Pregnancy.
Adverse Drug Reactions	Fluid retention/oedema, nausea and vomiting, muscle cramps, musculoskeletal pain, diarrhoea, rash. Fatigue, asthenia, headache, dizziness, insomnia, depression, anxiety, joint pain, arthralgia, myalgia, back pain, abdominal pain, flatulence, dyspepsia, loose stools, anorexia, constipation, taste disturbance, nasopharyngitis, cough, pharyngolaryngeal pain, pharyngitis, sinusitis, upper respiratory tract infection, pneumonia, influenza, dyspnoea, haemorrhage, pyrexia, increased wt, night sweats, rigors, hepatotoxicity, hypokalaemia, pruritus, chest pain, increased lacrimation.
Drug Interactions	Increased blood levels with CYP3A4 inhibitors (azole antifungals, macrolide antibiotics). Reduced blood levels with CYP3A4 inducers (carbamazepine, dexamethasone, St John's wort, phenobarbital, phenytoin, rifampicin). May increase blood levels of substrates of CYP3A4 (ciclosporin, pimozone, triazolo-benzodiazepines, dihydropyridine calcium-channel blockers, certain statins), CYP2C9 (warfarin) and CYP2D6.

	(ciclosporin, pimozone, triazolo-benzodiazepines, dihydropyridine calcium-channel blockers, certain statins), CYP2C9 (warfarin) and CYP2D6.
Mechanism of Action	Imatinib, a tyrosine kinase inhibitor, inhibits the Bcr-Abl tyrosine kinase which is created by the Philadelphia chromosome abnormality in chronic myeloid leukaemia (CML). It blocks proliferation and induces apoptosis in BCR-ABL positive cell lines, as well as fresh leukaemic cells from Philadelphia chromosome positive CML. Absorption: Mean bioavailability: approx 98%; peak blood concentrations reached after 2-4 hr. Distribution: Protein-binding: Approx 95%. Metabolism: Major isoenzyme responsible for metabolism is CYP3A4; isoenzymes CYP1A2, CYP2D6, CYP2C9 and CYP2C19 also play a minor role. Excretion: Elimination half-life: 18 hr (imatinib), 40 hr (N-demethylated piperazine derivative). About 81% is eliminated within 7 days in the faeces (68%) and urine (13%). Excreted mostly as metabolites, with only 25% as unchanged drug.
CIMS Class	Targeted Cancer Therapy
ATC Classification	L01XE01 - imatinib;

imidapril

CIMS Class : (ACE Inhibitors)
imidapril

P - Contraindicated in pregnancy
L - Contraindicated in lactation

related imidapril information

Indication & Dosage	<i>Oral</i> Hypertension Adult: Initially, 5 mg once daily. 1st dose preferably given at bedtime. Maintenance: 10 mg daily. Max: 20 mg/day. Elderly: Initially, 2.5 mg daily. Max Dose: 10 mg daily. Renal impairment: Initially, 2.5 mg daily. Hepatic impairment: Initially, 2.5 mg daily. Special Populations: Recommended dose in patients on diuretics: 2.5 mg daily.
Administration	Should be taken on an empty stomach. (Take 15 mins before meals. However, when initiating therapy, 1st dose should be given at bedtime.)
Contraindications	Aortic stenosis or outflow tract obstruction; renovascular disease; ascites. Pregnancy and lactation.
Special Precautions	Peripheral vascular diseases, generalised atherosclerosis, idiopathic or hereditary angioedema, heart failure, patients likely to be salt or water depleted. Assess renal function

	Peripheral vascular diseases, generalised atherosclerosis, idiopathic or hereditary angioedema, heart failure, patients likely to be salt or water depleted. Assess renal function before and during therapy; monitor for proteinuria. Conduct regular WBC counts in SLE and scleroderma patients. Liver cirrhosis. Discontinue diuretics 2-3 days before starting therapy and resume later if required. Elderly.
Adverse Drug Reactions	Dizziness, headache, fatigue, GI and taste disturbances, persistent dry cough and other upper respiratory tract symptoms, skin rash, angioedema, photosensitivity, renal impairment, hyperkalaemia, hyponatraemia, blood disorders, proteinuria, chest pain, palpitations, tachycardia, stomatitis, pancreatitis, cholestatic jaundice, alopecia, muscle cramps, paraesthesias, mood and sleep disturbances, impotence. Potentially Fatal: Excessive hypotension, which could result in MI or stroke in patients with ischaemic heart disease or cerebrovascular disease.
Drug Interactions	Additive hyperkalaemic effects with potassium-sparing diuretics, potassium supplements, and other hyperkalaemic drugs. Reduced antihypertensive effects or additive adverse renal effects with NSAIDs. Potentially Fatal: Marked hypotension with diuretics, other antihypertensives, alcohol, other agents that lower BP.
Storage	Oral: Store below 25°C.
Mechanism of Action	Imidapril prevents the conversion of angiotensin I to angiotension II by inhibiting ACE. It may also inhibit the degradation of bradykinin. It reduces preload and afterload in heart failure, and reduces left ventricular remodelling in MI. Absorption: Absorption of imidapril is about 70%; peak plasma levels of imidaprilat reached in about 7 hr. Distribution: Protein-binding: 85% (imidapril); 53% (imidaprilat).

	Absorption: Absorption of imidapril is about 70%, peak plasma levels of imidaprilat reached in about 7 hr. Distribution: Protein-binding: 85% (imidapril); 53% (imidaprilat). Metabolism: Imidapril is hydrolysed to imidaprilat in the liver. Excretion: 40% of an oral dose is excreted renally, the remaining dose in the faeces. Terminal half-life: >24 hr (imidaprilat).
CIMS Class	ACE Inhibitors
ATC Classification	C09AA16 - imidapril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

imipenem + cilastatin

CIMS Class : (Other Beta-lactams)
imipenem + cilastatin

P - Caution when used during pregnancy

L - Caution when used during lactation

related imipenem + cilastatin information

Indication & Dosage

Intravenous

Susceptible infections

Adult: In terms of imipenem, 1-2 g daily in divided doses every 6-8 hr, given via IV infusion. Doses 250 or 500 mg are infused over 20-30 minutes, and doses of 750 mg or 1 g over 40-60 minutes.

Child: >40 kg: same as adult dose. >3 mth and <40 kg: 15-25 mg/kg every 6 hr by IV infusion. Up to 90 mg/kg may be given to older children with cystic fibrosis. Neonates and infants <3 mth: 4 wk-3 mth, 25 mg/kg every 6 hr; 1-4 wk, 25 mg/kg every 8 hr; up to 1 wk, 25 mg/kg every 12 hr.

Max Dosage: Adults and children >40 kg: 4 g/day or 50 mg/kg. Children <40 kg: 2 g/day.

CrCl (ml/min)	Dosage Recommendation
31-70	500 mg every 6-8 hr
21-30	500 mg every 8-12 hr
6-20	250 mg or 3.5 mg/kg (whichever is lower) every 12 hr
≤5	Only give if haemodialysis started within 48 hr

	<i>Intravenous</i> Prophylaxis of surgical infections Adult: In terms of imipenem, 1 g given on induction of anaesthesia, followed by 1 g 3 hr later, with additional doses of 500 mg at 8 and 16 hr after induction if necessary. <i>Intramuscular</i> Mild to moderate susceptible infections Adult: In terms of imipenem, 500 mg or 750 mg every 12 hr. <i>Intramuscular</i> Uncomplicated gonorrhoea Adult: In terms of imipenem: A single 500 mg dose may be used.
Contraindications	Hypersensitivity.
Special Precautions	Caution when used in patients with known hypersensitivity to other β -lactams due to possibility of cross-sensitivity. CNS disorders such as epilepsy; renal, hepatic impairment; pregnancy, lactation.
Adverse Drug Reactions	Skin rashes, urticaria, eosinophilia, fever, nausea, vomiting, diarrhoea, tooth or tongue discoloration and altered taste. Erythema multiforme, exfoliative dermatitis. Pain and thrombophlebitis may occur at the inj site. Potentially Fatal: Stevens-Johnson syndrome, toxic epidermal necrolysis.
Drug Interactions	Concurrent admin with probenecid may increase the half-life of cilastatin. Increased risk of generalised seizures when used concurrently with ganciclovir.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Imipenem is a potent inhibitor of bacterial cell wall synthesis and is bactericidal against a broad spectrum of pathogens. It is resistant to degradation by bacterial β-lactamases. Cilastatin is an inhibitor of dehydropeptidase I, an enzyme found in the brush border of the renal tubules. It is given as the sodium salt with imipenem to prevent its renal metabolism and protect against nephrotoxic effects. Absorption: IM admin: 60-75% (imipenem); 95-100% (cilastatin). Distribution: Rapidly and widely distributed to most tissues and fluids. Protein binding: 20% (imipenem) and 40% (cilastatin). Metabolism: Imipenem: Metabolised renally by dehydropeptidase I; cilastatin: Partly metabolised renally. Excretion: Via urine (about 70% as unchanged drug). Half-life: 2-3 hr (imipenem after IM admin).
CIMS Class	Other Beta-lactams

imipramine

CIMS Class : (Antidepressants)
imipramine

P - Caution when used during pregnancy

L - Caution when used during lactation

related imipramine information

Indication & Dosage	<i>Oral</i> Depression Adult: As hydrochloride: Initially, 75 mg daily in divided doses increased gradually to 150-200 mg daily if necessary; 300 mg daily given in severely depressed patients. Elderly: As hydrochloride: Initially, 10 mg at night gradually increased to 30-50 mg daily. <i>Oral</i> Nocturnal enuresis Child: As hydrochloride: 6-7 yr (20-25 kg): 25 mg; 8-11 yr (25-35 kg): 25-50 mg; >11 yr (35-54 kg): 50-75 mg. Dose to be taken once daily before bedtime for up to 3 mth.
Administration	May be taken with or without food.
Overdosage	Symptoms include CNS stimulation followed by severe CNS depression; tachycardia and conduction disturbances; peripheral anticholinergic effects and seizures.
Contraindications	Post MI, heart block/arrhythmias; mania; porphyria; severe hepatic impairment.

	Post MI, heart block/arrhythmias; mania; porphyria; severe hepatic impairment.
Special Precautions	Epilepsy; children, elderly, pregnancy and lactation; cardiac disease; DM; prostatic hyperplasia; angle-closure glaucoma; phaeochromocytoma. Monitor for increased suicidality during early treatment. Withdraw gradually.
Adverse Drug Reactions	Sinus tachycardia, AV/bundle-branch block, postural hypotension, dry mouth, wt loss/gain, constipation, urinary hesitancy/retention, impotence; blurring of vision, exacerbation of glaucoma, liver dysfunction, tremors. Potentially Fatal: Rarely, agranulocytosis.
Drug Interactions	Increased plasma levels and effects with quinidine, cimetidine, SSRIs, propafenone, flecainide. Reduced plasma levels with barbiturates, phenytoin. May increase effects of anticholinergic drugs. Severe orthostatic hypotension with altretamine. Causes drowsiness and impaired performance in combination with alcohol. Potentially Fatal: Severe hypertension with adrenaline, noradrenaline and methylphenidate. Reduces hypotensive effects of guanethidine, bethanidine, debrisoquine, bretylium, methyl dopa and clonidine. Possible serotonin syndrome with MAOIs, separate admin by 3 wk.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Imipramine inhibits noradrenaline re-uptake and, to a lesser extent, that of serotonin. Absorption: Readily absorbed from the GI tract (oral). Peak plasma concentrations are achieved within 1-2 hr after oral

extent, that of serotonin.

Absorption: Readily absorbed from the GI tract (oral). Peak plasma concentrations are achieved within 1-2 hr after oral admin.

Distribution: Extensively protein-bound and widely distributed with an average volume of distribution of 21 l/kg. Both imipramine and desipramine cross the blood-brain barrier; the placenta and can enter breast milk.

Metabolism: Converted to primary active metabolite desipramine by demethylation during extensive first-pass hepatic metabolism.

Excretion: Via urine (as metabolites), faeces (small amounts); 9-28 hr (elimination half-life).

CIMS Class	Antidepressants
ATC Classification	N06AA02 - imipramine; Belongs to the class of non-selective monoamine reuptake inhibitors. Used in the management of depression.

indapamide

CIMS Class : (Diuretics)
indapamide

P - Caution when used during pregnancy
L - Caution when used during lactation

related indapamide information

Indication & Dosage	<i>Oral</i> Hypertension Adult: 1.25-2.5 mg once daily, alone or in conjunction with other antihypertensives. <i>Oral</i> Oedema Adult: 2.5 mg once daily increased to 5 mg daily after 1 wk if needed.
Administration	Should be taken with food.
Overdosage	Nausea, vomiting, weakness, GI disorders, electrolyte imbalance. In severe cases, hypotension and respiratory depression. Stomach emptying recommended.
Contraindications	Anuria, severe hepatic impairment.
Special Precautions	Pregnancy, lactation, elderly, renal impairment, fluid or electrolyte imbalance, hyperuricaemia, DM, lupus erythematosus.
Adverse Drug Reactions	Headache, dizziness, weakness, drowsiness, fatigue, agitation, nervousness, anorexia, nausea, vomiting, pain,

Adverse Drug Reactions	Headache, dizziness, weakness, drowsiness, fatigue, agitation, nervousness, anorexia, nausea, vomiting, pain, diarrhoea, constipation, orthostatic hypotension, palpitations, hypokalaemia, hyponatraemia, metabolic alkalosis.
Drug Interactions	Additive effect with other antihypertensive agents and diuretics. Increased chance of hypokalaemia with corticosteroids, corticotropin and amphotericin. Potentially Fatal: Increased risk of lithium toxicity. Hypokalaemia enhances digitalis toxicity with cardiac glycosides.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). if used in pregnancy-induced hypertension. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 20-25°C.
Mechanism of Action	Indapamide enhances excretion of sodium, chloride and water by interfering with the transport of sodium ions across the renal tubular epithelium. Absorption: Rapidly and completely absorbed from the GI tract (oral). Peak plasma levels are achieved within 2-2.5 hr.

	water by interfering with the transport of sodium ions across the renal tubular epithelium. Absorption: Rapidly and completely absorbed from the GI tract (oral). Peak plasma levels are achieved within 2-2.5 hr. Distribution: Widely distributed, preferentially and reversibly bound to erythrocytes. Metabolism: Extensively metabolised in the liver. Excretion: Via urine (60-70% as metabolites, 5-7% as unchanged), via faeces (16-23% remaining dose); 14 hr (elimination half-life).
CIMS Class	Diuretics
ATC Classification	C03BA11 - indapamide; Belongs to the class of low-ceiling sulfonamide diuretics. Used to promote excretion of urine.

indinavir

CIMS Class : (Antivirals)
indinavir

P - Caution when used during pregnancy

L - Caution when used during lactation

Food $\nrightarrow$ - Food interaction

related indinavir information

Indication & Dosage	<i>Oral</i> HIV infection Adult: 800 mg every 8 hr. Dose reduction may be required when used with delavirdine, itraconazole, ketoconazole and rifabutin. Child: >4 yr: 500 mg/m² every 8 hr without exceeding adult dose. Hepatic impairment: Mild-moderate (due to cirrhosis): 600 mg every 8 hr.
Overdosage	Symptoms: Renal and GI disturbances (doses >2400 mg). Management: Supportive and symptomatic.
Contraindications	Hypersensitivity. Severe hepatic impairment.
Special Precautions	Increased risk of urolithiasis/nephrolithiasis. Ensure adequate hydration. Hyperbilirubinaemia may be exacerbated. Diabetes; haemophilia. Monitor for signs of lipodystrophy. Pregnancy and lactation.
Adverse Drug	Flank pain, abdominal pain, nephrolithiasis, malaise, nausea,

Adverse Drug Reactions	Flank pain, abdominal pain, nephrolithiasis, malaise, nausea, vomiting, diarrhoea, elevated liver enzymes, hyperbilirubinaemia, raised creatinine phosphokinase and blood lipids, back pain, lipodystrophy, alopecia, acid regurgitation, dyspepsia, dry mouth, dysuria, dry skin, hyperpigmentation, headache, dizziness, somnolence, cough, dyspnoea. Potentially Fatal: Acute haemolytic anemia; acute hepatitis.
Drug Interactions	Reduced absorption with antacids. Increased concentrations with ketoconazole, delavirdine, nelfinavir and ritonavir. Reduced efficacy with nevirapine, efavirenz or rifampicin. Increased risk of myopathy with statins. Increased concentrations of phosphodiesterase-5 inhibitors. Potentially Fatal: Increased risk of cardiac arrhythmias with amiodarone, pimozide or cisapride. Increased sedation and respiratory depression with midazolam, alprazolam and triazolam. Increased risk of ergotism with ergot derivatives. Increased toxicity of drugs with narrow therapeutic index.
Food Interaction	Reduced concentrations with grapefruit juice. Reduced antiviral response with St. John's wort.
Storage	Oral: Store at 15-30°C (59-86°F).
Mechanism of Action	Indinavir binds reversibly to HIV-protease which prevents cleavage of the viral precursor polyproteins. As a result, immature viral particles incapable of infecting other cells are formed. Absorption: Absorbed rapidly from the GIT (oral); peak plasma concentrations after 0.8 hr. May be reduced by intake of high-calorie meals. Distribution: Protein-binding: 60%

	Absorption: Absorbed rapidly from the GI (oral); peak plasma concentrations after 0.8 hr. May be reduced by intake of high-calorie meals. Distribution: Protein-binding: 60% Metabolism: Oxidation by CYP3A4 and glucuronidation. Excretion: Via urine (<20%, half as unchanged drug), via faeces (remaining dose); 1.8 hr (elimination half-life).
CIMS Class	Antivirals
ATC Classification	J05AE02 - indinavir ; Belongs to the class of protease inhibitors. Used in the systemic treatment of viral infections.

indometacin

CIMS Class : (Ophthalmic Decongestants, Anesthetics, Anti-inflammatories) , (Nonsteroidal Anti-inflammatory Drugs (NSAIDs)) , (Other Cardiovascular Drugs)
indometacin

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ✖ - Lab interference

Food ✖ - Food interaction

related indometacin information

Indication & Dosage	<i>Oral</i> Pain and inflammation associated with musculoskeletal and joint disorders Adult: Initially, 25 mg bid-tid, increased if necessary by 25-50 mg daily at wkly intervals to 150-200 mg daily. <i>Oral</i> Acute gout Adult: 150-200 mg daily in divided doses until signs and symptoms disappear. <i>Oral</i> Dysmenorrhoea Adult: 75 mg daily. <i>Oral</i> Night pain and morning stiffness Adult: Up to 100 mg/day, on retiring. May also be given as rectal suppository. Total combined oral and rectal doses should not exceed 200 mg/day.

Night pain and morning stiffness

Adult: Up to 100 mg/day, on retiring. May also be given as rectal suppository. Total combined oral and rectal doses should not exceed 200 mg/day.

*Oral***Juvenile rheumatoid arthritis**

Child: 2-14 yr: start with 1-2 mg/kg/day in divided doses.

Max: 3 mg/kg/day or 150-200 mg/day, whichever is lower.

*Intravenous***Closure of patent ductus arteriosus**

Child: Given as 3 IV doses at 12-24 hr intervals. First dose: start with 0.2 mg/kg. Second and third doses (based on neonatal age at first dose): if <48 hr old, use 0.1 mg/kg/dose; if 2-7 days old, use 0.2 mg/kg/dose; if >7 days old, use 0.25 mg/kg/dose. Withhold treatment if urine output is <0.6 ml/kg/hr. Infuse each dose over 20-30 min. Second course of 1-3 doses may be repeated if ductus arteriosus remains open or re-opens 48 hr after the first course. Surgery may be required if neonate is unresponsive to 2 courses of treatment.

*Ophthalmic***Prophylaxis of miosis during cataract surgery**

Adult: As 0.5 or 1% solution: Instill 2 drops, repeat 2 hr later on the day before surgery, followed by 2 drops 3 hr before and 2 drops 1 hr before procedure. May instill up to 6 times/day post-operatively to prevent cystoid macular oedema, continue treatment until inflammatory signs have resolved.

Reconstitution: Add 1-2ml of preservative free 0.9% sodium chloride or water for injection. Further dilution of the reconstituted injection in IV infusions is not recommended. Reconstitution to be performed prior to injection and unused portion should be discarded.

	reconstituted injection in IV infusions is not recommended. Reconstitution to be performed prior to injection and unused portion should be discarded. Incompatibility: Glucose solution. Reconstituting in solutions
Contraindications	Active peptic ulcer; pregnancy (3rd trimester), hypersensitivity to aspirin and other NSAIDs; treatment of perioperative pain in CABG surgery; severe renal impairment; rectal admin in patients with proctitis and haemorrhoids; neonates with necrotizing enterocolitis, active bleeding, thrombocytopenia, coagulation defects and untreated infections.
Special Precautions	Hypertension; congestive heart failure; fluid retention; epilepsy, parkinsonism, psychiatric disorders; may affect performance of skilled tasks. Prolonged treatment duration may increase risk of CV thrombotic events. Monitor ophthalmologic, blood, electrolytes and renal function regularly; lactation.
Adverse Drug Reactions	GI upsets, headache, dizziness, tinnitus, lightheadedness, depression, insomnia, psychiatric disturbances, peripheral neuropathy, blurred vision, confusion; hyperglycaemia, hyperkalaemia. Potentially Fatal: Renal failure.
Drug Interactions	Increased risk of hyperkalaemia when used with ACE inhibitors or potassium sparing diuretics; increased risk of nephrotoxicity with ACE inhibitors, ciclosporin and tacrolimus; increased risk of bleeding with warfarin and other NSAIDs. Concurrent use may increase plasma concentration of digoxin, lithium and metotrexate. Concurrent use with probenecid may cause indometacin toxicity. Aluminum- or magnesium-containing antacids may delay absorption.

	may increase plasma concentration of digoxin, lithium and metotrexate. Concurrent use with probenecid may cause indometacin toxicity. Aluminum- or magnesium-containing antacids may delay absorption. Potentially Fatal: Concurrent use with diflunisal increases plasma concentrations of indometacin.
Food Interaction	Rate of absorption delayed by food.
Lab Interference	False-negative results in dexamethasone suppression test.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). if used for > 48 hr or after 34 wks' gestation or close to delivery. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store below 30°C. Protect from light.
Mechanism of Action	Indometacin has anti-inflammatory, analgesic and antipyretic actions. It inhibits cyclooxygenase thus reducing prostaglandin synthesis. Onset: 30 min after oral admin. Absorption: >90 % absorbed from the GIT (oral); peak plasma concentrations after 2 hr. Poor and incomplete (premature neonates). 80-90% absorbed after rectal admin. Distribution: Synovial fluid, CNS, placenta; enters breast

	plasma concentrations after 2 hr. Poor and incomplete (premature neonates). 80-90% absorbed after rectal admin. Distribution: Synovial fluid, CNS, placenta; enters breast milk (small amounts). Protein-binding: 99% Metabolism: Hepatic via glucuronidation and demethylation; undergoes enterohepatic recirculation. Excretion: Urine: 60% as drug and metabolites, approximately 33% in faeces. Terminal half-life: 2.6-11.2 hr (adult) and 12-28 hr (neonate).
CIMS Class	Ophthalmic Decongestants, Anesthetics, Anti-inflammatories / Nonsteroidal Anti-inflammatory Drugs (NSAIDs)/ Other Cardiovascular Drugs
ATC Classification	C01EB03 - indometacin; Belongs to the class of other preparations used in cardiac therapy. M01AB01 - indometacin; Belongs to the class of acetic acid derivatives and related substances of non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism. M02AA23 - indometacin; Belongs to the class of non-steroidal antiinflammatory preparations for topical use. Used in the treatment of joint and muscular pains. S01BC01 - indometacin; Belongs to the class of non-steroidal antiinflammatory agents. Used in the treatment of inflammation of the eye.

related infliximab information

related infliximab information	
Indication & Dosage	<i>Intravenous</i> Crohn's disease Adult: Initially, 5 mg/kg as IV infusion over at least 2 hr. Responding patients: Maintenance: 5 mg/kg at 2 and 6 wk after initial dose then every 8 wk thereafter or further dose of 5 mg/kg if disease recurs. May increase dose to 10 mg/kg in responders who subsequently lose response. Consider discontinuing treatment if there is no response by wk 14. <i>Intravenous</i> Rheumatoid arthritis Adult: Initially 3 mg/kg as an IV infusion over at least 2 hr. Repeat at 2 and 6 wk after 1st dose then every 8 wk thereafter. May increase dose to 10 mg/kg if needed or increase dosing frequency to every 4 wk for patients with incomplete response. <i>Intravenous</i> Fistulising Crohn's disease Adult: 5 mg/kg over a period of not <2 hr. Repeat at 2 and 6

Intravenous

Fistulising Crohn's disease

Adult: 5 mg/kg over a period of not <2 hr. Repeat at 2 and 6 wk after 1st infusion. Responding patients: 5 mg/kg every 8 wk or readministration if disease recurs, followed by 5 mg/kg every 8 wk.

Intravenous

Ankylosing spondylitis

Adult: 5 mg/kg over a period of 2 hr, followed by 5 mg/kg at 2 and 6 wk after 1st infusion, then every 8 wk thereafter. For ankylosing spondylitis: Stop treatment if there is no response by wk 6. For plaque psoriasis and psoriatic arthritis: Stop treatment if there is no response by wk 14.

Intravenous

Plaque psoriasis

Adult: 5 mg/kg over a period of 2 hr, followed by 5 mg/kg at 2 and 6 wk after 1st infusion, then every 8 wk thereafter. For ankylosing spondylitis: Stop treatment if there is no response by wk 6. For plaque psoriasis and psoriatic arthritis: Stop treatment if there is no response by wk 14.

Intravenous

Psoriatic arthritis

Adult: 5 mg/kg over a period of 2 hr, followed by 5 mg/kg at 2 and 6 wk after 1st infusion, then every 8 wk thereafter. For ankylosing spondylitis: Stop treatment if there is no response by wk 6. For plaque psoriasis and psoriatic arthritis: Stop treatment if there is no response by wk 14.

Intravenous

Acute ulcerative colitis

Adult: 5 mg/kg over a period of 2 hr, followed by 5 mg/kg at 2 and 6 wk after 1st infusion, then every 8 wk thereafter. For ankylosing spondylitis: Stop treatment if there is no response by wk 6. For plaque psoriasis and psoriatic arthritis: Stop

	Adult. 5 mg/kg over a period of 2 hr, followed by 5 mg/kg at 2 and 6 wk after 1st infusion, then every 8 wk thereafter. For ankylosing spondylitis: Stop treatment if there is no response by wk 6. For plaque psoriasis and psoriatic arthritis: Stop treatment if there is no response by wk 14.
Contraindications	Active TB, moderate or severe CHF, severe infection. Pregnancy and lactation.
Special Precautions	Discontinue use if severe infections develop. Heart failure, history of recurrent infections, demyelinating disorders, risk of infections, acute suppurative fistula. Patients undergoing surgery. Child and elderly. Monitor for signs of infection for 6 mth before, during and for 6 mth after treatment. Monitor hepatic function.
Adverse Drug Reactions	Acute infusion reactions e.g. fever, chills, pruritus, urticaria, dyspnoea, chest pain, changes in BP; fatigue, dizziness, headache, back pain; delayed hypersensitivity e.g. fever rash, headache, myalgia; opportunistic infection; flushing; GI disturbances; blood dyscrasia ; worsening heart failure; arrhythmias; lymphoproliferative disorders. Rarely, lupus-like syndrome. TB.
Drug Interactions	Increased risk of serious infections with anakinra, abatecept, live vaccines. Reduced formation of antibodies against infliximab and increased infliximab concentrations with methotrexate.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Store in a refrigerator (2-8°C); do not freeze.
Mechanism of	Infliximab is a chimeric monoclonal antibody to tumour

Mechanism of Action	Infliximab is a chimeric monoclonal antibody to tumour necrosis factor α (TNFα). It forms stable complexes with TNFα, resulting in loss of TNFα bioactivity. Onset: Crohn's disease: Approx 2 wk. Distribution: Vol of distribution: 3-6 L. Distributed mainly within the vascular compartment. Excretion: Half-life elimination: 7-12 days.
CIMS Class	Immunosuppressants / Disease-Modifying Anti-Rheumatic Drugs (DMARDs)
ATC Classification	L04AB02 - infliximab;

insulin

CIMS Class : (Insulin Preparations)
insulin

P - Caution when used during pregnancy

L - Caution when used during lactation

related insulin information

Indication & Dosage	<i>Intramuscular</i>
	Diabetic ketoacidosis Adult: As soluble insulin, initial loading dose of 20 units, followed by 6 units/hr until blood glucose drops to 10 mmol/l, when the dose is given 2 hrly. Renal impairment: Dose reduction may be needed. Hepatic impairment: Dose reduction may be needed.
	<i>Intravenous</i>
	Diabetic ketoacidosis Adult: As soluble insulin, given in concentration of 1 unit/ml using an infusion pump: Initially infuse at a rate of 6 units/hr, double or quadruple the rate if blood glucose concentration do not decrease by about 5 mmol/l/hr. If blood glucose concentrations have decreased to 10 mmol/l, reduce the infusion rate to 3 units/hr and continue with 5% glucose to prevent hypoglycaemia, until the patient can eat orally. Do not stop the insulin infusion before SC insulin is started. Ensure adequate fluid replacement and include potassium chloride in the infusion to prevent insulin-induced

	prevent hypoglycaemia, until the patient can eat orally. Do not stop the insulin infusion before SC insulin is started. Ensure adequate fluid replacement and include potassium chloride in the infusion to prevent insulin-induced hypokalaemia. Child: As soluble insulin, given in concentration of 1 unit/ml using an infusion pump: Initially infuse at a rate of 0.1 units/kg/hr, double or quadruple the rate if blood glucose concentration do not decrease by about 5 mmol/l/hr. If blood glucose concentrations have decreased to 10 mmol/l, reduce the infusion rate to 0.05 units/kg/hr and continue with 5% glucose to prevent hypoglycaemia, until the patient can eat orally. Do not stop the insulin infusion before SC insulin is started. Ensure adequate fluid replacement and include potassium chloride in the infusion to prevent insulin-induced hypokalaemia. Renal impairment: Dose reduction may be needed. Hepatic impairment: Dose reduction may be needed. <i>Subcutaneous</i> Diabetes mellitus Adult: Admin according to requirements; inject into thighs, upper arms, buttocks, or abdomen. Renal impairment: Dose adjustments may be needed. Hepatic impairment: Dose adjustments may be needed.
Overdosage	Symptoms: Hypoglycaemia. Management: In mild hypoglycaemic episodes, treat with oral glucose. In severe hypoglycaemic episodes, where the patient has become unconscious, treat with IM/SC glucagon (0.5-1 mg) or IV glucose. If the patient does not respond to glucagon within 10-15 minutes, IV glucose must be given. Once consciousness is regained, admin oral carbohydrates to prevent a relapse.
Contraindications	Hypoglycaemia.

Contraindications	Hypoglycaemia.
Special Precautions	Pregnancy (insulin requirements tend to fall during the 1st trimester, increase during the 2nd and 3rd) and lactation. Regular monitoring of HbA1c and blood glucose concentrations.
Adverse Drug Reactions	Hypoglycaemia, insulin resistance, lipoatrophy, hypokalaemia, blurred vision.
Drug Interactions	Possible absence of hypoglycaemic warning symptoms with β-blockers. Decreased hypoglycaemic effect with corticosteroids, danazol, diazoxide, diuretics, glucagon, isoniazid, phenothiazine derivatives, somatropin, sympathomimetic agents, thyroid hormones, oestrogens, progestins (e.g. in oral contraceptives), protease inhibitors and atypical antipsychotic (e.g. olanzapine and clozapine). Increased hypoglycaemic effect with oral antidiabetic agents, ACE inhibitors, disopyramide, fibrates, fluoxetine, MAOIs, pentoxifylline, propoxyphene, salicylates and sulfonamide antibiotics. Decreased insulin resistance with octreotide and lanreotide. Increased risk of wt gain and peripheral oedema with pioglitazone, rosiglitazone. Decreased effect of sermorelin.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Insulin lowers blood glucose levels. It regulates carbohydrate, protein and fat metabolism by inhibiting hepatic glucose production and lipolysis, and enhancing peripheral glucose

Insulin lowers blood glucose levels. It regulates carbohydrate, protein and fat metabolism by inhibiting hepatic glucose production and lipolysis, and enhancing peripheral glucose disposal. The various insulin formulations are classified according to their durations of action after SC Inj. They are divided into short-, intermediate-, or long-acting insulin.

Soluble insulin (also known as 'neutral insulin' or 'regular insulin') is a short-acting preparation. To extend the duration of action of insulin, preparations are formulated as suspensions in 2 methods. The 1st method involves complexing insulin with a protein so that it is slowly released, e.g. protamine zinc insulin (contains an excess of protamine) and isophane insulin (or NPH insulin which contains equal amounts of protamine and insulin). An alternative method is particle size modification e.g. insulin zinc suspensions. While all the formulations can be admin by SC inj, most by IM inj, only soluble insulin can be admin by IV. Compared to SC inj, IM admin usually has a faster onset of action, with a shorter duration of action.

Onset: 0.5-1 hr (short-acting e.g. soluble insulin); 2 hr (intermediate-acting e.g. biphasic insulin, isophane insulin, amorphous insulin zinc suspensions); 2-3 hr (mixed-insulin Zn suspension); 4 hr (long-acting e.g. insulin zinc suspensions, protamine zinc insulins).

Duration: 6-8 hr (short-acting e.g. soluble insulin); 24 hr (intermediate-acting e.g. biphasic insulin, isophane insulin, amorphous insulin zinc suspensions); 30 hr (mixed-insulin Zn suspension); 36 hr (long-acting e.g. insulin zinc suspensions, protamine zinc insulins).

Absorption: Inactivated (oral); fairly rapid (SC); rapid (IM); increased by exercise.

Metabolism: Mainly in liver, also in kidneys and muscle

	Absorption: Inactivated (oral); fairly rapid (SC); rapid (IM); increased by exercise. Metabolism: Mainly in liver, also in kidneys and muscle tissue. Excretion: Small amount excreted as unchanged drug in urine.

insulin aspart

CIMS Class : (Insulin Preparations)
insulin aspart

P - Caution when used during pregnancy

L - Caution when used during lactation

related insulin aspart information

Indication & Dosage	<i>Subcutaneous</i> Diabetes mellitus Adult: Administer 5-10 min before meal. Usual range: 0.5-1 units/kg/day. When used in a meal-related SC inj treatment regimen, insulin aspart may provide 50-70% of total insulin requirement with the remainder provided by an intermediate-acting or long-acting insulin. Renal impairment: Decreased dose may be necessary. Hepatic impairment: Decreased dose may be necessary.
Administration	Should be taken with food. (Administer immediately before a meal.)
Contraindications	Hypoglycaemia
Special Precautions	Renal or hepatic impairment; pregnancy; lactation. Transferring from other insulin. Monitor serum glucose, potassium, electrolytes, HbA1c and lipid profile. Concomitant illness esp infections; hypokalaemia.
Adverse Drug Reactions	Hypoglycaemia; oedema; pruritus; rash; hypersensitivity reactions; lipoatrophy or lipohypertrophy with SC Inj (rotate

	Hypoglycaemia; oedema; pruritus; rash; hypersensitivity reactions; lipoatrophy or lipohypertrophy with SC Inj (rotate Inj site).
Drug Interactions	Effects may be increased by: oral antidiabetic agents, ACE inhibitors, disopyramide, fibrates, fluoxetine, MAOIs, propoxyphene, salicylates, somatostatin analog (e.g., octreotide), sulfonamide antibiotics. Effects may be decreased by: corticosteroids, niacin, danazol, diuretics, sympathomimetic agents, isoniazid, phenothiazine derivatives, somatropin, thyroid hormones, oral contraceptives, lithium. Signs of hypoglycaemia may be masked by β -blockers, clonidine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Insulin aspart, a rapid-acting analog of human insulin, lowers blood glucose levels; it regulates carbohydrate, protein and fat metabolism by inhibiting hepatic glucose production and lipolysis, and enhancing peripheral glucose disposal. Onset: 0.5 hr. Duration: 3-5 hrs.
CIMS Class	Insulin Preparations
ATC Classification	A10AB05 - insulin aspart; Belongs to the class of fast-acting insulins and analogues. Used in the treatment of diabetes. A10AD05 - insulin aspart; Belongs to the class of intermediate-acting combined with fast-acting insulins and analogues. Used in the treatment of diabetes.

insulin detemir

CIMS Class : (Insulin Preparations)
insulin detemir

P - Caution when used during pregnancy

L - Caution when used during lactation

related insulin detemir information

Indication & Dosage

Subcutaneous

Diabetes mellitus

Adult: In insulin-naïve patients with type 2 DM who are not well controlled on oral antidiabetic drugs: Initial dosage of 0.1-0.2 units/kg given once daily in the evening or 10 units given once or twice daily, with subsequent dosage adjusted based on glycaemic control. In patients on basal insulin only: Insulin detemir may be substituted on a unit-for-unit basis for the basal insulin currently in use, adjust dose to achieve glycaemic targets. Inj may be given once daily at evening meal or at bedtime or twice daily in the morning and the second dose admin after the evening meal, at bedtime, or 12 hr after the morning dose.

Renal impairment: Dose adjustment may be needed.

Hepatic impairment: Dose adjustment may be needed.

Incompatibility: Do not mix with other insulin preparations.

Administration

May be taken with or without food. (For patients treated w/ once daily regimen, administer w/ evening meal or at

	May be taken with or without food. (For patients treated w/ once daily regimen, administer w/ evening meal or at bedtime. For patients who need twice daily dosing, the evening dose can be administered either w/ the evening meal or at bedtime or 12 hr after the morning dose.)
Overdosage	Symptoms: Hypoglycaemia. Management: In mild hypoglycaemic episodes, treat with oral glucose. In severe hypoglycaemic episodes, where the patient has become unconscious, treat with IM/subcutaneous glucagon (0.5-1 mg) or IV glucose. If the patient does not respond to glucagon within 10-15 minutes, IV glucose must be given. Once consciousness is regained, admin oral carbohydrates to prevent a relapse.
Contraindications	Do not admin by IV, IM or via insulin infusion pump.
Special Precautions	Renal or hepatic impairment. Regular monitoring of blood glucose and HbA1c. Continuous rotation of the inj site within a given area to reduce inj site reactions. Pregnancy, lactation
Adverse Drug Reactions	Hypoglycaemia, lipodystrophy, pruritus, rash, wt gain, sodium retention and oedema. Inj site reactions e.g. pain, itching, hives, swelling and inflammation.
Drug Interactions	Possible absence of hypoglycaemic warning symptoms with β -blockers. Increased blood sugar with thiazide diuretics, corticosteroids, chlorpromazine, tibolone, isoniazid, niacin, some calcium-channel blockers such as diltiazem or nifedipine, diazoxide, lithium and thyroid hormones. Increased risk of hypoglycemia with disopyramide, large doses of aspirin, gatifloxacin, MAOIs, mebanazine, nandrolone, pegvisomant, testosterone. Decreased insulin resistance with octreotide and lanreotide. Increased risk of wt gain and peripheral oedema

	decreased risk of osteoporosis, gallstones, and cataracts, mebanazine, nandrolone, pegvisomant, testosterone. Decreased insulin resistance with octreotide and lanreotide. Increased risk of wt gain and peripheral oedema with pioglitazone, rosiglitazone. Decreased effect of sermorelin.
Storage	Subcutaneous: Unopened preparation: Store between 2-8°C (36-46° F). Do not freeze. Once opened, the vial should be kept in refrigerator (do not freeze) or at room temperature, below 30°C (86°F) for up to 42 days. Once opened, cartridge or a prefilled syringe to be stored at room temperature, below 30°C (86°F) up to 42 days (do not refrigerate).
Mechanism of Action	Insulin detemir is a recombinant human insulin analogue which is long-acting. It is prepared using recombinant DNA technology and genetically modified cultures of <i>Saccharomyces cerevisiae</i>. Slow systemic absorption and reversible binding to albumin may account for the prolonged duration of action of insulin detemir. Duration: 24 hr Absorption: Max plasma concentration: 6-8 hr (SC admin). Absolute bioavailability: 60%. Distribution: Protein binding: 98% (albumin). Volume of distribution: 0.1 L/kg. Terminal half-life: 5-7 hr (after SC admin).
CIMS Class	Insulin Preparations
ATC Classification	A10AE05 - insulin detemir;

interferon alfa-2a

CIMS Class : (Antivirals) , (Immunological Chemotherapy)
interferon alfa-2a

P - Caution when used during pregnancy

L - Caution when used during lactation

related interferon alfa-2a information

Indication & Dosage	<i>Subcutaneous</i>
	Renal cell carcinoma
	Adult: As an adjunct to cytotoxic chemotherapy: In an escalating dose of 3 million units 3 times wkly for 1 wk, then 9 million units 3 times wkly for 1 wk, then 18 million units 3 times wkly thereafter for 3-12 mth.
	<i>Subcutaneous</i>
	Chronic hepatitis B
	Adult: 2.5-5 million units/m ² 3 times/wk for 4-6 mth.
	<i>Subcutaneous</i>
	Chronic hepatitis C
	Adult: 3-4.5 million units 3 times wkly for 6 mth when used with ribavirin. As monotherapy: Initial: 3-6 million units 3 times wkly for 6 mth followed by 3 million units 3 times wkly for an additional 6 mth, or 3 million units 3 times wkly for 12 mth.
	<i>Subcutaneous</i>
	Hairy cell leukaemia
	Adult: 3 million units daily for 16-24 wk. Maintenance: 3

.....

Subcutaneous

Hairy cell leukaemia

Adult: 3 million units daily for 16-24 wk. Maintenance: 3 million units 3 times/wk. May continue treatment for up to 24 wk.

Subcutaneous

AIDS-related Kaposi's sarcoma

Adult: In an escalating dose of 3 million units daily for 3 days, 9 million units daily for 3 days, 18 million units daily for 3 days, and 36 million units daily, if tolerated, on days 10-84. thereafter the max tolerated dose (up to 36 million units) may be given 3 times wkly.

Subcutaneous

Chronic myeloid leukaemia

Adult: In an escalating dose of 3 million units daily for 3 days, 6 million units daily for 3 days, and 9 million units daily thereafter. For responders after 12 wk: Continue treatment until a complete haematological response is achieved or for a max of 18 mth; for those who achieve a complete haematological response: Continue on 9 million units daily (at least 9 million units 3 times wkly) in order to achieve a cytogenetic response.

Subcutaneous

Follicular lymphoma

Adult: As an adjunct to chemotherapy: 6 million units/m² daily on days 22-26 of each 28-day chemotherapy cycle.

Subcutaneous

Cutaneous T-cell lymphoma

Adult: In an escalating dose of 3 million units daily for 3 days, then 9 million units daily for 3 days, and then 18 million units daily to complete 12 wk of treatment. Thereafter, the max tolerated dose (up to 18 million units) is given 3 times

	days, then 9 million units daily for 3 days, and then 18 million units daily to complete 12 wk of treatment. Thereafter, the max tolerated dose (up to 18 million units) is given 3 times wkly for at least 12 mth in responders. <i>Subcutaneous</i> Melanoma Adult: 3 million units 3 times/wk for 18 mth. Start treatment no later than 6 wk after surgery.
Overdosage	Symptoms may include profound lethargy, fatigue, prostration and coma.
Contraindications	Hypersensitivity. Autoimmune hepatitis, hepatic decompensation.
Special Precautions	History of depression (monitor for signs). Perform regular neuropsychiatric monitoring. Seizure disorders and/or compromised CNS function. Preexisting or any history of cardiac disease. Monitor CBC prior to and during therapy. Myelosuppression or concurrent use of myelosuppressive drugs. Hypothyroidism, hyperthyroidism, DM. Perform ophthalmological exam on patients with preexisting ophthalmologic disorders (e.g. diabetic or hypertensive retinopathy). Monitor patients with impaired renal function. Creatinine clearance <50 ml/min. May impair ability to drive or operate machinery. Pregnancy and lactation.
Adverse Drug Reactions	Depressive illness, suicidal behaviour, irritability, insomnia, anxiety. Flu-like symptoms. Headache, dizziness, paraesthesia, confusion, impaired concentration, alteration in taste or smell. GI disturbances. Dryness of oropharynx, epistaxis, rhinitis, arrhythmia, sinusitis. Inj site reaction, alopecia, rash, dry skin or pruritus. Conjunctivitis, menstrual irregularity, visual disturbances. Coughing, dyspnoea. Myalgia, joint or bone pain, arthritis or polyarthritis. Bone marrow depression.

	alopecia, rash, dry skin or pruritus. Conjunctivitis, menstrual irregularity, visual disturbances. Coughing, dyspnoea. Myalgia, joint or bone pain, arthritis or polyarthritis. Bone marrow depression. Potentially Fatal: Marked increase in triglyceride levels, GI haemorrhage, severe infections, pulmonary infiltrates or pulmonary function impairment.
Drug Interactions	Reduces clearance of theophylline. Enhanced myelosuppression with other myelosuppressive drugs (e.g. zidovudine). Drugs metabolised by CYP450 pathway (monitor for changes in pharmacologic or adverse effects of concomitant drug). Increased risk of toxicity of centrally acting drugs. Increased risk of renal failure with interleukin-2.
Storage	Subcutaneous: Store in a refrigerator at 2-8°C (36-46°F).
Mechanism of Action	Interferon alfa-2a has antiviral, antitumour and immunomodulatory activity. It inhibits replication of a wide range of RNA and DNA viruses. It also exerts antiproliferative effects on normal and malignant cells. Interferon alfa-2a suppresses antibody formation through an effect on B-lymphocytes and inhibits onset of delayed hypersensitivity. Absorption: >80% is absorbed (IM); peak plasma concentrations within 4-8 hr (IM). Metabolism: Excretion: Via urine (negligible amounts); 3.7-8.5 hr (elimination half-life).
CIMS Class	Antivirals / Immunological Chemotherapy

interferon alfa-2b

CIMS Class : (Immunological Chemotherapy) , (Antivirals)
interferon alfa-2b

P - Caution when used during pregnancy

L - Caution when used during lactation

related interferon alfa-2b information

Indication & Dosage	<i>Parenteral</i>
	Chronic active hepatitis B
	Adult: 5-10 million units IM/SC 3 times wkly for 4-6 mth, or 5 million units daily for 16 wk.
	<i>Parenteral</i>
	Chronic hepatitis C
	Adult: 3 million units IM/SC 3 times wkly for 6-12 mth (depending on genotype) when used with ribavirin, or for 6-18 mth (up to 24 mth) when used as monotherapy.
	<i>Parenteral</i>
	AIDS-related Kaposi's sarcoma
	Adult: 30 million units/m ² IM/SC 3 times wkly.
	<i>Parenteral</i>
	Hairy cell leukaemia
	Adult: 2 million units/m ² IM/SC 3 times wkly for up to 6 mth or more.
	<i>Subcutaneous</i>
	Chronic myeloid leukaemia
	Adult: 4-5 million units/m ² daily; continue at the max

or more.

Subcutaneous

Chronic myeloid leukaemia

Adult: 4-5 million units/m² daily; continue at the max tolerated dose to maintain remission.

Max Dosage: 4-10 million units/m² daily.

Subcutaneous

Follicular lymphoma

Adult: As an adjunct to chemotherapy: 5 million units 3 times wkly for 18 mth.

Subcutaneous

Carcinoid tumours

Adult: 3-9 million units (usually 5 million units) 3 times wkly.

Advanced disease: 5 million units daily.

Parenteral

Melanoma

Adult: Initially, 20 million units/m² daily for 5 days each wk for 4 wk by IV infusion over 20 minutes. Maintenance: 10 million units/m² via SC inj 3 times wkly for 48 wk.

Subcutaneous

Multiple myeloma

Adult: Maintenance dose following chemotherapy induction: 3 million units/m² 3 times wkly.

Injection

Condyloma acuminata

Adult: Inject 1 million units into each lesion 3 times wkly for 3 wk; repeat after 12-16 wk as needed. Max: 5 lesions per treatment course.

Contraindications

Hypersensitivity. Hepatic decompensation, autoimmune hepatitis or a history of autoimmune disease, immunosuppressed transplant recipients.

Special Precautions

History of pulmonary disease (e.g. COPD) or DM prone to ketoacidosis. Coagulation disorders or severe

	History of pulmonary disease (e.g. COPD) or DM prone to ketoacidosis. Coagulation disorders or severe myelosuppression. Monitor patients with history of MI and/or arrhythmic disorders. Preexisting or history of psychiatric disorder, particularly depression. Poorly controlled thyroid abnormalities. Perform ophthalmological exam on patients with preexisting ophthalmologic disorders (e.g. diabetic or hypertensive retinopathy). Monitor WBC count in myelosuppressed patients and in those receiving other myelosuppressive agents. Preexisting psoriasis. May impair ability to drive or operate machinery. Pregnancy and lactation.
Adverse Drug Reactions	Flu-like symptoms; alopecia; hypersensitivity reactions; nausea; anorexia; myelosuppression; lethargy; ocular side effects; depression; CV problems; nephrotoxicity; hypertriglyceridaemia; thyroid abnormalities; hyperglycaemia; psoriasiform rash; confusion; coma; seizures. Potentially Fatal: Hepatotoxicity, pulmonary infiltrates, pneumonitis and pneumonia, autoimmune diseases.
Drug Interactions	Reduces clearance of theophylline. Enhanced myelosuppression with other myelosuppressive drugs (e.g. zidovudine).
Storage	Injection: Store at 2-8°C (36-46°F). Parenteral: Store at 2-8°C (36-46°F). Subcutaneous: Store at 2-8°C (36-46°F).
Mechanism of Action	Interferon alfa-2b binds to a specific cell surface protein. Once bound, it initiates a series of intracellular activities including induction of certain enzymes, suppression of cell proliferation, enhancement of phagocytic activity of macrophages, augmentation of cytotoxicity of lymphocytes for target cells, and inhibition of viral replication.

	proliferation, enhancement of phagocytic activity of macrophages, augmentation of cytotoxicity of lymphocytes for target cells, and inhibition of viral replication. Absorption: Peak plasma concentrations in 3-12 hr (IM/SC); 30 min (IV). Excretion: Elimination half-life: 2-3 hr (IM/SC); 2 hr (IV).
CIMS Class	Immunological Chemotherapy / Antivirals
ATC Classification	L03AB05 - interferon alfa-2b; Belongs to the class of interferons. Used as immunostimulants.

related iohexol information

related iohexol information	
Indication & Dosage	<i>Oral</i> Gastrointestinal tract examination Adult: Use 350 mg iodine/ml solution: 50-100 ml. Child: <3 mth: 180 mg iodine/ml: 5-30 ml. 3 mth-3 yr: 180, 240 or 300 mg iodine/ml: up to 60 ml; 4-10 yr: 180, 240 or 300 mg iodine/ml: up to 80 ml; >10 yr: 180, 240 or 300 mg iodine/ml: up to 100 ml. <i>Oral</i> Contrast-enhanced computerized tomography of the abdomen Adult: Solutions diluted to 6-9 mg iodine/ml solution: 500-1000 ml. Child: Solutions diluted to 9-21 mg iodine/ml solution: 180-750 ml; given at once or over 30-45 min. Max: <3 mth: 5 g iodine; 3-18 yr: 10 g iodine. <i>Intrathecal</i> Contrast-enhanced computerized tomography Adult: Lumbar (via lumbar inj): 180 mg iodine/ml: 10-17 ml; 240 mg iodine/ml: 7-12.5 ml. Thoracic (via lumbar or cervical inj): 240 mg iodine/ml: 6-12.5 ml; 300 mg iodine/ml: 6-10 ml.

Contrast-enhanced computerized tomography

Adult: Lumbar (via lumbar inj): 180 mg iodine/ml: 10-17 ml; 240 mg iodine/ml: 7-12.5 ml. Thoracic (via lumbar or cervical inj): 240 mg iodine/ml: 6-12.5 ml; 300 mg iodine/ml: 6-10 ml. Cervical (via lumbar inj): 240 mg iodine/ml: 6-12.5 ml; 300 mg iodine/ml solution: 6-10 ml. Cervical (via C1-2 inj): 180 mg iodine/ml: 7-10 ml; 240 mg iodine/ml: 6-12.5 ml; 300 mg iodine/ml: 4-10 ml. Total columnar (via lumbar inj): 240 mg iodine/ml: 6-12.5 ml; 300 mg iodine/ml: 6-10 ml.

Child: Use 180 mg iodine/ml solution. 0-<3 mth: 240 ml; 3-<36 mth: 4-8 ml; 3-<7 yr: 5-10 ml; 7-<13 yr: 5-12 ml; 13-18 yr: 6-15 ml.

Injection

Angiocardiology

Adult: Ventriculography: 350 mg iodine/ml: 30-60 ml, usual: 40 ml, may be repeated as necessary. If with selective coronary arteriography: max 250 ml. Selective coronary arteriography: 350 mg iodine/ml: 3-14 ml per inj, usual: 5 ml. Aortic root and arch study when used alone: 350 mg iodine/ml: 20-75 ml, usual 50 ml. Multiple procedures: 350 mg iodine/ml: max 250 ml.

Child: Ventriculography: 350 mg iodine/ml: 1-1.5 ml/kg, usual: 1.25 ml/kg; 300 mg iodine/ml: 1.5-2 ml/kg, usual 1.75 ml/kg. Max: 5 ml/kg; 350 mg iodine/ml: 250 ml; 300 mg iodine/ml: 291 ml. Pulmonary angiography: 350 mg iodine/ml: 1 ml/kg. Multiple procedures: Max: 5 ml/kg; 350 mg iodine/ml: 250 ml; 300 mg iodine/ml: 291 ml.

Injection

Aortography and selective visceral arteriography

Adult: Use 300 or 350 mg iodine/ml solution, single inj. Aorta: 50-80 ml; major branches: 30-60 ml; renal arteries: 5-15 ml. Repeat as necessary. Max: 300 mg iodine/ml: 291 ml; 350 mg iodine/ml: 250 ml.

Aorta: 50-80 ml; major branches: 30-60 ml; renal arteries: 5-15 ml. Repeat as necessary. Max: 300 mg iodine/ml: 291 ml; 350 mg iodine/ml: 250 ml.

Child: Use 350 mg iodine/ml solution: 1 ml/kg, single dose. Max: 5 ml/kg up to 250 ml.

Intra-arterial

Cerebral arteriography

Adult: Use 300 mg iodine/ml solution: Common carotid artery: 6-12 ml; internal carotid artery: 8-10 ml; external carotid artery: 6-9 ml; vertebral artery: 6-10 ml.

Intravenous

Contrast-enhanced computerized tomography

Adult: Head imaging by inj: 300 mg iodine/ml: 70-150 ml; 350 mg iodine/ml: 80 ml. Head imaging by infusion: 240 mg iodine/ml: 120-250 ml. Body imaging by inj: 300 mg iodine/ml: 50-200 ml; 350 mg iodine/ml: 60-100 ml.

Child: Head imaging: 240 or 300 mg iodine/ml: 1-2 ml/kg. Max: 28 g iodine with 240 mg iodine/ml solution or 35 g iodine with 300 mg iodine/ml solution.

Intravenous

Digital subtraction angiography

Adult: 350 mg iodine/ml: 30-50 ml, as a bolus at 7.5-30 ml/second using a pressure injector, usually for 3 or more inj; max: 250 ml.

Intra-arterial

Digital subtraction angiography

Adult: Use 140 mg iodine/ml solution: Aorta: 20-45 ml at 8-20 ml/sec; carotid: 5-10 ml at 3-6 ml/sec; femoral: 9-20 ml at 3-6 ml/sec; vertebral: 4-10 ml at 2-8 ml/sec; renal: 6-12 ml at 3-6 ml/sec; other branches of the aorta (includes subclavian, axillary, innominate and iliac): 8-25 ml at 3-10 ml/sec.

at 3-6 ml/sec; other branches of the aorta (includes subclavian, axillary, innominate and iliac): 8-25 ml at 3-10 ml/sec.

Intra-arterial

Peripheral arteriography

Adult: Aortofemoral runoffs: 350 mg iodine/ml: 20-70 ml; 300 mg iodine/ml: 30-90 ml. Selective arteriograms (femoral/iliac): 350 mg iodine/ml: 10-30 ml; 300 mg iodine/ml: 10-60 ml. Venography (per leg): 240 mg iodine/ml: 20-150 ml; 300 mg iodine/ml: 40-100 ml.

Injection

Excretory urography

Adult: Use 300 or 350 mg iodine/ml solution: 200-350 mg iodine/kg.

Child: Use 300 mg iodine/ml solution: 0.5-3 ml/kg, usual: 1-1.5 ml/kg; max: 3 ml/kg.

Intravenous

Contrast-enhanced computerized tomography of the abdomen

Adult: In conjunction with dilute oral admin, use 300 mg iodine/ml solution: 100-150 ml. The oral dose is administered 20-40 min prior to IV dose and image acquisition.

Child: In conjunction with dilute oral admin, use 240 or 300 mg iodine/ml solution: 1-2 ml/kg; max 3 ml/kg. The oral dose is administered 30-60 min prior to IV dose and image acquisition.

Injection

Voiding cystourethrography

Adult: Use diluted solutions using sterile water for inj to concentrations of 50-100 mg iodine/ml. Usual volume: 50 mg iodine/ml solution: 50-600 ml; 100 mg iodine/ml: 50-300 ml.

Child: Children: Use diluted solutions using sterile water for inj to concentrations of 50-100 mg iodine/ml: 50-300 ml.

	iodine/ml solution: 50-600 ml; 100 mg iodine/ml: 50-300 ml. Child: Children: Use diluted solutions using sterile water for inj to concentrations of 50-100 mg iodine/ml: 50-300 ml. <i>Injection</i> Arthrography Adult: Knee: 240 mg iodine/ml: 5-15 ml; 300 mg iodine/ml: 5-15 ml; 350 mg iodine/ml: 5-10 ml. Shoulder: 240 mg iodine/ml: 3 ml; 300 mg iodine/ml: 10 ml. Temporomandibular: 300 mg iodine/ml: 0.5-1 ml. Lower volumes are recommended for double-contrast examinations; higher volumes are recommended for single-contrast examinations. <i>Injection</i> Endoscopic retrograde pancreatography (ERP) Adult: Use 240 mg iodine/ml: 10-50 ml. <i>Injection</i> Endoscopic retrograde cholangiopancreatography (ERCP) Adult: Use 240 mg iodine/ml: 10-50 ml. <i>Injection</i> Hysterosalpingography Adult: 240 mg iodine/ml: 15-20 ml; 300 mg iodine/ml: 15-20 ml. <i>Injection</i> Herniography Adult: 240 mg iodine/ml: 50 ml.
Contraindications	Procedure-specific. Intrathecal: Myelography in significant local or systemic infection where bacteremia is likely; concurrent use with corticosteroids; repeat myelography in the event of technical failure (risk of overdosage). Hysterosalpingography: During menstrual period or when menstrual flow is imminent; presence of infection; pregnancy,

	the event of technical failure (risk of overdosage). Hysterosalpingography: During menstrual period or when menstrual flow is imminent; presence of infection; pregnancy, 6 mth after termination of pregnancy or 30 days after conization or curettage.
Special Precautions	Asthma or a history of allergies (risk of anaphylactoid reactions is increased); compromised blood-brain barrier (severe neurotoxicity after intrathecal use); epilepsy and brain tumour (higher risk of convulsions); severe hepatic or renal impairment, diabetics with renal impairment, dehydration and others who may be at increased risk of renal failure; multiple myeloma (dehydration from use may cause precipitation of protein in the renal tubules, leading to anuria and fatal renal failure); severe hypertension; advanced cardiac disease; pheochromocytoma; sickle-cell disease; hyperthyroidism; debilitated, severely ill, very old, or very young patients; occlusive vascular disease. Special care to ensure that 140 and 350 mg iodine/ml solutions are not given intrathecally. Adequate resuscitative facilities should be available when radiographic procedures are undertaken, and patients should be kept under observation for a suitable period after the procedure.
Adverse Drug Reactions	Flushing or a sensation of heat; pain, extravasation, thrombophlebitis at the inj site; nausea, vomiting, headache, and dizziness; urticaria, pruritus, pallor, sweating, metallic taste, weakness, coughing, rhinitis, sneezing, lachrymation, visual disturbances; hypotension, tachycardia, bradycardia, transient ECG abnormalities, haemodynamic disturbances; dyspnoea, bronchospasm, angioedema, severe urticaria; convulsions, paraesthesia, paralysis; acute renal failure; thromboembolism, disseminated intravascular coagulation, thrombocytopenia; hyperthyroidism, thyroid storm

	convulsions, paraesthesia, paralysis; acute renal failure; thromboembolism, disseminated intravascular coagulation, thrombocytopenia; hyperthyroidism, thyroid storm thyrotoxicosis. Potentially Fatal: Profound hypotension, pulmonary oedema, respiratory arrest, ventricular fibrillation, circulatory failure, cardiac arrest, coma.
Lab Interference	Thyroid function, blood coagulation and certain urine tests.
Storage	Injection: Store at 20-25°C. Protect from light. Do not freeze. Intra-arterial: Store at 20-25°C. Protect from light. Do not freeze. Intrathecal: Store at 20-25°C. Protect from light. Do not freeze. Intravenous: Store at 20-25°C. Protect from light. Do not freeze. Oral: Store at 20-25°C. Protect from light. Do not freeze.
Mechanism of Action	Iohexol is a nonionic water-soluble radiographic contrast medium. It allows visualisation of internal body structures by opacifying the path of its flow. It contains a high concentration of organically bound iodine (140-350 mg iodine/ml). Distribution: Binding of iohexol to human plasma proteins: About 1.5%. Excretion: Via urine (90%, as unchanged drug); 121-150 minutes (elimination half-life).
CIMS Class	Miscellaneous
ATC Classification	V08AB02 - iohexol; Belongs to the class of watersoluble, nephrotropic, low osmolar preparations used as X-ray contrast media.

***iohexol information:**

Note that there are some more drugs interacting with iohexol

Indication & Dosage

Intravenous

Cardiac chambers and related arteries

Child: >2 yr: 370 mg iodine/ml as 1-2 ml/kg. Max dose for procedure: 4 ml/kg.

Intravenous

Contrast-enhanced computerized tomography

Adult: 300 mg iodine/ml. Head: 50-200 ml; max dose for procedure: 200 ml. Body: 50-200 ml as bolus inj, rapid infusion or both (usual dose for infusion: 100-200 ml); max dose for procedure: 200 ml. Max dose of iodine: 86 g.

Child: >2 yr: 300 mg iodine/ml as 1-2 ml/kg. Max dose for procedure: 3 ml/kg.

Intravenous

Excretory urography

Adult: 300 mg iodine/ml. Max dose for procedure: 100 ml. Max dose of iodine: 86 g.

Child: >2 yr: 300 mg iodine/ml as 1-2 ml/kg. Max dose for procedure: 3 ml/kg.

Max dose of iodine: 86 g.

Child: >2 yr: 300 mg iodine/ml as 1-2 ml/kg. Max dose for procedure: 3 ml/kg.

Intravenous

Peripheral venography

Adult: 240 mg iodine/ml. Max dose for procedure: 250 ml.

Max dose of iodine: 86 g.

Intra-arterial

Aortography and visceral angiography

Adult: 370 mg iodine/ml. Max dose for procedure: 225 ml.

Max dose of iodine: 86 g.

Intra-arterial

Cerebral arteriography

Adult: 300 mg iodine/ml. Max dose for procedure: 150 ml.

Carotid artery: 4-12 ml. Vertebral artery: 4-12 ml. Aortic arch inj: 20-50 ml. Max dose of iodine: 86 g.

Intra-arterial

Coronary arteriography and left ventriculography

Adult: 370 mg iodine/ml. Max dose for procedure: 225 ml.

Left coronary: 3-14 ml. Right coronary: 3-14 ml. Left ventricle: 30-60 ml. Max dose of iodine: 86 g.

Intra-arterial

Intra-arterial digital subtraction angiography

Adult: 150 mg iodine/ml. Max dose for procedure: 250 ml.

Carotid arteries: 6-10 ml. Vertebral: 4-8 ml. Aorta: 20-50 ml.

Major branches of the abdominal aorta: 2-20 ml. Max dose of iodine: 86 g.

Intra-arterial

Peripheral arteriography

Adult: 300 mg iodine/ml. Max dose for procedure: 250 ml.

Artery needs a pulse to be injected. Subclavian or femoral artery: 5-40 ml. Aortic bifurcation for distal runoff: 25-50 ml.

	Adult: 300 mg iodine/ml. Max dose for procedure: 250 ml. Artery needs a pulse to be injected. Subclavian or femoral artery: 5-40 ml. Aortic bifurcation for distal runoff: 25-50 ml. Max dose of iodine: 86 g.
Overdosage	Dialysable.
Contraindications	Not for intrathecal use.
Special Precautions	Ensure adequate hydration. Increased risk of immune reaction with previous contrast sensitivity, allergy to iodine, asthma, hay fever and food allergies. Renal impairment, combined renal and hepatic disease, combined renal and cardiac disease, DM, sickle-cell disease, severe thyrotoxicosis, myelomatosis or anuria. Pregnancy and lactation.
Adverse Drug Reactions	Vasodilatation, chest pain, hypertension, headache, pain, dizziness, nausea, vomiting, abnormal taste, urinary urgency, inj site reactions, back pain, abnormal vision. Potentially Fatal: Anaphylaxis and thrombosis.
Drug Interactions	Increased risk of delayed hypersensitivity with interleukins. May cause renal impairment and induce lactic acidosis with metformin.
Lab Interference	May interfere with thyroid function, urine and blood coagulation tests.
Storage	Intra-arterial: Store at 25°C (77°F). Intravenous: Store at 25°C (77°F).
Mechanism of Action	Iopromide is a nonionic iodinated radiographic contrast medium. It allows visualisation of internal body structures by opacifying the path of its flow. Distribution: Vol of distribution: 16 L. Protein-binding: 1%. Excretion: Via urine (97%, as unchanged drug). 2 hr (elimination half-life).
CIMS Class	Miscellaneous

CIMS Class	Miscellaneous
ATC Classification	V08AB05 - iopromide; Belongs to the class of watersoluble, nephrotropic, low osmolar preparations used as X-ray contrast media.

ipratropium bromide

CIMS Class : (Antiasthmatic & COPD Preparations) , (Nasal Decongestants & Other Nasal Preparations)
ipratropium bromide

P - Caution when used during pregnancy

L - Caution when used during lactation

related ipratropium bromide information

Indication & Dosage

Nasal

Rhinorrhoea associated with rhinitis

Adult: As metered-dose nasal spray (0.06%): 42 mcg into each nostril bid/tid, up to 84 mcg into each nostril 3-4 times daily for up to 4 days when rhinorrhoea is associated with common cold or up to 3 wk in seasonal allergic cases.

Child: As metered-dose nasal spray: =6 yr: 42 mcg into each nostril bid/tid.

Nasal

Seasonal allergic rhinitis

Adult: As metered-dose nasal spray (0.06%): 42 mcg into each nostril bid/tid, up to 84 mcg into each nostril 3-4 times daily for up to 4 days when rhinorrhoea is associated with common cold or up to 3 wk in seasonal allergic cases.

Child: As metered-dose nasal spray: =6 yr: 42 mcg into each nostril bid/tid.

Inhalation

Chronic obstructive pulmonary disease

	nostril bid/tid. <i>Inhalation</i> Chronic obstructive pulmonary disease Adult: As metered-dose aerosol: 20 or 40 mcg 3 or 4 times daily. Max: 12 inhalations daily. As dry powder: 40 mcg 3 or 4 times daily. Max: 320 mcg daily. As nebulised solution: 500 mcg (1 unit dose vial) 3-4 times daily. Child: As metered-dose aerosol: <6 yr: 20 mcg tid; 6-12 yr: 20 or 40 mcg tid. As nebulised solution: <6 yr: 125-250 mcg; 6-12 yr: 250 mcg at intervals of at least 6 hr up to 1 mg daily.
Special Precautions	Bladder neck obstruction, narrow-angle glaucoma or patients susceptible to glaucoma, prostatic hyperplasia. Protect patient's eyes from nebulised drug. Renal and hepatic impairment. Pregnancy, lactation, children, elderly.
Adverse Drug Reactions	Dry mouth, urinary retention, buccal ulceration, paralytic ileus, headache, nausea, constipation, paradoxical bronchospasm, immediate hypersensitivity reactions (urticaria, angioedema), acute angle-closure glaucoma, nasal dryness and epistaxis (nasal spray). Potentially Fatal: Anaphylactic reactions, atrial fibrillation, supraventricular tachycardia.
Drug Interactions	Increased toxicity with other anticholinergic drugs.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Inhalation: Aerosol: Store at 25°C (77°F). Do not expose above 49°C (120°F). Solution: Store at 15-30°C (59-86°F). Nasal: Store tightly closed at 25°C (77°F).

	Inhalation: Aerosol: Store at 25°C (77°F). Do not expose above 49°C (120°F). Solution: Store at 15-30°C (59-86°F). Nasal: Store tightly closed at 25°C (77°F).
Mechanism of Action	Ipratropium bromide blocks the action of acetylcholine at parasympathetic sites in bronchial smooth muscle causing bronchodilation. Absorption: Poorly absorbed from the GIT. Distribution: Minimally protein-bound. Excretion: Via urine and faeces (as unchanged drug and metabolites).
CIMS Class	Antiasthmatic & COPD Preparations / Nasal Decongestants & Other Nasal Preparations
ATC Classification	R01AX03 - ipratropium bromide; Belongs to the class of other topical preparations used as nasal decongestants. R03BB01 - ipratropium bromide; Belongs to the class of other inhalants used in the treatment of obstructive airway diseases, anticholinergics.

irbesartan

CIMS Class : (Angiotensin II Antagonists)
irbesartan

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related irbesartan information

Indication & Dosage	<i>Oral</i> Hypertension Adult: 150 mg once daily, increased to 300 mg once daily if necessary. For patients with intravascular volume depletion: Initially, 75 mg once daily. Child: 6-16 yr: 75 mg once daily increased to 150 mg if necessary. Elderly: >75 yr: Initially 75 mg once daily. Renal impairment: Haemodialysis: Initially, 75 mg once daily. <i>Oral</i> Diabetic nephropathy in Type 2 diabetes mellitus Adult: 150 mg once daily, increased to 300 mg once daily if necessary.
Administration	May be taken with or without food.
Contraindications	Hypersensitivity; pregnancy and lactation.
Special Precautions	Child <6 yr. Unilateral or bilateral renal artery stenosis; vol or Na depletion; aortic or mitral valve stenosis, hypertrophic

	Child <6 yr. Unilateral or bilateral renal artery stenosis; vol or Na depletion; aortic or mitral valve stenosis, hypertrophic cardiomyopathy.
Adverse Drug Reactions	Diarrhoea, dizziness, fatigue, headache, hyperkalaemia. Dyspepsia, oedema, myalgia, insomnia, nasal congestion, 1st dose orthostatic hypotension, rash, pharyngitis, urticaria, angioedema, anxiety/nervousness, tachycardia.
Drug Interactions	Potassium or potassium-sparing diuretics may increase risk of hyperkalaemia. NSAIDs may reduce antihypertensive response. Excretion of lithium may be reduced, monitor lithium concentrations.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Irbesartan is an angiotensin II type I receptor antagonist and therefore blocks the vasoconstricting and aldosterone-secreting effects of angiotensin II. Absorption: Rapidly absorbed from the GIT (oral); peak plasma concentrations are achieved after 1.5-2 hrs. Distribution: Protein-binding around 96% Metabolism: Some hepatic metabolism via cytochrome

	plasma concentrations are achieved after 1.5-2 hrs. Distribution: Protein-binding around 96% Metabolism: Some hepatic metabolism via cytochrome P450 isoenzyme CYP2C9 to inactive metabolites. Excretion: Via bile and urine (as unchanged drug and metabolites); via urine (20% of IV dose, <2% as unchanged). 11-15 hrs (elimination half-life).
CIMS Class	Angiotensin II Antagonists
ATC Classification	C09CA04 - irbesartan; Belongs to the class of angiotensin II antagonists. Used in the treatment of cardiovascular disease.

irinotecan

CIMS Class : (Cytotoxic Chemotherapy)
irinotecan

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related irinotecan information

Indication & Dosage

Intravenous

Refractory colorectal malignancies

Adult: 125 mg/m² infused IV over 90 min once wkly for 4 wk followed by a 2 wk rest period. Or, 350 mg/m² infused IV over 90 min repeated once every 3 wk.

Hepatic impairment: Dose reduction may be necessary.

Intravenous

Metastatic colorectal cancer

Adult: As 1st line treatment: 125 mg/m² infused IV over 90 min on days 1,8,15 and 22 of a 6 wk cycle. Alternatively 180 mg/m² infused IV over 90 min on days 1,15 and 29 of a 6 wk cycle.

Hepatic impairment: Dose reduction may be necessary.

Reconstitution: Dilute in 5% dextrose injection (preferred) or 0.9% sodium chloride injection to a final concentration of 0.12-2.8 mg/ml.

Contraindications

Inflammatory bowel disease, bowel obstruction, severe hepatic impairment. Pregnancy and lactation.

	Inflammatory bowel disease, bowel obstruction, severe hepatic impairment. Pregnancy and lactation.
Special Precautions	Previous pelvic/abdominal irradiation; elderly; Raised plasma-bilirubin concentration; severe myelosuppression. Avoid extravasation.
Adverse Drug Reactions	Neutropenia, anaemia, thrombocytopenia; acute diarrhoea, sweating, hypersalivation, abdominal cramps, lachrymation, miosis, weakness; nausea, vomiting, alopecia and skin reactions; cardiovascular toxicity. Potentially Fatal: Fatal sepsis due to myelosuppression; severe, chronic diarrhoea.
Drug Interactions	Diuretics increase risks of dehydration secondary to vomiting/diarrhoea; prophylactic dexamethasone as an antiemetic may enhance lymphocytopenia; prochlorperazine may increase incidence of akathisia; antineoplastic agents (myelosuppression and diarrhoea). St John's wort, ketoconazole may reduce irinotecan exposure.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Irinotecan, a derivative of camptothecin, works by inhibiting the enzyme topoisomerase I thereby interfering with the coiling and uncoiling of DNA during replication and causing irreparable damage. Distribution: Irinotecan is moderately bound to plasma albumin (approx 65%) and SN-38 is extensively bound (approx 95%). Metabolism: Converted to active metabolite SN-38 via

	albumin (approx 65%) and SN-38 is extensively bound (approx 95%). Metabolism: Converted to active metabolite SN-38 via hydrolysis in the liver. Excretion: Both biliary and urinary excretion. SN-38 primarily removed by glucuronidation. Elimination half life of 6-12 hr.
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01XX19 - irinotecan; Belongs to the class of other antineoplastic agents. Used in the treatment of cancer.

iron polymaltose

CIMS Class : (Vitamins & Minerals (Pre & Post Natal) / Antianemics)
iron polymaltose

related iron polymaltose information

Indication & Dosage

Oral

Iron-deficiency anaemia

Adult: As chewable tablet/syrup/drops: Doses equivalent to 100 mg of elemental iron daily, up to 300 mg daily.

Intramuscular

Iron-deficiency anaemia

Adult: As inj containing 100 mg iron as iron polymaltose/2 ml: Admin by ventro-gluteal inj according to Hochstetter method (refer to package insert for details). Total dose of iron needed (mg): $Wt (kg) \times (normal \text{ haemoglobin} - actual \text{ haemoglobin in g/L}) \times 0.24 + \text{iron depot}$. Iron depot calculated as 15 mg/kg up to a wt of about 34 kg, max of 500 mg for body wt =34 kg. May give dose as alternate day inj of 2 ml (or 4 ml at longer interval) until total dose is reached. Max single daily dose: >10-45 kg: 2 ml; >45 kg: 4 ml.

Child: As inj containing 100 mg iron as iron polymaltose/2 ml: Admin by ventro-gluteal inj according to Hochstetter method (refer to package insert for details). Total dose of iron needed (mg): $Wt (kg) \times (normal \text{ haemoglobin} - actual \text{ haemoglobin in g/L}) \times 0.24 + \text{iron depot}$. Iron depot

method (refer to package insert for details). Total dose of iron needed (mg): $Wt \text{ (kg)} \times (\text{normal haemoglobin} - \text{actual haemoglobin in g/L}) \times 0.24 + \text{iron depot}$. Iron depot calculated as 15 mg/kg up to a wt of about 34 kg, max of 500 mg for body wt = 34 kg. Max single daily dose: >10-45 kg: 2 ml; 5-10 kg: 1 ml; infants (up to 5 kg): 0.5 ml.

Intravenous

Iron-deficiency anaemia

Adult: As inj containing 100 mg iron as iron polymaltose/2 ml: Total dose of iron needed (mg): $Wt \text{ (kg)} \times (\text{normal haemoglobin} - \text{actual haemoglobin in g/L}) \times 0.24 + \text{iron depot}$. Iron depot calculated as 15 mg/kg up to a wt of about 34 kg, max of 500 mg for body wt = 34 kg. Refer to product insert for dosage table. 1st 50 ml to be infused slowly (5-10 drops/minute) and observe patient closely. If well tolerated, increase rate to 30 drops/minute (based on drop volume of 0.067ml).

Child: As inj containing 100 mg iron as iron polymaltose/2 ml: Total dose of iron needed (mg): $Wt \text{ (kg)} \times (\text{normal haemoglobin} - \text{actual haemoglobin in g/L}) \times 0.24 + \text{iron depot}$. Iron depot calculated as 15 mg/kg up to a wt of about 34 kg, max of 500 mg for body wt = 34 kg. Refer to product insert for dosage table. 1st 50 ml to be infused slowly (5-10 drops/minute) and observe patient closely. If well tolerated, increase rate to 30 drops/minute (based on drop volume of 0.067ml).

Reconstitution: IV infusion: Total dose to be admin to be added to 500 ml of normal saline (max 2500 mg in 500 ml).

Incompatibility: Do not mix with acidic substance or substances with a strong reducing effect.

Contraindications

Hypersensitivity or intolerance to iron and overloading of iron in the body. Anaemia not caused by iron deficiency.

	Hypersensitivity or intolerance to iron and overloading of iron in the body. Anaemia not caused by iron deficiency. Disturbances in iron utilisation, thalassemia. Patients receiving repeated blood transfusion. Parenteral: Iron overload, Ostler-Rendu-Weber syndrome, chronic polyarthritis, bronchial asthma, inflammation or infection of kidney or liver, uncontrolled hyperparathyroidism, decompensated liver cirrhosis. Pregnancy (1st trimester).
Special Precautions	Avoid concomitant parenteral and oral iron admin, oral iron therapy should start at least 1 wk after last iron inj. Parenteral: Pregnancy (2nd and 3rd trimester), allergies, hepatic and liver insufficiency, low iron binding capacity and or folic acid deficiency. Facilities for CPR should be available during admin. Excessive IV infusion rate may cause nausea and epigastric upset. IV infusion route should be used only if IM route is unacceptable and when there is no stored iron in the bone marrow.
Adverse Drug Reactions	GI irritation, epigastric pain, stomach cramping, constipation, nausea, vomiting, diarrhoea, dark stools, heart burn, discoloured urine, teeth staining. IM: pain at inj site, abdominal pain at lower quadrant and local inflammation with inguinal lymphadenopathy. IV: Joint and muscle pain, bronchospasm, hypotension, tachycardia, flushing, sweating, dizziness. Potentially Fatal: Parenteral: Anaphylactoid reactions, circulatory collapse.
Drug Interactions	Concurrent use with psychotropic drugs may worsen constipation. Increased systemic side effects with concomitant ACE inhibitors and parenteral iron admin.
Storage	Intramuscular: Store below 25°C. Do not

	Intramuscular: Store below 25°C. Do not freeze. Intravenous: Store below 25°C. Do not freeze. Oral: Store below 25°C.
Mechanism of Action	Iron polymaltose is a water soluble, macro-molecular complex of iron (III) hydroxide and isomaltose. It is used in the treatment of iron-deficiency anaemia.
CIMS Class	Vitamins & Minerals (Pre & Post Natal) / Antianemics

*iron polymaltose information:

isoniazid

CIMS Class : (Anti-TB Agents)
isoniazid

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related isoniazid information

Indication & Dosage

Oral

Tuberculosis

Adult: 5 mg/kg daily. Max: 300 mg daily. For intermittent treatment: 10 mg/kg 3 times a wk or 15 mg/kg twice wkly. Similar doses may also be given via IM admin. For latent tuberculosis: 300 mg daily for 6 mth; alternatively, 5 mg/kg daily or 15 mg/kg twice wkly for 9 mth.

Child: 10-15 mg/kg/day in 1-2 divided doses (max: 300 mg/day). Alternatively, intermittent therapy can be given at 20-40 mg/kg (max: 900 mg) 2-3 times wkly. For latent tuberculosis: 10-20 mg/kg/day or 20-40 mg/kg twice wkly for 9 mth. Max: 300 mg/dose for daily regimen and 900 mg/dose for intermittent regimens.

Renal impairment: Reduce dose in severe renal impairment.

Oral

Nontuberculous mycobacterial infections

Adult: 5 mg/kg/day for at least 12 mth of culture-negative

	<i>Oral</i> Nontuberculous mycobacterial infections Adult: 5 mg/kg/day for at least 12 mth of culture-negative sputum; usually used with ethambutol and rifampin. Max: 300 mg/day. Similar doses may also be given via IM admin.
Administration	Should be taken on an empty stomach. (Best taken on an empty stomach 1 hr before or 2 hr after meals. May be taken w/ meals to reduce GI discomfort.)
Overdosage	Symptoms: Slurred speech, metabolic acidosis, hallucinations, hyperglycaemia, respiratory distress or tachypnoea, convulsions, coma.
Contraindications	Acute liver disease or history of hepatic damage during INH therapy; hypersensitivity.
Special Precautions	Renal or hepatic impairment; convulsive disorders; history of psychosis; patients at risk of neuropathy or pyridoxine deficiency eg, diabetic, alcoholic, malnourished, uraemic, infected with HIV. Careful monitoring of hepatic function is necessary for black and hispanic women. Check hepatic function before and during treatment. Pregnancy and lactation.
Adverse Drug Reactions	Peripheral neuritis, optic neuritis; psychotic reactions, convulsions, nausea, vomiting, fatigue, epigastric distress, visual disturbances, fever, rash, pyridoxine deficiency. Potentially Fatal: Hepatotoxicity.
Drug Interactions	May increase toxicity of carbamazepine, ethosuximide, phenytoin, diazepam and triazolam, chlorzoxazone, theophylline, clofazimine, cycloserine and warfarin. May increase metabolism of enflurane resulting in nephrotoxic fluoride levels. Reduced efficacy and increased risk of peripheral neuropathies and hepatotoxicity with alcohol. Reduced

	metabolism of enflurane resulting in nephrotoxic fluoride levels. Reduced efficacy and increased risk of peripheral neuropathies and hepatotoxicity with alcohol. Reduced absorption with aluminium-containing antacids; give at least 1 hr before the antacid. Decreased serum levels with ketoconazole, zalcitabine. Increased risk of peripheral neuropathy with stavudine and zalcitabine. Potentially Fatal: Increased risk of hepatotoxicity with rifampicin and other hepatotoxic drugs.
Food Interaction	Decreased serum levels if taken with food. Avoid tyramine-containing foods e.g. cheese, red wine and some fish as severe elevations in BP may occur.
Lab Interference	False-positive urinary glucose with cupric sulfate solution.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 20-25°C.
Mechanism of Action	Isoniazid is active against <i>M tuberculosis</i>, <i>M bovis</i> and some strains of <i>M kansasii</i>. One of its main mechanisms appears to be mycolic acid synthesis inhibition resulting in loss of acid-fastness and bacterial cell wall disruption. Absorption: Absorbed readily from the GIT (oral) and after parenteral admin (IM); peak plasma concentrations after 1-2 hr (oral). Rate and extent may be reduced by the presence of food. Distribution: Body tissues and fluids, CSF, crosses the placenta and enters breast milk. Metabolism: Hepatic and enteral; acetylation by N-acetyltransferase to acetylisoniazid followed by hydrolysis

	placenta and enters breast milk. Metabolism: Hepatic and enteral; acetylation by N-acetyltransferase to acetylisoniazid followed by hydrolysis to isonicotinic acid and monoacetylhydrazine, then conjugated with glycine to isonicotinyl glycine and monoacetylhydrazine is further acetylated to diacetylhydrazine. Excretion: Via urine (as metabolites), via faeces (small amounts); 1-6 hr (elimination half-life), removed by dialysis.
CIMS Class	Anti-TB Agents
ATC Classification	J04AC01 - isoniazid; Belongs to the class of hydrazides. Used in the treatment of tuberculosis.

isoprenaline

CIMS Class : (Cardiac Drugs) , (Antiasthmatic & COPD Preparations)
isoprenaline

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related isoprenaline information

Indication & Dosage

Intravenous

Bronchospasm during anaesthesia

Adult: 0.01-0.02 mg (0.5-1 ml of a 1:50,000 dilution), repeat when necessary.

Elderly: Lower doses may be required.

Intravenous

Emergency treatment of cardiac arrhythmias

Adult: IV bolus inj: Initially, 0.02-0.06 mg (1-3 ml of a 1:50,000 dilution). Subsequent dose range: 0.01-0.2 mg. IV infusion: Initially, 5 mcg/minute. Adjust subsequent doses based on patient's response; usual range: 2-20 mcg/minute.

Child: Initially, 0.1 mcg/kg/minute. Subsequent dose range: 0.1-1 mcg/kg/minute.

Parenteral

Postoperative cardiac patients with bradycardia

Adult: For less urgent situations. Initial: 0.2 mg via IM or SC admin. Subsequent dose ranges: 0.02-1 mg (via IM admin) or 0.15-0.2 mg (via SC admin).

Adult: For less urgent situations. Initial: 0.2 mg via IM or SC admin. Subsequent dose ranges: 0.02-1 mg (via IM admin) or 0.15-0.2 mg (via SC admin).

Child: 0.029 mcg/kg/minute via IV infusion.

Intravenous

For temporary use in 3rd degree atrioventricular block until pacemaker insertion

Adult: 2-10 mcg/minute via IV infusion. Adjust subsequent rate based on patient's heart rate and rhythm response.

Intravenous

Complete heart block following closure of ventricular septal defects

Adult: 0.04-0.06 mg (2-3 mL of a 1:50,000 dilution) as bolus doses.

Child: Infants: 0.01-0.03 mg (0.5-1.5 mL of a 1:50,000 dilution) as bolus dose.

Intravenous

Adjunct in shock

Adult: 0.5-5 mcg/minute, adjust subsequent rate based on patient's response. In advanced stages: rates >30 mcg/minute have been used. Not recommended for >1 hr usage in patients with septic shock.

Intravenous

As a diagnostic agent

Adult: For diagnosing etiology of mitral regurgitation: 4 mcg/minute as infusion. For diagnosis of coronary artery disease or lesions: 1-3 mcg/minute as infusion.

Reconstitution: Reconstitute with supplied diluent only.

Overdosage

Symptoms: Tachycardia or other arrhythmias, palpitations, angina, BP changes, dizziness, headache, nausea or vomiting, restlessness, weakness, flushing. Management:

	Symptoms: Tachycardia or other arrhythmias, palpitations, angina, BP changes, dizziness, headache, nausea or vomiting, restlessness, weakness, flushing. Management: Supportive and symptomatic; monitor BP and ECG. Not known if dialysable.
Contraindications	Tachyarrhythmias; tachycardia or heart block due to digitalis intoxication; ventricular arrhythmias which require inotropic therapy; angina pectoris.
Special Precautions	Coronary artery disease, coronary insufficiency, diabetes, hyperthyroidism. Pregnancy and lactation. Parenteral: May paradoxically worsen heart block or precipitate Adams-Stokes attacks during normal sinus rhythm or transient heart block. Doses which can increase heart rate to >130 beats/min may increase the risk of inducing ventricular arrhythmias; caution in patients with failing heart or in those with significant degree of arteriosclerosis. Monitor response to therapy by frequent determination of the central venous pressure and blood gases. Ensure adequate ventilation. Monitor acid-base balance and correct any electrolyte disturbances. Inhalation: Severe paradoxical airway resistance may occur with repeated and excessive use. Carefully instruct the patient in the proper technique of admin.
Adverse Drug Reactions	Nervousness, restlessness, insomnia, anxiety, tension, blurring of vision, fear, excitement. Rarely, sweating, weakness, pallor, dizziness, mild tremor, headache, flushing of the face or skin, nausea, vomiting, tinnitus, lightheadedness, asthenia. Swelling of the parotid glands (prolonged use). Pulmonary oedema, dyspnoea. Palpitation and ventricular tachycardia. Transient myocardial ischaemia or myocardial dysfunction in children. Potentially Fatal: Ventricular arrhythmias.

	and ventricular tachycardia. Transient myocardial ischaemia or myocardial dysfunction in children. Potentially Fatal: Ventricular arrhythmias.
Drug Interactions	Additive peripheral vasoconstriction may occur with ergot alkaloids. Cardiac, bronchodilating and vasodilating effects may be antagonised by β-blockers e.g. propranolol. Potentially Fatal: IV: Severe arrhythmias may occur with epinephrine, digitalis, cyclopropane, halogenated hydrocarbon anaesthetics.
Lab Interference	May cause false elevations of bilirubin as measured in vitro by a sequential multiple analyser. May produce elevated values for urinary epinephrine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at controlled room temperature 20-25°C (68-77°F). Reconstituted solutions: To be used within 24 hr. Parenteral: Store at controlled room temperature 20-25°C (68-77°F). Reconstituted solutions: To be used within 24 hr.
Mechanism of Action	Isoprenaline is a sympathomimetic that acts directly on β-adrenergic receptors. It stimulates the CNS, has powerful stimulating action on the heart, and has bronchodilating properties. Duration: Inhalation: About 2 hr. Absorption: Less active after oral admin than after parenteral admin due to sulfate conjugation in the gut. Also absorbed through the oral mucosa. Metabolism: Resistant to metabolism by monoamine

	parenteral admin due to sulfate conjugation in the gut. Also absorbed through the oral mucosa. Metabolism: Resistant to metabolism by monoamine oxidase. Metabolised by catechol-O-methyltransferase in the liver, lungs, and other tissues. Excretion: Via urine (as unchanged drug and metabolites). Plasma half-life: IV: 1 to several min depending on rate of inj. Oral: More extended initial half-life. Inhalation: 5 min.
CIMS Class	Cardiac Drugs / Antiasthmatic & COPD Preparations
ATC Classification	C01CA02 - isoprenaline; Belongs to the class of adrenergic and dopaminergic cardiac stimulants excluding glycosides. Used in the treatment of heart failure. R03AB02 - isoprenaline; Belongs to the class of adrenergic inhalants, non-selective beta-adrenoreceptor agonists. Used in the treatment of obstructive airway diseases. R03CB01 - isoprenaline; Belongs to the class of adrenergics for systemic use, non-selective beta-adrenoreceptor agonists. Used in the treatment of obstructive airway diseases.

Indication & Dosage	<i>Oral</i> Management of angina Adult: 20-120 mg daily in divided doses. Gradually increase according to patient's response. Max dose: 240 mg daily. <i>Oral</i> Heart failure Adult: 30-160 mg daily in divided doses. Max dose: 240 mg daily. <i>Sublingual</i> Heart failure Adult: 5-15 mg every 2-3 hr. <i>Sublingual</i> Acute angina Adult: As tablet: 2.5-10 mg placed under the tongue. As spray: 1-3 sprays (1.25 mg/spray) directed under the tongue. <i>Intravenous</i> Unstable angina Adult: 2-12 mg/hr titrated according to patient's response.

	<i>Intravenous</i> Unstable angina Adult: 2-12 mg/hr titrated according to patient's response. Max dose: 20 mg/hr. <i>Intravenous</i> Heart failure Adult: 2-12 mg/hr titrated according to patient's response. Max dose: 20 mg/hr. <i>Intracoronary</i> Percutaneous transluminal coronary angioplasty Adult: 1 mg as a bolus before balloon inflation. Max dose within a 30-min period: 5 mg.
Administration	Should be taken on an empty stomach. (Take on an empty stomach ½ hr before meals.)
Overdosage	Symptoms: Increased intracranial pressure, throbbing headache, confusion, moderate fever; vertigo; palpitations; visual disturbances; nausea and vomiting; syncope; air hunger and dyspnoea; diaphoresis; heart block and bradycardia; paralysis; coma; seizures; and death. Methaemoglobinaemia.
Contraindications	Severe hypotension or anaemia, hypovolaemia, heart failure due to obstruction, or raised intracranial pressure due to head trauma or cerebral haemorrhage.
Special Precautions	Raised intracranial pressure, hypotension, hypovolaemia. Mitral valve prolapse, arterial hypoxaemia, glaucoma, elderly, hypothyroidism, malnutrition, pregnancy, lactation.
Adverse Drug Reactions	Hypotension, tachycardia, flushing, headache, dizziness, palpitation, syncope, confusion. Nausea, vomiting, abdominal pain. Apprehension, restlessness, weakness and vertigo. Potentially Fatal: Severe hypotension, circulatory collapse.

	abdominal pain. Apprehension, restlessness, weakness and vertigo. Potentially Fatal: Severe hypotension, circulatory collapse.
Drug Interactions	Increased hypotensive effects with alcohol or vasodilators. Marked orthostatic hypotension may occur when used with calcium channel blockers. Vasodilatory effect may be reduced with dihydroergotamine. Ergotamine effects may be enhanced. Reduced effectiveness of sublingual form with disopyramide. Potentially Fatal: Significant hypotension may occur with phosphodiesterase-5 inhibitors.
Lab Interference	False decrease in serum cholesterol.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at room temperature (25°C). Sublingual: Store at room temperature (25°C).
Mechanism of Action	Isosorbide dinitrate relaxes vascular smooth muscles by stimulating cyclic-GMP. It decreases left ventricular pressure (preload) and arterial resistance (afterload). Onset: 2-5 min (sublingual); <1 hr (oral as conventional tab). Duration: 2 hrs (sublingual); 4-6 hr (oral as conventional tab). Absorption: Readily absorbed from the oral mucosa (sublingual) and from the GIT (oral); absorbed from the skin (topical). Distribution: Widely distributed: Smooth muscle cells of the blood vessels. Metabolism: Extensive hepatic first-pass metabolism; converted to isosorbide-2-mononitrate and

	Distribution: Widely distributed: Smooth muscle cells of the blood vessels. Metabolism: Extensive hepatic first-pass metabolism; converted to isosorbide-2-mononitrate and isosorbide-5-mononitrate. Excretion: Elimination half-life: 45-60 min (sublingual); 20 min-4 hr (IV, oral).
CIMS Class	Anti-Anginal Drugs
ATC Classification	C01DA08 - isosorbide dinitrate; Belongs to the class of organic nitrate vasodilators. Used in the treatment of cardiac disease. C05AE02 - isosorbide dinitrate;

isosorbide mononitrate + aspirin

CIMS Class : (Anti-Anginal Drugs)
isosorbide mononitrate + aspirin

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related isosorbide mononitrate + aspirin information

Indication & Dosage	<i>Oral</i> Prophylaxis of angina, Prophylaxis of myocardial infarction Adult: Starting dose of ISMN and aspirin (60 mg/75 mg) is one or two tablets in the morning and of ISMN and aspirin (60 mg/150 mg) is one tablet in the morning.
Contraindications	Aspirin: Active gastro-ulceration, hypothrombinaemia, hypersensitivity, patients with history of ulceration or dyspepsia, children <12 yr, bleeding diathesis (like haemophilia) and concurrent use of anticoagulants. ISMN: hypersensitivity, acute circulatory failure, cardiogenic shock, severe hypotension, obstructive hypertrophic cardiomyopathy, pericardiac tamponade, low filling pressure, aortic and/or mitral valve stenosis, diseases associated with raised intracranial pressure, glaucoma, arterial hypoxemia and cor pulmonale, constructive pericarditis, orthostatic disturbances of circulatory regulation.

Special Precautions	Infants with hyperbilirubinuria because of risk of kernicterus resulting from displacement of bilirubin from plasma albumin. Neonates, children, nursing mothers, elderly, volume depletion, hypotension. Hypotension induced by ISMN may be accompanied by paradoxical bradycardia and increased angina pectoris. Nitrate therapy may aggravate the angina caused by hypertrophic cardiomyopathy.
Adverse Drug Reactions	Aspirin: Epigastric discomfort, gastric bleeding, rhinitis, urticaria, angioneurotic oedema, worsening of asthma, elevation of transaminases, hepatomegaly. Isosorbide mononitrate: Nausea, vomiting, urinary and faecal incontinence, abdominal pain, headache, apprehension, restlessness, weakness, vertigo, dizziness, tachycardia, palpitation, orthostatic hypotension.
Drug Interactions	Aspirin: Caution to be exercised while using aspirin with anticoagulants. Large doses of salicylates including aspirin may exert hypoglycaemic action and may enhance the effect of the oral hypoglycaemics. If necessary, the dosage of the hypoglycaemic agent must be reduced while the salicylate is given. This hypoglycaemic action may also affect the insulin requirements of diabetics. Aspirin may decrease the effects of probenecid, sulfinpyrazone and phenylbutazone. Sodium excretion produced by spironolactone may be decreased in the presence of salicylates. Alcohol and aspirin exhibit synergistic effect in causing GI bleeding. Risk of GI ulceration may be seen following concomitant admin of pyrazolone derivatives (phenylbutazone, oxyphenylbutazone and possibly, dipyron) with aspirin. Urinary alkalisers may decrease aspirin effectiveness. Phenobarbital is likely to

	pyrazolone derivatives (phenylbutazone, oxyphenylbutazone and possibly, dipyrrone) with aspirin. Urinary alkalisers may decrease aspirin effectiveness. Phenobarbital is likely to decrease aspirin effectiveness by enzyme induction. Aspirin is likely to increase the serum phenytoin levels. Aspirin's anti-inflammatory action may be decreased by propranolol probably by competing for the same receptors. Isosorbide mononitrate: Orthostatic hypotension may occur with combined use of calcium channel blockers, antihypertensive agents, phenothiazines and TCAs. Use of ISMN with alcohol may produce severe hypotension and collapse.
Lab Interference	Aspirin interferes with various urine tests for catecholamines, dopa, glucose, ketones, hippuric acid and pregnancy tests. It is also reported to interfere with some serum or plasma tests for albumin, barbiturates, calcium, propylthiouracil, tyrosine and uric acid.
Mechanism of Action	Aspirin, an antithrombotic agent, is widely used in the prophylaxis of angina and myocardial infarction. Aspirin induces a long-lasting functional defect in platelets, clinically detectable as prolongation in bleeding time. Isosorbide mononitrate (ISMN) relaxes the vascular smooth muscle via stimulation of intracellular cyclic guanosine monophosphate (cGMP) production. ISMN and aspirin interfere with different regulatory pathways and thus the combination effectively gives a more efficacious and safer therapeutic option. Combination reduces the chances of GI side effects. Patient compliance is better with once-daily admin of sustained-release formulation of ISMN than with thrice-daily admin of conventional release ISMN.
CIMS Class	Anti-Anginal Drugs
ATC Classification	C01DA14 - isosorbide mononitrate; Belongs to the class of organic nitrate vasodilators. Used in the treatment of cardiac

isotretinoin

CIMS Class : (Acne Treatment Preparations)
isotretinoin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food $\square$ - Food interaction

related isotretinoin information

Indication & Dosage	<i>Oral</i> Acne Adult: Initially, 0.5-1 mg/kg daily in 2 divided doses. Usual duration of treatment: 15-20 wk; may be discontinued if number of cysts is reduced by >70% (whichever is sooner). Patients intolerant to initial dose: Continue treatment at a lower dose. Patients with very severe acne or acne evident on the body instead of face: Up to 2 mg/kg daily. There should be a 2-mth drug-free interval if a 2nd course is necessary. Renal impairment: Dose reduction may be needed. Hepatic impairment: Dose reduction may be needed. <i>Topical/Cutaneous</i> Acne Adult: As 0.05% gel: Apply sparingly once or twice daily. Effect may not be evident for 6-8 wk.
Administration	Should be taken with food.

Contraindications	Pregnancy, lactation.
Special Precautions	Preexisting or predisposition to hypertriglyceridaemia (e.g. DM, obesity or increased alcohol intake). Monitor triglyceride levels. Monitor blood lipids and LFTs at wkly or bi-wkly intervals. Monitor blood glucose in known or suspected DM patients. Genetic predisposition for age-related osteoporosis, history of childhood osteoporosis, osteomalacia or other bone metabolism disorders. Anorexia nervosa. History of psychiatric disorder. May impair night vision. Avoid wax epilation and skin resurfacing procedures for at least 6 mth. Avoid prolonged exposure to UV light or sunlight. Discontinue if hearing impairment, abdominal pain, rectal bleeding, severe diarrhoea or adverse ocular effects occur. Patient should not donate blood during therapy and for at least 1 mth following drug discontinuation.
Adverse Drug Reactions	Dryness of mucous membranes, dryness of skin with scaling, fragility, erythema, cheilitis, pruritus, epistaxis, conjunctivitis, dry sore mouth and palmo-plantar exfoliation. Corneal opacities, dry eyes, visual disturbances, skeletal hyperostosis and musculoskeletal symptoms. Elevation of serum triglycerides, LFTs, ESR and blood glucose. Hair thinning, photosensitivity, changes in skin pigmentation, paronychia. GI disturbances, hepatitis. Headache, drowsiness, sweating, mood changes, psychotic symptoms, depression, suicidal tendencies, benign intracranial hypertension, seizures. Vasculitis, hypersensitivity reactions, IBS. Potentially Fatal: Anaphylaxis. Haemorrhagic pancreatitis.
Drug Interactions	Additive toxicity with vitamin A or its derivatives. Decreased efficacy of microdosed progesterone (use 2 forms of

	Additive toxicity with vitamin A or its derivatives. Decreased efficacy of microdosed progesterone (use 2 forms of contraception). May increase risk of bone loss with phenytoin. May increase risk of osteoporosis with systemic corticosteroids. Reduces plasma levels of carbamazepine. Potentially Fatal: Increased risk of pseudotumor cerebri with tetracyclines.
Food Interaction	Avoid or limit ethanol intake. Avoid dong quai, St John's wort.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Oral: Store at 15-30°C (59-86°F). Topical/Cutaneous: Store below 25°C (77°F).
Mechanism of Action	Isotretinoin is a synthetic retinoid which reduces sebaceous gland size and sebum production. It also regulates cell proliferation and differentiation. Absorption: Low oral bioavailability. Peak plasma concentrations in 1-4 hr (oral). Distribution: Protein-binding: 99.9%, mainly to albumin. Metabolism: Hepatic, via CYP450 isoenzyme pathway. Excretion: Via urine and faeces.
CIMS Class	Acne Treatment Preparations
ATC Classification	D10AD04 - isotretinoin; Belongs to the class of topical retinoid preparations used in the treatment of acne. D10BA01 - isotretinoin; Belongs to the class of systemic retinoid preparations used in the treatment of acne.

isoxsuprine

CIMS Class : (Peripheral Vasodilators & Cerebral Activators) , (Drugs Acting on the Uterus)
isoxsuprine

P - Caution when used during pregnancy
L - Caution when used during lactation

related isoxsuprine information

Indication & Dosage

Oral

Peripheral vascular disease

Adult: 10-20 mg 3 or 4 times daily.

Elderly: Initiate with lower doses.

Parenteral

To arrest premature labour

Adult: 200-500 mcg/minute as IV infusion; adjust according to response until control is achieved. Monitor maternal BP and hydration, maternal and foetal heart rates during the infusion. Once labour has been arrested, administer 10 mg every 3-8 hr for several days via IM inj. May continue prophylaxis orally by giving 30-90 mg daily in divided doses.

Administration

May be taken with or without food. (May be taken w/ meals, milk or antacids to minimise GI discomfort.)

Contraindications

Recent arterial haemorrhage. Do not give immediately postpartum and do not use in premature labour if there is an infection.

Special Precautions	Pregnancy, lactation.
Adverse Drug Reactions	Hypotension, dizziness, palpitation, nausea, vomiting, abdominal distress, severe rash, flushing, tachycardia. Maternal pulmonary oedema and foetal tachycardia (IV).
Drug Interactions	May potentiate effects of other vasodilators/hypotensive agents.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at room temperature, 15-30°C (59-86°F). Parenteral: Store at room temperature, 15-30°C (59-86°F).
Mechanism of Action	Isoxsuprine is an α -receptor antagonist with β -receptor agonist action. It causes peripheral and cerebral vasodilatation by directly acting on vascular smooth muscle. It also causes cardiac and uterine relaxation. Absorption: Well absorbed from the GI tract (oral); peak plasma concentrations after 1 hr. Excretion: Via urine (as conjugates); 1.5 hr (elimination half-life).
CIMS Class	Peripheral Vasodilators & Cerebral Activators / Note that there are some more drugs Acting on the Uterus
ATC Classification	C04AA01 - isoxsuprine; Belongs to the class of 2-amino-1-phenylethanol derivative agents used as peripheral vasodilators.

itopride

CIMS Class : (GIT Regulators, Antiflatulents & Anti-inflammatories)
itopride

P - Caution when used during pregnancy

L - Contraindicated in lactation

related itopride information

Indication & Dosage	<i>Oral</i> Antiemetic, Prokinetic agent Adult: 50 mg tid. Reduce dose depending on the patient's age and symptoms.
Administration	Should be taken on an empty stomach (i.e. At least one hour before food or two hours after food). (Take before meals.)
Contraindications	Hypersensitivity; lactation. GI haemorrhage, obstruction or perforation.
Special Precautions	Pregnancy, elderly.
Adverse Drug Reactions	Rash, diarrhoea, constipation, abdominal pain, headache, sleeping disorders, dizziness, galactorrhea, gynecomastia. Potentially Fatal: Leucocytopenia.
Drug Interactions	Anticholinergic agents reduce the action of itopride.
Mechanism of Action	Itopride increases acetylcholine concentrations by inhibiting dopamine D ₂ receptors and acetylcholinesterase. Higher acetylcholine increases GI peristalsis, increases the lower oesophageal sphincter pressure, stimulates gastric motility,

	dopamine D ₂ receptors and acetylcholinesterase. Higher acetylcholine increases GI peristalsis, increases the lower oesophageal sphincter pressure, stimulates gastric motility, accelerates gastric emptying, and improves gastro-duodenal coordination.
CIMS Class	GIT Regulators, Antiflatulents & Anti-inflammatories

Food **⌘** - Food i

related itraconazole information	
Indication & Dosage	<i>Oral</i> Oesophageal candidiasis Adult: As oral liquid: 200 mg daily in 1 or 2 divided doses held in the mou sec before swallowing. Double the dose in resistant infections. <i>Oral</i> Oral candidiasis Adult: As oral liquid: 200 mg daily in 1 or 2 divided doses held in the mou sec before swallowing. Double the dose in resistant infections. <i>Oral</i> Prophylaxis of fungal infections in immunocompromised patients Adult: As oral liquid: 5 mg/kg daily in 2 divided doses. <i>Oral</i> Oropharyngeal candidiasis Adult: As capsule: 100 mg daily for 15 days. <i>Oral</i> Vulvovaginal candidiasis Adult: As capsule: 200 mg bid for 1 day. <i>Oral</i>

Vulvovaginal candidiasis

Adult: As capsule: 200 mg bid for 1 day.

Oral

Pityriasis versicolor

Adult: As capsule: 200 mg daily for 7 days.

Oral

Tinea cruris

Adult: As capsule: 100 mg daily for 15 days or 200 mg daily for 7 days.

Oral

Tinea corporis

Adult: As capsule: 100 mg daily for 15 days or 200 mg daily for 7 days.

Oral

Nail fungal infections

Adult: As capsule: 200 mg daily for 3 mth. Alternatively, pulse therapy with 200 mg bid for 7 days, repeated once for fingernail infections and twice for toenail infections after drug-free intervals of 21-days.

Oral

Systemic fungal infections

Adult: As capsule: 100-200 mg once daily, increased to 200 mg bid for in disseminated infections. For life-threatening infections: Loading dose of 200 mg for 3 days has been given.

Oral

Primary or secondary prophylaxis of infections in neutropenic or AIDS patients

Adult: As capsule: 200 mg daily increased to 200 mg bid if necessary.

Oral

Tinea manuum

Adult: As capsule: 100 mg daily for 30 days or 200 mg bid for 7 days

Oral

Tinea pedis

Adult: As capsule: 100 mg daily for 30 days or 200 mg bid for 7 days

Intravenous

	Tinea pedis Adult: As capsule: 100 mg daily for 30 days or 200 mg bid for 7 days <i>Intravenous</i> Systemic fungal infections Adult: 200 mg infused bid over 1 hr for 2 days. Maintenance: 200 mg daily Special Populations: Treatment of oropharyngeal candidiasis in patients with AIDS or neutropenia: Increase dose to 200 mg as capsules daily for 15 days
Administration	Oral soln: Should be taken on an empty stomach. (Take on an empty stomach and refrain from eating for at least 1 hr after intake.) Cap: Should be taken with food. (Take immediately after a full meal.)
Contraindications	Hypersensitivity to azole antifungals; pregnancy and lactation; hepatic dysfunction; CrCl: <30 ml/min.
Special Precautions	Renal insufficiency; CHF, history of CHF, COPD; monitor liver function.
Adverse Drug Reactions	Dyspepsia, abdominal pain, nausea, vomiting, diarrhoea; menstrual disorders; constipation, rash, pruritus, urticaria; angioedema, anaphylaxis. Increases in liver enzyme values, jaundice, Stevens-Johnson syndrome, hypokalaemia. Potentially Fatal: Liver failure; heart failure; pulmonary oedema; CV disease
Drug Interactions	Concentration increased by: clarithromycin, erythromycin, HIV protease inhibitors Concentration decreased by: carbamazepine, phenobarbital, phenytoin, isoniazid, rifabutin, rifampin, nevirapine. Capsule absorption may be decreased by antacids, H₂-receptor antagonists, proton pump inhibitors. Potentially Fatal: Itraconazole is an inhibitor of CYP3A4 and plasma concentrations of many drugs including ciclosporin, digoxin and warfarin may be increased.
Food Interaction	Increase in absorption rate when capsule form is taken with or just after a meal; decreased when taken as a liquid in the presence of food.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.

	Category C: Either studies in animals have revealed adverse effects on the fetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the fetus.
Storage	Intravenous: Store at =25°C. Protect from light and freezing. Oral: Store 15-25°C.
Mechanism of Action	Itraconazole decreases ergosterol biosynthesis by interfering with cytochrome P450 activity. This inhibits cell membrane function of susceptible fungi including <i>Microsporum</i> species, <i>Trichophyton</i> species, <i>Candida</i> species, <i>Coccidioides neoformans</i>, <i>Histoplasma capsulatum</i>, <i>Blastomyces dermatitidis</i> and <i>Paracoccidioides brasiliensis</i>. It also has antiprotozoal activity against <i>Leishmania major</i>. Absorption: Absorbed from the GIT, capsule enhanced by acidic gastric environment or when taken with food; oral liquid better absorbed during fast state. Peak plasma concentrations are achieved after 1.5-5 hr. Distribution: Itraconazole is extensively bound (99.8%) to plasma proteins; distributed in skin, sebum, pus and other tissues and organs (higher concentrations compared to plasma). Small amounts are distributed in CSF and breast milk. Metabolism: Undergoes saturable hepatic metabolism (via cytochrome P450 isoenzyme CYP3A4); converted to hydroxyitraconazole (antifungal activity comparable to the parent drug) and other metabolites. Excretion: Via urine or bile (as inactive metabolites), via faeces (3-18% unchanged), stratum corneum and hair (small amounts); not removed by dialysis.
CIMS Class	Antifungals
ATC Classification	J02AC02 - itraconazole; Belongs to the class of systemic triazole derivatives - antimycotics. Used in the treatment of mycotic infections.

ivermectin

CIMS Class : (Anthelmintics)
ivermectin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related ivermectin information

Indication & Dosage

Oral

Onchocerciasis

Adult: =15 kg: 150 mcg/kg as a single dose; retreatment may be given every 6-12 mth until adult worms die.

Child: >5 yr and =15kg: 150 mcg/kg as a single dose every 6-12 mth until adult worms die.

Oral

Strongyloidiasis

Adult: 200 mcg/kg as a single dose for 1-2 days.

Child: >15 kg: 200 mcg/kg as a single dose for 1-2 days.

Oral

Filariasis

Adult: Dosing regimen depends on the causative agent. *Mansonella streptocerca* 150 mcg/kg as a single dose; *Mansonella ozzardi* 200 mcg/kg as a single dose.

Child: =15 kg: Dosing regimen depends on the causative agent. *Mansonella streptocerca* 150 mcg/kg as a single dose; *Mansonella ozzardi* 200 mcg/kg as a single dose.

Child: =15 kg: Dosing regimen depends on the causative agent. *Mansonella streptocerca* 150 mcg/kg as a single dose; *Mansonella ozzardi* 200 mcg/kg as a single dose.

Oral

Ascariasis

Adult: *Ascaris lumbricoides* 150-200 mcg/kg as a single dose.

Child: =15 kg: *Ascaris lumbricoides* 150-200 mcg/kg as a single dose.

Oral

Gnathostomiasis

Adult: *Gnathostoma spinigerum*: 200 mcg/kg once daily for 2 days.

Child: =15 kg: *Gnathostoma spinigerum*: 200 mcg/kg once daily for 2 days.

Oral

Scabies

Adult: *Sarcoptes scabiei* 200 mcg/kg as a single dose, repeat dose in 2 wk.

Child: =15 kg: *Sarcoptes scabiei* 200 mcg/kg as a single dose, repeat dose in 2 wk.

Administration	Should be taken on an empty stomach. (Take on an empty stomach.)
Contraindications	Hypersensitivity. Pregnancy and lactation. Childn <15 kg body weight.
Special Precautions	Concurrent <i>Loa loa</i> infection, impaired blood-brain barrier function due to infection.
Adverse Drug Reactions	Diarrhoea, nausea, vomiting, dizziness, pruritus, urticaria, rash, arthralgia, fever, myalgia, asthenia, postural hypotension, tachycardia, oedema, lymphadenopathy, sore throat, cough, headache, somnolence, transient eosinophilia,

	rash, arthralgia, fever, myalgia, asthenia, postural hypotension, tachycardia, oedema, lymphadenopathy, sore throat, cough, headache, somnolence, transient eosinophilia, raised liver enzyme values.
Drug Interactions	Bioavailability may be increased by alcohol, levamisole.
Food Interaction	Orange juice slightly reduces bioavailability of ivermectin.
Mechanism of Action	Ivermectin selectively binds and with high affinity to glutamate-gated chloride ion channels, which occur in invertebrate nerve and muscle cells leading to an increase in the permeability of cell membranes to chloride ions with hyperpolarization of the nerve or muscle cell and, ultimately, death of the parasite. Absorption: Absorbed from the GI tract (oral); peak plasma concentrations after 4 hr. Distribution: Enters breast milk (<2%). Protein-binding: About 93%. Excretion: Via faeces (as metabolites), via urine (<1%). Plasma elimination half-life: 12 hr.
CIMS Class	Anthelmintics
ATC Classification	P02CF01 - ivermectin; Belongs to the class of avermectine agents used as antinematodal.

ivermectin + albendazole

CIMS Class : (Anthelmintics)
ivermectin + albendazole

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related ivermectin + albendazole information

Indication & Dosage	<i>Oral</i> Nematode infestations Adult: Per tab contains ivermectin 3 or 6 mg and albendazole 400 mg: 1 tab once daily.
Contraindications	Hypersensitivity. Pregnancy, lactation. child <5 yrs or <15 kg body weight.
Adverse Drug Reactions	Diarrhoea, nausea, vomiting, dizziness, pruritus, urticaria, rash, arthralgia, fever, myalgia, asthenia, postural hypotension, tachycardia, oedema, lymphadenopathy, sore throat, cough, headache, somnolence, transient eosinophilia, raised liver enzyme values.
Drug Interactions	Cimetidine increases albendazole metabolism. Serum levels are increased if taken with dexamethasone and praziquantel agent.
Mechanism of Action	Ivermectin selectively binds and with high affinity to glutamate-gated and GABA (GABA)-gated chloride ion channels. This increases the permeability of the cell membrane to chloride ions leading to hyperpolarisation of

	glutamate-gated and GABA (GABA)-gated chloride ion channels. This increases the permeability of the cell membrane to chloride ions leading to hyperpolarisation of muscles and nerve cells, thus ultimately causing paralysis and death of the parasites. Albendazole causes degenerative alterations in the intestinal cells of the worm by inhibiting polymerisation or assembly of tubules into microtubules. The loss of the cytoplasmic microtubules leads to impaired uptake of glucose by the larval and adult stages of the susceptible parasites and depletes their glycogen stores. Degenerative changes in the endoplasmic reticulum, the mitochondria of the germinal layer and subsequent release of lysosomes result in decreased production of ATP (ATP), which is the energy required for the survival of the helminth. Due to diminished energy production, the parasite is immobilised and eventually dies.
CIMS Class	Anthelmintics
ATC Classification	P02CA03 - albendazole; Belongs to the class of benzimidazole derivative agents used as antinematodal. P02CF01 - ivermectin; Belongs to the class of avermectine agents used as antinematodal.

kanamycin

CIMS Class : (Aminoglycosides)
kanamycin

P - Caution when used during pregnancy
L - Caution when used during lactation

related kanamycin information

Indication & Dosage	<i>Oral</i> Suppression of intestinal flora Adult: Pre-operative use: 1 g every hr for 4 hr, then 1 g every 6 hr for 36-72 hr. Renal impairment: Adjustments in dose and/or dosing frequency may be required. <i>Oral</i> Hepatic encephalopathy Adult: 8-12 g daily in divided doses. Renal impairment: Adjustments in dose and/or dosing frequency may be required. <i>Parenteral</i> Susceptible Gram-negative and staphylococcal infections Adult: 15 mg/kg daily IM or as IV infusion of a 0.25-0.5% solution over 30-60 minutes. Max: 1.5 g daily in 2-4 divided doses. Recommended treatment duration: Not more than 7-10 days for acute infections. Not to exceed a cumulative dose of 10 g. For chronic bacterial infections: 3-4 g wkly,

solution over 30-60 minutes. Max: 1.5 g daily in 2-4 divided doses. Recommended treatment duration: Not more than 7-10 days for acute infections. Not to exceed a cumulative dose of 10 g. For chronic bacterial infections: 3-4 g wkly, given as 1 g on alternate days or 1 g bid on 2 days each wk. Max cumulative dose: 50 g. Prolonged use is not recommended due to risk of nephrotoxicity.

Child: 15 mg/kg daily IM or as IV infusion of a 0.25-0.5% solution over 30-60 min. Max daily dose: 1.5 g in 2-4 divided doses. Treatment duration: 7-10 days. Max cumulative dose: 10 g.

Renal impairment: Adjustments in dose and/or dosing frequency may be required.

Intramuscular

Penicillin-resistant gonorrhoea

Adult: 2 g as a single dose.

Renal impairment: Adjustments in dose and/or dosing frequency may be required.

Intramuscular

Treatment and prophylaxis of neonatal gonococcal infections

Child: Infants born to mothers with gonorrhoea: 25 mg/kg as a single dose. Max: 75 mg.

Renal impairment: Adjustments in dose and/or dosing frequency may be required.

Intraperitoneal

Peritonitis or peritoneal contamination during surgery

Adult: Dilute 500 mg in 20 mL sterile distilled water and instill into the peritoneal cavity.

Renal impairment: Adjustments in dose and/or dosing frequency may be required.

Inhalation

Susceptible Gram-negative and staphylococcal

	frequency may be required. <i>Inhalation</i> Susceptible Gram-negative and staphylococcal infections Adult: 250 mg 2-4 times daily, given via nebulisation. Dilute 250 mg in 3 mL 0.9% sodium chloride. Renal impairment: Adjustments in dose and/or dosing frequency may be required. <i>Irrigation</i> Irrigation of body cavities Adult: Instil 0.25% solution into abscess cavities, pleural space, or peritoneal or ventricular cavities. Renal impairment: Adjustments in dose and/or dosing frequency may be required.
Contraindications	Hypersensitivity. GI ulceration (oral).
Special Precautions	Renal impairment, dehydration, previous exposure to ototoxic drugs; preexisting tinnitus, vertigo or subclinical hearing loss. Parkinsonism, myasthenia gravis. Infants, neonates, elderly. Pregnancy, lactation.
Adverse Drug Reactions	Pain, inflammation, bruising, haematoma at inj site; GI disturbances; malabsorption of fat. Potentially Fatal: Neuromuscular blockade; nephrotoxicity; ototoxicity.
Drug Interactions	Synergistic effects with ampicillin, benzylpenicillin and other β-lactam antibiotics. May reduce renal excretion of zalcitabine. Potentially Fatal: Increased risk of ototoxicity with ethacrynic acid and furosemide. Increased risk of nephrotoxicity with cephalosporins, ciclosporin, cisplatin, vancomycin, hydrocortisone and indomethacin. Potentiates effects of neuromuscular blocking agents.

Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intramuscular: Store at 20-25°C. Parenteral: Store at 20-25°C.
Mechanism of Action	Kanamycin irreversibly binds to 30S, and to some extent 50S, ribosomal subunits of susceptible bacteria disrupting protein synthesis, thus rendering the bacterial cell membrane defective. Absorption: <1% is absorbed from the GI tract but may be markedly increased if GI mucosa is inflamed or ulcerated (oral); peak plasma concentrations after 1 hr (IM). Distribution: Present in cord blood and breast milk. Excretion: Via urine by glomerular filtration (as unchanged drug); 3 hr (elimination half-life).
CIMS Class	Aminoglycosides
ATC Classification	A07AA08 - kanamycin; Belongs to the class of antibiotics. Used for the treatment of intestinal infections. J01GB04 - kanamycin; Belongs to the class of other aminoglycosides. Used in the treatment of systemic infections. S01AA24 - kanamycin; Belongs to the class of antibiotics. Used in the treatment of eye infections.

ketamine

CIMS Class : (Anaesthetics - Local & General)
ketamine

P - Caution when used during pregnancy

L - Caution when used during lactation

related ketamine information

Indication & Dosage	<i>Intravenous</i> Induction of anaesthesia Adult: 1-4.5 mg/kg as IV inj. Surgical anaesthesia is produced within 30 sec of the end of inj. Usual dose to produce 5-10 minutes of anaesthesia: 2 mg/kg over 60 seconds. Alternatively, 1-2 mg/kg infused at 0.5 mg/kg/minute; may use with diazepam to prevent emergence reactions. Child: 1-4.5 mg/kg as IV Inj. Surgical anaesthesia is produced within 30 sec of the end of inj and lasts for 5-10 min if 2 mg/kg is given over 60 sec. Alternatively, 0.5-2 mg/kg as IV infusion. Maintenance: Achieve with 10-45 mcg/kg/min; titrate infusion rate according to response. <i>Intramuscular</i> Induction of anaesthesia Adult: 6.5-13 mg/kg. Usual dose to produce 12-25 minutes of anesthesia: 10 mg/kg. Incompatibility: May form precipitates with barbiturates; do

	10 mg/kg. Usual dose to produce 12-20 minutes of anesthesia: 10 mg/kg. Incompatibility: May form precipitates with barbiturates; do not inject in the same syringe.
Contraindications	Hypertension, history of cerebrovascular accident. Eye injury, raised ocular and intracranial pressure. Psychotic disorders.
Special Precautions	Minimise verbal and tactile stimulation during recovery period. Chronic alcoholic and alcohol-intoxicated patients. Preanaesthetic elevated CSF pressure. Dependence and tolerance may develop. May impair ability to drive or operate machinery. Monitor cardiac function in patients with hypertension or cardiac decompensation. Pregnancy and lactation.
Adverse Drug Reactions	Emergence reactions e.g. vivid dreams, hallucinations, confusion, irrational behaviour. Increased muscle tone sometimes resembling seizures. Temporary hypertension and tachycardia. Hypotension, bradycardia, arrhythmias. Respiratory depression, apnoea, laryngospasm, diplopia, nystagmus, nausea, vomiting, lachrymation, hypersalivation, raised intraocular and CSF pressure, skin rash and pain at inj site.
Drug Interactions	May increase effects of nondepolarising muscle relaxants. May reduce hypnotic effect of thiopental. Prolonged recovery time with barbiturates/narcotics. Reduced cardiac output, BP and pulse rate with halothane. Increased risk of hypertension and tachycardia with thyroid hormones. Seizures and tachycardia may occur when used with theophyllines.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not

Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intramuscular: Store at 15-30°C (59-86°F). Intravenous: Store at 15-30°C (59-86°F).
Mechanism of Action	Ketamine has a direct action on the cortex and limbic system. It produces a cataleptic-like state wherein the patient is withdrawn from the surrounding environment. Distribution: Crosses the placenta. Metabolism: Hepatic biotransformation to norketamine. Other metabolic pathways include hydroxylation of the cyclohexone ring and conjugation with glucuronic acid. Excretion: Via urine (as metabolites); 2.5 hr (beta phase half-life).
CIMS Class	Anaesthetics - Local & General
ATC Classification	N01AX03 - ketamine; Belongs to the class of other agents used as general anesthetics.

ketoconazole

CIMS Class : (Antifungals) , (Topical Antifungals & Antiparasites) , (Psoriasis, Seborrhea & Ichthyosis Preparations)
ketoconazole

P - Caution when used during pregnancy
L - Caution when used during lactation

related ketoconazole information

Indication & Dosage

Oral

Fungal infections

Adult: 200 mg once daily. Increase to 400 mg once daily if clinical response is insufficient. Treatment duration: 14 days and for at least 1 wk after symptoms have cleared and cultures have become negative.

Child: ≥2 yr: 3.3-6.6 mg/kg daily as a single dose. Treatment duration: 1-2 wk for candidiasis; at least 4 wk in recalcitrant dermatophyte infections and up to 6 mth for other systemic mycoses.

Oral

Chronic vaginal candidiasis

Adult: 400 mg once daily for 5 days.

Topical/Cutaneous

Seborrheic dermatitis

Adult: As 2% cream: Apply to the affected area bid for 4 wk or until clinical clearing. As 2% foam: Apply to the affected area bid for 4 wk. As 1 or 2% shampoo: Apply on the scalp

	Adult: As 2% cream: Apply to the affected area bid for 4 wk or until clinical clearing. As 2% foam: Apply to the affected area bid for 4 wk. As 1 or 2% shampoo: Apply on the scalp twice wkly for 2-4 wk; continue for a few days until symptoms disappear. For prophylaxis: 2% shampoo is used once every 1-2 wk. <i>Topical/Cutaneous</i> Pityriasis versicolor Adult: As 2% cream: Apply 1-2 times daily to cover affected and surrounding area until at least a few days after disappearance of symptoms. For treatment of pityriasis versicolor: As 2% shampoo: Apply on the skin once daily for up to 5 days. For prophylaxis: 2% shampoo is used once daily for a max of 3 days before exposure to sunshine. <i>Topical/Cutaneous</i> Skin fungal infections Adult: As 2% cream: Apply 1-2 times daily to cover affected and surrounding area until at least a few days after disappearance of symptoms. For treatment of pityriasis versicolor: As 2% shampoo: Apply on the skin once daily for up to 5 days. For prophylaxis: 2% shampoo is used once daily for a max of 3 days before exposure to sunshine.
Administration	Should be taken with food.
Contraindications	Hypersensitivity; preexisting liver disease, porphyria. Concurrent use with cisapride, terfenadine or astemizole.
Special Precautions	Hepatic impairment; monitor liver function regularly. Pregnancy, lactation. Predisposition to adrenocortical insufficiency. Discontinue treatment if there is persistent or worsening of liver enzyme elevation.
Adverse Drug Reactions	GI disturbances e.g. nausea and vomiting; rash, dermatitis, burning sensation, pruritus; headache, dizziness, somnolence, fever and chills; thrombocytopenia;

	GI disturbances e.g. nausea and vomiting; rash, dermatitis, burning sensation, pruritus; headache, dizziness, somnolence, fever and chills; thrombocytopenia; gynaecomastia, impotence; raised intracranial pressure; photophobia; transient elevations in LFTs. Potentially Fatal: Hepatotoxicity.
Drug Interactions	Reduced absorption with antimuscarinics, antacids, H2-blockers, PPIs, sucralfate. Reduced plasma concentrations with rifampicin, isoniazid, efavirenz, nevirapine or phenytoin. May reduce concentrations of isoniazid and rifampicin. May increase plasma concentrations of CYP3A4 substrates such as benzodiazepines, mirtazapine, nefazodone, tacrolimus, oral anticoagulants, rosiglitazone, sertindole, sildenafil. Disulfiram-like reaction with alcohol. May reduce efficacy of oral contraceptives. Avoid concurrent use with clopidogrel. Potentially Fatal: Increased risk of cardiac arrhythmias with astemizole, cisapride, pimozide, quinidine or nilotinib. May reduce metabolism of conviptan; avoid concurrent usage. Increased risk of dofetilide toxicity when used together.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-25°C (59-77°F). Topical/Cutaneous: Store below 25°C (77°F).
Mechanism of Action	Ketoconazole interferes with biosynthesis of triglycerides and phospholipids by blocking fungal cytochrome P450, thus altering cell membrane permeability in susceptible fungi. It

	Ketoconazole interferes with biosynthesis of triglycerides and phospholipids by blocking fungal cytochrome P450, thus altering cell membrane permeability in susceptible fungi. It also inhibits other fungal enzymes resulting in the accumulation of toxic concentrations of hydrogen peroxide. Absorption: Variably absorbed from the GIT (oral), may be increased with decreasing gastric pH. Minimally absorbed systemically (topical or vaginal). Peak plasma concentrations after 2 hr (oral). Distribution: Widely distributed, CSF (poor penetration); enters breast milk. Protein-binding: >90%, mainly to albumin. Metabolism: Hepatic; converted to inactive metabolites. Excretion: Via faeces (as metabolites and unchanged drug), via urine; 2 hr (initial half-life), 8 hr (terminal half-life).
CIMS Class	Antifungals / Topical Antifungals & Antiparasites / Psoriasis, Seborrhea & Ichthyosis Preparations
ATC Classification	D01AC08 - ketoconazole; Belongs to the class of imidazole and triazole derivatives for topical use. Used in the treatment of fungal infection. G01AF11 - ketoconazole; Belongs to the class of imidazole derivative anti-infectives. Used in the treatment of gynecological infections. J02AB02 - ketoconazole; Belongs to the class of systemic imidazole derivative antimycotics. Used in the treatment of mycotic infections.

ketoprofen

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
ketoprofen

P - Caution when used during pregnancy

L - Caution when used during lactation

related ketoprofen information

Indication & Dosage

Oral

Rheumatic disorders

Adult: 100-200 mg/day in 2-4 divided doses. As modified-release formulation: Administer dose once daily. Max: 300 mg daily in divided doses.

Elderly: >75 yr: Reduce initial dose.

Renal impairment: Max dose: Mild impairment: 150 mg daily; severe impairment: 100 mg daily.

Hepatic impairment: Max dose: 100 mg daily if serum albumin <3.5 g/dL.

Oral

Pain and inflammation

Adult: 25-50 mg every 6-8 hr. Max: 300 mg daily in divided doses.

Elderly: >75 yr: Reduce initial dose.

Renal impairment: Max dose: Mild impairment: 150 mg daily; severe impairment: 100 mg daily.

Hepatic impairment: Max dose: 100 mg daily if serum albumin <3.5 g/dL.

	Renal impairment: Max dose: mild impairment: 200 mg daily; severe impairment: 100 mg daily. Hepatic impairment: Max dose: 100 mg daily if serum albumin <3.5 g/dL. <i>Intramuscular</i> Pain and inflammation associated with musculoskeletal and joint disorders Adult: 50-100 mg by deep inj into the gluteal muscle every 4 hr. Max: 200 mg in 24 hr for up to 3 days. <i>Intramuscular</i> Pain following orthopaedic surgery Adult: 50-100 mg by deep inj into the gluteal muscle every 4 hr. Max: 200 mg in 24 hr for up to 3 days. <i>Topical/Cutaneous</i> Local pain relief Adult: Apply 2.5% gel onto affected areas 2-4 times daily for up to 10 days. <i>Rectal</i> Rheumatic disorders Adult: 100 mg at night or bid. Recommended total (including oral and rectal forms): Not to exceed 200 mg daily.
Administration	Should be taken with food. (Preferably taken w/ or after meals.)
Overdosage	Symptoms: Lethargy, drowsiness, nausea, vomiting, epigastric pain. Respiratory depression, coma, convulsions (large overdoses). Rarely GI bleeding, hypotension, hypertension or acute renal failure. Management: Symptomatic and supportive.
Contraindications	Acute or history of peptic ulcer or dyspepsia. Hypersensitivity to aspirin or other NSAIDs or those suffering from bronchial asthma, angioedema, urticaria or rhinitis. Severe renal insufficiency.

	to aspirin or other NSAIDs or those suffering from bronchial asthma, angioedema, urticaria or rhinitis. Severe renal insufficiency.
Special Precautions	Pregnancy, lactation. Renal or hepatic impairment. Elderly. Heart failure.
Adverse Drug Reactions	Acute interstitial nephritis, reversible decline in renal function; GI symptoms e.g. discomfort, nausea, diarrhoea; pain and tissue damage at inj site (IM). Potentially Fatal: Rarely, idiosyncrasy, anaphylaxis; very rarely GI haemorrhage.
Drug Interactions	Risk of nephrotoxicity increased with ACE inhibitors, ciclosporin, tacrolimus or diuretics. Increased risk of hyperkalaemia with ACE inhibitors and potassium-sparing diuretics. Reduces effects of antihypertensives (e.g. ACE inhibitors, β-blockers). Increased risk of convulsions with quinolones. Increased risk of adverse effects with aspirin. Increased risk of GI bleeding and ulceration with corticosteroids, SSRIs, clopidogrel and ticlopidine. Increased risk of haematotoxicity with zidovudine. May alter the efficacy of mifepristone. Increased plasma levels with probenecid. Potentially Fatal: Enhances effects of oral anticoagulants, phenytoin and sulfonylureas. Increases plasma concentrations of lithium, methotrexate and cardiac glycosides.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). in 3rd trimester or near delivery.

	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intramuscular: Store below 30°C. Oral: Store at room temperature 15-30°C (59-86°F). Rectal: Store below 25°C. Topical/Cutaneous: Store below 25°C.
Mechanism of Action	Ketoprofen exhibits anti-inflammatory, analgesic and antipyretic activities. It potently inhibits the enzyme cyclooxygenase resulting in prostaglandin synthesis inhibition. It also prevents formation of thromboxane A₂ by platelet aggregation. Absorption: Readily absorbed from the GI tract (oral); reduced absorption with food. Peak plasma concentrations after 0.5-2 hr. Well absorbed (IM, rectal); minimal (topical). Distribution: Synovial fluid (substantial concentrations). Protein-binding: 99%. Metabolism: Hepatic via conjugation with glucuronic acid. Excretion: Urine (as glucuronide conjugates); 1.5-4 hr (elimination half-life).
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AE03 - ketoprofen; Belongs to the class of propionic acid derivatives of non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism. M02AA10 - ketoprofen; Belongs to the class of non-steroidal antiinflammatory preparations for topical use. Used in the

inflammation and rheumatism.

M02AA10 - ketoprofen; Belongs to the class of non-steroidal antiinflammatory preparations for topical use. Used in the treatment of joint and muscular pains.

ketorolac

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs)) , (Ophthalmic Decongestants, Anesthetics, Anti-inflammatories)
ketorolac

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related ketorolac information

Indication & Dosage

Oral

Moderate to severe pain

Adult: 10 mg every 4-6 hr. Max: 40 mg/day. Max duration: 7 days.

Elderly: 10 mg every 6-8 hr. Max duration: 7 days.

Renal impairment: Contraindicated in moderate to severe impairment.

Parenteral

Moderate to severe pain

Adult: 60 mg as a single dose via IM inj or 30 mg as a single IV dose. Alternatively, 30 mg every 6 hr via IM or IV admin up to a max of 120 mg daily. Halve the doses in patients weighing <50 kg. Max duration: 2 days; patient should be transferred to oral therapy as soon as possible.

Elderly: 30 mg as a single dose via IM inj or 15 mg as a single IV dose. Alternatively, 15 mg every 6 hr via IM or IV admin up to a max of 60 mg daily.

Renal impairment: 30 mg as a single dose via IM inj or 15

single IV dose. Alternatively, 15 mg every 6 hr via IM or IV admin up to a max of 60 mg daily.

Renal impairment: 30 mg as a single dose via IM inj or 15 mg as a single IV dose. Alternatively, 15 mg every 6 hr via IM or IV admin up to a max of 60 mg daily. Contraindicated in moderate to severe impairment.

Ophthalmic

Ocular itching associated with seasonal allergic conjunctivitis

Adult: As trometamol: Instil 1 drop of a 0.5% solution into the affected eye(s) 4 times daily.

Renal impairment: Contraindicated in moderate to severe impairment.

Ophthalmic

Prophylaxis and reduction of postoperative ocular inflammation

Adult: As trometamol: Instil 1 drop of a 0.5% solution into the appropriate eye(s) 4 times daily starting 24 hr after surgery. Continue for 2 wk.

Renal impairment: Contraindicated in moderate to severe impairment.

Ophthalmic

Cystoid macular oedema

Adult: As trometamol: Instil 1-2 drops of a 0.5% solution into the appropriate eye(s) every 6-8 hr starting 24 hr before surgery and continue for 3-4 wk after surgery.

Renal impairment: Contraindicated in moderate to severe impairment.

Ophthalmic

Pain and photophobia after incisional refractive surgery

Adult: As trometamol: Instil 1 drop of a 0.5% solution 4 times daily into the operated eye for up to 3 days after surgery.

	Pain and photophobia after incisional refractive surgery Adult: As trometamol: Instil 1 drop of a 0.5% solution 4 times daily into the operated eye for up to 3 days after surgery. Renal impairment: Contraindicated in moderate to severe impairment. Incompatibility: Y-site incompatibility: Fenoldopam, azithromycin. Syringe incompatibility: Promethazine, hydroxyzine, nalbuphine, haloperidol, prochlorperazine edisylate, triethylperazine. Admixture incompatibility: Promethazine, morphine, hydroxyzine, meperidine.
Overdosage	Symptoms: Abdominal pain, nausea, vomiting, hyperventilation, peptic ulceration, erosive gastritis and renal dysfunction. Management: Supportive and symptomatic.
Contraindications	Hypersensitivity to aspirin or other NSAIDs, asthma. Hypovolaemia or dehydration. Do not give postoperatively to patients with high risk of haemorrhage. History of peptic ulcer or coagulation disorders. Nasal polyps, angioedema, bronchospasm. Labour. Moderate to severe renal impairment. GI bleeding, cerebrovascular bleeding. As prophylactic analgesic before surgery. Pregnancy, lactation.
Special Precautions	Elderly, patients weighing <50 kg, hepatic dysfunction, heart failure, predisposition to reduced blood volume or renal blood flow. Mild renal impairment; monitor renal function closely.
Adverse Drug Reactions	GI ulcer, bleeding and perforation, drowsiness, rash, bronchospasm, hypotension, psychosis, dry mouth, fever, bradycardia, chest pain, dizziness, headache, sweating, oedema, pallor, liver function changes. Transient stinging and local irritation (ophthalmic). Potentially Fatal: Anaphylaxis. Severe skin reactions. MI,

	oedema, pallor, liver function changes. Transient stinging and local irritation (ophthalmic). Potentially Fatal: Anaphylaxis. Severe skin reactions. MI, stroke, GI bleeding.
Drug Interactions	May reduce effects of antihypertensives (e.g. ACE inhibitors or angiotensin II receptor antagonists). Increased risk of renal toxicity with ACE inhibitors, diuretics. Increased adverse effects with aspirin or other NSAIDs. Hallucinations may occur when used with fluoxetine, thiothixene, alprazolam. Potentially Fatal: Increased risk of GI bleeding with warfarin. May increase toxicity of methotrexate and lithium. Increased plasma concentrations with probenecid.
Storage	Ophthalmic: Store at 15-25°C (59-77°F). Oral: Store at 15-30°C (59-86°F). Parenteral: Store at 15-30°C (59-86°F). Protect from light.
Mechanism of Action	Ketorolac inhibits prostaglandin synthesis by decreasing the activity of the cyclooxygenase enzyme. Onset: 30-60 min (oral); 10 min (IM). Duration: 6-8 hr (oral/IM). Absorption: Well absorbed (oral/IM); peak plasma concentrations after 30-60 min. Distribution: Protein-binding: 99%. Crosses the placenta; enters breast milk; poorly penetrates into CSF. Metabolism: Hepatic via glucuronic acid conjugation. Excretion: Via urine (90%, as unchanged drug and metabolites); via faeces (remaining dose). Terminal elimination half-life: 4-6 hr; 6-7 hr (elderly); 9-10 hr (renal impairment).
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs) / Ophthalmic Decongestants, Anesthetics, Anti-inflammatories

	Nonsteroidal Anti-inflammatory Drugs (NSAIDs) / Ophthalmic Decongestants, Anesthetics, Anti-inflammatories
ATC Classification	M01AB15 - ketorolac; Belongs to the class of acetic acid derivatives and related substances of non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism. S01BC05 - ketorolac; Belongs to the class of non-steroidal antiinflammatory agents. Used in the treatment of inflammation of the eye.

ketotifen

CIMS Class : (Antiasthmatic & COPD Preparations) , (Ophthalmic Decongestants, Anesthetics, Anti-inflammatories) , (Antihistamines & Antiallergics)
ketotifen

P - Caution when used during pregnancy

L - Caution when used during lactation

related ketotifen information

Indication & Dosage

Oral

Allergic conditions

Adult: 1 mg bid up to 2 mg bid, as needed. Alternatively, 0.5-1 mg at night for the 1st few days of treatment to minimise drowsiness.

Child: 6 mth to 3 yr: 0.5 mg bid; >3 yr: 1 mg bid.

Oral

Asthma prophylaxis

Adult: 1 mg bid up to 2 mg bid, as needed. Alternatively, 0.5-1 mg at night for the 1st few days of treatment to minimise drowsiness.

Child: 6 mth to 3 yr: 0.5 mg bid; >3 yr: 1 mg bid.

Ophthalmic

Allergic conjunctivitis

Adult: As 0.025% solution: Instill 1 drop into the affected eye(s) bid.

Child: =3 yr: As 0.025% solution: Instill 1 drop into the affected eye(s) bid.

	Adult: AS 0.025% solution: Instill 1 drop into the affected eye(s) bid. Child: =3 yr: As 0.025% solution: Instill 1 drop into the affected eye(s) bid.
Administration	Should be taken with food.
Overdosage	Symptoms: Drowsiness, confusion, dyspnoea, bradycardia or tachycardia, disorientation, convulsions, severe hypotension, reversible coma. Management: Supportive and symptomatic.
Contraindications	Acute asthma attack.
Special Precautions	May impair tasks requiring mental alertness e.g. driving or operating machinery. History of epilepsy. Pregnancy and lactation. Children <3 yr.
Adverse Drug Reactions	Sedation, drowsiness, dizziness, dry mouth, weight gain, increased appetite, CNS stimulation. Rarely, cystitis. Conjunctival injection, headaches and rhinitis (ophthalmic).
Drug Interactions	Reduced platelet count with oral antidiabetics. Potentially Fatal: May potentiate CNS effects of sedatives, hypnotics, antihistamines and alcohol.
Storage	Ophthalmic: Store at 25°C. Oral: Store below 25°C (77°F).
Mechanism of Action	Ketotifen selectively and noncompetitively inhibits the release of mediators from cells involved in hypersensitivity reactions. It is also a mast cell stabiliser. Onset: Within min (ophthalmic). Absorption: Absorbed completely for the GIT (oral); bioavailability: 50%; peak plasma concentrations after 2-4 hr. Distribution: Protein-binding: 75%. Metabolism: Hepatic first-pass metabolism. Excretion: Via urine (as inactive metabolites and traces of unchanged drug); 21 hr (elimination half-life).

	Metabolism: Hepatic first-pass metabolism. Excretion: Via urine (as inactive metabolites and traces of unchanged drug); 21 hr (elimination half-life).
CIMS Class	Antiasthmatic & COPD Preparations / Ophthalmic Decongestants, Anesthetics, Anti-inflammatories /Antihistamines & Antiallergics
ATC Classification	R06AX17 - ketotifen; Belongs to the class of other agents used as systemic antihistamines. S01GX08 - ketotifen; Belongs to the class of other agent used as ophthalmologic antiallergics.

labetalol

CIMS Class : (Beta-Blockers)
labetalol

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related labetalol information

Indication & Dosage

Oral

Hypertension

Adult: As hydrochloride: Initially, 100 mg bid; increase gradually according to patient's response to 200-400 mg bid. Max dose: 2.4 g daily in 2-4 divided doses.

Elderly: Initially, 50 mg bid.

Intravenous

Emergency treatment of hypertension

Adult: As hydrochloride: 50 mg injected slowly for at least 1 min; repeat at 5-min intervals as necessary, up to 200 mg. Monitor BP and the patient should remain supine during and 3 hr after the procedure. Alternatively, 2 mg/min infusion at concentrations of 1 mg/ml or 2 mg/3 ml of a suitable diluent.

Intravenous

Hypertension in pregnancy

Adult: As hydrochloride: Start infusion at a rate of 20 mg/hr, then doubled every 30 min until a favourable response is achieved or a dose of 160 mg/hr is reached.

	Adult: As hydrochloride: Start infusion at a rate of 20 mg/hr, then doubled every 30 min until a favourable response is achieved or a dose of 160 mg/hr is reached. <i>Intravenous</i> Hypertension after myocardial infarction Adult: As hydrochloride: Start infusion at a rate of 15 mg/hr, then increase gradually until a favourable response is obtained or a dose of 120 mg/hr is reached. <i>Intravenous</i> Hypotensive anaesthesia Adult: As hydrochloride: Initially, 10-20 mg; increase at 5-10 mg increments if satisfactory hypotension is not achieved after 5 minutes. Administer higher initial doses if halothane anaesthesia is not used.
Administration	Should be taken with food. (Take immediately after meals.)
Contraindications	2nd and 3rd degree heart block, cardiogenic shock, obstructive airway disease e.g. bronchial asthma, uncompensated heart failure, severe bradycardia, sick sinus syndrome, Prinzmetal's angina, severe peripheral arterial disease.
Special Precautions	Phaeochromocytoma, compensated heart failure, nonallergic bronchospasm. Avoid abrupt withdrawal. DM. Hepatic impairment. Perform LFTs. Elderly. Pregnancy and lactation.
Adverse Drug Reactions	Orthostatic hypotension, dizziness, fatigue, vertigo, paraesthesia, headache, nasal stuffiness, dyspnoea, diarrhoea, abdominal pain, sexual dysfunction, dyspepsia, nausea, vomiting, scalp tingling, rash, increased transaminases, nightmares, worsening of intermittent claudication. Potentially Fatal: Hepatic injury.

	transaminases, nightmares, worsening of intermittent claudication. Potentially Fatal: Hepatic injury.
Drug Interactions	Increased bioavailability with cimetidine. Decreased bioavailability with glutethimide. Increased incidence of tremors with TCAs. Additive hypotensive effect with nitroglycerin. Potentially Fatal: Increased risk of bradycardia with drugs that slows AV conduction. Synergistic hypotensive effect with halothane.
Lab Interference	False-positive results in fluorimetric analysis of urinary catecholamines.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 2-30°C (36-86°F). Oral: Store at 2-30°C (36-86°F).
Mechanism of Action	Labetalol competitively inhibits the adrenergic stimulation of β-receptors within the myocardium, bronchial and vascular smooth muscle, and α_1-receptors within vascular smooth muscle. It also has some intrinsic β_2-agonist and membrane-stabilising activity.

	smooth muscle, and α_1-receptors within vascular smooth muscle. It also has some intrinsic β_2-agonist and membrane-stabilising activity. Absorption: Absorbed readily from the GIT (oral); peak plasma concentrations after 1-2 hr. Bioavailability increased by food. Distribution: Protein-binding: 50%. Crosses the blood-brain barrier, placenta and enters breast milk. Metabolism: Extensive first-pass metabolism. Excretion: Via urine (as metabolites and traces of unchanged drug); also via faeces. Elimination half-life: 8 hr (steady state), 5.5 hr (IV infusion).
CIMS Class	Beta-Blockers
ATC Classification	C07AG01 - labetalol; Belongs to the class of alpha and beta blocking agents. Used in the treatment of cardiovascular diseases.

lacidipine

CIMS Class : (Calcium Antagonists)
lacidipine

P - Caution when used during pregnancy

L - Caution when used during lactation

Food α - Food interaction

related lacidipine information

Indication & Dosage	<i>Oral</i> Hypertension Adult: Initially, 2 mg once daily preferably in the morning; increase to 4 mg daily after 3-4 wk if necessary. May be increased further to 6 mg in some patients. Hepatic impairment: Severe impairment: Reduce dose.
Administration	May be taken with or without food.
Contraindications	Within 1 mth of MI, cardiogenic shock, unstable angina, aortic stenosis.
Special Precautions	Conduction abnormalities, congenital or acquired QT prolongation, poor cardiac reserve. Hepatic impairment. Pregnancy and lactation.
Adverse Drug Reactions	Headache, flushing, oedema, dizziness, palpitations, aggravation of angina, increased alkaline phosphatase. Rarely asthenia, rash (e.g. erythema and itching), gastric upset, nausea, gum hyperplasia, polyuria, muscle cramps, mood disturbances.

	Rarely asthenia, rash (e.g. erythema and itching), gastric upset, nausea, gum hyperplasia, polyuria, muscle cramps, mood disturbances.
Drug Interactions	Additive hypotensive effect with other antihypertensives (e.g. diuretics, β -blockers, ACE inhibitors). Increased plasma concentration with cimetidine. Elimination and metabolism may be altered by potent CYP3A4 inhibitors and inducers. Potentially Fatal: Increased risk of ventricular arrhythmias with drugs that prolong QT interval (e.g. class I and III antiarrhythmics, TCAs, certain antipsychotics, antibiotics and antihistamines).
Food Interaction	Plasma concentrations increased with grapefruit juice.
Storage	Oral: Store below 30°C (86°F).
Mechanism of Action	Lacidipine is a potent dihydropyridine calcium antagonist mainly selective for calcium channels in the vascular smooth muscle. It dilates peripheral arterioles resulting in reduced peripheral vascular resistance and blood pressure. Absorption: Rapidly but poorly absorbed from the GIT (oral). Distribution: Protein-binding: >95% Metabolism: Extensive first-pass metabolism. Excretion: In the bile via faeces (70%, as metabolites), via urine (remaining dose); 13-19 hr (elimination half-life).
CIMS Class	Calcium Antagonists
ATC Classification	C08CA09 - lacidipine; Belongs to the class of selective dihydropyridine derivative calcium-channel blockers with mainly vascular effects. Used in the treatment of cardiovascular diseases.

lactulose

CIMS Class : (Laxatives, Purgatives)
lactulose

related lactulose information

Indication & Dosage

Oral

Constipation

Adult: Initially, 10-20 g (15-30 ml) daily as a single dose or in 2 divided doses; gradually adjust according to patient's response. Max dose: 45 ml (or up to 40 g of the reconstituted oral powder formulation)/day.

Child: As 3.35 mg/5 ml solution: 1 mth to 1 yr: 2.5 ml; 1-5 yr: 5 ml; 5-10 yr: 10 ml; 10-18 yr: 15 ml. All doses to be given bid.

Oral

Hepatic encephalopathy

Adult: 60-100 g (90-150 ml) daily in 3 divided doses; adjust to produce 2 or 3 soft stools each day.

Rectal

Hepatic encephalopathy

Adult: Mix 200 g (300 ml) with 700 ml water or 0.9% sodium chloride as a retention enema. Retain enema for 30-60 minutes; repeat every 4-6 hr until oral medication can be administered.

Administration

May be taken with or without food. (May be taken w/ meals

	May be taken with or without food. (May be taken w/ meals to reduce GI discomfort.)
Contraindications	Galactosaemia, intestinal obstruction. Patients on low galactose diet.
Special Precautions	Monitor electrolyte imbalance. Lactose intolerance; diabetics.
Adverse Drug Reactions	Diarrhoea (dose-related), nausea, vomiting, hypokalaemia, bloating and abdominal cramps. Potentially Fatal: Dehydration and hypernatraemia on aggressive treatment.
Drug Interactions	May prevent release of mesalazine in the colon. Decreased effect with oral neomycin, antacids.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-30°C (59-86°F). Rectal: Store at 2-30°C (36-86°F).
Mechanism of Action	Lactulose promotes peristalsis by producing an osmotic effect in the colon with resultant distention. In hepatic encephalopathy, it reduces absorption of ammonium ions and toxic nitrogenous compounds, resulting in reduced blood ammonia concentrations. Onset: 48 hr. Absorption: Not appreciable (oral). Metabolism: Via colonic flora to lactic acid and acetic acid. Excretion: Faeces, urine (as unchanged drug).

	Absorption: Not appreciable (oral). Metabolism: Via colonic flora to lactic acid and acetic acid. Excretion: Faeces, urine (as unchanged drug).
CIMS Class	Laxatives, Purgatives
ATC Classification	A06AD11 - lactulose; Belongs to the class of osmotically acting laxatives. Used in the treatment of constipation.

lamivudine

CIMS Class : (Antivirals)
lamivudine

P - Caution when used during pregnancy

L - Contraindicated in lactation

related lamivudine information

Indication & Dosage

Oral

HIV infection

Adult: 150 mg bid or 300 mg once daily, in combination with other antiretrovirals.

Child: 3 mth-12 yr: 4 mg/kg bid. Max: 300 mg/day.

Renal impairment: Dialysis patients: Not recommended.

CrCl (ml/min)	Dosage Recommendation
30-49	1st dose 150 mg, then 150 mg once daily.
15-29	1st dose 150 mg, then 100 mg once daily.
5-14	1st dose 150 mg, then 50 mg once daily.
<5	1st dose 50 mg, then 25 mg once daily.

Oral

Chronic hepatitis B

Adult: 100 mg once daily. For patients with concomitant HIV infection: 300 mg once daily or in 2 divided doses.

Child: >2 yr: 3 mg/kg once daily. Max: 100 mg/day.

Renal impairment: Haemodialysis patients: Dose adjustment in accordance with CrCl. Peritoneal dialysis patients: Not recommended.

	Renal impairment: Haemodialysis patients: Dose adjustment in accordance with CrCl. Peritoneal dialysis patients: Not recommended. <table><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr><tr><td>30-49</td><td>1st dose 100 mg, then 50 mg once daily.</td></tr><tr><td>15-29</td><td>1st dose 100 mg, then 25 mg once daily.</td></tr><tr><td>5-14</td><td>1st dose 35 mg, then 15 mg once daily.</td></tr><tr><td><5</td><td>1st dose 35 mg, then 10 mg once daily.</td></tr></table>	CrCl (ml/min)	Dosage Recommendation	30-49	1st dose 100 mg, then 50 mg once daily.	15-29	1st dose 100 mg, then 25 mg once daily.	5-14	1st dose 35 mg, then 15 mg once daily.	<5	1st dose 35 mg, then 10 mg once daily.	
CrCl (ml/min)	Dosage Recommendation											
30-49	1st dose 100 mg, then 50 mg once daily.											
15-29	1st dose 100 mg, then 25 mg once daily.											
5-14	1st dose 35 mg, then 15 mg once daily.											
<5	1st dose 35 mg, then 10 mg once daily.											
Administration	May be taken with or without food.											
Contraindications	Hypersensitivity. Lactation.											
Special Precautions	Discontinue use if there is rapid increase in aminotransferase levels, progressive hepatomegaly, or metabolic or lactic acidosis of unknown origin. Discontinue use if clinical signs, symptoms or lab abnormalities suggestive of pancreatitis develop. Hepatomegaly or other risk factors for hepatic impairment. Monitor hepatic function in chronic hepatitis B patients. Exclude HIV infection prior to hepatitis B therapy. Renal impairment. Pregnancy.											
Adverse Drug Reactions	Abdominal pain, nausea, vomiting, diarrhoea, insomnia, cough, nasal symptoms, arthralgia, muscle pain, headache, fever, rash, alopecia, malaise, increased creatinine phosphokinase and alanine aminotransferase, peripheral neuropathy. Rarely rhabdomyolysis, pancreatitis, hepatitis. Neutropenia and anaemia (in combination with zidovudine), thrombocytopenia, increases in LFTs. Paronychia. Angioedema, urticaria, and anaphylactoid reaction. Potentially Fatal: Lactic acidosis associated with severe hepatomegaly and hepatic steatosis.											
Drug Interactions	Renal excretion may be inhibited by high doses of trimethoprim (co-trimoxazole). May antagonise the antiviral action of zalcitabine.											
Pregnancy Category (US												

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 25°C (77°F).
Mechanism of Action	Lamivudine, a nucleoside analogue, is phosphorylated in the body to the active triphosphate form. In the active form, it inhibits hepatitis B virus polymerase and HIV reverse transcriptase enzymes. Absorption: Rapidly absorbed from the GI tract, delayed if taken with food (oral); peak plasma concentrations after 1 hr. Distribution: Crosses the blood-brain barrier and placenta; enters breast milk. Protein-binding: Up to 36%. Metabolism: Intracellular; low hepatic metabolism. Excretion: Via urine (as unchanged drug); 5-7 hr (elimination half-life).
CIMS Class	Antivirals
ATC Classification	J05AF05 - lamivudine; Belongs to the class of nucleoside and nucleotide reverse transcriptase inhibitors. Used in the systemic treatment of viral infections.

lamivudine + zidovudine

CIMS Class : (Antivirals)
lamivudine + zidovudine

P - Caution when used during pre

L - Contraindicated in l

related lamivudine + zidovudine information

Indication & Dosage

Oral

HIV infection

Adult: As a combination containing lamivudine 150 mg, zidovudine 300 mg: 1 tablet bid.

Child: As a combination containing lamivudine 150 mg, zidovudine 300 mg: combined formulation not recommended; 14-21 kg: ½ tablet bid; 21-30 kg: 1 tablet bid; >30 kg: 1 tablet each morning, 1 tablet each night (if not tolerated: ½ tablet bid); >30 kg: 1 tablet bid.

CrCl (ml/min)	Dosage Recommendation
<50	Avoid

Hepatic impairment: In severe impairment use separate formulations.

Administration

May be taken with or without food.

Overdosage

Due to zidovudine component. Symptoms: nausea, vomiting, ataxia and granulocytopenia. Treatment: symptom specific and supportive. Dialysis does not significantly remove lamivudine or zidovudine (does increase clearance of primary metabolite).

Contraindications

Neutrophil count $<0.75 \times 10^9/l$; haemoglobin levels <7.5 g/dl or 4.65 mmol/L. Lactation.

	Neutrophil count $<0.75 \times 10^9/l$; haemoglobin levels <7.5 g/dl or 4.65 mmol/Lactation.
Special Precautions	Renal and hepatic impairment; poor bone marrow reserve prior to treatment; risk of opportunistic infection; patients (especially obese women) with risk factors for or active liver disease. Patients with low body wt should avoid the combined formulation. Separate formulations of lamivudine or zidovudine should not be given at the same time as the combined formulation. If dose adjustment is necessary for either component, separate formulations should be used. Monitor haematological parameters (advanced disease: 2 wkly for 1st 3 mo of treatment, then monthly; early disease: 1-3 mthly), LFTs, mean cell volume, serum creatinine, kinase, viral load, CD4 counts and blood lactate levels. Patients should report any sore throat, nausea, vomiting, unexplained bruising or bleeding. Maintain adequate hydration (2-3 L/day) unless fluid restricted. Withdraw treatment if symptomatic hyperlactaemia, metabolic/lactic acidosis, progressive hepatomegaly or rapidly elevating aminotransferase levels occur. Cases of lactic acidosis and hepatic steatosis syndrome have been reported in pregnancy. Monitor hepatic enzymes and electrolytes regularly during 3rd trimester.
Adverse Drug Reactions	Headache, malaise and fatigue, fever or chills, nausea, diarrhoea, anorexia, abdominal pain, neuropathy, insomnia and other sleep disorders, dizziness, depressive disorders, nasal signs and symptoms, skin rashes, musculoskeletal pain, myalgia, arthralgia; anaemia, neutropenia and leucopenia (particularly at high doses of zidovudine; 1200-1500 mg/day), usually seen 4-5 wk after treatment commencing; respiratory symptoms eg rapid and/or deep breathing; if symptomatic hyperlactatemia, metabolic/lactic acidosis, progressive hepatomegaly, or rapidly elevating aminotransferase levels occur, withdraw treatment; mitochondrial damage leading to hyperlactatemia and hyperlipasemia; lipodystrophy; immune reactivation syndrome, osteonecrosis. Potentially Fatal: Lactic acidosis associated with liver failure and pancreatitis (normally after several mth of treatment); haematological toxicity (eg neutropenia and severe anaemia).
Drug Interactions	Zidovudine: acyclovir and valacyclovir may increase CNS depression. In combination with

	Zidovudine: acyclovir and valacyclovir may increase CNS depression. Increased risk of haematologic toxicity with ganciclovir, valganciclovir, dapsone, doxorubicin, vincristine and vinorelbine. Doxorubicin may reduce phosphorylation; fluconazole may increase levels/effects; increased risk of hepatic decompensation or haematologic toxicities with interferon-α and ribavirin (also increases risk of pancreatitis and lactic acidosis). Methadone may increase effects/levels. Increased risk of myalgia, malaise and/or fever, maculopapular rash and effects/levels with probenecid. Stavudine may decrease antiviral activity; valproic acid may increase plasma levels (AUC increased by 80%). Lamivudine: Increased risk of hepatic decompensation or haematologic toxicities with interferon-α and ribavirin (also increases risk of mitochondrial toxicity, pancreatitis and acidosis). Ganciclovir and valganciclovir may increase effects and toxicity; sulfamethoxazole/trimethoprim may increase AUC and decrease clearance (increasing levels and effects).
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drug should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store 2-30 °C.
Mechanism of Action	Synergistically reduce viral resistance and inhibit reverse transcriptase via chain termination. Absorption: Lamivudine: oral bioavailability: 80-85% (children 66%); C_{max}: 1.5 mcg/ml (32%); AUC: 6.1 mcg.h/ml (20%); T_{max}: 0.75 (0.5-2.0 hr). Zidovudine: oral bioavailability: 60-70%; C_{max}: 2.0 mcg/ml (40%); AUC: 2.4 mcg.h/ml; T_{max}: 0.5 (0.25-2.0) hr. Distribution: Volume of distribution: lamivudine 1.3 l/kg; zidovudine 1.6 l/kg. Protein binding: lamivudine: <36 %; zidovudine: 34-38%. Lamivudine and zidovudine enter CSF. Metabolism: Lamivudine: Hepatically (small extent). Zidovudine: metabolized

	Distribution: Volume of distribution: lamivudine 1.5 l/kg, zidovudine 1.0 l/kg. Protein binding: lamivudine: <36 %; zidovudine: 34-38%. Lamivudine and zidovudine enter CSF. Metabolism: Lamivudine: Hepatically (small extent). Zidovudine: metabolized via glucuronidation to 3'-amino-3'-deoxythymidine (major metabolite; approx 50-80%). Excretion: Elimination half-life: lamivudine: (adults) 5-7 hr, (children) 2 hr; zidovudine: 1.1 hr.
CIMS Class	Antivirals
ATC Classification	J05AF01 - zidovudine; Belongs to the class of nucleoside and nucleotide reverse transcriptase inhibitors. Used in the systemic treatment of viral infections. J05AF05 - lamivudine; Belongs to the class of nucleoside and nucleotide reverse transcriptase inhibitors. Used in the systemic treatment of viral infections.

lamotrigine

CIMS Class : (Anticonvulsants) , (Antipsychotics)
lamotrigine

P - Caution when used during pregnancy

L - Caution when used during lactation

related lamotrigine information

Indication & Dosage

Oral

Epilepsy

Adult: Initially, 25 mg once daily for 2 wk followed by 50 mg once daily for 2 wk; thereafter, increase the dose by a max of 50-100 mg every 1-2 wk to usual maintenance doses of 100-200 mg daily, as a single dose or in 2 divided doses. Some patients may require up to 500 mg daily.

Child: >12 yr: Initially, 25 mg once daily for 2 wk followed by 50 mg once daily for 2 wk; thereafter, increase the dose by a max of 50-100 mg every 1-2 wk to usual maintenance doses of 100 -200 mg daily, as a single dose or in 2 divided doses. Some patients may require up to 500 mg daily. <12 yr: Not recommended.

Max Dosage: Adult: 500 mg daily.

Hepatic impairment: Moderate impairment (Child-Pugh category B): Reduce dose by about 50%. Severe impairment (Child-Pugh category C): Reduce dose by about 75%.

Oral

Adjunct in epilepsy

Adult: With valproate: Initially, 25 mg on alternate days for 2 wk

C). Reduce dose by about 75%.

Oral

Adjunct in epilepsy

Adult: With valproate: Initially, 25 mg on alternate days for 2 wk followed by 25 mg once daily for 2 wk; thereafter, increase by a max of 25-50 mg every 1-2 wk; usual maintenance doses: 100-200 mg daily in 1-2 divided doses. With enzyme-inducing antiepileptics but not with valproate: 50 mg once daily for 2 wk followed by 50 mg bid for 2 wk; thereafter, increase by a max of 100 mg every 1-2 wk; usual maintenance doses: 200-400 mg/day in 2 divided doses; up to 700 mg/day in some patients. With oxcarbazepine but no enzyme-inducing or -inhibiting antiepileptics: 25 mg once daily for 2 wk followed by 50 mg once daily for 2 wk; thereafter increase dose by a max of 50-100 mg every 1-2 wk; usual maintenance doses: 100-200 mg daily in 1-2 divided doses; up to 500 mg daily in some patients.

Child: With valproate: Initially, 0.15 mg/kg once daily for 2 wk followed by 0.3 mg/kg once daily for 2 wk; thereafter, increase by a max of 0.3 mg/kg every 1-2 wk to usual maintenance doses of 1-5 mg/kg once daily or in 2 divided doses.

Hepatic impairment: Moderate impairment (Child-Pugh category B): Reduce dose by about 50%. Severe impairment (Child-Pugh category C): Reduce dose by about 75%.

Oral

Bipolar disorder

Adult: Monotherapy: Initially, 25 mg once daily for 2 wk followed by 50 mg once daily for 2 wk; thereafter, double the daily dose at wkly intervals to usual maintenance dose of 200 mg daily. Max dose: 200 mg/day. With valproate: Initially, 25 mg every other day for 2 wk followed by 25 mg once daily for 2 wk; thereafter, double the daily dose at wkly intervals to usual maintenance dose of 100 mg daily. With enzyme-inducing antiepileptics but not with valproate: Initially, 50 mg once daily for 2 wk followed by 100 mg daily in 2 divided doses for 2 wk; thereafter, increase in 100-mg increments wkly to usual

	With enzyme-inducing antiepileptics but not with valproate: Initially, 50 mg once daily for 2 wk followed by 100 mg daily in 2 divided doses for 2 wk; thereafter, increase in 100-mg increments wkly to usual maintenance dose of 400 mg daily in 2 divided doses. Hepatic impairment: Moderate impairment (Child-Pugh category B): Reduce dose by about 50%. Severe impairment (Child-Pugh category C): Reduce dose by about 75%.
Administration	May be taken with or without food.
Overdosage	Symptoms: Nystagmus and muscle hypertonicity, QRS interval prolongation, low-grade fever, erythema, and periorbital oedema, generalised tonic-clonic seizures, tremor, muscle weakness, ataxia, hypertonia. Management: Gastric lavage and activated charcoal.
Special Precautions	Hepatic or renal impairment. Closely monitor patient. Monitor children's body wt. Advise patient to report any hypersensitivity reaction. Avoid abrupt withdrawal unless severe skin reactions have developed. May impair ability to drive or operate machinery. Pregnancy and lactation.
Adverse Drug Reactions	Skin eruptions usually maculopapular in nature, nausea, headache, tiredness, dizziness, ataxia, irritability/aggression, tremor, agitation, confusion, hallucination, diplopia, blurred vision. Haematological abnormalities e.g. leucopenia and thrombocytopenia. Elevations of LFTs. Arthralgia, pain and back pain. Potentially Fatal: Stevens-Johnson syndrome and toxic epidermal necrolysis.
Drug Interactions	Metabolism enhanced by enzyme-inducing drugs e.g. phenytoin, carbamazepine, phenobarbitone, primidone, rifampicin, ethinyloestradiol/levonorgestrel combination. Metabolism reduced by sodium valproate.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and

	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store below 30°C (86°F).
Mechanism of Action	Lamotrigine inhibits voltage-sensitive sodium channels, thereby stabilising neuronal membranes and consequently inhibiting pathological release of excitatory amino acids (e.g. glutamate and aspartate). These amino acids play a role in the generation and spread of epileptic seizures. Absorption: Well absorbed from the GI tract (oral); peak plasma concentrations after 2.5 hr. Distribution: Widely distributed; enters breast milk. Metabolism: Extensively hepatic. Excretion: Via urine (as glucuronide conjugate); 24 hr (elimination half-life at steady state).
CIMS Class	Anticonvulsants / Antipsychotics
ATC Classification	N03AX09 - lamotrigine; Belongs to the class of other antiepileptics. Used in the management of epilepsy.

lansoprazole

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants)
lansoprazole

P - Caution when used during pregnancy

L - Caution when used during lactation

related lansoprazole information

Indication & Dosage	<i>Oral</i>
	Peptic ulcer
	Adult: 30 mg once daily in the morning given for 4 wk (duodenal ulcer) or for 8 wk (gastric ulcer).
	Hepatic impairment: Severe impairment: Max dose: 30 mg/day.
	<i>Oral</i>
	Hypersecretory conditions
	Adult: Initially, 60 mg daily and adjust as required. Daily doses >120 mg should be given in 2 divided doses.
	Hepatic impairment: Severe impairment: Max dose: 30 mg/day.
	<i>Oral</i>
	Acid-related dyspepsia
	Adult: 15-30 mg once daily in the morning for 2-4 wk.
	Hepatic impairment: Severe impairment: Max dose: 30 mg/day.
	<i>Oral</i>
	Gastro-oesophageal reflux disease

Hepatic impairment: Severe impairment: Max dose: 30 mg/day.

Oral

Gastro-oesophageal reflux disease

Adult: 30 mg once daily in the morning for 4-8 wk.

Maintenance: 15-30 mg once daily according to response.

Child: and erosive oesophagitis: 1-11 yr: ≤ 30 kg: 15 mg once daily; >30 kg: 30 mg once daily. May increase doses up to 30 mg bid if patient is still symptomatic after 2 or more wk of treatment. 12-17 yr: For erosive oesophagitis: 30 mg once daily for up to 8 wk; For nonerosive gastro-oesophageal reflux disease: 15 mg once daily for up to 8 wk.

Hepatic impairment: Severe impairment: Max dose: 30 mg/day.

Oral

NSAID-associated ulceration

Adult: 15-30 mg daily for 4-8 wk.

Hepatic impairment: Severe impairment: Max dose: 30 mg/day.

Oral

Prophylaxis of NSAID-induced ulcers

Adult: 15-30 mg daily for 4-8 wk.

Hepatic impairment: Severe impairment: Max dose: 30 mg/day.

Oral

***H.pylori* infection**

Adult: 1-wk triple therapy: 30 mg bid combined with clarithromycin 500 mg bid and either amoxicillin 1 g bid or metronidazole 400 mg bid.

Hepatic impairment: Severe impairment: Max dose: 30 mg/day.

Intravenous

Erosive oesophagitis

	mg/day. <i>Intravenous</i> Erosive oesophagitis Adult: 30 mg over 30 minutes daily for up to 7 days. Hepatic impairment: Consider dose adjustment.
Administration	Should be taken on an empty stomach. (Take before meals.)
Special Precautions	Hepatic impairment. Gastric malignancy should be ruled out. Pregnancy and lactation.
Adverse Drug Reactions	Diarrhoea, abdominal pain, nausea, constipation, headache, dizziness, eosinophilia, myalgia, glossitis, stomatitis, rash.
Drug Interactions	Reduced bioavailability with antacids and sucralfate. May decrease the absorption of atazanavir, itraconazole and ketoconazole. May increase plasma concentration of cilostazol.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Store at 25°C (77°F). Oral: Store at 25°C (77°F).
Mechanism of Action	Lansoprazole inhibits gastric acid secretion by inhibiting the H⁺/K⁺ ATPase, which is also known as the proton pump. Both basal and stimulated acid are inhibited. Absorption: Rapidly absorbed from the GIT (oral); peak plasma concentrations after 1.5 hr. Distribution: Protein-binding: 97%. Metabolism: Extensively hepatic; converted to 5-hydroxyl-lansoprazole and lansoprazole sulfone. Excretion: Via faeces (main) and urine (15-30% of a dose); 1-2 hr (elimination half-life).

	5-hydroxyl-lansoprazole and lansoprazole sulfone. Excretion: Via faeces (main) and urine (15-30% of a dose); 1-2 hr (elimination half-life).
CIMS Class	Antacids, Antireflux Agents & Antiulcerants
ATC Classification	A02BC03 - lansoprazole; Belongs to the class of proton pump inhibitors. Used in the treatment of peptic ulcer and gastro-oesophageal reflux disease (GERD).

lanthanum carbonate

CIMS Class : (Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence)
lanthanum carbonate

P - Caution when used during pregnancy
L - Caution when used during lactation
Lab - Lab interference

related lanthanum carbonate information

Indication & Dosage	<i>Oral</i> Hyperphosphataemia in end stage renal failure Adult: Initially, 0.75-2.25 g daily, given in divided doses with meals. Dose may be adjusted every 2-3 wk until an acceptable serum phosphate concentration is achieved; usual maintenance dose: 1.5-3 g daily in divided doses. Max: 3.75 g daily.
Administration	Should be taken with food. (Take w/ or immediately after meals. Chew thoroughly before swallowing. Do not swallow whole.)
Overdosage	Supportive treatment is recommended.
Special Precautions	Caution when used in patients with acute peptic ulcer, ulcerative colitis, Crohn's disease or bowel obstruction. Tablets should be thoroughly chewed before swallowing. Pregnancy and lactation.
Adverse Drug Reactions	GI disturbances, including nausea, vomiting, constipation,

Adverse Drug Reactions	GI disturbances, including nausea, vomiting, constipation, diarrhoea, dyspepsia and abdominal pain.
Drug Interactions	Compounds that are known to interact with antacids should not be taken within 2 hr of administering lanthanum carbonate.
Lab Interference	Abdominal x-rays of patients taking lanthanum carbonate may have a radio-opaque appearance typical of an imaging agent.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Lanthanum carbonate is a non-calcium, non-aluminium phosphate binder used for hyperphosphataemia in patients with chronic renal failure. It works by inhibiting phosphate absorption by forming highly insoluble lanthanum phosphate complexes, thus reducing both serum phosphate and calcium phosphate product. Distribution: Highly bound to plasma proteins. Metabolism: Not metabolised. Excretion: Eliminated mainly by the biliary system. Elimination half life: Approx 36 hr.
CIMS Class	Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence
ATC Classification	V03AE03 - lanthanum carbonate; Belongs to the class of other therapeutic products, drugs used in the treatment of hyperkalemia and hyperphosphatemia.

latanoprost

CIMS Class : (Antiglaucoma Preparations)
latanoprost

P - Caution when used during pregnancy

L - Caution when used during lactation

related latanoprost information

Indication & Dosage	<i>Ophthalmic</i> Ocular hypertension, Open-angle glaucoma Adult: Instil 1 drop of a 0.005% solution once daily in the evening.
Special Precautions	Do not use within 5 min of thiomersal-containing preparations. Aphakia or pseudophakia with torn posterior lens cap or anterior chamber lenses; risk factors for cystoid macular oedema; brittle or severe asthma; history of intraocular inflammation; inflammatory, neovascular, angle-closure or congenital glaucoma; pregnancy, lactation. Remove contact lenses during use.
Adverse Drug Reactions	Brown pigmentation particularly in those with mixed-color irides; blepharitis, ocular irritation and pain; darkening, thickening and lengthening of eyelashes; localised oedema; conjunctival hyperaemia; transient punctate epithelial erosions; dyspnoea; exacerbation of asthma; local skin reactions; iritis; uveitis; darkening of palpebral skin.
Pregnancy	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Ophthalmic: Store unopened at 2-8°C and at <25°C for up to 6 wk after opening.
Mechanism of Action	Latanoprost, a synthetic analogue of prostaglandin F_{2a}, reduces the IOP by increasing the outflow of aqueous humour. Absorption: Absorbed through the cornea; peak concentration in the aqueous humour is reached around 2 hr after administration. Metabolism: Rapidly hydrolysed to biologically active latanoprost acid by esterases in the cornea. Excretion: Via urine.
CIMS Class	Antiglaucoma Preparations
ATC Classification	S01EE01 - latanoprost; Belongs to the class of prostaglandin analogues used in the treatment of glaucoma and miosis.

latanoprost + timolol

CIMS Class : (Antiglaucoma Preparations)
latanoprost + timolol

P - Caution when used during pregnancy

L - Caution when used during lactation

related latanoprost + timolol information

Indication & Dosage	<i>Ophthalmic</i> Open-angle glaucoma, Ocular hypertension Adult: As eye preparation containing latanoprost 0.005% and timolol 0.5%: Instill 1 drop into the affected eye(s) once daily. Not to be used as an initial therapy.
Overdosage	Symptoms of systemic timolol overdose: Bradycardia, hypotension, bronchospasm and cardiac arrest. Treatment is symptomatic and supportive. Latanoprost overload can cause ocular irritation and conjunctival hyperaemia, no other ocular or systemic side effects are known. If latanoprost is accidentally ingested orally, gastric lavage may be used. Treatment is symptomatic and supportive.
Contraindications	Reactive airway diseases e.g. bronchial asthma or a history of bronchial asthma, severe COPD. Sinus bradycardia, 2nd or 3rd degree AV block, overt cardiac failure, cardiogenic shock.
Special Precautions	Monitor heart rate and signs of cardiac failure in patients with history of severe cardiac disease. May worsen Prinzmetal angina, severe peripheral and central circulatory disorders

	Monitor heart rate and signs of cardiac failure in patients with history of severe cardiac disease. May worsen Prinzmetal angina, severe peripheral and central circulatory disorders and hypotension. Monitor for signs of bronchospasm in asthmatic patients. β-blockers may mask signs and symptoms of acute hypoglycaemia and hyperthyroidism. Prolonged treatment with latanoprost may change eye colour by increasing the amount of brown pigment in the iris especially in patients with mixed coloured irides; regular eye examination is recommended. Caution when used in aphakic patients due to risk of macular oedema. Contact lenses should be removed during application and reinserted at least 15 minutes after application. May cause transient blurring of vision; patients should not drive or operate machinery until this resolves. Pregnancy and lactation.
Adverse Drug Reactions	Increased iris pigmentation, eye irritation, eye pain, stinging and burning sensation. Rarely, bradycardia, arrhythmia, CHF, bronchospasm and allergic reactions.
Drug Interactions	Additive effect on the intraocular pressure and other systemic effects may occur when used with oral β-blockers, calcium channel blockers, guanethidine, antiarrhythmics, digitalis glycosides or parasympathomimetics. Concurrent use of ≥ 2 ophthalmic prostaglandin analogues may lead to paradoxical increase in intraocular pressure. Mydriasis may occur when used concurrently with epinephrine. β-blocker may increase hypoglycaemic effect of antidiabetic agents.
Storage	Ophthalmic: Store at 2-8°C. For opened bottles, may store below 25°C.
Mechanism of Action	Latanoprost is an analogue of prostaglandin F_{2a}; it reduces intraocular pressure (IOP) by increasing outflow of aqueous humour. Timolol is a non-selective adrenergic blocker. It lowers IOP by decreasing the formation of aqueous by the

	Latanoprost is an analogue of prostaglandin F_{2a}, it reduces intraocular pressure (IOP) by increasing outflow of aqueous humour. Timolol is a non-selective adrenergic blocker. It lowers IOP by decreasing the formation of aqueous by the ciliary epithelium. Absorption: Latanoprost: Well-absorbed through the cornea; a prodrug that is activated by the esterases in the cornea. Distribution: Latanoprost: Active metabolite has a small volume of distribution of 0.16 L/kg and protein binding of 87%. Metabolism: Latanoprost: Active metabolite is mainly metabolised hepatically. Timolol: Largely metabolised in the liver. Excretion: Latanoprost: Plasma half-life of active metabolite is about 17 minutes and the metabolites are excreted primarily in the urine. Timolol: Plasma half-life is about 6 hr and the metabolites are mainly excreted in the urine.
CIMS Class	Antiglaucoma Preparations
ATC Classification	C07AA06 - timolol; Belongs to the class of non-selective beta-blocking agents. Used in the treatment of cardiovascular diseases. S01ED01 - timolol; Belongs to the class of beta blocking agents used in the treatment of glaucoma and miosis. S01EE01 - latanoprost; Belongs to the class of prostaglandin analogues used in the treatment of glaucoma and miosis.

leflunomide

CIMS Class : (Disease-Modifying Anti-Rheumatic Drugs (DMARDs))
leflunomide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related leflunomide information

Indication & Dosage	<i>Oral</i> Rheumatoid arthritis, Psoriatic arthritis Adult: 100 mg daily for 3 days as a loading dose. Maintenance: 10-20 mg daily. Renal impairment: Dosage may need to be reduced. Hepatic impairment: Dosage may need to be reduced.
Administration	May be taken with or without food.
Contraindications	Significant hepatic impairment, compromised immune function including bone marrow dysplasia or severe uncontrolled infection; concurrent vaccination with live vaccines. Pregnancy, lactation.
Special Precautions	Renal and hepatic impairment; women with childbearing potential. Monitor blood counts and BP regularly. Avoid alcohol.
Adverse Drug Reactions	Thrombocytopenia, anaphylaxis, eosinophilia, leukopenia, pancytopenia. Headache, dizziness, weakness, bronchitis, urinary tract infection, alopecia, rash, dry skin, eczema, pruritus, hypokalaemia, weight loss, arthralgia, joint disorder,

	thrombocytopenia, arthralgia, osteopenia, osteoporosis, pancytopenia. Headache, dizziness, weakness, bronchitis, urinary tract infection, alopecia, rash, dry skin, eczema, pruritus, hypokalaemia, weight loss, arthralgia, joint disorder, leg cramps, rhinitis, sinusitis, hypertension, diarrhoea, nausea, abdominal pain, synovitis, tenosynovitis, paraesthesia, pharyngitis, anorexia, vomiting, oral thrush, stomatitis. Potentially Fatal: Hepatotoxicity.
Drug Interactions	Cholestyramine and activated charcoal decrease active metabolite. Concurrent use of methotrexate and other hepatotoxic drugs increase the risk of hepatotoxicity. Rifampicin increases blood levels of the active metabolite.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Mechanism of Action	Leflunomide is an immunomodulating agent and DMARD. It inhibits pyrimidine synthesis by inhibiting dihydroorotate dehydrogenase enzyme activity. It also has anti-inflammatory properties. Absorption: Peak plasma concentrations of active metabolite within 6-12 hr. Distribution: Active metabolite is 99% protein bound and has a low volume of distribution (0.13 L/kg). Metabolism: Rapidly converted to active metabolite A77 1726 in GI mucosa and the liver. Excretion: Urine (as glucuronides), faeces. Elimination half life of active metabolite approximately 14-18 days.
CIMS Class	Disease-Modifying Anti-Rheumatic Drugs (DMARDs)

	Disease-Modifying Anti-Rheumatic Drugs (DMARDs)
ATC Classification	L04AA13 - leflunomide; Belongs to the class of selective immunosuppressive agents. Used to induce immunosuppression.

lercanidipine

CIMS Class : (Calcium Antagonists)
lercanidipine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food $\square$ - Food interaction

related lercanidipine information

Indication & Dosage	<i>Oral</i> Hypertension Adult: As hydrochloride: 10 mg once daily, increased after 2 wk to 20 mg daily if necessary. Renal impairment: Dosage may need to be reduced in mild to moderate renal impairment. Avoid in patients with CrCl <12 ml/min.
Administration	Should be taken on an empty stomach. (Take on an empty stomach at least 15 mins before meals.)
Contraindications	Severe hepatic or renal impairment; aortic stenosis, unstable angina, uncontrolled heart failure, within 1 mth of MI; lactation, pregnancy.
Special Precautions	Left ventricular dysfunction, sick sinus syndrome (if pacemaker not fitted).
Adverse Drug Reactions	Tachycardia, oedema, flushing, headache, dizziness, asthenia, rash, diarrhoea, polyuria, palpitations, hypotension, drowsiness, myalgia.

	Tachycardia, oedema, flushing, headache, dizziness, asthenia, rash, diarrhoea, polyuria, palpitations, hypotension, drowsiness, myalgia.
Drug Interactions	Plasma concentration reduced by inducers of CYP3A4 eg rifampicin, phenytoin, carbamazepine. Bioavailability also reduced by metoprolol and possibly propranolol. Plasma concentrations increased by inhibitors of CYP3A4 eg imidazole antifungals, erythromycin, ritonavir, fluoxetine. Alcohol may potentiate vasodilating effect. Potentially Fatal: Significantly increased plasma levels of both lercanidipine and ciclosporin when administered together.
Food Interaction	Grapefruit juice may inhibit metabolism.
Mechanism of Action	Lercanidipine is a dihydropyridine calcium-channel blocker which acts by inhibiting the influx of calcium ions through the slow channels of the vascular smooth muscle and myocardium during depolarization. Its main effect is vasodilatation because it has greater selectivity for vascular smooth muscle than cardiac smooth muscle. Absorption: Fully absorbed from the GI tract. Peak plasma levels occur in 1.5-3 hr. Distribution: Extensively distributed in tissues and organs. >98% protein bound. Metabolism: Undergoes extensive hepatic metabolism to inactive metabolites via CYP3A4 isoenzyme. Excretion: Mean elimination half life is approx 8-10 hr.
CIMS Class	Calcium Antagonists
ATC Classification	C08CA13 - lercanidipine; Belongs to the class of selective dihydropyridine derivative calcium-channel blockers with mainly vascular effects. Used in the treatment of cardiovascular diseases.

dihydropyridine derivative calcium-channel blockers with mainly vascular effects. Used in the treatment of cardiovascular diseases.

letrozole

CIMS Class : (Hormonal Chemotherapy)
letrozole

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related letrozole information

Indication & Dosage	<i>Oral</i> Adjuvant therapy for postmenopausal women with hormone receptor positive early breast cancer, Advanced or locally advanced breast cancer Adult: 2.5 mg once daily. Hepatic impairment: Reduce dose by 50% in patients with cirrhosis and severe hepatic impairment; recommended dose: 2.5 mg on alternate days.
Administration	May be taken with or without food.
Contraindications	Premenopausal women and children; hypersensitivity.
Special Precautions	Severe renal impairment; severe hepatic impairment; osteoporosis. Caution when driving or operating machinery.
Adverse Drug Reactions	Hot flushes, arthralgia, nausea, vomiting, fatigue, dizziness, headache, dyspepsia, constipation, diarrhoea, anorexia, alopecia, increased sweating, rash, peripheral oedema, osteoporosis, musculoskeletal pain, vaginal irritation. Potentially Fatal: Thromboembolic events.
Drug Interactions	Plasma levels reduced by tamoxifen.

Drug Interactions	Plasma levels reduced by tamoxifen.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Letrozole competitively binds to the heme group of aromatase, a cytochrome P450 enzyme which catalyzes conversion of androgen to oestrogen, leading to inhibition of the enzyme and a significant reduction in plasma oestrogen levels. Absorption: Rapidly and completely absorbed from the GI tract. Distribution: Weakly bound to plasma proteins and has a large volume of distribution of about 1.9 l/kg. Metabolism: Slow hepatic metabolism to inactive metabolites. Excretion: Via urine (6% as unchanged drug); elimination half life of about 2 days.
CIMS Class	Hormonal Chemotherapy
ATC Classification	L02BG04 - letrozole; Belongs to the class of enzyme inhibitors. Used in endocrine therapy.

leuprorelin

CIMS Class : (Other Drugs Affecting Hormonal Regulation) , (Hormonal
Chemotherapy)
leuprorelin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab - Lab interference

related leuprorelin information

Indication & Dosage	<i>Parenteral</i> Palliative treatment of advanced prostate cancer Adult: 1 mg as a single daily dose by SC Inj. As depot preparations: 3.75 mg once a mth, as a single IM/SC Inj; or 11.25 mg every 3 mth via SC inj. Alternatively, an implant containing 72 mg of leuprorelin acetate may be inserted subcutaneously into the inner part of the upper arm; releasing drug at a controlled rate of 120 mcg/day for 12 mth. An anti-androgen such as cyproterone acetate may be given for a few days prior to starting treatment and continued for 3 wk, to prevent disease flare.
	<i>Parenteral</i> Endometriosis Adult: As depot preparations: 3.75 mg every mth given as a single IM/SC inj or 11.25 mg every 3 mth as IM depot Inj. Initiate treatment during the 1st 5 days of menstrual cycle up to 6 mth (for endometriosis) or 3 mth (for women

	single IM/SC inj or 11.25 mg every 3 mth as IM depot Inj. Initiate treatment during the 1st 5 days of menstrual cycle up to 6 mth (for endometriosis) or 3 mth (for women with anaemia due to uterine fibroids). <i>Parenteral</i> Uterine fibroids Adult: As depot preparations: 3.75 mg every mth given as a single IM/SC inj or 11.25 mg every 3 mth as IM depot Inj. Initiate treatment during the 1st 5 days of menstrual cycle up to 6 mth (for endometriosis) or 3 mth (for women with anaemia due to uterine fibroids). <i>Parenteral</i> Precocious puberty Child: Initially, 50 mcg/kg daily by SC inj, may be titrated upwards by 10 mcg/kg/day if total suppression of ovarian or testicular steroidogenesis is not achieved. As depot preparations: ≤25 kg: 7.5 mg; >25-37.5 kg: 11.25 mg and >37.5 kg: 15 mg; doses to be given via IM/SC inj every 4 wk; may titrate dose upwards in increments of 3.75 mg every 4 wk if down-regulation is not achieved. <i>Parenteral</i> As preparation for uterine surgery Adult: As depot preparations: 3.75 mg as a single inj via IM/SC given 5-6 wk before the procedure, or mthly for 3-4 mth prior to surgery for uterine fibroids.
Contraindications	Pregnancy, lactation; hypersensitivity to GnRH, GnRH agonist analogs or product excipients; undiagnosed abnormal vaginal bleeding.
Special Precautions	Worsening of signs and symptoms of prostatic cancer, osteoporosis (including drug induced). For management of central precocious puberty, treatment should be discontinued before the girl reaches 11 yr old or the boy

	osteoporosis (including drug induced). For management of central precocious puberty, treatment should be discontinued before the girl reaches 11 yr old or the boy reaches 12 yr old.
Adverse Drug Reactions	ECG changes/ischaemia, oedema, insomnia/sleep disorders, pain, headache, dizziness, nervousness, paraesthesias, impotence/decreased libido, gynaecomastia/breast tenderness/changes, hot flushes/sweats, GI disturbances, anorexia, constipation, nausea/vomiting, myalgia, bone pain, urinary frequency/urgency/disorders, haematuria, dyspnoea, anaemia, dermatitis, acne/seborrhoea, asthenia, amenorrhoea, reduced bone density. Potentially Fatal: Thrombocytopenia and leucopenia.
Lab Interference	As leuporelin suppresses the pituitary-gonadal system, diagnostic tests of pituitary gonadotropic and gonadal functions during treatment and up to 12 wk after discontinuing leuporelin depot may be misleading.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Mechanism of Action	Leuporelin is a gonadotropin-releasing hormone (GnRH) analogue. Continuous admin leads to down regulation of GnRH receptors and subsequently reduces gonadotrophin secretion. Reduced gonadotrophin levels lead to inhibition of sex hormone (androgen and oestrogen) production. Absorption: Bioavailability: 94% (SC admin) and zero if given orally. Distribution: Protein binding: 43-49%. Metabolism: Major metabolite: Pentapeptide.

	given orally. Distribution: Protein binding: 43-49%. Metabolism: Major metabolite: Pentapeptide. Excretion: Elimination half-life: 3 hr (IV admin). Excreted via urine.
CIMS Class	Other Drugs Affecting Hormonal Regulation / Hormonal Chemotherapy
ATC Classification	L02AE02 - leuporelin; Belongs to the class of gonadotropin releasing hormone analogues. Used in endocrine therapy.

levamisole

CIMS Class : (Anthelmintics) , (Cytotoxic Chemotherapy)
levamisole

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related levamisole information

Indication & Dosage

Oral

Ascariasis

Adult: 150 mg as a single dose.

Child: 3 mg/kg as a single dose.

Oral

Ancylostomiasis

Adult: 2.5 mg/kg as a single dose, repeated after 7 days in severe cases.

Child: 2.5 mg/kg as a single dose, repeated after 7 days in severe cases.

Oral

Mixed ascariasis hookworm infections

Adult: 2.5 mg/kg as a single dose, repeated after 7 days in severe cases.

Child: 2.5 mg/kg as a single dose, repeated after 7 days in severe cases.

Administration

Should be taken with food. (Take w/ meals to minimise side effects such as nausea.)

	Should be taken with food. (Take w/ meals to minimise side effects such as nausea.)
Contraindications	Preexisting blood disorders; pregnancy and lactation; rheumatoid arthritis; severe renal impairment.
Special Precautions	Hepatic impairment, Sjogren's syndrome.
Adverse Drug Reactions	Nausea, vomiting, diarrhoea, abdominal pain, dizziness and headache. Fever, influenza-like syndrome, arthralgia, muscle pain, rash, taste disturbances and cutaneous vasculitis. Potentially Fatal: Agranulocytosis, leucopenia, thrombocytopenia.
Drug Interactions	May increase toxicity of phenytoin. Increases bioavailability of ivermectin; decreases bioavailability of albendazole. Alcohol causes disulfiram-like reaction.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Levamisole is the active laevo-isomer of tetramisole. It works by paralysing susceptible intestinal worms which are then excreted from the intestines. Levamisole also enhances cellular immune responses in humans. Absorption: Well-absorbed from the GI tract. Peak plasma concentrations are achieved in 1.5-2 hr. Metabolism: Occurs extensively in the liver. Excretion: Mainly in the urine (70% as metabolites and 5% as unchanged drug) and small amounts in the faeces.
CIMS Class	Anthelmintics / Cytotoxic Chemotherapy
ATC Classification	P02CE01 - levamisole; Belongs to the class of

ATC Classification

P02CE01 - levamisole; Belongs to the class of imidazothiazole derivative agents used as antinematodal.

levetiracetam

CIMS Class : (Anticonvulsants)
levetiracetam

P - Caution when used during pregnancy

L - Caution when used during lactation

related levetiracetam information

Indication & Dosage

Oral

Adjunct in partial seizures

Adult: Initially, 500 mg bid on the 1st day. May increase in steps of 1 g at 2-4 wk intervals until effective antiepileptic control is achieved. Max: 3 g/day.

Child: 4-15 yr (<50 kg): Initially 10 mg/kg bid. May be increased by 10 mg/kg bid at 2-wk intervals. Adolescents =16 yr or 50 kg initially 500 mg bid. May be increased by 500 mg bid at 2-4 wk intervals. Max: 60 mg/kg/day.

Renal impairment: Suitable total daily dose (given as 2 divided doses) based on CrCl.

CrCl (ml/min)	Dosage Recommendation
50-79	1-2 g
30-49	500 mg - 1.5 g
<30	500 mg - 1 g

Oral

Monotherapy for partial seizures with or without secondary generalisation

Adult: Initially 500 mg daily, increased after 2 wk to 1 g daily.

CrCl

Monotherapy for partial seizures with or without secondary generalisation

Adult: Initially 500 mg daily, increased after 2 wk to 1 g daily. May further increase in steps of 500 mg at 2 wk intervals. Max: 3 g/day.

Renal impairment: Suitable total daily dose (given as 2 divided doses) based on CrCl.

CrCl (ml/min)	Dosage Recommendation
50-79	1-2 g
30-49	500 mg - 1.5 g
<30	500 mg - 1 g

Intravenous

Adjunct in partial seizures

Adult: Initially, 500 mg bid on the 1st day. May increase in steps of 1 g at 2-4 wk intervals until effective antiepileptic control is achieved. Max: 3 g/day. No safety and efficacy data for IV usage >4 days.

Child: 4-15 yr (<50 kg): Initially 10 mg/kg bid via IV infusion over 15 min. May be increased by 10 mg/kg bid at 2-wk intervals. Adolescents ≥16 yr or 50 kg initially 500mg bid via IV infusion over 15 min. May be increased by 500 mg bid at 2-4 wk intervals. Max: 60 mg/kg/day.

Renal impairment: Suitable total daily dose (given as 2 divided doses) based on CrCl.

CrCl (ml/min)	Dosage Recommendation
50-79	1-2 g
30-49	500 mg - 1.5 g
<30	500 mg - 1 g

Intravenous

Monotherapy for partial seizures with or without secondary generalisation

Adult: Initially 500 mg daily, increased after 2 wk to 1 g daily.

	Monotherapy for partial seizures with or without secondary generalisation Adult: Initially 500 mg daily, increased after 2 wk to 1 g daily. May further increase in steps of 500 mg at 2 wk intervals. Max: 3 g/day. No safety and efficacy data for IV usage >4 days. Renal impairment: Suitable total daily dose (given as 2 divided doses) based on CrCl.	
	CrCl (ml/min)	Dosage Recommendation
	50-79	1 - 2 g
	30-50	500 mg - 1.5 g
	<30	500 mg - 1 g
	Reconstitution: Add 100 ml of suitable diluent to vial. Suitable diluents include sodium chloride (0.9%) injection; lactated Ringer's injection and dextrose 5% injection.	
Administration	May be taken with or without food. (Oral soln should be diluted in a glass of water.)	
Special Precautions	Renal and hepatic impairment; pregnancy, lactation; patients undergoing haemodialysis. If psychotic symptoms (eg hallucination) and behavioural symptoms (eg agitation, anxiety) occur, reduce dosage. Abrupt withdrawal may result in increased seizure frequency. May impair ability to drive or operate machinery during initial therapy.	
Adverse Drug Reactions	Somnolence, asthenia, dizziness, vertigo, depression, emotional instability, hostility, nervousness, ataxia, tremor, amnesia, headache, nausea, dyspepsia, diarrhoea, anorexia, rash, diplopia.	
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the	

	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Once reconstituted store at 15-30°C and use within 24 hr.
Mechanism of Action	Anticonvulsant used in the treatment of partial seizures. The precise mechanism of anticonvulsant effect is unknown. Onset: 1 hr Absorption: Rapidly and almost completely absorbed from GI tract. Distribution: Not significantly protein bound (<10%). Distributed in breast milk. Metabolism: Not extensively metabolised (24% into inactive metabolite); primarily by enzymatic hydrolysis. Excretion: Excreted in the urine as both unchanged drug (66%) and metabolites. Plasma half life of 6-8 hr.
CIMS Class	Anticonvulsants
ATC Classification	N03AX14 - levetiracetam; Belongs to the class of other antiepileptics. Used in the management of epilepsy.

levobunolol

CIMS Class : (Antiglaucoma Preparations)
levobunolol

P - Caution when used during pregnancy

L - Caution when used during lactation

related levobunolol information

Indication & Dosage	<i>Ophthalmic</i> Open-angle glaucoma, Ocular hypertension Adult: As hydrochloride: 0.5% solution: 1-2 drops of in the affected eye(s) once daily; may be given bid for more severe or uncontrolled glaucoma. 0.25% solution: 1-2 drops bid.
Contraindications	Bronchial asthma, severe COPD; sinus bradycardia; 2nd and 3rd degree heart block; overt cardiac failure; cardiogenic shock.
Special Precautions	Patients at risk of developing hypoglycaemia. DM. Thyrotoxicosis. Known diminished pulmonary function. Cerebrovascular insufficiency. Do not drive or operate machinery until vision is clear. Pregnancy and lactation.
Adverse Drug Reactions	Ocular stinging, burning, blepharoconjunctivitis, decreased heart rate, decreased BP, iridocyclitis, headache, transient ataxia, dizziness, lethargy, decreased corneal sensitivity, tearing, visual disturbances, urticaria and pruritus.
Drug Interactions	Mydriasis may occur when used with epinephrine. Additive effects with catecholamine-depleting drugs e.g.reserpine.

	Mydriasis may occur when used with epinephrine. Additive effects with catecholamine-depleting drugs e.g.reserpine. Possible AV conduction disturbances, LVF and hypotension with IV calcium antagonists. Additive prolongation of AV conduction time with digitalis and calcium antagonists. Additive hypotensive effects with phenothiazine-related agents. Additive effect with systemic β-blockers.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Ophthalmic: Store at 15-30°C (59-86°F).
Mechanism of Action	Levobunolol, a nonselective β-adrenergic blocking agent, decreases IOP by reducing aqueous humour production. Onset: Within 1 hr (ophthalmic). Duration: Up to 24 hr (ophthalmic). Absorption: Rapidly and almost completely absorbed from the GI tract (oral). Metabolism: Extensively hepatic. Excretion: Via urine as metabolites and unchanged drug.
CIMS Class	Antiglaucoma Preparations
ATC Classification	S01ED03 - levobunolol; Belongs to the class of beta blocking agents used in the treatment of glaucoma and miosis.

levocetirizine

CIMS Class : (Antihistamines & Antiallergics)
levocetirizine

L - Contraindicated in lactation

related levocetirizine information

Indication & Dosage

Oral

Allergic conditions

Adult: As hydrochloride: 5 mg daily in the evening; 2.5 mg may be adequate in some patients. Max dose: 5 mg daily.

Child: As hydrochloride: 6-11 yr: 2.5 mg once daily. Max dose: 2.5 mg daily. ≥12 yr: 5 mg once daily; 2.5 mg may be adequate in some patients. Max dose: 5 mg daily. All doses to be taken in the evening.

CrCl (ml/min)	Dosage Recommendation
50-80	2.5 mg once daily.
30-50	2.5 mg every other day.
10-30	2.5 mg twice wkly (give every 3-4 days).

Administration

May be taken with or without food.

Overdosage

Symptoms: Drowsiness, agitation, restlessness.

Management: Supportive and symptomatic.

Contraindications

Lactation. End-stage renal disease (CrCl <10 ml/min) or haemodialysis patients. Child 6-11 yr with renal impairment.

Special Precautions

Renal impairment. May impair ability to drive or operate machinery.

Adverse Drug Reactions	Fatigue, somnolence, dry mouth, nasopharyngitis, pyrexia, cough, epistaxis.
Drug Interactions	Additive sedation with alcohol and other CNS depressants.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 20-25°C (68-77°F).
Mechanism of Action	Levocetirizine, an active isomer of cetirizine, selectively inhibits histamine H₁-receptors. Absorption: Rapidly and extensively absorbed from the GI tract (oral); peak plasma concentration in 0.9 hr. Distribution: Protein-binding: 91-92%. Metabolism: Via aromatic oxidation, N- and O-dealkylation and taurine conjugation. Excretion: Via urine (85.4%), via faeces (12.9%), as metabolites and unchanged drug; 8 hr (plasma half-life).
CIMS Class	Antihistamines & Antiallergics
ATC Classification	R06AE09 - levocetirizine; Belongs to the class of piperazine derivatives used as systemic antihistamines.

levodopa

CIMS Class : (Antiparkinsonian Drugs)
levodopa

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related levodopa information

Indication & Dosage

Oral

Parkinsonism

Adult: Initially, 125 mg bid; increase gradually every 3-7 days according to response. Max dose: 8 g daily in divided doses.

Oral

Parkinsonism in conjunction with benserazide

Adult: Patients not previously on levodopa therapy: Initially, 50 mg 3 or 4 times daily; gradually increase in increments of 100 mg once or twice wkly. Increase initial dose to 100 mg tid for advanced disease stages. Maintenance dose: 400-800 mg daily in divided doses; most require <600 mg daily.

Patients previously on levodopa monotherapy: 10-15% of the usual dose previously taken. Patient previously on other levodopa/dopa-decarboxylase combination therapy: Initially, 50 mg 3 or 4 times daily.

Elderly: Initially, 50 mg once or bid, then increase by 50 mg

	levodopa/dopa-decarboxylase combination therapy: Initially, 50 mg 3 or 4 times daily. Elderly: Initially, 50 mg once or bid, then increase by 50 mg every 3rd or 4th day. <i>Oral</i> Parkinsonism in conjunction with carbidopa Adult: Patients not previously on levodopa therapy: Initially, 25 mg carbidopa with 100 mg levodopa tid; gradually increase in increments of 12.5 mg carbidopa with 50 mg levodopa or 25 mg carbidopa with 100 mg levodopa every day or on alternate days. Maintenance dose: 75-200 mg carbidopa with 750 mg to 2 g levodopa daily in divided doses. Max carbidopa dose: 200 mg daily. Patients previously on levodopa monotherapy: 20-25% of the dose previously taken 3 or 4 times daily. Patient previously on other levodopa/dopa-decarboxylase combination therapy: Initial dose should provide the same daily levodopa dose.
Administration	Should be taken with food. (GI discomfort may be reduced by increasing the dose of l-dopa gradually, &/or by taking w/ or after meals. However, taking l-dopa on a full stomach may lead to lower plasma conc. In later disease, it may be preferable to admin on an empty stomach if the patient can tolerate it. Keep a consistent diet. A change in diet to foods high in protein may delay l-dopa absorption & reduce amt taken up in circulation.)
Overdosage	Symptoms: Hypertension (initially), hypotension, sinus tachycardia, symptomatic orthostatic hypotension, marked confusion, agitation, insomnia, restlessness, severe anorexia, insomnia.
Contraindications	Angle-closure glaucoma; malignant melanoma.
Special Precautions	Heart disease, liver or renal disease, pulmonary disease, endocrine disorders, seizure disorders, dementia or

Special Precautions	Heart disease, liver or renal disease, pulmonary disease, endocrine disorders, seizure disorders, dementia or psychosis; open-angle glaucoma, osteomalacia, history of peptic ulcer. Monitor hepatic, psychiatric, haematological, renal and CV functions periodically. May impair ability to drive or operate machinery. Elderly. Avoid abrupt withdrawal. Pregnancy and lactation.
Adverse Drug Reactions	GI disturbances e.g. nausea, vomiting, anorexia. GI bleeding in peptic ulcer patients. Orthostatic hypotension, cardiac arrhythmias. Psychiatric symptoms (especially the elderly), depression with or without suicidal tendency. Abnormal involuntary movements or dyskinesias, delirium, hallucinations. Slight elevation of liver enzymes, BUN and uric acid. Transient leucopenia and thrombocytopenia.
Drug Interactions	Increased postural hypotension and possible reduced absorption with TCAs. Reduced effects with phenothiazines, butyrophenones, thioxanthenes and other antipsychotic agents; reserpine, papaverine, phenytoin, isoniazid. Reversal of effects of levodopa monotherapy with pyridoxine. Exacerbation of abnormal involuntary movements and possibly delayed absorption with anticholinergics. Additive hypotensive effects with antihypertensive agents. Increased CNS toxicity with methyldopa. Exacerbation of parkinsonian symptoms with metoclopramide. Potentially Fatal: Increased risk of hypertensive crises with nonselective MAOIs. Increased risk of cardiac arrhythmias with cyclopropane or halogenated anaesthetics.
Food Interaction	Food reduces and delays absorption of levodopa. Effects of levodopa reduced by beans, liver, skimmed milk, yeast and wheat germ. Large neutral amino acids reduce absorption

	Food reduces and delays absorption of levodopa. Effects of levodopa reduced by beans, liver, skimmed milk, yeast and wheat germ. Large neutral amino acids reduce absorption and passage across blood-brain barrier. Recommended to be taken after a light meal to slow absorption and reduce central emetic effect.
Lab Interference	False-positive Coombs' test. Interferes with serum tests for bilirubin, catecholamines, creatinine, glucose and uric acid and urine tests for creatinine, glucose, ketone and vanillyl mandelic acid (VMA).
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 20-25°C (68-77°F).
Mechanism of Action	Levodopa increases dopamine levels in the brain leading to the stimulation of dopamine receptors. Absorption: Rapidly absorbed from the GI tract (oral); absorption reduced and delayed by food. Peak plasma concentrations within 2 hr. Distribution: Protein-binding: 10-30%. Penetrates the blood-brain barrier; crosses the placenta; distributed into breast milk. Metabolism: Metabolised in the gut, liver and kidney; decarboxylated by L-aminodecarboxylase to dihydrophenylacetic acid (DOPAC) and homovanillic acid (HVA). Other routes: O-methylation, transamination, oxidation. Excretion: Via urine within 24 hr (80% as metabolites); via faeces (minimal amounts). 30-60 min (elimination half-life).
CIMS Class	Antiparkinsonian Drugs

CIMS Class	Antiparkinsonian Drugs
ATC Classification	N04BA01 - levodopa; Belongs to the class of dopa and dopa derivative dopaminergic agents. Used in the management of parkinson's disease.

Oral

Acute bacterial sinusitis

Adult: 500 mg once daily for 10-14 days. Alternatively, 750 mg once daily for 5 days.

Renal impairment: Haemodialysis/CAPD: Initially, 500 mg daily, then 250 mg every 48 hr. Alternatively: Initially, 750 mg daily, then 500 mg every 48 hr.

CrCl (ml/min)	Dosage Recommendation
20-49	Initially, 500 mg daily, then 250 mg every 24 hr. Alternatively: Initially, 750 mg daily, then 750 mg every 48 hr.
10-19	Initially, 500 mg daily, then 250 mg every 48 hr. Alternatively: Initially, 750 mg daily, then 500 mg every 48 hr.

Oral

Acute bacterial exacerbation of chronic bronchitis

Adult: 500 mg once daily for 7 days.

Renal impairment: Haemodialysis/CAPD: Initially, 500 mg daily, then 250 mg every 48 hr.

Acute bacterial exacerbation of chronic bronchitis

Adult: 500 mg once daily for 7 days.

Renal impairment: Haemodialysis/CAPD: Initially, 500 mg daily, then 250 mg every 48 hr.

CrCl (ml/min)	Dosage Recommendation
20-49	Initially, 500 mg daily, then 250 mg every 24 hr.
10-19	Initially, 500 mg daily, then 250 mg every 48 hr.

*Oral***Community-acquired pneumonia**

Adult: 500 mg once for 7-14 days. Alternatively, 750 mg once daily for 5 days.

Renal impairment: Haemodialysis/CAPD: Initially, 500 mg daily, then 250 mg every 48 hr. Alternatively: Initially, 750 mg daily, then 500 mg every 48 hr.

CrCl (ml/min)	Dosage Recommendation
20-49	Initially, 500 mg daily, then 250 mg every 24 hr. Alternatively: Initially, 750 mg daily, then 750 mg every 48 hr.
10-19	Initially, 500 mg daily, then 250 mg every 48 hr. Alternatively: Initially, 750 mg daily, then 500 mg every 48 hr.

*Oral***Nosocomial pneumonia**

Adult: 750 mg once daily for 7-14 days.

Renal impairment: Haemodialysis/CAPD: Initially, 750 mg daily, then 500 mg every 48 hr.

CrCl (ml/min)	Dosage Recommendation
20-49	Initially, 750 mg daily, then 750 mg every 48 hr.
10-19	Initially, 750 mg daily, then 500 mg every 48 hr.

Oral

Oral

Complicated skin and skin structure infections

Adult: 750 mg once daily for 7-14 days.

Renal impairment: Haemodialysis/CAPD: Initially, 750 mg daily, then 500 mg every 48 hr.

CrCl (ml/min)	Dosage Recommendation
20-49	Initially, 750 mg daily, then 750 mg every 48 hr.
10-19	Initially, 750 mg daily, then 500 mg every 48 hr.

Oral

Uncomplicated urinary tract infections

Adult: 250 mg once daily for 3 days.

Oral

Complicated urinary tract infections

Adult: 250 mg once daily for 10 days.

CrCl (ml/min)	Dosage Recommendation
10-19	Initially 250 mg daily, then 250 mg every 48 hr.

Oral

Acute pyelonephritis

Adult: 250 mg once daily for 10 days.

CrCl (ml/min)	Dosage Recommendation
10-19	Initially 250 mg daily, then 250 mg every 48 hr.

Oral

Uncomplicated skin and skin structure infections

Adult: 500 mg once daily for 7-10 days.

Renal impairment: Haemodialysis/CAPD: Initially, 500 mg daily, then 250 mg every 48 hr.

Complicated skin and skin structure infections

Adult: 500 mg once daily for 7-10 days.

Renal impairment: Haemodialysis/CAPD: Initially, 500 mg daily, then 250 mg every 48 hr.

CrCl (ml/min)	Dosage Recommendation
20-49	Initially, 500 mg daily, then 250 mg every 24 hr.
10-19	Initially, 500 mg daily, then 250 mg every 48 hr.

Oral**Chronic bacterial prostatitis**

Adult: 500 mg once daily for 28 days.

Renal impairment: Haemodialysis/CAPD: Initially, 500 mg daily, then 250 mg every 48 hr.

CrCl (ml/min)	Dosage Recommendation
20-49	Initially, 500 mg daily, then 250 mg every 24 hr
10-19	Initially, 500 mg daily, then 250 mg every 48 hr.

Oral**Treatment and postexposure prophylaxis of inhalation anthrax**

Adult: 500 mg once daily for 60 days.

Renal impairment: Haemodialysis/CAPD: Initially, 500 mg daily, then 250 mg every 48 hr.

CrCl (ml/min)	Dosage Recommendation
20-49	Initially, 500 mg daily, then 250 mg every 24 hr.
10-19	Initially, 500 mg daily, then 250 mg every 48 hr.

Intravenous**Acute bacterial sinusitis**

Adult: 500 mg once daily for 10-14 days. Alternatively, 750

Intravenous

Acute bacterial sinusitis

Adult: 500 mg once daily for 10-14 days. Alternatively, 750 mg once daily for 5 days. Infuse slowly over 60-90 min.

Renal impairment: Haemodialysis/CAPD: Initially, 500 mg daily, then 250 mg every 48 hr. Alternatively: Initially, 750 mg daily, then 500 mg every 48 hr. Infuse slowly over 60-90 min.

CrCl (ml/min)	Dosage Recommendation
20-49	Initially, 500 mg daily, then 250 mg every 24 hr. Alternatively: Initially, 750 mg daily, then 750 mg every 48 hr.
10-19	Initially, 500 mg daily, then 250 mg every 48 hr. Alternatively: Initially, 750 mg daily, then 500 mg every 48 hr.

Intravenous

Acute bacterial exacerbation of chronic bronchitis

Adult: 500 mg once daily for 7 days. Infuse slowly over 60 min.

Renal impairment: Haemodialysis/CAPD: Initially, 500 mg daily, then 250 mg every 48 hr. Infuse slowly over 60-90 min.

CrCl (ml/min)	Dosage Recommendation
20-49	Initially, 500 mg daily, then 250 mg every 24 hr.
10-19	Initially, 500 mg daily, then 250 mg every 48 hr.

Intravenous

Community-acquired pneumonia

Adult: 500 mg once for 7-14 days. Alternatively, 750 mg once daily for 5 days. Infuse slowly over 60-90 min.

Renal impairment: Haemodialysis/CAPD: Initially, 500 mg daily, then 250 mg every 48 hr. Alternatively: Initially, 750 mg daily, then 500 mg every 48 hr. Infuse slowly over 60-90 min.

CrCl	Dosage Recommendation
------	-----------------------

daily, then 250 mg every 48 hr. Alternatively: Initially, 750 mg daily, then 500 mg every 48 hr. Infuse slowly over 60-90 min.

CrCl (ml/min)	Dosage Recommendation
20-49	Initially, 500 mg daily, then 250 mg every 24 hr. Alternatively: Initially, 750 mg daily, then 750 mg every 48 hr.
10-19	Initially, 500 mg daily, then 250 mg every 48 hr. Alternatively: Initially, 750 mg daily, then 500 mg every 48 hr.

Intravenous

Nosocomial pneumonia

Adult: 750 mg once daily for 7-14 days. Infuse slowly over 60-90 min.

Renal impairment: Haemodialysis/CAPD: Initially, 750 mg daily, then 500 mg every 48 hr. Infuse slowly over 60-90 min.

CrCl (ml/min)	Dosage Recommendation
20-49	Initially, 750 mg daily, then 750 mg every 48 hr.
10-19	Initially, 750 mg daily, then 500 mg every 48 hr.

Intravenous

Complicated skin and skin structure infections

Adult: 750 mg once daily for 7-14 days. Infuse slowly over 60-90 min.

Renal impairment: Haemodialysis/CAPD: Initially, 750 mg daily, then 500 mg every 48 hr. Infuse slowly over 60-90 min.

CrCl (ml/min)	Dosage Recommendation
20-49	Initially, 750 mg daily, then 750 mg every 48 hr.
10-19	Initially, 750 mg daily, then 500 mg every 48 hr.

Intravenous

Uncomplicated urinary tract infections

Intravenous

Uncomplicated urinary tract infections

Adult: 250 mg once daily for 3 days. Infuse slowly over 60-90 min.

Intravenous

Complicated urinary tract infections

Adult: 250 mg once daily for 10 days. Infuse slowly over 60-90 min.

CrCl (ml/min)	Dosage Recommendation
10-19	Initially 250 mg daily, then 250 mg every 48 hr.

Intravenous

Acute pyelonephritis

Adult: 250 mg once daily for 10 days. Infuse slowly over 60-90 min.

CrCl (ml/min)	Dosage Recommendation
10-19	Initially 250 mg daily, then 250 mg every 48 hr.

Intravenous

Uncomplicated skin and skin structure infections

Adult: 500 mg once daily for 7-10 days. Infuse slowly over 60-90 min.

Renal impairment: Haemodialysis/CAPD: Initially, 500 mg daily, then 250 mg every 48 hr. Infuse slowly over 60-90 min.

CrCl (ml/min)	Dosage Recommendation
20-49	Initially, 500 mg daily, then 250 mg every 24 hr.
10-19	Initially, 500 mg daily, then 250 mg every 48 hr.

Intravenous

Chronic bacterial prostatitis

Intravenous

Chronic bacterial prostatitis

Adult: 500 mg once daily for 28 days. Infuse slowly over 60-90 min.

Renal impairment: Haemodialysis/CAPD: Initially, 500 mg daily, then 250 mg every 48 hr. Infuse slowly over 60-90 min.

CrCl (ml/min)	Dosage Recommendation
20-49	Initially, 500 mg daily, then 250 mg every 24 hr.
10-19	Initially, 500 mg daily, then 250 mg every 48 hr.

Intravenous

Treatment and postexposure prophylaxis of inhalation anthrax

Adult: 500 mg once daily for 60 days. Infuse slowly over 60-90 min.

Renal impairment: Haemodialysis/CAPD: Initially, 500 mg daily, then 250 mg every 48 hr. Infuse slowly over 60-90 min.

CrCl (ml/min)	Dosage Recommendation
20-49	Initially, 500 mg daily, then 250 mg every 24 hr.
10-19	Initially, 500 mg daily, then 250 mg every 48 hr.

Ophthalmic

Ocular infections

Adult: 1-2 drops of 0.5% solution every 2 hr while awake (up to 8 times daily) for 2 days, then 1-2 drops every 4 hr while awake (up to 4 times daily) for the next 5 days.

Child: >1 yr: 1-2 drops of 0.5% solution every 2 hr while awake (up to 8 times daily) for 2 days, then 1-2 drops every 4 hr while awake (up to 4 times daily) for the next 5 days.

	Child: >1 yr: 1-2 drops of 0.5% solution every 2 hr while awake (up to 8 times daily) for 2 days, then 1-2 drops every 4 hr while awake (up to 4 times daily) for the next 5 days.
Administration	Tab: May be taken with or without food. (Ensure adequate fluid intake.) Oral soln: Should be taken on an empty stomach. (Take on an empty stomach 1 hr before or 2 hr after meals. Ensure adequate fluid intake.)
Contraindications	Hypersensitivity to levofloxacin or other quinolones. Child <18 yr.
Special Precautions	Known or suspected CNS disorders (e.g. severe cerebral arteriosclerosis, epilepsy) or other risk factors that predispose to seizures. Avoid unnecessary exposure to sunlight or artificial UV light. History of prolonged QT interval, uncorrected electrolyte disturbances. DM (carefully monitor blood glucose levels). Periodically monitor renal, hepatic and haematopoietic functions during treatment. Pregnancy and lactation. Elderly. May impair ability to drive or operate machinery.
Adverse Drug Reactions	Oral/IV: Nausea, diarrhoea, constipation, headache, insomnia, inj site reactions (IV). Ophthalmic: Transient decrease in vision, ocular burning, ocular pain or discomfort, foreign body sensation, headache, fever, pharyngitis, photophobia. Potentially Fatal: Anaphylaxis.
Drug Interactions	Increased concentration of ciclosporin or tacrolimus. Reduced absorption with didanosine, ferrous sulfate or dietary supplements containing zinc, calcium, magnesium or iron. May increase plasma levels of theophylline. Increased risk of tendon rupture with corticosteroids. Reduced absorption with sucralfate and antacids containing magnesium and aluminium; administer at least 2 hr before or

	or iron. May increase plasma levels of theophylline. Increased risk of tendon rupture with corticosteroids. Reduced absorption with sucralfate and antacids containing magnesium and aluminium; administer at least 2 hr before or 2 hr after antacids. Increased half-life and decreased clearance of procainamide. Altered glucose levels with antidiabetic agents (e.g. insulin, glyburide). Potentially Fatal: Increased risks of ventricular arrhythmias with QT prolonging drugs e.g. class IA (quinidine, procainamide) or class III (amiodarone, sotalol) antiarrhythmics, fluoxetine, imipramine. Increased risk of CNS stimulation and seizures with NSAIDs. Increased prothrombin time with warfarin.
Lab Interference	False-positive tests for opiates.
Pregnancy Category (US FDA)	Contraindicated esp in 1st trimester. Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store below 25°C (77°F). Ophthalmic: Store at 15-25°C (59-77°F). Oral: Tablet: Store at 15-30°C (59-86°F). Oral solution: Store at 25°C (77°F).
Mechanism of Action	Levofloxacin exerts antibacterial action by inhibiting bacterial topoisomerase IV and DNA gyrase, the enzymes required for DNA replication, transcription repair and recombination. It has in vitro activity against a wide range of gram-negative and gram-positive microorganisms. Absorption: Rapid and complete absorption from the GIT (oral); peak plasma concentrations within 1-2 hr. Distribution: Widely distributed in bronchial mucosa, lungs; CSF (relatively poor). Protein-binding: 30-40%.

	(oral); peak plasma concentrations within 1-2 hr. Distribution: Widely distributed in bronchial mucosa, lungs; CSF (relatively poor). Protein-binding: 30-40%. Metabolism: Limited. Excretion: Mainly via urine (largely as unchanged drug); 6-8 hr (elimination half-life).
CIMS Class	Quinolones / Eye Anti-infectives & Antiseptics
ATC Classification	J01MA12 - levofloxacin; Belongs to the class of quinolones, fluoroquinolone. Used in the treatment of systemic infections. S01AX19 - levofloxacin; Belongs to the class of other anti-infectives. Used in the treatment of eye infections.

levonorgestrel

CIMS Class : (Oral Contraceptives) , (Oestrogens & Progesterones & Related Synthetic Drugs) , (Depot Contraceptives) , (Other Contraceptives)
levonorgestrel

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab - Lab interference

related levonorgestrel information

Indication & Dosage	<i>Oral</i>
	Contraception
	Adult: Monotherapy: 30 or 37.5 mcg daily. Monophasic combined oral contraceptive (COC): 150-250 mcg daily. Triphasic COC: 50-125 mcg daily.
	<i>Oral</i>
	Emergency contraception
	Adult: 1.5 mg as soon as possible or within 72 hr of coitus. Alternatively, 750 mcg as soon as possible or within 72 hr of coitus followed by a 2nd dose 12 hr later. Another regimen combines levonorgestrel 500 mcg and ethinylestradiol 100 mcg; may be given within 72 hr of coitus followed by a 2nd dose 12 hr later.
	<i>Oral</i>
	Menopausal hormone replacement therapy
	Adult: As progestogenic component: 75-250 mcg for 10-12 days of a 28-day cycle.

	Menopausal hormone replacement therapy Adult: As progestogenic component: 75-250 mcg for 10-12 days of a 28-day cycle. <i>Subcutaneous</i> Contraception Adult: Insert 6 implants (36 mg/implant) under the skin within the first 7 days of the menstrual cycle and replace at intervals of up to 5 yr. <i>Intrauterine</i> Contraception Adult: 52 mg released at an initial rate of 20 mcg/day. System is effective for up to 5 yr. <i>Intrauterine</i> Menorrhagia Adult: 52 mg released at an initial rate of 20 mcg/day. System is effective for up to 5 yr. <i>Transdermal</i> Menopausal hormone replacement therapy Adult: As combined transdermal patch (releases 10 mcg/24 hr with an oestrogen): Apply once wkly for 2 wk of a 4-wk cycle. Alternatively, a patch releasing 7 or 15 mcg/24 hr with an oestrogen is applied once wkly for continuous HRT.
Administration	May be taken with or without food.
Contraindications	Pregnancy, undiagnosed vaginal bleeding, severe arterial disease; liver adenoma, porphyria; after recent evacuation of hydatidiform mole; history of breast cancer; hepatic impairment.
Special Precautions	Sex-steroid dependent cancer, past ectopic pregnancy, malabsorption syndromes, functional ovarian cysts, active liver disease, recurrent cholestatic jaundice, history of jaundice in pregnancy, CV or renal impairment, DM, asthma, epilepsy, migraine, conditions aggravated by fluid retention,

	liver disease, recurrent cholestatic jaundice, history of jaundice in pregnancy, CV or renal impairment, DM, asthma, epilepsy, migraine, conditions aggravated by fluid retention, depression and thromboembolism (high doses); lactation.
Adverse Drug Reactions	Menstrual irregularities; nausea, vomiting, headache, dizziness, breast discomfort, gynaecomastia, depression, skin disorders, disturbance of appetite, wt changes, fluid retention, oedema, changes in libido, cholestatic jaundice, hair loss or hirsutism. Benign intracranial hypertension, thrombocytopenic purpura. Potentially Fatal: Thrombocytopenia, stroke.
Drug Interactions	Reduced efficacy with enzyme-inducing drugs; aminoglutethimide. May inhibit ciclosporin metabolism.
Lab Interference	May interfere with laboratory tests e.g. liver, renal, thyroid and adrenal function tests, plasma levels of binding proteins and lipid/lipoprotein fractions, and fibrinolysis and coagulation parameters.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Intrauterine: Store at 25°C (77°F).
Mechanism of Action	Levonorgestrel, a nortestosterone derivative, is an active isomer of norgestrel. It is a potent inhibitor of ovulation and has androgenic activity. Absorption: Rapid and almost complete from the GI tract (oral). Distribution: Protein-binding: 42-68% (sex binding globulin), 30-56% (albumin). Distributed into breast milk.

	Absorption: Rapid and almost complete from the GI tract (oral). Distribution: Protein-binding: 42-68% (sex binding globulin), 30-56% (albumin). Distributed into breast milk. Metabolism: Hepatic; converted to sulfate and glucuronide conjugates. Excretion: Via urine and via faeces (lesser extent).
CIMS Class	Oral Contraceptives / Oestrogens & Progesterones & Related Synthetic Drugs / Depot Contraceptives / Other Contraceptives
ATC Classification	G03AC03 - levonorgestrel; Belongs to the class of progestogens. Used as systemic contraceptives.

levonorgestrel + ethinylestradiol

CIMS Class : (Oral Contraceptives)
levonorgestrel + ethinylestradiol

P - Contraindicated in pregnancy
L - Caution when used during lactation
Lab ⚠ - Lab interference
Food ⚠ - Food interaction

related levonorgestrel + ethinylestradiol information

Indication & Dosage

Oral

Contraception

Adult: Monophasic combined oral contraceptive (COC): levonorgestrel 15 mcg + ethinylestradiol 30 mcg once daily. Triphasic COC: levonorgestrel 5 mcg + ethinylestradiol 30-40 mcg once daily.

Renal impairment: Use with caution and monitor BP.

Hepatic impairment: Contraindicated.

Overdosage

Symptoms: nausea and vomiting, withdrawal bleeding may occur in females.
Treatment: symptom specific and supportive; emesis and charcoal administration may be used.

Contraindications

Pregnancy, undiagnosed vaginal bleeding, severe arterial disease (or family history of atherogenic lipid profile); liver adenoma; porphyria; after evacuation of hydatidiform mole; history of breast cancer; hepatic impairment; thrombotic or thromboembolic disorders; breast carcinoma except in selected patients treated for metastatic disease; oestrogen-dependent tumour; smoking ≥ 4 cigarettes daily; >50 yr; diabetes complications present; BMI >39 kg/m²; recent severe migraine with typical focal aura, lasting >72 hr despite treatment or migraine treated with triptans.

	or thromboembolic disorders; breast carcinoma except in selected patients treated for metastatic disease; oestrogen-dependent tumour; smoking ≥ 4 cigarettes daily; >50 yr; diabetes complications present; BMI >39 kg/m²; risk with typical focal aura, lasting >72 hr despite treatment or migraine treated with ergot derivatives; BP >160 mmHg systolic and 100 mmHg diastolic; transient ischaemic attacks without headaches; SLE; gallstones; history of haemolytic uraemic syndrome, pruritis during pregnancy; cholestatic jaundice; chorea; deterioration of otosclerosis pemphigoid; breast feeding during 1st 6 months of delivery.
Special Precautions	Sex-steroid dependent cancer; past ectopic pregnancy; malabsorption syndrome; functional ovarian cysts; active liver disease, recurrent cholestatic jaundice; history of jaundice in pregnancy; history of CV or renal impairment; DM; asthma; migraine; depression; lactation; conditions exacerbated by fluid retention; hypercalcaemia; CV and gall bladder diseases; lipid effects; familial defective lipoprotein metabolism; patients at risk of venous thromboembolism, breast cancer, preexisting uterine leiomyomata and benign hepatic adenoma; family history of arterial disease in 1st degree relative <45 yr; BP $>$ systolic 140 mmHg and diastolic 90 mmHg; >35 yr; BMI 30-39 kg/m²; migraine without focal aura controlled with 5HT₁; GI upset (vomiting and diarrhoea), missed pills and interaction with other drugs may require additional contraceptive precautions. Should be taken at same time each day.
Adverse Drug Reactions	Menstrual irregularities; headache, dizziness; breast discomfort; gynaecological depression; disturbance of appetite; wt changes; fluid retention; oedema; decrease in libido; hair loss or hirsutism; GI disturbances (nausea and vomiting); genitourinary changes; haematologic disorders; endocrine and metabolic disorders; cholestatic jaundice; local skin reactions; chorea; contact lens intolerance; steeping of corneal curvature; pulmonary thromboembolism; carbohydrate and/or glucose intolerance; depression; chloasma; BP increase; impairment; reduced menstrual loss, 'spotting' in early cycles, absence of withdrawal bleeding; rarely photosensitivity; increased risk in breast cancer; elevation of plasma bound iodine, cortisol and thyroid binding, erythrocyte sedimentation may be accelerated; increases in plasma copper, iron and alkaline phosphatase; may affect serum triglyceride and lipoprotein levels; retinal

	with uterine bleeding, rarely photosensitivity, increased risk in breast cancer, elevation of plasma bound iodine, cortisol and thyroid binding, erythrocyte sedimentation may be accelerated; increases in plasma copper, iron and phosphatase; may affect serum triglyceride and lipoprotein levels; retinal thrombosis. Potentially Fatal: Hepatic tumours; increased risk of thromboembolism.
Drug Interactions	CYP3A4 inducers may decrease levels/effects eg aminoglutethimide, carbamazepine, nafcillin, nevirapine, atazanavir, phenobarbital, phenytoin, lamotrigine, rifamycins, griseofulvin and ritonavir; ampicillin, tetracycline and other antibiotics may reduce efficacy; oestrogens may antagonise anticoagulant effect of coumarins; may inhibit metabolism of prednisolone and ciclosporin; may reduce clearance of alprazolam, chlordiazepoxide, diazepam; may increase clearance of lorazepam, oxazepam, temazepam.
Food Interaction	St John's Wort (<i>Hypericum perforatum</i>) may reduce levels and effect; avoid alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, yucca may have oestrogenic properties and in the adverse and toxic effects; bloodroot, chasteberry, damiana, oregano, may have progestogenic properties and may increase the adverse and toxic effects of oral contraceptives may reduce metabolism and levels of cyanocobalamin; increased dietary intake or supplementation may be necessary; grapefruit antagonises metabolism.
Lab Interference	Estradiol has reduced response to metyrapone test.
Mechanism of Action	Combination of hormonal contraceptives inhibits ovulation by modulating secretion of gonadotrophins, luteinising hormone and follicle stimulating hormone through a negative feedback system. They reduce sperm penetration if ovulation does occur by altering the cervical mucus; cause changes in the endometrium which reduce the risk of nidation and may change the tubal transport of the egg through the fallopian tubes. Absorption: Absorbed by GI tract. Bioavailability: ethinyl estradiol: 38-48%; levonorgestrel: 100%. Distribution: Distribution: Ethinyl estradiol: 4.3 L/kg; Levonorgestrel: 1.8 L/kg

	Absorption: Absorbed by GI tract. Bioavailability: ethinyl estradiol: 38-48% levonorgestrel: 100%. Distribution: Distribution: Ethinyl estradiol: 4.3 L/kg; Levonorgestrel: 1.8 L/kg Protein binding: Ethinyl estradiol: 95-97%; Levonorgestrel: 97-99% bind to sex hormone-binding globulin and albumin. Metabolism: Slowly metabolised. Estradiol: hepatic via oxidation and conjugation in GI tract; hydroxylated via CYP3A4 to metabolites; first-pass effect; enterohepatic recirculation; reversibly converted to estrone and estriol. Levonorgestrel: hepatic involving CYP3A4; undergoes reduction and conjugation followed by hydrolysis to form metabolites. Excretion: Half life elimination: estradiol: 12-23 hr; levonorgestrel: 22-49 hr Excretion: levonorgestrel: urine (40-68% parent drug and metabolites) and faeces (16-48% as metabolites); estradiol: through urine as metabolites estrone and estriol, also through faeces in small quantities as glucuronide and sulphate conjugates.
CIMS Class	Oral Contraceptives
ATC Classification	G03AC03 - levonorgestrel; Belongs to the class of progestogens. Used as systemic contraceptives.

levosulpiride

CIMS Class : (GIT Regulators, Antiflatulents & Anti-inflammatories)
levosulpiride

P - Caution when used during pregnancy

L - Caution when used during lactation

related levosulpiride information

Indication & Dosage	<i>Oral</i> Gastro-oesophageal reflux disease, Irritable bowel syndrome, Dyspepsia Adult: 25 mg tid. Elderly: Dose reductions may be necessary.
Contraindications	Phaeochromocytoma, epilepsy, manic states, hyperprolactinaemia, mammary dysplasia, malignant mastopathies, cardiac impairment. GI bleeding, mechanical obstruction or perforation.
Special Precautions	May impair ability to drive or operate machinery. Pregnancy and lactation.
Adverse Drug Reactions	Amenorrhoea, gynaecomastia, galactorrhoea, changes in libido. Potentially Fatal: Neuroleptic malignant syndrome.
Drug Interactions	Reduced bioavailability with sucralfate, aluminium- and magnesium-containing antacids. Effect on GI motility may be antagonised by anticholinergic agents, narcotics and analgesics. Avoid alcohol.

	magnesium-containing antacids. Effect on GI motility may be antagonised by anticholinergic agents, narcotics and analgesics. Avoid alcohol.
Storage	Oral: Store at 15-30°C (59-86°F).
Mechanism of Action	Levosulpiride is a substituted benzamide, which exerts antidopaminergic (selective dopamine D₂ receptors) activity on both central and peripheral levels. It is an atypical neuroleptic and a prokinetic agent. Absorption: Oral bioavailability is about 30%; peak plasma concentrations after about 3 hr. Excretion: Mainly via urine. Plasma half-life: 9.7 hr (oral); 4.3 hr (IV).
CIMS Class	GIT Regulators, Antiflatulents & Anti-inflammatories
ATC Classification	N05AL07 - levosulpiride; Belongs to the class of benzamides antipsychotics. Used in the management of psychosis.

levothyroxine sodium

CIMS Class : (Thyroid Hormones)
levothyroxine sodium

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related levothyroxine sodium information

Indication & Dosage

Oral

Replacement therapy in hypothyroidism

Adult: Initially, 50-100 mcg daily, may increase by 25-50 mcg at 4-wkly intervals until the thyroid deficiency is corrected. Usual maintenance dose: 100-200 mcg daily. Patient should be evaluated every 6-8 wk to monitor response. Initiate with lower doses at 25-50 mg daily in patients >50 yr or patients <60 yr with underlying CV disease. Lower initial doses may be considered in patients with subclinical hypothyroidism if treatment is considered necessary.

Child: Neonates: Initially, 10-15 mcg/kg/day. Neonates at risk for cardiac failure: Consider lower doses of 25 mcg/day. Neonates with thyroxine levels <5 mcg/dl: Initially, 50 mcg/day. Adjust dose every 4-6 wk. Infants and children: Dose based on body wt and age: 0-3 mth: 10-15 mcg/kg/day; 3-6 mth: 8-10 mcg/kg/day; 6-12 mth: 6-8 mcg/kg/day; 1-5 yr: 5-6 mcg/kg/day; 6-12 yr: 4-5 mcg/kg/day; >12 yr: 2-3 mcg/kg/day. Older children: To minimise hyperactivity, initially $\frac{1}{4}$ of the recommended dose and increase by $\frac{1}{4}$ dose each wk until full

mcg/kg/day; 1-5 yr: 5-6 mcg/kg/day; 6-12 yr: 4-5 mcg/kg/day; >12 yr: 2-3 mcg/kg/day. Older children: To minimise hyperactivity, initially $\frac{1}{4}$ of the recommended dose and increase by $\frac{1}{4}$ dose each wk until full replacement dose is reached. Children who have completed growth and puberty: Initially, 1.7 mcg/kg/day as a single dose. Titrate dose every 6 wk. Average initial dose: About 100 mcg; usual dose: =200 mcg/day; dose =300 mcg/day is rare and reevaluation should be prompted.

Elderly: >50 yr without cardiac disease or <50 yr with cardiac disease: Initially, 25-50 mcg/day. Adjust dose every 6-8 wk as needed. >50 yr with cardiac disease: Initially, 12.5-25 mcg/day. Adjust dose by 12.5-25 mcg increments every 4-6 wk. Elderly patients may require <1 mcg/kg/day.

Oral

Severe and chronic hypothyroidism

Adult: Initially, 12.5-50 mcg/day. Adjust dose in steps of 12.5-25 mcg at 4-wkly intervals.

Child: Initially, 25 mcg/day. Adjust dose by 25 mcg every 2-4 wk.

Oral

TSH suppression

Adult: For thyrotropin-dependent well-differentiated thyroid cancer: Doses >2 mcg/kg/day may be given as a single dose to suppress TSH to <0.1 mIU/L. For benign nodules and nontoxic multinodular goitre: Target TSH is generally higher at 0.1-0.5 mIU/L for nodules and 0.5-1.0 mIU/L for multinodular goitre.

Intravenous

Myxoedema coma

Adult: Initially, 200-500 mcg, followed by 100-300 mcg on the 2nd day if necessary, then 100-200 mcg daily until euthyroid state is achieved or the patient can tolerate oral admin. Patient with cardiac disease: Consider lower dose.

Elderly: Lower doses may be needed.

	achieved or the patient can tolerate oral admin. Patient with cardiac disease: Consider lower dose. Elderly: Lower doses may be needed.
Overdosage	Chronic: Symptoms include hyperthyroidism, wt loss, nervousness, sweating, tachycardia, palpitations, insomnia, heat intolerance, menstrual irregularities, psychotic symptoms, fever, premature closure of epiphyses in infants. Reduce dose or withdraw therapy temporarily; general supportive care is advised. Acute: Symptoms include fever, hypoglycaemia, CHF, undiagnosed adrenal failure. Management is symptomatic and supportive; β-blockers (for massive overdose).
Contraindications	Untreated hyperthyroidism; uncorrected adrenal failure; recent MI.
Special Precautions	Angina, heart failure; DM; diabetes insipidus; elderly; long-standing hypothyroidism; adrenal insufficiency; myxoedema. Do not use for treatment of obesity or for wt loss. Pregnancy, lactation.
Adverse Drug Reactions	Nervousness, excitability, tremor, muscle weakness, cramps; sweating, flushing, heat intolerance, headache, insomnia, tachycardia, palpitations, angina pectoris, excessive wt loss; menstrual irregularities; diarrhoea, vomiting. Potentially Fatal: Convulsions, cardiac arrhythmia, heart failure, coma.
Drug Interactions	Reduced absorption with iron, colestyramine, colestipol, aluminium- and magnesium-containing antacids, calcium carbonate, simethicone, sucralfate. May alter requirements of antidiabetic drugs. Reduced efficacy of thyroid replacement therapy with imatinib. Reduced tri-iodothyronine serum levels with amiodarone. Reduced serum levels of thyroxine with carbamazepine, phenytoin, phenobarbital, rifampicin, oestrogens. Potentially Fatal: Increased therapeutic and toxic effects of levothyroxine and TCAs. May change hypoprothrombinaemic response to warfarin and other oral anticoagulants (markedly increased response during replacement). Increased risk of significant hypertension and tachycardia with ketamine.

	response to warfarin and other oral anticoagulants (markedly increased response during replacement). Increased risk of significant hypertension and tachycardia with ketamine.
Food Interaction	Decreased bioavailability and lower serum levels of thyroxine with enteral nutrition. Reduced absorption with soybean infant formula, cottonseed meal, walnuts and dietary fibre.
Lab Interference	May alter thyroid function tests.
Pregnancy Category (US FDA)	Category A: Controlled studies in women fail to demonstrate a risk to the foetus in the 1 st trimester (and there is no evidence of a risk in later trimesters), and the possibility of foetal harm remains remote.
Storage	Intravenous: Store at 15-30°C (59-86°F). Oral: Store at 15-30°C (59-86°F).
Mechanism of Action	Levothyroxine sodium increases the basal metabolic rate (BMR) of carbohydrates, fats and proteins. It is also involved in the regulation and differentiation of cell growth. These effects are mediated at the cellular level by the thyroxine metabolite, tri-iodothyronine. Onset: Oral: 3-5 days; IV: 6-8 hr. Absorption: Variable but adequate from the GI tract (oral); increased in fasting state. Distribution: Crosses the placenta; enters breast milk. Protein-binding: Extensive to thyroxine-binding globulin. Metabolism: Hepatic and renal; converted to liothyronine and inactive reverse triiodothyronine; undergoes enterohepatic recirculation. Excretion: Via faeces. Half-life: 6-7 days (euthyroid); prolonged in hypothyroidism and reduced in hyperthyroidism.
CIMS Class	Thyroid Hormones
ATC Classification	H03AA01 - levothyroxine sodium; Belongs to the class of thyroid hormones. Used in the management of thyroid diseases.

lidocaine

CIMS Class : (Anaesthetics - Local & General) , (Cardiac Drugs)
lidocaine

P - Caution when used during pregnancy

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related lidocaine information

Indication & Dosage

Intravenous

Pulseless ventricular fibrillation or ventricular tachycardia

Adult: As hydrochloride: 1-1.5 mg/kg repeated as necessary. Max total: 3 mg/kg. For ventricular arrhythmias in more stable patients: Usual loading dose: 50-100 mg as an IV inj at 25-50 mg/minute, may repeat once or twice up to a max of 200-300 mg in 1 hr, followed by 1-4 mg/minute via continuous IV infusion. May need to reduce dose if the infusion is longer than 24 hr.

Hepatic impairment: Reduce dose by 50% in acute hepatitis and decompensated cirrhosis.

Parenteral

Sympathetic nerve block

Adult: As hydrochloride: 50 mg (5 ml) of a 1% solution for cervical block or 50-100 mg (5-10 ml) of a 1% solution for lumbar block.

Hepatic impairment: Reduce dose by 50% in acute

cervical block or 50-100 mg (5-10 ml) of a 1% solution for lumbar block.

Hepatic impairment: Reduce dose by 50% in acute hepatitis and decompensated cirrhosis.

Epidural

Epidural anaesthesia

Adult: As hydrochloride: 2-3 ml solution administered for each dermatome to be anaesthetized. Recommended doses are: lumbar epidural 250-300 mg (25-30 ml of a 1% solution) for analgesia and 225-300 mg (15-20 ml of a 1.5% solution) or 200-300 mg (10-15 ml of a 2% solution) for anaesthesia; for thoracic epidural: 200-300 mg of a 1% solution. For obstetric caudal analgesia, up to 300 mg (30 ml of a 0.5% or 1% solution); for surgical caudal analgesia: 225-300 mg (15-20 ml of a 1.5% solution). For continuous epidural anaesthesia, not to repeat max doses more frequently than 1.5 hrly.

Hepatic impairment: Reduce dose by 50% in acute hepatitis and decompensated cirrhosis.

Intraspinal

Spinal anaesthesia

Adult: As hyperbaric solution of 1.5% or 5% lidocaine in 7.5% glucose solution. Normal vaginal delivery: 50 mg (1 ml) of a 5% solution or 9-15 mg (0.6-1 ml) of a 1.5% solution. Caesarian operation: Up to 75 mg (1.5 ml) of a 5% solution. Other surgical procedures: 75-100 mg (1.5-2 ml).

Hepatic impairment: Reduce dose by 50% in acute hepatitis and decompensated cirrhosis.

Intravenous

Intravenous regional anaesthesia

Adult: 50-300 mg (10-60 ml) of a 0.5% solution without adrenaline; max dose: 4 mg/kg.

Intravenous regional anaesthesia

Adult: 50-300 mg (10-60 ml) of a 0.5% solution

without adrenaline; max dose: 4 mg/kg.

Hepatic impairment: Reduce dose by 50% in acute hepatitis and decompensated cirrhosis.

Urethral

Surface anaesthesia

Adult: As 2% gel: Female: 60-100 mg inserted into the urethra several minutes before examination. Male: 100-200 mg before catheterisation and 600 mg before sounding or cystoscopy.

Hepatic impairment: Reduce dose by 50% in acute hepatitis and decompensated cirrhosis.

Intramuscular

Emergency treatment of ventricular arrhythmias

Adult: As hydrochloride: 300 mg injected into the deltoid muscle, repeat after 60-90 minutes if necessary.

Hepatic impairment: Reduce dose by 50% in acute hepatitis and decompensated cirrhosis.

Parenteral

Percutaneous infiltration anaesthesia

Adult: As hydrochloride: 5-300 mg (1-60 ml of a 0.5% solution or 0.5-30 ml of a 1% solution).

Hepatic impairment: Reduce dose by 50% in acute hepatitis and decompensated cirrhosis.

Parenteral

Peripheral nerve block

Adult: As hydrochloride: For brachial plexus block: 225-300 mg (15-20 ml) of a 1.5% solution; for intercostal nerve block: 30 mg (3 ml) of a 1% solution; for paracervical block: 100 mg (10 ml) of a 1% solution on each side, repeated not more frequently than every 90 minutes; for paravertebral block: 30-50 mg (3-5 ml) of a 1% solution; for pudendal block: 100

30-50 mg (3-5 ml) of a 1% solution; for paravertebral block: 10-20 mg (1-2 ml) of a 1% solution on each side, repeated not more frequently than every 90 minutes; for paravertebral block: 30-50 mg (3-5 ml) of a 1% solution; for pudendal block: 100 mg (10 ml) as a 1% solution on each side; for retrobulbar block: 120-200 mg (3-5 ml) of a 4% solution.

Hepatic impairment: Reduce dose by 50% in acute hepatitis and decompensated cirrhosis.

Injection

Pupil dilatation during phacoemulsification cataract surgery

Adult: As a 1% ophthalmic preservative-free solution (often used in combination with phenylephrine and cyclopentolate). To be injected into the anterior chamber of the eye at the beginning of the procedure.

Mouth/Throat

Surface anaesthesia

Adult: For pain: 300 mg (15 ml) of 2% solution rinsed and ejected for mouth and throat pain; or gargled and swallowed if necessary for pharyngeal pain. Not to be used more frequently than every 3 hr. Max (topical oral solution): 2.4 g/day. Before bronchoscopy, bronchography, laryngoscopy, oesophagoscopy, endotracheal intubation, and biopsy in the mouth and throat: 40-300 mg (1-7.5 ml) of 4% solution. For dentistry and otorhinolaryngology procedures: 10-50 mg of 10% solution sprayed to mucous membrane. For laryngotracheal anaesthesia: 160 mg of 4% solution sprayed or instilled as a single dose into the lumen of the larynx and trachea.

Hepatic impairment: Reduce dose by 50% in acute hepatitis and decompensated cirrhosis.

Ophthalmic

Surface anaesthesia

hepatitis and decompensated cirrhosis.

Ophthalmic

Surface anaesthesia

Adult: As hydrochloride 4 % with fluorescein: 1 or more drops as required.

Child: As hydrochloride 4 % with fluorescein : As directed by physician.

Topical/Cutaneous

Surface anaesthesia

Adult: As eutectic mixture containing lidocaine base 2.5% and prilocaine base 2.5%: Apply cream to skin under an occlusive dressing before procedure. Use without an occlusive dressing for genital warts.

Hepatic impairment: Reduce dose by 50% in acute hepatitis and decompensated cirrhosis.

Rectal

Haemorrhoids

Adult: Apply topically to clean, dry area or using applicator, insert rectally, up to 6 times/day.

Child: =12 yr: Apply topically to clean, dry area or using applicator, insert rectally, up to 6 times/day.

Hepatic impairment: Reduce dose by 50% in acute hepatitis and decompensated cirrhosis.

Rectal

Perianal pain and itching

Adult: Apply topically to clean, dry area or using applicator, insert rectally, up to 6 times/day.

Child: =12 yr: Apply topically to clean, dry area or using applicator, insert rectally, up to 6 times/day.

Hepatic impairment: Reduce dose by 50% in acute hepatitis and decompensated cirrhosis.

Reconstitution: Standard diluent: 2 g/250 ml dextrose 5%.

	Hepatic Impairment: Reduces dose by 50% in acute hepatitis and decompensated cirrhosis. Reconstitution: Standard diluent: 2 g/250 ml dextrose 5%. Incompatibility: Y-site incompatibility: Amphotericin B cholesteryl sulfate complex, thiopental. Syringe incompatibility: Cefazolin. Admixture incompatibility: Phenytoin, amphotericin B, dacarbazine, methohexital.
Overdosage	Severe hypotension, asystole, bradycardia, apnoea, seizures, coma, cardiac arrest, respiratory arrest, and death.
Contraindications	Hypovolaemia; heart block or other conduction disturbances.
Special Precautions	Hepatic or renal impairment; CHF and following cardiac surgery; bradycardia; respiratory depression; porphyria; elderly or debilitated patients; pregnancy.
Adverse Drug Reactions	Dizziness, paraesthesia, drowsiness, confusion, respiratory depression and convulsions. Potentially Fatal: Hypotension and bradycardia leading to cardiac arrest; anaphylaxis.
Drug Interactions	Additive cardiac effects with IV phenytoin. Effects antagonized by hypokalaemia caused by acetazolamide, loop diuretics and thiazides. Dose requirements may be increased with long-term use of phenytoin and other enzyme-inducers. Potentially Fatal: Cimetidine and propranolol increase plasma concentration and toxicity. Increased risk of myocardial depression with beta blockers and other antiarrhythmics.
Food Interaction	Decreased levels with St John's wort.
Lab Interference	IM admin of lidocaine increases creatine phosphokinase levels interfering with diagnosis of MI.
Pregnancy Category (US)	

Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). As LA & cardiac drug. Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Epidural: Stable at room temperature. Intramuscular: Stable at room temperature. Intraspinal: Stable at room temperature. Intravenous: Stable at room temperature. Mouth/Throat: Stable at room temperature. Ophthalmic: Store at 15-25°C. Protect from light. Discard after use. Parenteral: Stable at room temperature. Rectal: Stable at room temperature. Topical/Cutaneous: Stable at room temperature. Urethral: Stable at room temperature.
Mechanism of Action	Lidocaine is an amide type local anaesthetic. It stabilises the neuronal membrane and inhibits sodium ion movements, which are necessary for conduction of impulses. In the heart, lidocaine reduces phase 4 depolarisation and automaticity.

neuronal membrane and inhibits sodium ion movements, which are necessary for conduction of impulses. In the heart, lidocaine reduces phase 4 depolarisation and automaticity. Duration of action potential and effective refractory period are also reduced.

Onset: 45-90 sec.

Duration: 10-20 min.

Absorption: Readily absorbed from the GI tract, mucous membranes, damaged skin, inj sites, including muscle; poor through intact skin.

Distribution: Crosses the placenta, blood-brain barrier and enters breast milk. Protein-binding: 66% (α 1-acid glycoprotein).

Metabolism: 90% hepatic; converted to monoethylglycinexylidide and glycinexylidide. First-pass metabolism is extensive, bioavailability after oral dose is approx 35%.

Excretion: Via urine (<10% unchanged). Elimination half-life: biphasic; initial: 7-30 min; terminal: 1.5-2 hr (adults), 3.2 hr (infants, premature infants).

CIMS Class	Anaesthetics - Local & General / Cardiac Drugs
ATC Classification	C01BB01 - lidocaine; Belongs to class Ib antiarrhythmics used in the treatment of arrhythmia. C05AD01 - lidocaine; Belongs to the class of products containing local anesthetics. Used in the treatment of hemorrhoids. D04AB01 - lidocaine; Belongs to the class of topical anesthetics used in the treatment of pruritus. N01BB02 - lidocaine; Belongs to the class of amides. Used as local anesthetics. R02AD02 - lidocaine; Belongs to the class of local anesthetics used in throat preparations.

as local anesthetics.

R02AD02 - lidocaine; Belongs to the class of local anesthetics used in throat preparations.

S01HA07 - lidocaine; Belongs to the class of other agents used as local ophthalmologic anesthetics.

S02DA01 - lidocaine; Belongs to the class of analgesic and anesthetic agents used as otologicals.

lidocaine + epinephrine

CIMS Class : (Anaesthetics - Local & General)
lidocaine + epinephrine

P - Caution when used during pregnancy

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related lidocaine + epinephrine information

related lidocaine + epinephrine information	
Indication & Dosage	<i>Injection</i> Local or regional anaesthesia, nerve blocks, epidural and caudal anaesthesia Adult: Per ml prep contains lidocaine HCl 20 mg and epinephrine 5 mcg. Dosage depends on several factors such as route, type and extent of surgical procedure, duration of anaesthesia and patient's condition and age. Max dose of lidocaine given with epinephrine: 7 mg/kg and not >500 mg. Child: 3 mth-12 yr: Per ml prep contains lidocaine HCl 20 mg and epinephrine 5 mcg. Dosage depends on several factors such as route, type and extent of surgical procedure, duration of anaesthesia and patient's condition and age. Max dose 3 mg/kg. Ideal body weight should be used in children with high body weight. Reconstitution: Can be diluted if necessary in glucose 5%, sodium chloride 0.9% and lactated Ringer's solution. Incompatibility: Y-site administration: ampicillin, thiopental,

	Reconstitution: Can be diluted if necessary in glucose 5%, sodium chloride 0.9% and lactated Ringer's solution. Incompatibility: Y-site administration: ampicillin, thiopental, amphotericin B cholesteryl sulphate complex; in syringe: cefazolin, sodium bicarbonate; when admixed: aminophylline, hyaluronidase, mephentemine, amphotericin B, decarbazine, methohexital and thiopental.
Overdosage	Lidocaine has a narrow therapeutic index. Symptoms: dizziness, paresthesia, sedation, confusion, coma, seizures, ataxia; respiratory arrest, pulmonary oedema; arrhythmias, cardiac toxicity (sinus arrest, AV block, asystole, and hypotension); QRS and QT intervals are usually normal, although they may be prolonged after massive overdose; renal failure; metabolic acidosis and hypertension which may result in subarachnoid haemorrhage and hemiplegia. Treatment: supportive and symptom specific. Lidocaine not removed by haemofiltration.
Contraindications	Tachycardia, hypertension, cerebral arteriosclerosis, ischaemic heart disease, IV admin, anaesthetise digits or appendages, myasthenia gravis.
Special Precautions	Epilepsy, impaired cardiac conduction, CHF, DM, closed angle glaucoma, impaired liver function (if site of admin is likely to result in high blood levels), severe renal dysfunction. Local anaesthetic effect may be reduced if injected into an inflamed or infected area. Cerebrovascular insufficiency, hyperthyroidism. Neonates, elderly, patients in poor general condition (optimise patient's condition before major block), pregnancy.
Adverse Drug Reactions	Severity of adverse effects in CNS and CVS are directly related to blood levels of lidocaine; the effects are more likely to occur after systemic administration rather than infiltration;

	Severity of adverse effects in CNS and CVS are directly related to blood levels of lidocaine; the effects are more likely to occur after systemic administration rather than infiltration; dizziness; muscle twitching; local anaesthetic of mouth/throat impairs swallowing and increases the risk of aspiration (patients cautioned against eating or drinking for 3-4 hr after anaesthesia); transient effect on auditory system of neonate; erythema; pigmentation; pain; headache; palpitations; local necrosis; pulmonary oedema; hyperglycaemia; bradycardia; reduced cardiac output; anxiety. Epidural may cause hypotension, bradycardia, nausea and vomiting. Intraoral inj may cause stress reactions such as diaphoresis, palpitation, hyperventilation, generalised pallor and faintness. Topically: papules, burns, rash, skin irritation, burning sensation and blanching. Potentially Fatal: Severity of adverse effects in CNS and CVS related to blood levels of lidocaine; effects more likely to occur after systemic administration rather than infiltration. CNS toxicity (due to inadvertent IV admin), medullary depression with tonic & clonic convulsions; ventricular fibrillation; severe hypertension with cerebral haemorrhage and pulmonary oedema; unconsciousness; possibly respiratory arrest. Allergic reactions including anaphylactic symptoms and possibly life threatening asthmatic episodes in susceptible patients may occur due to sodium metabisulphate constituent. Central nerve blocks may cause CV depression (especially in hypovolaemia). Retrobulbar inj may reach subarachnoid space causing CV collapse, apnoea, convulsions, temporary blindness. Paracervical block may cause foetal bradycardia/tachycardia (careful monitoring of foetal heart rate is necessary).
Drug Interactions	Significance of interaction depends on route of delivery and systemic exposure; lidocaine prolongs duration of action of

	Significance of interaction depends on route of delivery and systemic exposure; lidocaine prolongs duration of action of suxamethonium; benzodiazepines & barbiturates raise the convulsive threshold to lidocaine; vasopressors potentiate pressor effects of adrenaline; BP may increase with non-selective β-blockers, TCAs, halogenated inhalational anaesthetics and α-blockers; general anaesthetics may increase sensitivity of myocardium to dysrhythmic effects of epinephrine; lidocaine may increase levels and effects of benzodiazepines, calcium channel blockers, ciclosporine, aminophylline, fluvoxamine, mexiletine, mirtazapine, ropinirole, theophylline, trifluoperazine, dextromethorphan, fluoxetine, nefazodone, paroxetine, risperidone, TCAs and venlafaxine. Levels and effects of lidocaine may be increased by propranolol, chlorpromazine, delavirdine, fluoxetine, miconazole, pergolide, quinidine, quinine, ritonavir, ropinirole, cimetidine,azole antifungals, clarithromycin, diclofenac, doxycycline, erythromycin, isoniazid, nicardipine and verapamil. Lidocaine may decrease levels and effects of codeine, hydrocodone, oxycodone, tramadol, carbamazepine, nafcillin, nevirapine, phenobarbital, phenytoin and rifamycins. Midazolam, cisapride, ergot alkaloids, lovastatin and simvastatin are not recommended in combination with lidocaine. Potentially Fatal: Possible additive cardiac effects with amiodarone (ECG monitoring should be considered).
Food Interaction	St John's Wort may reduce lidocaine level, avoid; ephedra and yohimbe may cause CNS stimulation, avoid.
Lab Interference	Lidocaine may increase creatinine phosphokinase which may interfere with diagnosis of MI.

	Lidocaine may increase creatinine phosphokinase which may interfere with diagnosis of MI.
Storage	Injection: Protect from light. Transdermal systems: 20-25 °C. Inj: store at 2-8 °C and discard within 3 days of opening.
Mechanism of Action	Lidocaine is a local anaesthetic which decreases permeability of sodium ions, blocking induction and conduction of nerve impulses. Combination with epinephrine restricts systemic spread of lidocaine, vascular absorption and its duration of local anaesthetic effect. Onset: Peak effect: approx 5 min. Duration: Approx 2 hr; dose and anaesthetic procedure dependant. Absorption: Topical: lidocaine: minimal; epinephrine: minimal; readily absorbed from GI tract, mucous membranes, damaged skin, inj sites including muscle. Distribution: Crosses placenta and blood-brain barrier. Volume of distribution: lidocaine: 1.1-2.1 L/kg, altered by many patient factors eg CHF, liver disease. Protein binding: lidocaine: 60-80% to α_1 acid glycoprotein. Metabolism: Lidocaine: 90% via hepatic 1st pass metabolism to active metabolites which can cause CNS toxicity. Epinephrine: metabolised by monoamine oxidase and catechol-o-methyltransferase taken up in the adrenergic neuron; circulating ephedrine is hepatically metabolised. Excretion: Lidocaine: elimination half life: 2 hr; excreted via urine (<10% unchanged). Ephedrine: excreted via urine as inactive metabolites and small amounts of unchanged drug.
CIMS Class	Anaesthetics - Local & General
ATC Classification	A01AD01 - epinephrine; Belongs to the class of other local agents. Used in the treatment of diseases of the mouth.

A01AD01 - epinephrine; Belongs to the class of other local agents. Used in the treatment of diseases of the mouth.

B02BC09 - epinephrine; Belongs to the class of local hemostatics. Used in the treatment of hemorrhage.

C01BB01 - lidocaine; Belongs to class Ib antiarrhythmics used in the treatment of arrhythmia.

C01CA24 - epinephrine; Belongs to the class of adrenergic and dopaminergic cardiac stimulants excluding glycosides. Used in the treatment of heart failure.

C05AD01 - lidocaine; Belongs to the class of products containing local anesthetics. Used in the treatment of hemorrhoids.

D04AB01 - lidocaine; Belongs to the class of topical anesthetics used in the treatment of pruritus.

N01BB02 - lidocaine; Belongs to the class of amides. Used as local anesthetics.

R01AA14 - epinephrine; Belongs to the class of topical sympathomimetic agents used as nasal decongestants.

R02AD02 - lidocaine; Belongs to the class of local anesthetics used in throat preparations.

R03AA01 - epinephrine; Belongs to the class of adrenergic inhalants, alpha- and beta-adrenoreceptor agonists. Used in the treatment of obstructive airway diseases.

S01EA01 - epinephrine; Belongs to the class of sympathomimetics used in glaucoma therapy.

S01HA07 - lidocaine; Belongs to the class of other agents used as local ophthalmologic anesthetics.

S02DA01 - lidocaine; Belongs to the class of analgesic and anesthetic agents used as otologicals.

lincomycin

CIMS Class : (Other Antibiotics)
lincomycin

P - Caution when used during pregnancy

L - Caution when used during lactation

related lincomycin information

Indication & Dosage

Oral

Severe anaerobic infections

Adult: 500 mg 3 or 4 times daily.

Child: =1 mth: 30-60 mg/kg daily in divided doses.

Renal impairment: Severe impairment: Reduce to 25-30% of the usual dose.

Hepatic impairment: Dose adjustment may be needed.

Parenteral

Severe anaerobic infections

Adult: Dose can be administered by IM or IV inj. IM admin: 600 mg 1-2 times daily. IV admin: 0.6-1 g 2-3 times daily by slow IV infusion (over at least 1 hr), may increase up to a total of 8 g daily in severe infections.

Child: >1 mth: 10-20 mg/kg daily in divided doses by IM inj or IV infusion.

Renal impairment: Severe impairment: Reduce to 25-30% of the usual dose.

Hepatic impairment: Dose adjustment may be needed.

Subconjunctival

	Renal impairment: Severe impairment: Reduce to 25-30% of the usual dose. Hepatic impairment: Dose adjustment may be needed. <i>Subconjunctival</i> Severe anaerobic infections Adult: Administer 75 mg by subconjunctival inj to maintain sufficient MICs in the ocular fluid levels for at least 5 hr. Renal impairment: Severe impairment: Reduce to 25-30% of the usual dose. Hepatic impairment: Dose adjustment may be needed. Reconstitution: For IV admin: 1 g of lincomycin should be diluted in at least 100 ml of diluent. Incompatibility: Syringe incompatibility: Ampicillin. Admixture incompatibility: Phenytoin, kanamycin.
Administration	Should be taken on an empty stomach. (Take w/ full glass of water on an empty stomach 1 hr before or 2 hr after meals.)
Contraindications	Hypersensitivity to lincomycin or clindamycin.
Special Precautions	Elderly. Severe renal and hepatic impairment. Pregnancy and lactation. Monitor liver function and CBC on long-term treatment. History of GI disease e.g. colitis.
Adverse Drug Reactions	Hypotension (IV); vertigo; dermatitis, erythema multiforme, rash, urticaria; colitis, diarrhoea, glossitis, nausea, vomiting, pruritus ani, stomatitis; vaginitis; agranulocytosis, aplastic anaemia, leukopenia, neutropenia, pancytopenia, thrombocytopenic purpura; jaundice, LFT abnormalities; tinnitus; azotaemia, proteinuria, oliguria; hypersensitivity reactions. Potentially Fatal: Anaphylaxis. IV: Syncope, CV collapse.
Drug Interactions	May potentiate effects of neuromuscular blocking agents. Reduced absorption with kaolin. May reduce effects of erythromycin.

	May potentiate effects of neuromuscular blocking agents. Reduced absorption with kaolin. May reduce effects of erythromycin.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 20-25°C. Parenteral: Store at 20-25°C. Subconjunctival: Store at 20-25°C.
Mechanism of Action	Lincomycin exerts bacteriostatic and bactericidal effects by binding to 50S ribosome subunit. This results in inhibition of protein synthesis, specifically peptide-bond formation, in susceptible organisms. Absorption: 20-30% is absorbed from the GI tract (oral); peak plasma concentrations after 2-4 hr. Food reduces rate and extent of absorption. Distribution: Widely into tissues, bone, body fluids; CSF (poor, except when meninges are inflamed); crosses the placenta and enters breast milk. Metabolism: Hepatic (partially inactivated). Excretion: Via bile, urine, faeces (as unchanged drug and metabolites); 5 hr (elimination half-life).
CIMS Class	Other Antibiotics
ATC Classification	J01FF02 - lincomycin; Belongs to the class of lincosamides. Used in the treatment of systemic infections.

lindane

CIMS Class : (Topical Antifungals & Antiparasites)
lindane

P - Caution when used during pregnancy

L - Contraindicated in lactation

related lindane information

Indication & Dosage

Topical/Cutaneous

Scabies

Adult: Apply a thin layer of 1% topical preparation onto all skin areas from the neck to toes. Completely wash off from the body with warm water after 8-12 hr.

Topical/Cutaneous

Pediculosis

Adult: Apply 30-60 ml of 1% shampoo to dry hair. Amount depends on the length of the hair; most patients will require 30 ml (max 60 ml). Massage into hair for 4 min then add small quantities of water to form a good lather. Immediately rinse thoroughly until all the lather is gone. Dry the hair and comb with a fine tooth comb.

Overdosage

Symptoms: Vomiting, restlessness, ataxia, seizures, arrhythmias, pulmonary oedema, haematuria, hepatitis. Occasionally, severe CNS, hepatic, renal toxicity (excessive use for prolonged periods). Management: Gastric lavage (if ingested) and general supportive measures.

	Occasionally, severe CNS, hepatic, renal toxicity (excessive use for prolonged periods). Management: Gastric lavage (if ingested) and general supportive measures.
Contraindications	Hypersensitivity. Uncontrolled seizures; broken skin; premature infant. Lactation.
Special Precautions	Infants, small children, patients <50 kg, history of seizures or conditions which may increase risk of seizures. Hepatic impairment. Avoid contact with face, eyes, mucous membranes and urethral meatus. Pregnancy.
Adverse Drug Reactions	Cardiac arrhythmia, ataxia, dizziness, headache, restlessness, seizure, pain, alopecia, contact dermatitis, eczematous eruptions, pruritus, urticaria, nausea, vomiting, aplastic anaemia, hepatitis, burning and stinging, paraesthesia, haematuria, pulmonary oedema. Potentially Fatal: Severe neurologic toxicities.
Drug Interactions	Enhanced absorption and increased risk of toxicity with oils and oil-based preparations. Potentially Fatal: Increased toxicity with drugs that lower seizure threshold e.g. antidepressants, antipsychotics, ciclosporin, isoniazid.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Topical/Cutaneous: Store at controlled room temperature.
Mechanism of Action	Lindane stimulates the nervous system of parasites by direct absorption through their exoskeletons causing seizures and death. Absorption: =13% (systemic absorption after topical application); peak plasma concentrations after 6 hr in

	direct absorption through their exoskeletons causing seizures and death. Absorption: =13% (systemic absorption after topical application); peak plasma concentrations after 6 hr in children. Distribution: Stored in body fat, accumulates in brain; skin and adipose tissue. Metabolism: Hepatic. Excretion: Via urine and faeces; 17-22 hr (elimination half-life in children).
CIMS Class	Topical Antifungals & Antiparasites
ATC Classification	P03AB02 - lindane; Belongs to the class of chlorine-containing agents used as ectoparasitocides.

related linezolid information

Indication & Dosage	<i>Oral</i> Uncomplicated skin and skin structure infections Adult: 400 mg every 12 hr for 10-14 days. Child: Preterm neonates (<34 wk gestational age): 10 mg/kg every 12 hr; may increase to 10 mg/kg every 8 hr if response is suboptimal. By day 7 of life, all neonates should receive 10 mg/kg every 8 hr. Infant (excluding preterm neonates <1 wk) and children <5 yr: 10 mg/kg every 8 hr for 10-14 days. Children 5-11 yr: 10 mg/kg every 12 hr for 10-14 days; 12-18 yr: 600 mg every 12 hr for 10-14 days. <i>Intravenous</i> Complicated skin and skin structure infections Adult: 600 mg 12 hrly for 10-14 days, as an infusion over 30-120 minutes. Similar doses can also be given via oral route. Child: Preterm neonates (<34 wk gestational age): 10 mg/kg every 12 hr; may increase to 10 mg/kg every 8 hr if response is suboptimal. By day 7 of life, all neonates should receive 10 mg/kg every 8 hr. Infant (excluding preterm neonates <1 wk) and children ≥11 yr: 10 mg/kg every 8 hr for
---------------------	--

may increase to 10 mg/kg every 8 hr if response is suboptimal. By day 7 of life, all neonates should receive 10 mg/kg every 8 hr. Infant (excluding preterm neonates <1 wk) and children =11 yr: 10 mg/kg every 8 hr for 10-14 days.

CrCl (ml/min)	Dosage Recommendation
<30	Use with caution.

Intravenous

Nosocomial pneumonia

Adult: 600 mg 12 hrly for 10-14 days, as an infusion over 30-120 minutes. Similar doses can also be given via oral route.

Child: Preterm neonates (<34 wk gestational age): 10 mg/kg every 12 hr; may increase to 10 mg/kg every 8 hr if response is suboptimal. By day 7 of life, all neonates should receive 10 mg/kg every 8 hr. Infant (excluding preterm neonates <1 wk) and children =11 yr: 10 mg/kg every 8 hr for 10-14 days.

CrCl (ml/min)	Dosage Recommendation
<30	Use with caution.

Intravenous

Community-acquired pneumonia

Adult: 600 mg 12 hrly for 10-14 days, as an infusion over 30-120 minutes. Similar doses can also be given via oral route.

Child: Preterm neonates (<34 wk gestational age): 10 mg/kg every 12 hr; may increase to 10 mg/kg every 8 hr if response is suboptimal. By day 7 of life, all neonates should receive 10 mg/kg every 8 hr. Infant (excluding preterm neonates <1 wk) and children =11 yr: 10 mg/kg every 8 hr for 10-14 days.

CrCl (ml/min)	Dosage Recommendation
<30	Use with caution.

Intravenous

Methicillin-resistant *Staphylococcus aureus* infections

Adult: 600 mg every 12 hr. Treatment duration for vancomycin-resistant

	<i>Intravenous</i> Methicillin-resistant <i>Staphylococcus aureus</i> infections Adult: 600 mg every 12 hr. Treatment duration for vancomycin-resistant enterococci: 14-28 day. Similar doses can also be given via oral route. Child: For VRE infections: Preterm neonates (<34 wk gestational age): 10 mg/kg every 12 hr; may increase to 10 mg/kg every 8 hr if response is suboptimal. By day 7 of life, all neonates should receive 10 mg/kg every 8 hr. Infant (excluding preterm neonates <1 wk) and children =11 yr: 10 mg/kg every 8 hr for 14-28 days. <i>Intravenous</i> Vancomycin-resistant enterococci infections Adult: 600 mg every 12 hr. Treatment duration for vancomycin-resistant enterococci: 14-28 day. Similar doses can also be given via oral route. Child: For VRE infections: Preterm neonates (<34 wk gestational age): 10 mg/kg every 12 hr; may increase to 10 mg/kg every 8 hr if response is suboptimal. By day 7 of life, all neonates should receive 10 mg/kg every 8 hr. Infant (excluding preterm neonates <1 wk) and children =11 yr: 10 mg/kg every 8 hr for 14-28 days. Reconstitution: To reconstitute granules for oral suspension, add 123 ml in 2 equal aliquots and shake well to make 150 ml suspension.	
	Administration	May be taken with or without food.
	Contraindications	Hypersensitivity.
	Special Precautions	Preexisting myelosuppression, renal impairment (CrCl < 30ml/min), uncontrolled hypertension, phaeochromocytoma, carcinoid syndrome, untreated hyperthyroidism, chronic infection, history of seizures, bipolar depression, schizophrenia or acute confusional states. Pregnancy and lactation. Monitor complete blood counts weekly. Give after haemodialysis. Not known if linezolid or metabolites removed during peritoneal dialysis.
	Adverse Drug Reactions	Diarrhoea (antibiotic associated colitis reported), headache, nausea,

Adverse Drug Reactions	Diarrhoea (antibiotic associated colitis reported), headache, nausea, vomiting, constipation, abnormal liver function tests, fever, vaginal and oral candidiasis, skin rash, pruritus, dizziness, insomnia, anaemia, tongue discoloration, taste disturbance, lactic acidosis, optic and peripheral neuropathy (particularly if used = 28 days). Potentially Fatal: Reversible myelosuppression including anaemia, leukopenia, pancytopenia and thrombocytopenia (particularly if using > 10-14 days), transient ischaemic attacks, renal failure, Stevens-Johnson syndrome.
Drug Interactions	Use with caution with serotonergic, vasopressor or dopaminergic agents to reduce the incidence of serotonin syndrome. Adrenergic drugs Eg. dopamine, epinephrine, phenylpropanolamine and pseudoephedrine may cause hypertension. Concurrent use with tramadol may increase risk of seizures. Potentially Fatal: MAOI; avoid concurrent use or use within 2 wk of stopping another MAOI to reduce risk of hypertensive crisis.
Food Interaction	Beverages and foods high in tyramine content may cause hypertensive crisis. Avoid dietary tyramine =100 mg per meal.
Lab Interference	May alter blood counts.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Infusion: Store at 25°C. Protect from light. Oral: Store at 25°C. Reconstituted oral suspension should be used within 21 days of constitution. Protect from light.
Mechanism of Action	Linezolid is a bacteriostatic oxazolidinone, inhibiting ribosomal protein synthesis. It is active against gram-positive bacteria including vancomycin-resistant enterococci and MRSA. It has limited in-vitro

	Linezolid is an bacteriostatic oxazolidinone, inhibiting ribosomal protein synthesis. It is active against gram-positive bacteria including vancomycin-resistant enterococci and MRSA. It has limited in-vitro activity against gram-negative bacteria. Absorption: Oral bioavailability: Approx 100%. Rapidly absorbed after oral admin. Peak plasma concentrations after 1-2 hrs, although delayed if administered with high fat meal. Distribution: Plasma protein binding: Approx 31%. Readily distributed into well perfused tissues; bone, fat, lungs, muscle, skin blister fluids and CSF. Animal studies have shown Linezolid in milk but not known if distributed into human milk. Therapeutic concentrations not achieved or maintained in CNS fluid. Volume of distribution at steady state: 40-50 L. Metabolism: Oxidised to 2 main inactive metabolites. Excretion: Approx 65% of dose eliminated via non renal route. Renal clearance low. Elimination half life: 4.6-7hr (oral).
CIMS Class	Other Antibiotics
ATC Classification	J01XX08 - linezolid; Belongs to the class of other antibacterials. Used in the treatment of systemic infections.

related lisinopril information

Indication & Dosage

Oral

Hypertension

Adult: Initially, 5-10 mg daily given at bedtime to avoid precipitous fall in BP. Patient with renovascular hypertension, volume depletion, severe hypertension: Initially, 2.5-5 mg once daily. Patient on diuretic: Initially, 5 mg once daily. Maintenance: 20 mg once daily, up to 80 mg daily may be used if needed.

Child: ≥6 yr: Initially, 0.07 mg/kg (up to 5 mg once daily).
Adjust dose until desired BP goal is achieved.

Renal impairment: Adult: Dialysis: Initially 2.5 mg once daily. Max dose: 40 mg once daily. Child: Do not give if GFR <30 ml/min/1.73 m².

CrCl (ml/min)	Dosage Recommendation
31-80	Initially 5-10 mg once daily.
10-30	Initially 2.5-5 mg once daily.
<10	Initially 2.5 mg once daily.

	<i>Oral</i> Heart failure Adult: As adjunctive therapy: Initially, 2.5 mg daily. Maintenance: 5-40 mg daily as a single dose. <i>Oral</i> Post myocardial infarction Adult: Initially, 5 mg once daily for 2 days started within 24 hr of the onset of symptoms. Increase to 10 mg once daily. Patients with low systolic BP: Initially, 2.5 mg once daily. <i>Oral</i> Diabetic nephropathy Adult: For hypertensive type 2 diabetics with microalbuminuria: 10 mg once daily, may increase to 20 mg once daily to achieve a sitting diastolic BP <90 mmHg.	
Administration	May be taken with or without food.	
Overdosage	Symptom: Most likely hypotension. Treatment: Normal saline IV infusion may be used.	
Contraindications	History of angioedema related to previous treatment with ACE inhibitors, hereditary or idiopathic angioedema. Bilateral renal artery stenosis. Pregnancy (2nd or 3rd trimester), lactation.	
Special Precautions	Hypovolaemia, hyperkalaemia, collagen vascular disease, valvular stenosis; before, during or immediately after anaesthesia, preexisting renal insufficiency, unilateral renal artery stenosis. Children <6 yr. Assess renal function. May impair ability to drive or operate machinery.	
Adverse Drug Reactions	Dizziness, headache, fatigue; cough, upper respiratory tract infection; rash; diarrhoea, nausea, vomiting, abdominal pain;	

	Dizziness, headache, fatigue; cough, upper respiratory tract infection; rash; diarrhoea, nausea, vomiting, abdominal pain; chest pain, weakness; orthostatic effects; hypotension; hyperkalaemia; impotence; decreased haemoglobin; increased serum creatinine. Potentially Fatal: Severe hypotension, angioedema.
Drug Interactions	Increased hypersensitivity reactions with allopurinol. Decreased serum levels with antacids. Reduced antihypertensive effect with aprotinin, NSAIDs, salicylates. May enhance the neutropenic effect of azathioprine. May enhance the nephrotoxic effect of ciclosporin. Increased risk of hyperkalaemia with eplerenone, potassium-sparing diuretics, trimethoprim. May enhance the adverse effects of ferric gluconate, gold sodium thiomalate. Increased risk of hypoglycaemia with insulin. Increased risk of neutropenia with mercaptopurine. Increased hypotensive effect and/or the nephrotoxic effect with thiazide diuretics. Potentially Fatal: May increase serum level of lithium. Increased risk of adverse renal effects with NSAIDs, salicylates. Increased risk of acute hypotensive events or acute renal failure with loop diuretics.
Food Interaction	Avoid dong quai; ephedra, yohimbe, ginseng (may worsen hypertension).
Lab Interference	False-positive urine acetone determination results with sodium nitroprusside. Increases serum potassium and BUN/serum creatinine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.

	adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 15-30°C (59-86°F).
Mechanism of Action	Lisinopril competitively inhibits angiotensin-converting enzyme (ACE) from converting angiotensin I to angiotensin II resulting in decreased levels of angiotensin II (a potent vasoconstrictor). This increases plasma renin activity and reduces aldosterone secretion. It also increases bradykinin levels. Onset: 1-2 hr. Duration: 24 hr (once daily dosing). Absorption: Absorbed slowly and incompletely from the GI tract (oral); peak plasma concentrations after 7 hr. Distribution: Protein-binding: Not significantly bound (25%). Excretion: Via urine (as unchanged drug); 12 hr (elimination half-life).
CIMS Class	ACE Inhibitors
ATC Classification	C09AA03 - lisinopril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

lisinopril + hydrochlorothiazide

CIMS Class : (Diuretics) , (ACE Inhibitors)
lisinopril + hydrochlorothiazide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related lisinopril + hydrochlorothiazide information

Indication & Dosage

Oral

Mild to moderate hypertension

Adult: As tablets containing lisinopril

(mg)/hydrochlorothiazide (mg): 10/12.5, 20/12.5. Usual: 1 tablet once daily, may increase to 2 tablets once daily if needed.

CrCl (ml/min)	Dosage Recommendation
≤30	Not recommended.

Overdosage

Symptoms: hypotension, bradycardia may occur; electrolyte depletion and dehydration from excessive diuresis.

Treatment: symptom specific and supportive; induction of emesis and/or gastric lavage, correction of dehydration, electrolyte imbalance and hypotension with IV solution.

Contraindications

Hypersensitivity to sulphonamide drugs. Patients with anuria, aortic stenosis or hyperkalaemia. History of angioneurotic oedema related to use of ACE inhibitors. Hereditary or idiopathic angioedema. Lactation.

	aortic stenosis or hyperkalaemia. History of angioneurotic oedema related to use of ACE inhibitors. Hereditary or idiopathic angioedema. Lactation.
Special Precautions	Hepatic cirrhosis, severe heart failure, oedema, renal impairment (including haemodialysis patients), unilateral renal artery stenosis, hepatic impairment, diabetes, gout, hyperuricaemia, left ventricular hypertrophy and/or ventricular ectopics (extrasystoles), electrolyte disturbances (e.g. hyperkalaemia), collagen vascular disease, valvular stenosis, renovascular hypertension, hypercholesterolemia. Before, during or immediately after anaesthesia; surgery. Assess renal function before initiation. Patients with hypertension should be stabilised on individual components before starting combination. Therapy should not be started after MI if systolic blood pressure <100 mmHg. Hypotension may occur after initial dose in patients who are hypovolaemic and/or salt depleted (diuretic should be discontinued for 2-3 days and then lisinopril initiated alone). Discontinue before carrying parathyroid function test.
Adverse Drug Reactions	Volume depletion and electrolyte imbalance (eg hyperkalaemia); dry mouth, thirst; lethargy, drowsiness; muscle pain, cramps; hypotension; hypersensitivity reactions eg, rashes, photosensitivity, thrombocytopenia, jaundice, pancreatitis; fatigue; weakness; may precipitate an attack of gout (hyperuricaemia); impotence, hyperglycaemia; anorexia, gastric irritation, nausea, vomiting, constipation, diarrhoea; sialadenitis; dizziness; hypercalcaemia; headache; cough; chest pain; angioneurotic oedema; occasional increase in liver enzymes and serum bilirubin; renal function deterioration; alopecia; oliguria/anuria; urticaria, pruritis; diaphoresis. Potentially Fatal: Seizures; cholestatic jaundice;

deterioration; alopecia; oliguria/anuria; urticaria, pruritis; diaphoresis.

Potentially Fatal: Seizures; cholestatic jaundice; neutropenia and agranulocytosis (with or without myeloid hyperplasia); acute renal failure, oliguria; progressive azotemia; haemolytic anaemia; angioedema associated with laryngeal oedema.

Drug Interactions

Antacids may decrease the bioavailability of ACE inhibitors; aprotinin may decrease effects of lisinopril during infusion. Sympathomimetics and indomethacin may decrease antihypertensive effects. Increased risk of hyperkalaemia with eplerenone, potassium sparing diuretics, ciclosporine, trimethoprim, corticosteroids. May increase toxic effects of gold sodium thiomalate. Increased risk of hypoglycaemia with insulin and oral antidiabetics. Increased risk of hypovolaemia (and resulting renal failure) with loop diuretics. Concurrent use with β -blockers may increase hyperglycaemic effects in type 2 DM. NSAIDs may exacerbate renal impairment; narcotics, antipsychotics and alcohol may enhance hypotensive effects. Cholestyramine and colestipol resins may reduce absorption of hydrochlorothiazide; leave 2 hr between doses. Potassium containing salt substitutes may increase risk of hyperkalaemia.

Potentially Fatal: Potentiates bone marrow suppression caused by anticancer drugs eg azathioprine, mercaptopurine; reduces renal clearance and increases toxicity of lithium (monitor lithium levels especially in 1st 4 wk); increased risk of hypokalaemia with corticosteroids, prolongs paralysis caused by tubocurarine; increased risk of nephrotoxicity with ciclosporin, aminoglycosides, salicylates, increased risk of cardiac toxicity in hypokalaemia with cardiac

	paralysis caused by tubocurarine; increased risk of nephrotoxicity with ciclosporin, aminoglycosides, salicylates, increased risk of cardiac toxicity in hypokalaemia with cardiac glycosides.
Food Interaction	Hydrochlorothiazide peak serum levels may be decreased if taken with food. Avoid dong quai (if using for hypertension as it exerts estrogenic activity), ephedra, yohimbe, ginseng (may worsen hypertension) and garlic (increased hypertensive effect).
Lab Interference	False-positive urine acetone determination results using Na nitroprusside. Increases serum K and BUN/serum creatinine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store below 25°C.
Mechanism of Action	Lisinopril competitively inhibits ACE from converting angiotensin I to angiotensin II resulting in increased plasma renin activity and reduced aldosterone secretion, causing reduced BP and sodium and water retention. Hydrochlorothiazide increases renal excretion of sodium and chloride and reduces cardiac load. The two drugs exert additive effects in hypertension.

	Hydrochlorothiazide increases renal excretion of sodium and chloride and reduces cardiac load. The two drugs exert additive effects in hypertension. Onset: Lisinopril: 1 hr; hydrochlorothiazide: diuresis: approx 2 hr. Duration: Lisinopril: 24 hr; hydrochlorothiazide: 6-12 hr. Absorption: Lisinopril: Well absorbed, unaffected by food; peak effect: approx 6 hr. Hydrochlorothiazide: approx 50-80%; peak effect: 4-6 hr. Distribution: Plasma protein binding: lisinopril: 25%; hydrochlorothiazide: 68%. Distribution of hydrochlorothiazide: 3.6-7.8 L/kg. Metabolism: Lisinopril: Not significantly metabolised. Hydrochlorothiazide: Not metabolised. Excretion: Half-life elimination: lisinopril: 11-12 hr; hydrochlorothiazide: 5.6-14.8 hr. Excretion: lisinopril Mainly via urine as unchanged drug (lisinopril and hydrochlorothiazide).
CIMS Class	Diuretics / ACE Inhibitors
ATC Classification	C03AA03 - hydrochlorothiazide; Belongs to the class of low-ceiling thiazide diuretics. Used to promote excretion of urine. C09AA03 - lisinopril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

lithium

CIMS Class : (Antidepressants)
lithium

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related lithium information

Indication & Dosage

Oral

Mania, Bipolar disorder, Recurrent unipolar depression

Adult: Dose depends on the preparation used. Doses should be adjusted to produce a serum-lithium concentration of 0.4-1 mmol/l. Camcolit® tablets: Treatment: Initiate at 1-1.5 g daily; Prevention: Initiate at 300-400 mg daily. Priadel® tablets: Treatment and prevention: Initially, 400-1,200 mg daily in 1-2 divided doses. Priadel® syrup: Treatment and prevention: Initially, 1.04-3.12 g daily in 2 divided doses. Liskonum® tablets: Treatment: Initially, 450-675 mg bid; Prevention: Initially, 450 mg bid. Doses should be divided throughout the day during the initial period; once-daily dosing may be used when serum-lithium concentrations have stabilised. Adjust initial dose 4-7 days after starting based on results of serum-lithium concentrations. Monitor serum-lithium concentrations once wkly until dosage has remained constant for 4 wk, after which monitoring may be reduced to once every 3 mth.

serum-lithium concentrations once wkly until dosage has remained constant for 4 wk, after which monitoring may be reduced to once every 3 mth.

Child: =12 yr: Acute phase: Serum concentrations of 1-1.2 mEq/l. Max dose: 1.5 mEq/l. Initially, 1.8 g lithium carbonate daily as conventional capsules/tablets in 3-4 divided doses, or 30 ml (approx 48 mEq) lithium citrate oral solution daily in 3-4 divided doses. Alternatively, initially 1.8 g lithium carbonate daily as extended-release tablets in 2-3 divided doses. Maintenance: Not established.

Elderly: =900 mg lithium carbonate daily. Titrate dose slowly to achieve therapeutic serum concentrations. Maintenance: Maintain serum concentrations at the lower end of 0.6-1.2 mEq/l.

CrCl (ml/min)	Dosage Recommendation
10-50	50-75% of normal dose.
<10	25-50% of normal dose.

Administration

Should be taken with food.

Overdosage

Symptoms: Sedation, confusion, tremors, joint pain, visual changes, seizures, coma. Management: No specific antidote. Acute overdose: Discontinue admin and remove any unabsorbed drug by gastric lavage. Correct fluid and electrolyte imbalances and provide supportive care. Dialysis (severe cases).

Contraindications

Severe renal and cardiac disease; severe dehydration, sodium depletion, debilitation.

Special Precautions

Monitor serum lithium levels (twice wkly or more frequently in acute phase; at least every 2 mth during maintenance). Thyroid disorders, mild to moderate renal or cardiac impairment. Marked fluid loss (protracted sweating, diarrhoea or prolonged fever). Maintain normal fluid and salt intake. Elderly. Monitor changes in renal function. Patients with

	impairment. Marked fluid loss (protracted sweating, diarrhoea or prolonged fever). Maintain normal fluid and salt intake. Elderly. Monitor changes in renal function. Patients with suicidal tendency. May impair ability to drive or operate machinery. Children <12 yr. Pregnancy and lactation.
Adverse Drug Reactions	Exacerbation of psoriasis, acne, rash; nausea, diarrhoea, vertigo, muscle weakness, dazed feeling; loss of concentration; tremors; hypothyroidism; wt gain, oedema; cardiac arrhythmias; exophthalmos; restlessness; electrolyte disturbances. Potentially Fatal: Severe neurotoxicity, leucopenia.
Drug Interactions	Reduced serum levels with carbonic anhydrase inhibitors, chlorpromazine, sodium-containing preparations, theophylline, urea. Enhanced hypothyroid effects with iodine salts. Enhanced effects of neuromuscular-blocking agents. Reduced pressor response to sympathomimetics. Potentially Fatal: Increased risk of lithium toxicity with ACE inhibitors, angiotensin receptor antagonists, loop diuretics, metronidazole, phenytoin. Increased risk of neurotoxicity with carbamazepine, calcium-channel blockers, haloperidol, methyldopa, phenothiazines, SSRIs, TCAs. Increased serum levels with COX-2 inhibitors, NSAIDs (except sulindac, aspirin), tetracyclines, thiazide diuretics. Increased risk of encephalopathy with haloperidol. Increased risk of serotonin syndrome with sibutramine. Fatal malignant hyperpyrexia may occur when used with MAOIs.
Food Interaction	Caffeine may reduce serum concentrations of lithium.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which

	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 25°C (77°F).
Mechanism of Action	Lithium's exact mechanism is unclear but it alters intraneuronal metabolism of catecholamines and sodium transport in neurons and muscle cells. Absorption: Readily and completely absorbed from the GI tract (oral); serum levels increase with food. Peak plasma concentrations after 0.5-3 hr (conventional preparation), 2-12 hr (modified-release preparations). Distribution: Throughout the body, bones, thyroid gland, portions of the brain; crosses the placenta, enters breast milk. Not protein-bound. Metabolism: Not metabolised. Excretion: Via urine (as unchanged drug), faeces, saliva, sweat (small amounts). Elimination half-life: 20-24 hr (normal renal function), 36 hr (elderly), 40-50 hr (renal dysfunction).
CIMS Class	Antidepressants
ATC Classification	N05AN - Lithium; Used in the management of psychosis. N05AN01 - lithium; Belongs to the class of lithium antipsychotics. Used in the management of psychosis.

lomefloxacin

CIMS Class : (Quinolones) , (Eye Anti-infectives & Antiseptics) , (Ear Anti-infectives & Antiseptics)
lomefloxacin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related lomefloxacin information

Indication & Dosage

Oral

Acute bacterial exacerbation of chronic bronchitis

Adult: 400 mg once daily for 10 days.

Renal impairment: Haemodialysis: Initially, 400 mg daily.

Maintenance: 200 mg daily.

CrCl (ml/min)	Dosage Recommendation
10-40	Initially, 400 mg daily. Maintenance: 200 mg daily.

Oral

Prophylaxis of surgical infections

Adult: 400 mg as a single dose 1-6 hr before procedure.

Oral

Uncomplicated urinary tract infections

Adult: 400 mg once daily. Due to *E. coli*: For 3 successive days. Due to *K. pneumoniae*, *P. mirabilis* or *S.*

saprophyticus: For 10 successive days.

Renal impairment: Haemodialysis: Initially, 400 mg daily.

	days. Due to <i>K. pneumoniae</i>, <i>P. mirabilis</i> or <i>S. saprophyticus</i>: For 10 successive days. Renal impairment: Haemodialysis: Initially, 400 mg daily. Maintenance: 200 mg daily.	
	CrCl (ml/min)	Dosage Recommendation
	10-40	Initially, 400 mg daily. Maintenance: 200 mg daily.
	<i>Oral</i> Complicated urinary tract infections Adult: Due to <i>E. coli</i>, <i>K. pneumoniae</i>, <i>P. mirabilis</i> or <i>P. aeruginosa</i>: 400 mg once daily for 14 successive days. Renal impairment: Haemodialysis: Initially, 400 mg daily. Maintenance: 200 mg daily.	
	CrCl (ml/min)	Dosage Recommendation
	10-40	Initially, 400 mg daily. Maintenance: 200 mg daily.
	<i>Ophthalmic</i> Bacterial conjunctivitis Adult: Instil 0.3% solution into the affected eye/s. <i>Otic/Aural</i> Otitis externa Adult: Instil 0.3% solution into the affected ear/s. <i>Otic/Aural</i> Otitis media Adult: Instil 0.3% solution into the affected ear/s.	
Administration	May be taken with or without food.	
Overdosage	Empty the stomach by inducing vomiting or by gastric lavage. Treatment is supportive. Maintain adequate hydration. Haemodialysis or peritoneal dialysis is unlikely to be helpful.	
Contraindications	Hypersensitivity to the drug or other quinolones; children	

Contraindications	Hypersensitivity to the drug or other quinolones; children <18 yr; pregnancy and lactation.
Special Precautions	Avoid prolonged exposure to sunlight or artificial UV light. Known or suspected CNS disorders e.g. severe cerebral arteriosclerosis, epilepsy or other factors that predispose to seizures. Avoid in patients with known QT prolongation, uncorrected hypokalaemia. May impair ability to drive or operate machinery. Renal impairment.
Adverse Drug Reactions	Nausea, abdominal pain or discomfort, diarrhoea; headache, dizziness, insomnia; rash, pruritus, photosensitivity; thrombocytopenia. Potentially Fatal: Anaphylactic or anaphylactoid reactions.
Drug Interactions	Reduced bioavailability with sucralfate, antacids containing magnesium or aluminium, vitamin or mineral supplements containing iron. Increased serum levels with cimetidine. Potential increase in serum levels of ciclosporin. Renal elimination reduced with probenecid. Potentially Fatal: Increased risk of ventricular arrhythmias with class IA (quinidine, procainamide) or class III (amiodarone, sotalol) antiarrhythmic agents.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Lomefloxacin promotes breakage of double-stranded DNA in susceptible organisms and inhibits DNA gyrase, which is essential in reproduction of bacterial DNA. Absorption: Rapid and complete from the GI tract (oral);

	in susceptible organisms and inhibits DNA gyrase, which is essential in reproduction of bacterial DNA. Absorption: Rapid and complete from the GI tract (oral); peak plasma concentrations after 1-1.5 hr. Absorption delayed with food. Distribution: Widely distributed; lungs and prostate. Protein-binding: 10%. Excretion: Via urine (as unchanged drug and small amounts of glucuronide metabolites); may be prolonged in renal impairment. Via faeces (small amounts as unchanged drug); 7-8 hr (elimination half-life).
CIMS Class	Quinolones / Eye Anti-infectives & Antiseptics / Ear Anti-infectives & Antiseptics
ATC Classification	J01MA07 - lomefloxacin; Belongs to the class of quinolones, fluoroquinolone. Used in the treatment of systemic infections. S01AX17 - lomefloxacin; Belongs to the class of other anti-infectives. Used in the treatment of eye infections.

Iomustine

CIMS Class : (Cytotoxic Chemotherapy)
Iomustine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related Iomustine information

Indication & Dosage

Oral

Brain tumours, Hodgkin's disease, resistant or relapsed, Malignant melanoma, Lung cancer

Adult: 100-130 mg/m² as a single dose every 6 wk. Adjust dose according to platelet and leukocyte counts.

Compromised marrow function: 100 mg/m² as a single dose every 6 wk.

Child: 75-150 mg/m² as a single dose every 6 wk. Readjust dose according to platelet and leukocyte counts.

CrCl (ml/min)	Dosage Recommendation
10-50	Admin 75% of normal dose.
<10	Admin 25-50% of normal dose.

Administration

Should be taken on an empty stomach. (Take on an empty stomach. May be taken at bedtime to reduce occurrence of nausea.)

Overdosage

Symptoms: Pancytopenia, hepatic dysfunction, abdominal pain, pulmonary toxicity with tachypnoea and hypoxaemia, confusion and disorientation. Severe myelosuppression.

Management: Symptomatic and supportive.

	pain, pulmonary toxicity with tachypnoea and hypoxaemia, confusion and disorientation. Severe myelosuppression. Management: Symptomatic and supportive.
Contraindications	Pregnancy and lactation.
Special Precautions	Monitor CBC with differential platelet count wkly for at least 6 wk after a dose. Periodically perform pulmonary function studies and LFTs.
Adverse Drug Reactions	Pulmonary infiltrates, pulmonary fibrosis, nausea, vomiting, hepatotoxicity, nephrotoxicity, stomatitis, alopecia, disorientation, lethargy, dysarthria, ataxia, visual disturbances. Potentially Fatal: Delayed bone marrow suppression and permanent marrow damage following prolonged use.
Drug Interactions	Increased levels/effects with CYP2D6 inhibitors.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 15-30°C (59-86°F).
Mechanism of Action	Lomustine inhibits the synthesis of DNA and RNA via alkylation although carbamoylation and modification of cellular proteins may also be involved. Absorption: Rapidly absorbed from the GI tract (oral); also absorbed after topical application. Peak plasma concentrations of metabolites after 1-6 hr (oral). Distribution: Widely distributed; drug and metabolites cross the blood-brain barrier; active metabolites appear in CSF within 30 min (oral); metabolites present in milk. Metabolism: Hepatic via hydroxylation; enterohepatically recycled.

	CSF within 30 min (oral); metabolites present in milk. Metabolism: Hepatic via hydroxylation; enterohepatically recycled. Excretion: Via urine (approx 50%); via faeces (<5%); via expired air (<10%).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01AD02 - lomustine; Belongs to the class of alkylating agents, nitrosoureas. Used in the treatment of cancer.

loperamide

CIMS Class : (Antidiarrheals)
loperamide

P - Caution when used during pregnancy

L - Caution when used during lactation

related loperamide information

Indication & Dosage

Oral

Acute diarrhoea

Adult: As hydrochloride: Initially, 4 mg followed by 2 mg after each loose stool. Usual dose: 6-8 mg daily. As oxide: Initially, 2-4 mg followed by 1 mg after each loose stool. Max dose as hydrochloride: 16 mg daily; as oxide: 8 mg daily.

Child: As hydrochloride: 4-8 yr: 1 mg 3 or 4 times daily for up to 3 days; 9-12 yr: 2 mg 4 times daily for up to 5 days.

Oral

Chronic diarrhoea

Adult: As hydrochloride: Initially, 4-8 mg daily in divided doses, adjusted if necessary. Max: 16 mg daily; discontinue if no improvement at this dose after 10 days.

Child: Treatment in children is generally not recommended but the following doses have been suggested: 1 mth-1 yr: As hydrochloride, 100-200 mcg/kg bid given 30 min before feeds (Max: 2 mg/kg daily); 1-12 yr: As hydrochloride, 100-200 mcg/kg (Max: 2 mg/dose) 3 to 4 times daily (Max: 16 mg daily).

	As hydrochloride, 100-200 mcg/kg bid given 30 min before feeds (Max: 2 mg/kg daily); 1-12 yr: As hydrochloride, 100-200 mcg/kg (Max: 2 mg/dose) 3 to 4 times daily (Max: 16 mg daily).
Administration	May be taken with or without food.
Overdosage	Urinary retention, paralytic ileus and CNS depression may occur. Perform gastric lavage (not necessary if spontaneous vomiting occurs) followed by administration of a slurry of 100 g activated charcoal. If symptoms of overdose occur, naloxone may be given as an antidote.
Contraindications	Conditions when inhibition of peristalsis is undesirable (e.g. ileus or megacolon); antibiotic induced colitis; active inflammatory bowel disease; if abdominal distention develops during use; abdominal pain in the absence of diarrhoea.
Special Precautions	Concomitant specific therapy must be given in those with infectious diarrhoea; hepatic dysfunction; infants; pregnancy, lactation.
Adverse Drug Reactions	Abdominal pain, distention, and discomfort; paralytic ileus; constipation, dry mouth, drowsiness, dizziness, fatigue, rash. Potentially Fatal: Toxic megacolon.
Drug Interactions	Bioavailability increased by co-trimoxazole, ritonavir, saquinavir. Respiratory depression reported when administered with quinidine. Loperamide increases GI absorption of desmopressin and decreases exposure to saquinavir.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in

	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Loperamide inhibits peristalsis and prolongs transit time by acting directly on intestinal wall muscles. It also reduces faecal volume, increases viscosity and decreases fluid and electrolyte loss. Onset: 0.5-1 hr. Absorption: Absorbed from the GI tract. Peak plasma concentrations achieved after 2.5 hr (oral solution) or 4-5 hr (capsule). Excretion: Excreted in the urine (<2%) and faeces (30% as unchanged drug). Elimination half life of around 10.8 hr.
CIMS Class	Antidiarrheals
ATC Classification	A07DA03 - loperamide; Belongs to the class of antipropulsives. Used in the treatment of diarrhea.

lopinavir + ritonavir

CIMS Class : (Antivirals)
lopinavir + ritonavir

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related lopinavir + ritonavir information

Indication & Dosage	<i>Oral</i> HIV infection Adult: Each capsule contains lopinavir 133.3 mg and ritonavir 33.3 mg. For treatment-naïve patients: 3 capsules bid or 6 capsules once daily. For treatment-experienced patients: 3 capsules bid. When used with efavirenz, nevirapine, amprenavir or nelfinavir, it is recommended that dose is increased to 4 capsules bid.
Administration	Cap & oral soln: Should be taken with food. Tab: May be taken with or without food. (Swallow whole, do not chew/ crush/ break.)
Contraindications	Hypersensitivity. Avoid concomitant use with ergot derivatives (dihydroergotamine, ergonovine, ergotamine, methylergonovine), cisapride, pimozide, and sedatives (midazolam, triazolam).
Special Precautions	Pancreatitis, hepatic impairment, haemophilia. Pregnancy, lactation, elderly, child <6 mth.

	Pancreatitis, hepatic impairment, haemophilia. Pregnancy, lactation, elderly, child <6 mth.
Adverse Drug Reactions	Diarrhoea, vomiting, headache, asthenia, abdominal pain, and nausea ; elevations in liver enzymes, total cholesterol and triglycerides.
Drug Interactions	Co-administration with drugs primarily metabolized by CYP3A (e.g. dihydropyridine Ca channel blockers, HMG-CoA reductase inhibitors, immunosuppressants and sildenafil) may result in increased plasma concentrations of the other drugs that could increase or prolong their therapeutic and adverse effects. Potentially Fatal: Drugs that should not be used concurrently: rifampicin, ergot derivatives, cisapride, HMG Co-A inhibitors, pimozide, and sedatives (midazolam, triazolam).
Food Interaction	Concurrent use with St John's wort may substantially reduce concentrations of protease inhibitors leading to reduced/loss of virologic response which increases risk of resistance.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Lopinavir inhibits HIV protease, causing the enzyme incapable of processing the polyprotein precursor. This leads to the production of non-infectious and immature HIV particles. Ritonavir, a selectively competitive reversible inhibitor of HIV protease, interferes with the formation of essential proteins and enzymes. After which, the formation of immature and non-infectious viruses follows. It also interferes with the production of infectious HIV and limits

	inhibitor of HIV protease, interferes with the formation of essential proteins and enzymes. After which, the formation of immature and non-infectious viruses follows. It also interferes with the production of infectious HIV and limits further infectious spread of the virus.
CIMS Class	Antivirals
ATC Classification	J05AE03 - ritonavir; Belongs to the class of protease inhibitors. Used in the systemic treatment of viral infections. J05AE06 - lopinavir; Belongs to the class of protease inhibitors. Used in the systemic treatment of viral infections.

loratadine

CIMS Class : (Antihistamines & Antiallergics)
loratadine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related loratadine information

Indication & Dosage	<i>Oral</i> Allergic conditions Adult: 10 mg once daily. Child: 2-5 yr: 5 mg once daily. 6-12 yr: 10 mg once daily. Renal impairment: Dosage may need to be reduced to alternate day admin. Hepatic impairment: Dosage may need to be reduced to alternate day admin.
Administration	May be taken with or without food.
Contraindications	Pregnancy, lactation, children <2 yr.
Special Precautions	Severe hepatic damage, epilepsy, renal insufficiency.
Adverse Drug Reactions	Fatigue, giddiness, dizziness, dry mouth, headache, nausea, somnolence.
Drug Interactions	Plasma concentrations increased by ketoconazole, cimetidine, nefazodone, erythromycin and possibly other inhibitors of CYP3A4.

	Plasma concentrations increased by ketoconazole, cimetidine, nefazodone, erythromycin and possibly other inhibitors of CYP3A4.
Lab Interference	Reactions to skin testing procedures may be reduced.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Loratadine is a non-sedating antihistamine. It works by selectively binding to peripheral histamine H₁ -receptors on effector cells. Absorption: Absorbed rapidly from the GI tract (oral); peak plasma concentrations after 1 hr. Absorption delayed by the presence of food. Distribution: Enters breast milk, does not cross the blood-brain barrier. Protein-binding: 98%. Metabolism: Extensively hepatic; converted to descarboethoxyloratadine (desloratadine). Excretion: Via urine and faeces (as metabolites); elimination half-life 8.4 hr (loratadine) and 28 hr (desloratadine).
CIMS Class	Antihistamines & Antiallergics
ATC Classification	R06AX13 - loratadine; Belongs to the class of other agents used as systemic antihistamines.

lorazepam

CIMS Class : (Anxiolytics) , (Anticonvulsants) , (Antivertigo Drugs)
lorazepam

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related lorazepam information

Indication & Dosage	<i>Oral</i>
	Anxiety
	Adult: Usual dose: 1-6 mg daily in 2 or 3 divided doses. Largest dose taken at night. Up to 10 mg daily has been used.
	Elderly: Initial dose of 1-2 mg daily in 2 or 3 divided doses. Adjust as necessary.
	<i>Oral</i>
	Insomnia associated with anxiety
	Adult: 1-4 mg as a single dose given at bedtime.
	Elderly: 1-2 mg initially, adjust as needed.
	<i>Oral</i>
	Premedication in surgery
	Adult: 2-3 mg given the night before the operation followed by a smaller dose if necessary, the next morning. Alternatively, 2-4 mg is given 1-2 hr before the operation.
	Child: 1 mth-12 yr: 0.05-0.1 mg/kg (max: 4 mg) given at least 1 hr before surgery. Same dose may be given the night before either as an addition to or to replace the

Alternatively, 2-4 mg is given 1-2 hr before the operation.

Child: 1 mth-12 yr: 0.05-0.1 mg/kg (max: 4 mg) given at least 1 hr before surgery. Same dose may be given the night before either as an addition to or to replace the pre-operative dose.

Oral

Prophylaxis of nausea and vomiting associated with cytotoxic therapy

Adult: For moderately emetogenic chemotherapy: May add 1-2 mg to the antiemetic therapy with domperidone or metoclopramide.

Parenteral

Acute anxiety

Adult: 25-30 mcg/kg repeated every 6 hr if necessary. Dose may be given via IV or IM inj. Give IV inj at a rate of not >2 mg/minute into a large vein.

Child: Usual: 50 mcg/kg every 4-8 hr.

Intravenous

Status epilepticus

Adult: 4 mg injected slowly, may repeat once after 10 minutes if seizures recur. Dose should be given at a rate not >2 mg/minute into a large vein.

Child: Neonates and children up to 12 yr: 0.1 mg/kg (max: 4 mg) as a single dose, may repeat once after 10 minutes if needed.

Parenteral

Premedication in surgery

Adult: 50 mcg/kg, to be given 30-45 minutes before the operation if given via IV inj or 1-1.5 hr before operation if given via IM inj.

Intravenous

Sedation in critical care

Adult: 0.02-0.06 mg/kg every 2-6 hr as inj or 0.01-0.1

	<i>Intravenous</i> Sedation in critical care Adult: 0.02-0.06 mg/kg every 2-6 hr as inj or 0.01-0.1 mg/kg/hr as continuous IV infusion. Child: ≥2 mth: 0.025-0.05 mg/kg (max 2 mg) every 2-4 hr as intermittent IV infusion or 0.025 mg/kg/hr (to a max of 2 mg/hr) as continuous IV infusion.
Administration	May be taken with or without food.
Overdosage	The main symptom of overdosage is excessive CNS depression. Treatment is generally supportive but flumazenil may also be used in hospitalised patients if the benefits are thought to outweigh the risk of seizure.
Contraindications	Severe hepatic impairment; respiratory depression; acute narrow-angle glaucoma; pregnancy and lactation.
Special Precautions	Hepatic and renal dysfunction; pulmonary insufficiency; myasthenia gravis; may impair ability to drive or operate machinery; elderly or debilitated patients.
Adverse Drug Reactions	Drowsiness, headache, dizziness, confusion; blurred vision; nausea; weakness; unsteadiness. Potentially Fatal: Respiratory depression.
Drug Interactions	Potential of CNS depression produced by alcohol; general anaesthetics; narcotic analgesics; TCAs; MAOIs; phenothiazines; antipsychotics; barbiturates; scopolamine.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Lorazepam is a short acting benzodiazepine. Lorazepam enhances the inhibitory effect of GABA on neuronal excitability by modulating GABA _A receptors.

	Lorazepam is a short acting benzodiazepine. Lorazepam enhances the inhibitory effect of GABA on neuronal excitability by modulating GABA_A receptors. Onset: Hypnosis: 20-30 min (IM); sedation: 5-20 min (IV); anticonvulsant: 5 min (IV), 30-60 min (oral). Duration: 6-8 hr. Absorption: Readily absorbed (oral, IM); peak plasma concentrations after 2 hr. Distribution: Crosses the placenta and blood-brain barrier; enters breast milk. Protein-binding: 85%. Metabolism: Hepatic; converted to inactive metabolites. Excretion: Urine and faeces; 10-20 hr (elimination half-life).
CIMS Class	Anxiolytics / Anticonvulsants / Antivertigo Drugs
ATC Classification	N05BA06 - lorazepam; Belongs to the class of benzodiazepine derivatives anxiolytics. Used in the management of anxiety, agitation or tension.

lornoxicam

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
lornoxicam

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related lornoxicam information

Indication & Dosage	<i>Oral</i> Pain relief Adult: 8-16 mg daily. Max: 24 mg daily. <i>Oral</i> Osteoarthritis Adult: 12 mg daily in 2-3 divided doses, up to 16 mg daily if needed. <i>Oral</i> Rheumatoid arthritis Adult: 12 mg daily in 2-3 divided doses, up to 16 mg daily if needed. <i>Parenteral</i> Pain relief Adult: 8 mg once or twice daily by IM/IV inj. Max: 24 mg daily.
Contraindications	Patients with peptic ulceration; severe renal impairment; pregnancy and lactation.
Special Precautions	Active infections; asthma; allergic disorders; haemorrhagic

Special Precautions	Active infections; asthma; allergic disorders; haemorrhagic disorders; hypertension; impaired renal, hepatic, cardiac function.
Adverse Drug Reactions	Abdominal pain, diarrhoea, dizziness, dyspepsia, nausea, vomiting; headache; haematologic disorders; CNS effects; visual disturbance; tinnitus; nephrotoxicity; fluid retention; photosensitivity; alveolitis; pancreatitis; Stevens-Johnson syndrome; toxic epidermal necrolysis; colitis induction/exacerbation; stomatitis; hypertension, palpitation; insomnia, somnolence.
Drug Interactions	Increased lornoxicam blood conc when given concomitantly with cimetidine. Enhanced effects of anticoagulants, sulfonylureas, methotrexate, ciclosporin, digoxin. Decreased effects of diuretics, ACE inhibitors. Potentially Fatal: Increased risk of lithium toxicity.
Mechanism of Action	Lornoxicam is an NSAID that is used in musculoskeletal, joint disorders and other painful conditions including postoperative pain. Lornoxicam is a potent inhibitor of both COX-1 and COX-2 enzymes. Absorption: Extensively absorbed from the GI tract. Peak plasma concentration within 1-2 hr (oral) or 25 min (IM). Distribution: 99% bound to plasma proteins. Metabolism: Metabolised to its inactive metabolite. Excretion: Excreted in the faeces (as metabolites) and urine (as unchanged drug). Mean elimination half life of 3-4 hr.
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AC05 - lornoxicam; Belongs to the class of non-steroidal antiinflammatory and antirheumatic products, oxicams. Used in the treatment of inflammation and rheumatism.

losartan

CIMS Class : (Angiotensin II Antagonists)
losartan

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related losartan information

Indication & Dosage

Oral

Hypertension

Adult: 50 mg once daily, increased to 100 mg daily as a single dose or in 2 divided doses if needed.

Child: ≥6 yr: Initially 700 mcg/kg increased to a maximum of 50 mg once daily if needed.

Elderly: >75 yr: Initially, 25 mg once daily.

CrCl (ml/min)	Dosage Recommendation
<20	Initially 25 mg once daily.

Hepatic impairment: Initially, 25 mg once daily

Oral

Diabetic nephropathy in Type 2 diabetes mellitus

Adult: 50 mg once daily, increased to 100 mg daily as a single dose or in 2 divided doses if needed.

Elderly: >75: Initially 25 mg once daily.

Renal impairment: CrCl <20 ml/min: Initially 25 mg once daily.

CrCl (ml/min)	Dosage Recommendation
<20	Initially 25 mg once daily.

Hepatic impairment: Initially 25 mg once daily.

	daily.	
	Hepatic impairment: Initially 25 mg once daily.	
	Special Populations: Patients with intravascular fluid depletion: Initially, 25 mg once daily.	
Administration	May be taken with or without food.	
Contraindications	Pregnancy, lactation; children with CrCl <30 ml/min/1.73m ² .	
Special Precautions	Volume-depleted patients including patients on diuretics and salt restriction; renal artery stenosis; elderly; renal or hepatic impairment. Monitor serum-potassium concentration.	
Adverse Drug Reactions	Headache, dizziness, back pain, myalgia, respiratory tract disorders, asthenia/fatigue, first dose hypotension, rash, angioedema, neutropenia, GI disturbances, transient elevation of liver enzymes, impaired renal function, taste disturbances and hyperkalaemia.	
Drug Interactions	Hypotensive effect of losartan potentiated by diuretics and other antihypertensives. Risk of hyperkalaemia increases with concomitant ACE inhibitors, ciclosporin, potassium-sparing diuretics and K supplements. Hypotensive effect may be antagonised and increased risk of renal impairment when used with NSAIDs. Potentially Fatal: Risk of lithium toxicity with losartan use.	
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters.	

	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Losartan is an angiotensin II receptor antagonist. The drug and its active metabolite selectively block the vasoconstrictor and aldosterone-secreting effects of angiotensin II by selectively antagonising its binding to AT₁ receptors. Absorption: Readily absorbed from GI tract with peak plasma concentrations of losartan after around 1 hr and its active metabolite after 3-4 hr. Distribution: 98% plasma protein bound. Metabolism: Hepatic metabolism principally by isoenzymes CYP3A4 and 2C9. Excretion: Excreted in faeces and urine as metabolites and unchanged drug. Terminal elimination half life of 2 hr (losartan) and 6-9 hr (active metabolite).
CIMS Class	Angiotensin II Antagonists
ATC Classification	C09CA01 - losartan; Belongs to the class of angiotensin II antagonists. Used in the treatment of cardiovascular disease.

losartan + hydrochlorothiazide

CIMS Class : (Angiotensin II Antagonists) , (Diuretics)
losartan + hydrochlorothiazide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related losartan + hydrochlorothiazide information

Indication & Dosage

Oral

Hypertension

Adult: Per tablet contains losartan 50 mg and hydrochlorothiazide 12.5 mg. For patients who are not adequately controlled on losartan or hydrochlorothiazide monotherapy: 1 tab once daily. May increase to 2 tabs once daily 2-4 wk later if needed. Max: 2 tabs/day.

Renal impairment: Dialysis patients: Avoid.

CrCl (ml/min)	Dosage Recommendation
<20	Avoid.

Overdosage

Symptoms: hypotension and tachycardia. Treatment: supportive and symptom specific. Not removed via haemodialysis.

Contraindications

Pregnancy, lactation; intravascular volume depletion.

Special Precautions

Existing electrolyte disturbances; hepatic cirrhosis; severe hepatic failure; oedema; elderly (>75 yr); renal impairment; hepatic impairment; diabetes, gout, hyperlipidaemia; hyperuricaemia; ECG: LVH and/or ventricular ectopics

	Existing electrolyte disturbances, hepatic cirrhosis, severe hepatic failure; oedema; elderly (>75 yr); renal impairment; hepatic impairment; diabetes, gout, hyperlipidaemia; hyperuricaemia; ECG: LVH and/or ventricular ectopics extrasystoles); volume depleted patients; patients on diuretics and salt restriction; renal artery stenosis; aortic and mitral stenosis. Monitor potassium concentration. Discontinue before performing tests for parathyroid function.
Adverse Drug Reactions	Volume depletion and electrolyte imbalance (especially hyperkalaemia); dry mouth, thirst; lethargy, drowsiness; muscle pain and cramps; rashes, photosensitivity, thrombocytopenia, jaundice, pancreatitis; fatigue, weakness; may precipitate an attack of gout; impotence; hyperglycaemia; anorexia, nausea, vomiting, constipation, diarrhoea; sialadenitis; raised urinary calcium concentration; headache, dizziness; back pain, myalgia; first-dose hypotension; angiodema; neutropenia; GI disturbances; transient elevation of liver enzymes; taste disturbances, cough; exacerbation or activation of systemic lupus erythematosus; palpitations; xanthopsia; leucopenia, agranulocytosis, aplastic anaemia; necrotising angitis; glucosuria; renal dysfunction, interstitial nephritis, renal failure; migraine; hyponatraemia; UTI; chest pain; gastritis, wt gain, dyspepsia, abdominal pain; bronchitis, upper respiratory infection, nasal congestion, sinusitis; rise in cholesterol and/or triglycerides. Potentially Fatal: Hypersensitivity reactions; hemolytic anaemia; toxic epidermal necrolysis.
Drug Interactions	Hydrochlorothiazide increases plasma concentration fluconazole. Increased hypotensive effect with: ACE inhibitors, alcohol, adrenergic neurone blockers, aldesleukin, α-blockers, alprostadil, general anaesthetics, antipsychotics, anxiolytics and hypnotics, baclofen,

	concentration nadolazole. Increased hypotensive effect with ACE inhibitors, alcohol, adrenergic neurone blockers, aldesleukin, α-blockers, alprostadil, general anaesthetics, antipsychotics, anxiolytics and hypnotics, baclofen, β-blockers, calcium-channel blockers, clonidine, diazoxide, epoetin, hydralazine, levodopa, MAOIs, methyldopa, minoxidil, monoxidine, nitrates, NSAIDs, oestrogens, sodium nitroprusside, tizanidine, phenothiazines. Increased risk of renal impairment with aspirin (in doses >300 mg daily), NSAIDs. Hypotensive effect antagonised by aspirin, corticosteroids, indomethacin, ketorolac. Increased risk of hyperkalaemia with potassium-sparing and aldosterone antagonists, drospirenone (monitor serum potassium during 1st cycle), epoetin, heparin, ketorolac, potassium salts. Increased risk of hypersensitivity with allopurinol (especially in renal impairment). May antagonise hypoglycaemic effects of antidiabetics. Increased risk of hypercalcaemia with calcium salts and vitamin D. Increased risk of hyponatraemia with chlorpropamide. Increased risk of hypermagnesaemia with ciclosporin. Absorption may be reduced by colestipol and colestyramine (take at least 2 hr apart). Potentially Fatal: Increased risk of nephrotoxicity and ototoxicity with platinum compounds, aminoglycosides. Hypokalaemia caused by diuretics may cause cardiac toxicity with amiodarone (interaction may occur for several weeks or months due to long half life of amiodarone). Increased risk of nephrotoxicity and hyperkalaemia with ciclosporin. Reduced excretion of lithium (risk of lithium toxicity with diuretics).
Food Interaction	Avoid dong quai (if using for hypertension as it has estrogenic activity; ephedra, ginseng, yohimbe (may worsen hypertension), garlic (may have additive effects), St John's wort (may decrease levels).
Pregnancy	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Protect from light and store at 15-30 °C.
Mechanism of Action	Hydrochlorothiazide increases renal excretion of sodium and chloride and reduces cardiac load. Losartan is an angiotensin II receptor (type AT₁) antagonist antihypertensive which acts by blocking the actions of angiotensin II of renin-angiotensin-aldosterone system. The drug and its active metabolite selectively block the vasoconstrictor and aldosterone secreting effects of angiotensin II. The two drugs exert additive effects in hypertension. Onset: Hydrochlorothiazide: diuresis: approx 2 hr; losartan: 6 hr. Duration: Hydrochlorothiazide: 6-12 hr. Absorption: Hydrochlorothiazide: oral absorption: Approx 50-80%; time to peak: 1-2.5 hr; peak effect: 4-6 hr; bioavailability: 50-80%. Losartan: time to peak: 1 hr; losartan's active metabolite (E-3174): time to peak 3-4 hr (AUC is 4 times greater than that of losartan); bioavailability:

	bioavailability: 50-80%. Losartan: time to peak: 1 hr; losartan's active metabolite (E-3174): time to peak 3-4 hr (AUC is 4 times greater than that of losartan); bioavailability: 25-33%. Distribution: Hydrochlorothiazide: 3.6-7.8 L/kg; protein binding: 68%. Losartan: volume of distribution: 34 L; plasma protein binding: high. Losartan's active metabolite (E-3174): volume of distribution: 12 L. Metabolism: Hydrochlorothiazide: Not metabolised. Losartan: Hepatic (14%) via CYP2C9 and CYP3A4 to active metabolite, E-3174 (40 more times potent than losartan), extensive 1st-pass effect. Excretion: Hydrochlorothiazide: half life elimination: 5.6-14.8 hr; excretion: via urine (as unchanged drug). Losartan: excretion via urine (4% as unchanged drug and 6% as active metabolite); plasma clearance: 600 ml/minute (active metabolite: 50 ml/min).
CIMS Class	Angiotensin II Antagonists / Diuretics
ATC Classification	C03AA03 - hydrochlorothiazide; Belongs to the class of low-ceiling thiazide diuretics. Used to promote excretion of urine. C09CA01 - losartan; Belongs to the class of angiotensin II antagonists. Used in the treatment of cardiovascular disease.

losartan + ramipril

CIMS Class : (ACE Inhibitors) , (Angiotensin II Antagonists)
losartan + ramipril

P - Contraindicated in pregnancy
L - Caution when used during lactation

related losartan + ramipril information

Indication & Dosage	<i>Oral</i> Mild to moderate hypertension Adult: 1 tab daily (losartan K 50 mg and ramipril 1.25 mg). Treatment should be initiated with a lower dose and the dosage may be gradually increased till the max response is observed. Special Populations: The initial recommended dose for patients with CrCl < 40ml/min/1.73m³ is losartan K 50mg plus ramipril 1.25mg once daily. The dosage adjustment is recommended in cirrhotic patients, impaired liver function.
Contraindications	Hypersensitivity, history of angioedema, bilateral renal stenosis, high-dose diuretic therapy, salt depleted states, renal impairment, pregnancy
Special Precautions	Patients on diuretic, renal impairment, heart failure and hereditary edema, serum K conc should be monitored in elderly and patients with renal stenosis and lactation.
Adverse Drug	First-dose hypotension, angioedema, hyperkalaemia,

Adverse Drug Reactions	First-dose hypotension, angioedema, hyperkalaemia, dyspepsia, muscle cramp, myalgia, dizziness, insomnia, nasal congestion, cough, upper resp infection, sinusitis, asthenia, oedema, abdominal pain, chest pain, nausea, headache, pharyngitis, superficial peeling of palms and haemolysis, renal impairment, pancytopenia, haemolytic anaemia, thrombocytopenia, increase in BUN and serum creatinine, angioneurotic oedema, cough, arthralgia, fever, impotence, increased sweating, malaise, wt gain, rash.
Drug Interactions	Concomitant use of potassium-sparing diuretics (eg, spironolactone, triamterene, amiloride), K supplements, or salt substitutes containing K may lead to increase in serum potassium. Cimetidine may increase AUC of losartan, phenobarbital may reduce the AUC of losartan and that of its active metabolite. Co-administration with diuretics can cause hypotension. Serum lithium level is increased when lithium is co-administered with ramipril.
Mechanism of Action	Losartan and its principal active metabolite block the vasoconstrictor and aldosterone-secreting effects of angiotensin II by selectively blocking the binding of angiotensin II to the AT1 receptor found in many tissues (vascular smooth muscle, adrenal gland). Ramipril and its metabolite, ramiprilat inhibit angiotensin-converting enzyme (ACE). Inhibition of ACE results in decreased plasma angiotensin II. Both administered in combination gives additive antihypertensive effect.
CIMS Class	ACE Inhibitors / Angiotensin II Antagonists
ATC Classification	C09AA05 - ramipril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease. C09CA01 - losartan; Belongs to the class of angiotensin II

C09AA05 - ramipril; Belongs to the class of ACE inhibitors.

Used in the treatment of cardiovascular disease.

C09CA01 - losartan; Belongs to the class of angiotensin II antagonists. Used in the treatment of cardiovascular disease.

Ioteprednol

CIMS Class : (Eye Corticosteroids)
Ioteprednol

P - Caution when used during pregnancy

L - Caution when used during lactation

related Ioteprednol information

Indication & Dosage	<i>Ophthalmic</i> Allergic conjunctivitis Adult: Instil 1 drop of a 0.2% suspension into the affected eye(s) 4 times daily for <2 wk. <i>Ophthalmic</i> Ocular inflammation Adult: Instil 1-2 drops of a 0.5% suspension into the affected eye(s) 4 times daily. May initiate with 1 drop of a 0.5% suspension every hr; may reduce frequency gradually once improvement occurs. <i>Ophthalmic</i> Postoperative ocular inflammation Adult: Instil 1-2 drops of a 0.5% suspension 4 times daily into the eye(s) undergoing surgery beginning 24 hr after surgery for 2 wk.
Contraindications	Viral infections of the cornea and conjunctiva; mycobacterial eye infection; fungal infections of ocular structures.
Special Precautions	May mask and exacerbate existing ocular infection.

Special Precautions	May mask and exacerbate existing ocular infection. Re-evaluate patients if symptoms do not improve after 2 days. Glaucoma; may delay healing after cataract surgery. Monitor intraocular pressure (prolonged use).
Adverse Drug Reactions	Headache. Rhinitis, pharyngitis. Abnormal vision/blurring, burning sensation on instillation, chemosis, dry eyes, itching, conjunctivitis/irritation, corneal abnormalities, eyelid erythema, papillae uveitis. Glaucoma and optic nerve injury, posterior subcapsular cataracts (prolonged use). Changes in visual acuity, field defects. Secondary ocular infection.
Storage	Ophthalmic: Store at 15-25°C.
Mechanism of Action	Loteprednol is a synthetic nonfluorinated glucocorticoid. It stimulates the production of lipocortins, proteins that modulate the activity of prostaglandins and leukotrienes.
CIMS Class	Eye Corticosteroids

lovastatin

CIMS Class : (Dyslipidaemic Agents)
lovastatin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related lovastatin information

Indication & Dosage

Oral

Hyperlipidaemias, Primary prophylaxis of coronary artery disease

Adult: Initially, 10-20 mg daily at night; may be increased at 4-wk intervals as necessary. Max: 80 mg/day (immediate-release); 60 mg/day (extended-release).

Child: Adjunct to diet in adolescent patients with heterozygous familial hypercholesterolaemia with LDL >189 mg/dl, or LDL >160 mg/dl with positive family history of premature CVD, or LDL >160 mg/dl in the presence of at least 2 other CVD risk factors: 10-17 yr: Immediate-release tablet: LDL reduction <20%: Initially, 10 mg/day. =20%: Initially, 20 mg/day. Usual range: 10-40 mg daily, then adjust dose at 4-wk intervals. Doses to be taken at night.

CrCl (ml/min)	Dosage Recommendation
<30	Doses >20 mg/day should be used with caution.

	<30 Doses >20 mg/day should be used with caution.
	Special Populations: Patient on concurrent ciclosporin or other immunosuppressants: Initially, 10 mg/day. Max dose: 20 mg/day. Patient on concurrent fibrates, danazol and/or niacin (>1 g/day): Max dose: 20 mg/day. Avoid concurrent use unless risk to benefit favors use. Patient on concurrent amiodarone/verapamil: Max dose: 40 mg/day (immediate release); 20 mg/day (extended release).
Administration	Should be taken with food.
Contraindications	Active liver disease; unexplained persistently elevated serum transaminases. Pregnancy and lactation.
Special Precautions	Renal impairment; inadequately controlled hypothyroidism; history of liver disease; alcoholism; patients at risk of rhabdomyolysis. Elderly. Monitor LFTs.
Adverse Drug Reactions	Increased creatine phosphokinase; flatulence, nausea, dyspepsia, constipation or diarrhoea, abdominal pain; muscle cramps, myalgia, weakness; blurred vision; headache, dizziness; rash. Potentially Fatal: Rhabdomyolysis and acute renal failure.
Drug Interactions	Reduced absorption with cholestyramine, isradipine. May increase warfarin effect. Potentially Fatal: Increased risk of myopathy and rhabdomyolysis with amiodarone, azole antifungals, fibrates, colchicine, ciclosporin, danazol, macrolides, nefazodone, niacin (high doses), protease inhibitors, verapamil. Increased levels/effects with diclofenac, doxycycline, imatinib, isoniazid, nifedipine, propofol, quinidine, diltiazem.

	metazouone, macrolin (high doses), protease inhibitors, verapamil. Increased levels/effects with diclofenac, doxycycline, imatinib, isoniazid, nicardipine, propofol, quinidine, diltiazem.
Food Interaction	Bioavailability of extended-release tablet reduced by food; bioavailability of immediate-release tablet increased by food. Serum levels increased with grapefruit juice; avoid concurrent intake of >1 quart/day. Serum levels reduced with St John's wort.
Lab Interference	May alter thyroid function tests.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Oral: Immediate-release tablet: Store at 5-30°C (41-86°F). Extended-release tablet: Store at 20-25°C (68-77°F).
Mechanism of Action	Lovastatin reduces cholesterol synthesis by inhibiting the rate-limiting step catalysed by HMG-CoA reductase. Absorption: 30% absorbed from the GI tract; peak plasma concentrations after 2-4 hr (oral). Distribution: <5% reach the circulation. Protein-binding: >95%. Metabolism: Extensively hepatic via hydrolysis; converted to active β -hydroxyacid form. Excretion: Via faeces (85%); via urine (10%); 1-2 hr (elimination half-life).
CIMS Class	Dyslipidaemic Agents
ATC Classification	C10AA02 - lovastatin; Belongs to the class of HMG CoA reductase inhibitors. Used in the treatment of hyperlipidemia.

loxapine

CIMS Class : (Antipsychotics)
loxapine

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related loxapine information

Indication & Dosage

Oral

Psychoses

Adult: Initially, 20-50 mg daily in 2 divided doses. Increase according to patient response and tolerance over the next 7-10 days to 60-100 mg daily or more, in 2-4 divided doses. Max dose: 250 mg daily. Maintenance dose range: 20-100 mg daily in divided doses.

Elderly: 20-60 mg/day.

Intramuscular

Acute psychosis

Adult: Up to 300 mg daily in 2-3 divided doses.

Elderly: Reduced dose may be required.

Administration

Should be taken with food.

Overdosage

Symptoms: Deep sleep, dystonia, agitation, dysrhythmias, extrapyramidal reactions, hypotension, seizures.

Management: Symptomatic and supportive.

Contraindications	Severe CNS depression, coma.
Special Precautions	Parkinson's disease. Haemodynamic instability; bone marrow suppression; predisposition to seizures; subcortical brain damage; severe cardiac, hepatic, renal or respiratory impairment. Patients at risk of pneumonia (e.g. Alzheimer's disease). Breast cancer or other prolactin-dependent tumours. Cerebrovascular disease. Decreased GI motility, urinary retention, benign prostatic hyperplasia, xerostomia or visual problems. Narrow-angle glaucoma; myasthenia gravis. May impair ability to drive or operate machinery. Pregnancy and lactation.
Adverse Drug Reactions	Arrhythmia, BP changes, orthostatic hypotension, tachycardia, syncope; agitation, ataxia, confusion, dizziness, drowsiness, extrapyramidal symptoms, faintness, headache, insomnia, lightheadedness, seizure, slurred speech, tension; sexual dysfunction, urinary retention; agranulocytosis, leukopenia, thrombocytopenia; muscle weakness; alopecia, dermatitis, photosensitivity, pruritus, rash, seborrhoea; amenorrhoea, irregular menstruation, breast enlargement, galactorrhoea, gynaecomastia; ileus, constipation, nausea, vomiting, polydipsia, wt changes, xerostomia; blurred vision; nasal congestion. Potentially Fatal: Neuroleptic malignant syndrome.
Drug Interactions	Inhibits vasopressor effect of epinephrine. Potentially Fatal: Additive CNS depression with other CNS depressants (e.g. benzodiazepines, barbiturates, alcohol).
Food Interaction	CNS depression may be increased with kava kava, gotu kola, valerian, St John's wort.
Lab Interference	False-positive tests for phenylketonuria, amylase,

Lab Interference	False-positive tests for phenylketonuria, amylase, uroporphyrins, urobilinogen.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 20-25°C (68-77°F).
Mechanism of Action	Loxapine, a dibenzoxazepine antipsychotic, antagonises central dopaminergic action by blocking postsynaptic mesolimbic D₁ and D₂ receptors in the brain. It also has serotonin 5-HT₂ inhibiting activity. Absorption: Absorbed readily from the GI tract; peak plasma concentrations within 1-2 hr. Distribution: Widely distributed; crosses the placenta and distributes into breast milk. Metabolism: Very rapidly and extensively hepatic. Major metabolites: 7- and 8-hydroxyloxapine. Excretion: Mainly via urine (as conjugated metabolites); via faeces (small amounts as unconjugated metabolites). 12-19 hr (terminal elimination half-life).
CIMS Class	Antipsychotics
ATC Classification	N05AH01 - loxapine; Belongs to the class of diazepines, oxazepines and thiazepines antipsychotics. Used in the management of psychosis.

magnesium hydroxide

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants) , (Laxatives, Purgatives)
magnesium hydroxide

P - Caution when used during pregnancy

related magnesium hydroxide information

Indication & Dosage

Oral

Gastrointestinal hyperacidity

Adult: Up to 1 g daily, usually given in conjunction with an aluminium-containing antacid eg, aluminium hydroxide.

Oral

Osmotic laxative

Adult: 2.4-4.8 g daily as a single dose or in divided doses.

Child: 6–11 yr: 1.2–2.4 g daily; 2–5 yr: 0.4–1.2 g daily.

Doses may be given as a single dose or in divided doses.

Contraindications

Intestinal obstruction, faecal impaction; renal failure; appendicitis.

Special Precautions

Colostomy, ileostomy; electrolyte imbalance. Monitor for toxicity in patients with impaired renal function. Pregnancy.

Adverse Drug Reactions

GI irritation, diarrhoea, abdominal cramps;
hypermagnesaemia (in patients with renal impairment).
Paralytic ileus.

Drug Interactions

Decreases absorption of tetracyclines and biphosphonates.
Separate administration of these and other drugs by around

	Decreases absorption of tetracyclines and biphosphonates. Separate administration of these and other drugs by around 2 hr.
Mechanism of Action	Magnesium hydroxide increases peristaltic activity causing osmotic retention of fluids, thus resulting in bowel evacuation. It also reduces stomach acid by reacting with hydrochloric acid to form Mg chloride.
CIMS Class	Antacids, Antireflux Agents & Antiulcerants / Laxatives, Purgatives
ATC Classification	A02AA04 - magnesium hydroxide; Belongs to the class of magnesium-containing antacids. Used for the treatment of acid-related disorders. G04BX01 - magnesium hydroxide; Belongs to the class of other urologicals. Used in the treatment of urological problems.

mannitol

CIMS Class : (Diuretics) , (Intravenous & Other Sterile Solutions)
mannitol

P - Caution when used during pregnancy

L - Caution when used during lactation

related mannitol information

Indication & Dosage

Intravenous

Oliguric phase of renal failure

Adult: 50-100 g in a 24-hr period by IV infusion of a 5-25% solution. Adjust rate of administration to maintain a urine flow of at least 30-50 mL/hr.

Child: 0.25-2 g/kg.

Intravenous

Reduction of raised intraocular pressure

Adult: 0.25-2 g/kg by IV infusion of a 15-25% solution given over 30-60 minutes.

Intravenous

Reduction of raised intracranial pressure

Adult: 0.25-2 g/kg by IV infusion of a 15-25% solution given over 30-60 minutes.

Intravenous

Cerebral oedema

Adult: 0.25-2 g/kg by IV infusion of a 15-25% solution given over 30-60 minutes.

Intravenous

	Adult: 0.25-2 g/kg by IV infusion of a 15-25% solution given over 30-60 minutes. <i>Intravenous</i> Renal function testing Adult: 0.2 g/kg infused over 3-5 min. <i>Irrigation</i> Transurethral prostatic resection Adult: Use 2.5-5% solution for bladder irrigation.
Contraindications	Pulmonary congestion or oedema; intracranial bleeding; CHF; metabolic oedema with abnormal capillary fragility; anuria due to severe renal disease; severe dehydration.
Special Precautions	Hypervolaemia; urinary tract obstruction; check for signs of fluid and electrolyte imbalance. Should not be administered with whole blood. Pregnancy, lactation.
Adverse Drug Reactions	Fluid and electrolyte imbalance; acidosis (with high doses). Nausea, vomiting, thirst; headache, dizziness, convulsions, chills, fever; tachycardia, chest pain; blurred vision; urticaria and hypotension or hypertension; acute renal failure; skin necrosis; thrombophlebitis.
Drug Interactions	Increased nephrotoxicity with ciclosporin.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 20-25°C Irrigation: Store at 20-25°C
Mechanism of Action	Mannitol increases urinary output by inhibiting tubular reabsorption of water and electrolytes. It raises the osmotic pressure of the plasma allowing water to be drawn out of body tissues. Onset: Diuresis: 1-3 hr. Reduction in intracerebral pressure:

	reabsorption of water and electrolytes. It raises the osmotic pressure of the plasma allowing water to be drawn out of body tissues. Onset: Diuresis: 1-3 hr. Reduction in intracerebral pressure: around 15 min. Duration: Reduction in intracerebral pressure: 1.5-6 hr. Absorption: Small amounts are absorbed from the GI tract. Distribution: Concentrated in extracellular compartments. It does not penetrate the blood-brain barrier nor the eye. Metabolism: Minimal hepatic metabolism, converted to glycogen. Excretion: Urine via the kidneys (unchanged drug).
CIMS Class	Diuretics / Intravenous & Other Sterile Solutions
ATC Classification	A06AD16 - mannitol; Belongs to the class of osmotically acting laxatives. Used in the treatment of constipation. B05BC01 - mannitol; Belongs to the class of solutions producing osmotic diuresis used in I.V. solutions. B05CX04 - mannitol; Belongs to the class of other solutions used as irrigating solutions.

related mebendazole information

Indication & Dosage

Oral

Ascariasis

Adult: 100 mg bid for 3 consecutive days. Alternatively, 500 mg as a single dose. A 2nd course may be given if patient is not cured within 3-4 wk.

Child: >1 yr: 100 mg bid for 3 consecutive days.

Alternatively, 500 mg as a single dose. A 2nd course may be given if patient is not cured within 3-4 wk.

Hepatic impairment: Dose reduction may be required.

Oral

Trichuriasis

Adult: 100 mg bid for 3 consecutive days. Alternatively, 500 mg as a single dose. A 2nd course may be given if patient is not cured within 3-4 wk.

Child: >1 yr: 100 mg bid for 3 consecutive days.

Alternatively, 500 mg as a single dose. A 2nd course may be given if patient is not cured within 3-4 wk.

Hepatic impairment: Dose reduction may be required.

Alternatively, 500 mg as a single dose. A 2nd course may be given if patient is not cured within 3-4 wk.

Hepatic impairment: Dose reduction may be required.

Oral

Hookworm infections

Adult: 100 mg bid for 3 consecutive days. Alternatively, 500 mg as a single dose. A 2nd course may be given if patient is not cured within 3-4 wk.

Child: >1 yr: 100 mg bid for 3 consecutive days.

Alternatively, 500 mg as a single dose. A 2nd course may be given if patient is not cured within 3-4 wk.

Hepatic impairment: Dose reduction may be required.

Oral

Enterobiasis

Adult: 100 mg as a single dose; may repeat if necessary 2-3 wk after initial treatment.

Child: >2 yr: 100 mg as a single dose; may repeat if necessary 2-3 wk after initial treatment.

Hepatic impairment: Dose reduction may be required.

Oral

Capillariasis

Adult: 200 mg bid for 20 days.

Child: >2 yr: 200 mg bid for 20 days.

Hepatic impairment: Dose reduction may be required.

Oral

Filariasis

Adult: Caused by *Mansonella perstans*: 100 mg bid for 30 days; caused by *Onchocerca volvulus*: 1 g bid for 28 days.

Child: >2 yr: 100 mg bid for 30 days.

Hepatic impairment: Dose reduction may be required.

Oral

Toxocariasis

	Hepatic impairment: Dose reduction may be required. <i>Oral</i> Toxocariasis Adult: 100-200 mg bid for 5 days; may continue for up to 20 days. Child: >2 yr: 100-200 mg bid for 5-20 days. Hepatic impairment: Dose reduction may be required. <i>Oral</i> Trichinellosis Adult: Caused by <i>Trichinella spiralis</i>: 200-400 mg tid for 3 days followed by 400-500 mg tid for 10 days. Child: >2 yr: 200-400 mg tid for 3 days followed by 500 mg tid for 10 days. Hepatic impairment: Dose reduction may be required. <i>Oral</i> Trichostrongyliasis Adult: Caused by <i>Trichostrongylus</i>: 100 mg bid for 3 consecutive days. Child: >2 yr: 100 mg bid for 3 consecutive days. Hepatic impairment: Dose reduction may be required. <i>Oral</i> Dracunculiasis Adult: Caused by <i>Dracunculus medinensis</i>: 400-800 mg daily for 6 days.
Administration	May be taken with or without food.
Overdosage	Symptoms: Abdominal pain, altered mental status. Management: Supportive.
Contraindications	Hypersensitivity. Infants and children <2 yr.
Special Precautions	Monitor blood counts and hepatic function especially in patients receiving high doses. Pregnancy and lactation.
Adverse Drug Reactions	Transient diarrhoea, abdominal pain, nausea, vomiting, headache, tinnitus, numbness, fever and dizziness.

Adverse Drug Reactions	Transient diarrhoea, abdominal pain, nausea, vomiting, headache, tinnitus, numbness, fever and dizziness. Potentially Fatal: Myelosuppression (high doses).
Drug Interactions	Reduced plasma levels with enzyme inducers e.g. phenytoin, carbamazepine. Increased plasma levels with cimetidine.
Food Interaction	Fatty food increases absorption.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Mebendazole acts by destroying the cytoplasmic microtubules in the worm's intestinal cells. This blocks the uptake of glucose and other nutrients resulting in death of the helminth. Absorption: Poorly absorbed from the GI tract. Distribution: Highly protein-bound. Metabolism: Extensively hepatic; undergoes 1st-pass elimination. Excretion: Mainly via faeces (as unchanged drug and metabolites); via urine (2%, as unchanged drug and metabolites).
CIMS Class	Anthelmintics
ATC Classification	P02CA01 - mebendazole; Belongs to the class of benzimidazole derivative agents used as antinematodal.

mebeverine

CIMS Class : (Antispasmodics)
mebeverine

P - Caution when used during pregnancy
L - Caution when used during lactation

related mebeverine information

Indication & Dosage	<i>Oral</i> Irritable bowel syndrome, Gastrointestinal tract spasm Adult: As hydrochloride: 135 mg tid or 100 mg tid. Modified-release preparation: 200 mg bid. As embonate: 150 mg tid. Child: As hydrochloride: 3-4 yr: 25 mg; 4-8 yr: 50 mg; 8-10 yr: 100 mg; >10 yr: 135-150 mg. All doses may be given tid. Modified-release preparation: Not recommended.
Administration	Should be taken with food. (Take immediately before or during meals.)
Contraindications	Paralytic ileus.
Special Precautions	Severe hepatic or renal impairment; cardiac disorders e.g. heart block; porphyria. May impair ability to drive or operate machinery. Pregnancy and lactation.
Adverse Drug Reactions	GI disturbances, dizziness, headache, insomnia, anorexia, decreased heart rate, hypersensitivity reactions.
Storage	Oral: Conventional preparation: Store at or below 30°C. Modified-release preparation: Store at 5-25°C.

	Oral: Conventional preparation: Store at or below 30°C. Modified-release preparation: Store at 5-25°C.
Mechanism of Action	Mebeverine is an antispasmodic agent which exerts direct action on the GI smooth muscle. Absorption: Rapidly absorbed from the GI tract (oral); peak plasma concentrations within 1-3 hr. Distribution: Protein-binding: 75% to albumin. Metabolism: Hydrolysed completely in the liver to veratric acid and mebeverine alcohol. Excretion: Via urine (as metabolites).
CIMS Class	Antispasmodics

meclozine

CIMS Class : (Antivertigo Drugs)
meclozine

P - Caution when used during pregnancy

L - Caution when used during lactation

related meclozine information

Indication & Dosage	<i>Oral</i> Motion sickness Adult: 25-50 mg 1 hr before travelling and repeat every 24 hr if needed. Child: As hydrochloride: 2-6 yr: 6.25 mg once daily; 6-12 yr: 12.5 mg once daily; >12 yr: 25-50 mg 1 hr before travelling and repeat every 24 hr if needed. <i>Oral</i> Vertigo and vestibular disorders Adult: Up to 100 mg daily in divided doses.
Special Precautions	Angle-closure glaucoma, prostatic hyperplasia; pyloric or duodenal obstruction; asthma. Elderly. May affect the ability to drive or operate machinery. Pregnancy and lactation.
Adverse Drug Reactions	Drowsiness, thickening of bronchial secretions, dry mouth, fatigue, blurred vision.
Drug Interactions	Additive effects with CNS depressants, neuroleptics, anticholinergics, alcohol.
Storage	Oral: Conventional tablet: Store at 15-30°C (59-86°F).

Storage	Oral: Conventional tablet: Store at 15-30°C (59-86°F). Chewable tablet: Store below 30°C (86°F).
Mechanism of Action	Meclozine blocks vasopressor response to histamine and has a slight blocking action against acetylcholine. It decreases excitability of the middle ear labyrinth and blocks conduction in the middle ear vestibular-cerebellar pathways. Onset: About 1 hr (oral). Duration: 8-24 hr (oral). Metabolism: Hepatic. Excretion: Via urine (as metabolites); via faeces (as unchanged drug).
CIMS Class	Antivertigo Drugs
ATC Classification	R06AE05 - meclozine; Belongs to the class of piperazine derivatives used as systemic antihistamines.

mecobalamin

CIMS Class : (Vitamin B-Complex / with C) , (Nootropics & Neurotonics)
mecobalamin

Lab α - Lab interference

related mecobalamin information

Indication & Dosage	<i>Oral</i> Peripheral neuropathies Adult: 1500 mcg/day in 3 divided doses. <i>Parenteral</i> Peripheral neuropathies Adult: 500 mcg daily IM/IV 3 times/wk. <i>Parenteral</i> Megaloblastic anaemia caused by vitamin B12 deficiency Adult: 500 mcg daily IM/IV 3 times/wk. Maintenance dose: After about 2 mth of therapy, reduce dose to single admin of 500 mcg every 1-3 mth.
Administration	May be taken with or without food.
Adverse Drug Reactions	Oral: Anorexia, nausea, vomiting and diarrhoea. Parenteral: Rash, headache, hot sensation, diaphoresis and pain/induration at IM inj site. Potentially Fatal: Anaphylactoid reactions (parenteral).
Drug Interactions	Decreased GI tract absorption with neomycin, aminosalicylic acid, H₂-blockers and colchicine. Reduced serum concentrations with oral contraceptives. Reduced effects in

	Decreased GI tract absorption with neomycin, aminosalicylic acid, H ₂ -blockers and colchicine. Reduced serum concentrations with oral contraceptives. Reduced effects in anaemia with parenteral chloramphenicol.
Lab Interference	May interfere with precise diagnosis in patients with folate deficiency.
Storage	Oral: Store at room temperature. Protect from moisture and light. Parenteral: Store at room temperature. Do not expose to direct light.
Mechanism of Action	Mecobalamin is the neurologically active form of vitamin B12 and occurs as a water-soluble vitamin in the body. It is a cofactor in the enzyme methionine synthase, which functions to transfer methyl groups for the regeneration of methionine from homocysteine. In anaemia, it increases erythrocyte production by promoting nucleic acid synthesis in the bone marrow and by promoting maturation and division of erythrocytes. Absorption: Peak plasma concentrations after 3 hr (oral); 0.9 hr (IM); 3 min (IV). Excretion: Via urine.
CIMS Class	Vitamin B-Complex / with C / Nootropics & Neurotonics
ATC Classification	B03BA05 - mecobalamin;

medroxyprogesterone

CIMS Class : (Oestrogens & Progesterones & Related Synthetic Drugs)
medroxyprogesterone

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related medroxyprogesterone information

related medroxyprogesterone information	
Indication & Dosage	<i>Oral</i> Menorrhagia Adult: 2.5-10 mg daily for 5-10 days starting on the 16th-21st day of the menstrual cycle. Repeat for 2 cycles. <i>Oral</i> Mild to moderate endometriosis Adult: 10 mg tid. <i>Oral</i> As progestogen component in menopausal hormonal replacement therapy Adult: Dosage dependant on oestrogen component of therapy, several regimens are used: 1.5 mg, 2.5 mg or 5 mg daily; 5 or 10 mg daily for 12-14 days of a 28-day cycle; 20 mg daily for 14 days of a 91-day cycle. <i>Oral</i> Breast cancer Adult: 0.4-1.5 g daily. Max: 2 g daily. <i>Oral</i>

Breast cancer

Adult: 0.4-1.5 g daily. Max: 2 g daily.

Oral

Palliative treatment of endometrial and renal carcinoma

Adult: 200-600 mg daily.

Oral

Secondary amenorrhoea

Adult: 2.5-10 mg daily for 5-10 days. Repeated for 3 cycles.

Oral

Palliative treatment of prostatic carcinoma

Adult: 100-600 mg daily.

Intramuscular

Endometriosis

Adult: 50 mg wkly or 100 mg every 2 wk.

Intramuscular

Contraception

Adult: 150 mg every 12 wk.

Intramuscular

Breast cancer

Adult: 0.5-1 g daily for first 4 wk. Maintenance 0.5 g twice wkly.

Intramuscular

Palliative treatment of endometrial and renal carcinoma

Adult: Initially 0.4-1 g wkly. Reduce as necessary, maintenance may be as low as 0.4 g mthly.

Intramuscular

Palliative treatment of prostatic carcinoma

Adult: 0.5 g twice wkly for first 3 mth. Maintenance 0.5 g wkly.

Subcutaneous

Endometriosis

Adult: 104 mg every 12-14 wk.

	<i>Subcutaneous</i> Endometriosis Adult: 104 mg every 12-14 wk. <i>Subcutaneous</i> Contraception Adult: 104 mg every 12-14 wk.
Administration	May be taken with or without food. (Incidence of minor indigestion may increase as dose increases. Take w/ meals if necessary.)
Contraindications	Thromboembolic disorders; cerebral apoplexy; severe hepatic dysfunction; undiagnosed vaginal bleeding, incomplete abortion, hormone-dependent carcinoma; pregnancy.
Special Precautions	Patients with depression, DM, epilepsy, asthma, migraine, hypertension, renal or cardiac dysfunction. Monitor patient closely for loss of vision, proptosis, diplopia and thromboembolic disorders. Lactation.
Adverse Drug Reactions	Depression, fluid retention. Fatigue, insomnia, dizziness, headache, nausea; breast tenderness; wt gain/loss, anorexia; cholestatic jaundice; pain at Inj site. Potentially Fatal: Thrombophlebitis and pulmonary embolism.
Drug Interactions	Aminoglutethimide and enzyme-inducing drugs (e.g. carbamazepine, griseofulvin, phenobarbital, rifampicin, phenytoin) may reduce plasma concentrations leading to reduced efficacy. Additional measures required when medroxyprogesterone is used for contraception during coadministration with these drugs.
Lab Interference	Altered thyroid and liver function tests.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have

Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Mechanism of Action	Medroxyprogesterone is a synthetic progestogen which converts the proliferative phase of the endometrium into secretory phase. It has some androgenic and anabolic activities but no oestrogenic effects. Parenteral use leads to inhibition of pituitary gonadotropins, thus preventing follicular maturation and ovulation. Absorption: Well absorbed from the GIT (oral). Distribution: Enters the breast milk. Protein-binding: Highly bound to albumin. Metabolism: Hepatic. Excretion: Via the urine and faeces (as glucuronide conjugates); Elimination half-life: 24-30 hrs (oral), 50 days (IM).
CIMS Class	Oestrogens & Progesterones & Related Synthetic Drugs
ATC Classification	G03AC06 - medroxyprogesterone; Belongs to the class of progestogens. Used as systemic contraceptives. G03DA02 - medroxyprogesterone; Belongs to the class of pregnen (4) derivative progestogens used in progestogenic hormone preparations. L02AB02 - medroxyprogesterone; Belongs to the class of progestogens. Used in endocrine therapy.

mefenamic acid

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
mefenamic acid

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related mefenamic acid information

Indication & Dosage	<i>Oral</i> Mild to moderate pain, Rheumatoid arthritis, Dental pain, Postoperative pain, Dysmenorrhoea, Osteoarthritis, Menorrhagia Adult: 250-500 mg tid. Child: >6 mth: 25 mg/kg daily in divided doses for up to 7 days.
Administration	Should be taken with food.
Contraindications	Inflammatory bowel disease; peptic ulcer; neonates; pregnancy (3rd trimester), lactation. Coronary artery bypass graft surgery, severe renal impairment, severe heart failure.
Special Precautions	Renal and hepatic impairment, asthma. Monitor blood counts and liver function during long-term therapy. Drowsiness may affect ability to perform skilled tasks. Elderly.
Adverse Drug Reactions	Abdominal pain, dyspepsia, constipation, diarrhoea, nausea, GI ulcers; oedema; bronchospasm; headache, drowsiness, insomnia, visual disturbances; CHF, hypertension,

	Abdominal pain, dyspepsia, constipation, diarrhoea, nausea, GI ulcers; oedema; bronchospasm; headache, drowsiness, insomnia, visual disturbances; CHF, hypertension, tachycardia, syncope; urticaria, rash; thrombocytopenia, aplastic anaemia, agranulocytosis; tinnitus; elevated liver enzymes; abnormal renal function. Potentially Fatal: Autoimmune haemolytic anaemia; convulsions (overdosage).
Drug Interactions	Enhances activity of oral anticoagulants but rarely significant. Increases risk of GI irritation with alcohol. Increased ciclosporin, lithium toxicity and convulsions reported with ciprofloxacin. Absorption increased by magnesium hydroxide antacids. ACE inhibitor effects may be antagonised.
Lab Interference	False-positive test for bile in urine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 3rd trimester or near delivery. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Mefenamic acid inhibits the enzymes cyclooxygenase (COX)-1 and COX-2 and reduces the formation of prostaglandins and leukotrienes. It also acts as an antagonist at prostaglandin receptor sites. It has analgesic and

	(COX)-1 and COX-2 and reduces the formation of prostaglandins and leukotrienes. It also acts as an antagonist at prostaglandin receptor sites. It has analgesic and antipyretic properties with minor anti-inflammatory activity. Absorption: Absorbed from the GIT (oral); peak plasma concentrations after 2-4 hrs. Distribution: Enters breast milk (small amounts). >90% bound to plasma albumin. Apparent volume of distribution 1.06 l/kg. Metabolism: Hepatic via enzyme CYP2C9. Excretion: Urine (52%) as unchanged drug and metabolites; faeces (20%). Elimination half life 2-4 hrs.
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AG01 - mefenamic acid; Belongs to the class of non-steroidal antiinflammatory and antirheumatic products, fenamates. Used in the treatment of inflammation and rheumatism.

mefloquine

CIMS Class : (Antimalarials)
mefloquine

P - Caution when used during pregnancy
L - Caution when used during lactation

related mefloquine information

Indication & Dosage	<i>Oral</i> Malaria Adult: 20-25 mg/kg as a single dose or preferably in 2 or 3 divided doses at 6-8 hrs interval. Max dose 1.5 g. Child: 20-25 mg/kg taken in 2 divided doses. <i>Oral</i> Prophylaxis of malaria Adult: 250 mg once wkly taken 1-3 wk before exposure and continuing for 4 wk after leaving the malarious area. Child: <45 kg: 250 mg once wkly; 30-45 kg: 187.5 mg once wkly; 20-30 kg: 125 mg once wkly; 10-20 kg: 62.5 mg once wkly; 5-10 kg: 31.25 mg once wkly. Start prophylaxis 1-3 wk before exposure and continue for 4 wk after leaving malarious area.
Administration	Should be taken with food. (Best taken w/ meals & a full glass of water.)
Contraindications	Treatment with quinine during the preceding 12 hr. Prophylaxis in patients with history of psychiatric illness,

	Treatment with quinine during the preceding 12 hr. Prophylaxis in patients with history of psychiatric illness, seizure, hepatic disorder. Co-admin with halofantrine due to increased risk of cardiac arrhythmias.
Special Precautions	Epilepsy; delay admin until at least 12 hr after the last dose of quinine/quinine-related compounds (monitoring of cardiac and neurological functions is warranted). Avoid driving or operating machines during and up to 3 wk after mefloquine use. Pregnancy, lactation; cardiac conduction disturbances; children <3 mth or 5 kg.
Adverse Drug Reactions	Nausea, vomiting, abdominal pain, diarrhoea; dysphoria, dizziness; headache; sleep disorders; vertigo; neuropsychiatric reactions; bradycardia; visual/auditory disturbances; pruritus; sialorrhea, arthralgia and fatigue; syncope; extrasystole. Potentially Fatal: Seizures, thrombocytopenia, leucopenia, AV block, encephalopathy.
Drug Interactions	Mefloquine may compromise adequate immunization by live typhoid vaccine. Increased risk of ventricular arrhythmias with amiodarone, atomoxetine, ivrabradine, moxifloxacin, pimozide. Increased risk of cardiac toxicity and/or convulsions when used with quinidine, quinine, chloroquine and hydroxychloroquine. May antagonise anticonvulsant effects of antiepileptics. Bradycardia may occur with digoxin, calcium channel blockers and β-blockers. Potentially Fatal: Avoid concomitant use with halofantrine as potentially fatal cardiac arrhythmias may occur.
Pregnancy Category (US FDA)	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Mefloquine is a 4-methanolquinine antimalarial which acts as a blood schizontocide. It is active against most Plasmodium species and is used both as prophylaxis and treatment against malaria. Absorption: Well absorbed from the GIT (oral). Distribution: Widely distributed; small amount enters breast milk, crosses placenta. Protein-binding: 98% Metabolism: Hepatic (small amounts). Excretion: Urine (as unchanged drug and metabolites), faeces. Elimination half-life: 2-4 wk
CIMS Class	Antimalarials
ATC Classification	P01BC02 - mefloquine; Belongs to the class of methanolquinoline antimalarials. Used in the management of malarial infections.

megestrol

CIMS Class : (Hormonal Chemotherapy)
megestrol

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related megestrol information

Indication & Dosage	<i>Oral</i> Palliative treatment of breast carcinoma Adult: 40 mg 4 times daily or 160 mg once daily. <i>Oral</i> Palliative treatment of endometrial carcinoma Adult: 40-320 mg daily in divided doses. <i>Oral</i> Anorexia and cachexia in patients with cancer or AIDS Adult: Initial: 800 mg daily. Usual range: 400-800 mg daily. As suspension containing 625 mg megestrol acetate in 5 ml: 625 mg daily.
Administration	Standard formulation: Should be taken with food. Megace ES: May be taken with or without food.
Contraindications	Pregnancy and lactation. Severe hepatic impairment.
Special Precautions	History of thrombophlebitis, mild to moderate hepatic impairment, risk of fluid retention, history of depression, diabetes, hypertension, renal or cardiac dysfunction.
Adverse Drug	Acne, urticaria, fluid retention, wt gain, heart failure, nausea,

Adverse Drug Reactions	Acne, urticaria, fluid retention, wt gain, heart failure, nausea, vomiting, GI disturbances, changes in libido, breast discomfort, premenstrual symptoms, irregular menstrual cycles, depression, insomnia, somnolence, alopecia, hirsutism, anaphylactoid-like reaction, jaundice, hot flushes, adrenocortical suppression, nausea, carpal tunnel syndrome, hypercalcaemia, tumour flare, hypertension.
Drug Interactions	Concentrations of indinavir may be reduced. Possible reduced efficacy of cisplatin. Warfarin half life may be increased. Megestrol concentration may be decreased by aminoglutethimide and enzyme-inducing drugs.
Mechanism of Action	Megestrol is a progestogen used as an antineoplastic and appetite stimulant. The mechanism of its antineoplastic effects is not known but may be due to inhibition of oestrogen synthesis, modulation of other steroid hormones and/or a direct cytotoxic effect on tumour cells. Absorption: Variable absorption from the GIT (oral); peak plasma concentrations after 1-3 hrs. Distribution: Protein-binding: High. Metabolism: Hepatic. Excretion: Urine (as steroid metabolites and inactive compound), faeces.
CIMS Class	Hormonal Chemotherapy
ATC Classification	G03AC05 - megestrol; Belongs to the class of progestogens. Used as systemic contraceptives. G03DB02 - megestrol; Belongs to the class of pregnadien derivative progestogens used in progestogenic hormone preparations. L02AB01 - megestrol; Belongs to the class of progestogens.

derivative progestogens used in progestogenic hormone preparations.

L02AB01 - megestrol; Belongs to the class of progestogens.

Used in endocrine therapy.

melatonin

CIMS Class : (Supplements & Adjuvant Therapy)
melatonin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related melatonin information

Indication & Dosage	<i>Oral</i> Disturbed biorhythms, Sleep disorders Adult: Usual dose 3-6 mg at bedtime. Child: 2-3 mg at bedtime, increased after 1-2 wk to 4-6 mg if needed. Max dose 10 mg.
Contraindications	Pregnancy and lactation.
Special Precautions	May impair ability to drive or operate machinery. Epilepsy
Adverse Drug Reactions	Increased seizure activity; drowsiness, headache. Disruption of normal circadian rhythm. May worsen symptoms for individuals with depression.
Mechanism of Action	Melatonin is the hormone secreted by the pineal gland. In humans, the plasma levels of melatonin are high at night and low during the day and it appears to have a role in circadian rhythm regulation. This action of melatonin finds a possible place in the management of jet lag and other sleep disorders. Melatonin is also being used in the treatment of cluster headaches.

	place in the management of jet lag and other sleep disorders. Melatonin is also being used in the treatment of cluster headaches.
CIMS Class	Supplements & Adjuvant Therapy
ATC Classification	N05CH01 - melatonin;

meloxicam

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
meloxicam

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related meloxicam information

Indication & Dosage

Oral

Rheumatoid arthritis

Adult: 15 mg daily as a single dose. Patients with increased risk of adverse effects: Initially 7.5 mg.

Elderly: 7.5 mg daily for long-term treatment.

Oral

Ankylosing spondylitis

Adult: 15 mg daily as a single dose. Patients with increased risk of adverse effects: Initially 7.5 mg.

Elderly: 7.5 mg daily for long-term treatment.

Oral

Acute exacerbations of osteoarthritis

Adult: 7.5 mg daily up to a max of 15 mg as a single dose.

Elderly: 7.5 mg daily.

Oral

Juvenile rheumatoid arthritis

Child: ≥2 yr: 125 mcg/kg once daily. Max dose: 7.5 mg daily.

Rectal

	Juvenile rheumatoid arthritis Child: =2 yr: 125 mcg/kg ocne daily. Max dose: 7.5 mg daily. <i>Rectal</i> Ankylosing spondylitis Adult: 15 mg daily as a single dose. Patient with increased risk of adverse effects: Initially 7.5 mg. Limit use to the shortest time possible. Elderly: 7.5 mg daily. Limit use to the shortest time possible. <i>Rectal</i> Rheumatoid arthritis Adult: 15 mg daily as a single dose. Patient with increased risk of adverse effects: Initially 7.5 mg. Limit use to the shortest time possible. Elderly: 7.5 mg daily. Limit use to the shortest time possible. <i>Rectal</i> Acute exacerbations of osteoarthritis Adult: 7.5 mg daily up to a max of 15 mg daily as a single dose. Limit use to the shortest time possible. Elderly: 7.5 mg daily. Limit use to the shortest time possible.
Administration	May be taken with or without food. (May be taken w/ meals if GI discomfort occurs.)
Overdosage	Symptoms: Lethargy, drowsiness, nausea, vomiting, epigastric pain. Severe symptoms e.g. apnoea, metabolic acidosis, coma, nystagmus, seizures, leukocytosis, renal failure may occur. Management: Supportive and symptomatic. Multiple doses of charcoal may be needed; cholestyramine increases meloxicam clearance. Not dialysable.
Contraindications	Hypersensitivity to meloxicam, aspirin or other NSAIDs; severe hepatic impairment; bleeding disorders; renal failure without dialysis. Rectal admin in patients with proctitis, haemorrhoids or rectal bleeding.

	hypersensitivity to meloxicam, aspirin or other NSAIDs, severe hepatic impairment; bleeding disorders; renal failure without dialysis. Rectal admin in patients with proctitis, haemorrhoids or rectal bleeding.
Special Precautions	History of GI disease, asthma, hypertension, CVD or risk factors, fluid retention or heart failure. Monitor patients with advanced renal disease. May impair ability to drive or operate machinery. Elderly. Pregnancy (avoid in the 3rd trimester) and lactation.
Adverse Drug Reactions	Dyspepsia, headache, nausea, diarrhoea, upper respiratory tract infection, abdominal pain, dizziness, oedema, flatulence, influenza-like symptoms, back pain, muscle spasms, musculoskeletal pain, rash, anaemia. GI perforation, ulceration and/or bleeding. In children: Abdominal pain, vomiting, diarrhoea, headache, pyrexia. Potentially Fatal: Stevens Johnson syndrome, thrombocytopenia, interstitial nephritis and idiosyncratic liver abnormality.
Drug Interactions	May reduce effects of antihypertensives. Increased clearance with bile acid sequestrants e.g. colestyramine. Increased risk of renal failure with diuretics; may reduce natriuretic effects of furosemide and thiazides. May increase toxicity of methotrexate. Potentially Fatal: May increase plasma concentrations and toxicity of lithium. Increased risk of severe GI effects with aspirin, warfarin.
Food Interaction	Avoid herbal preparations or food with antiplatelet activity e.g. alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, coleus, cordyceps, dong quai, evening primrose, feverfew, fenugreek, garlic, ginger, ginkgo biloba, red clover, horse chestnut, grapeseed, green tea, ginseng, guggul, horse chestnut seed, horseradish, licorice, prickly

	primrose, feverfew, fenugreek, garlic, ginger, ginkgo biloba, red clover, horse chestnut, grapeseed, green tea, ginseng, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, sweet clover, turmeric, white willow.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 3rd trimester or near term. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 25°C (77°F).
Mechanism of Action	Meloxicam inhibits prostaglandin synthesis by reducing cyclooxygenase enzyme activity. This results in decreased production of prostaglandin precursors. Absorption: Well absorbed from the GI tract (oral). Distribution: Protein-binding: 99%. Metabolism: Extensively hepatic via oxidation pathway. Excretion: Via urine and faeces (as inactive metabolites); 20 hr (elimination half-life).
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AC06 - meloxicam; Belongs to the class of non-steroidal antiinflammatory and antirheumatic products, oxicams. Used in the treatment of inflammation and rheumatism.

melphalan

CIMS Class : (Cytotoxic Chemotherapy)
melphalan

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related melphalan information

Indication & Dosage

Oral

Multiple myeloma

Adult: 150 mcg/kg daily in divided doses for 4-7 days or 250 mcg/kg daily for 4 days or 6 mg daily for 2-3 wk. Usually combined with corticosteroids. Follow treatment course by a rest period of up to 6 wk to allow haematologic recovery. Then repeat the course or start maintenance treatment with 1-3 mg or up to 50 mcg/kg daily. For optimal effect, adjust therapy to produce moderate leucopenia (WBC counts of 3,000-3,500 cells/mm³).

Renal impairment: Dose reduction may be required.

Oral

Breast cancer

Adult: 150 mcg/kg daily or 6 mg/m² daily for 5 days, repeated every 6 wk.

Renal impairment: Dose reduction may be required.

Oral

repeated every 6 wk.

Renal impairment: Dose reduction may be required.

Oral

Ovarian carcinoma

Adult: 200 mcg/kg daily for 5 days every 4-8 wk.

Renal impairment: Dose reduction may be required.

Oral

Polycythemia vera

Adult: 6-10 mg daily for 5-7 days; 2-4 mg daily for remission induction. Maintenance dose: 2-6 mg wkly.

Renal impairment: Dose reduction may be required.

Intravenous

Ovarian adenocarcinoma

Adult: 1 mg/kg as a single dose repeated in 4 wk if platelet and neutrophil counts permit. May be infused in sodium chloride 0.9% or inj into the tubing of a fast-running drip.

Renal impairment: Reduce dose by 50%.

Intravenous

Multiple myeloma

Adult: 400 mcg/kg or 16 mg/m² infused over 15-20 min.

First 4 doses may be given every 2 wk and further doses given every 4 wk depending on toxicity. High-dose regimen: 100-200 mg/m² followed by autologous stem cell rescue which is essential if doses exceed 140 mg/m², to be given through a central venous catheter.

Renal impairment: Conventional dose: Reduce dose by 50%. High-dose regimen: Not recommended in moderate to severe impairment.

Intravenous

Neuroblastoma

Adult: High-dose regimen: 100-240 mg/m² followed by autologous stem cell rescue which is essential if doses are >140 mg/m². Give through a central venous catheter.

Neuroblastoma

Adult: High-dose regimen: 100-240 mg/m² followed by autologous stem cell rescue which is essential if doses are >140 mg/m². Give through a central venous catheter.

Renal impairment: High-dose regimen: Not recommended in moderate to severe impairment.

Intra-arterial

Melanoma

Adult: Upper extremity perfusions: 0.6-1 mg/kg. Lower extremity perfusions: 0.8-1.5 mg/kg (in melanoma) or 1-1.4 mg/kg (in sarcoma).

Renal impairment: Reduce dose by 50%.

Intra-arterial

Soft tissue sarcoma

Adult: Upper extremity perfusions: 0.6-1 mg/kg. Lower extremity perfusions: 0.8-1.5 mg/kg (in melanoma) or 1-1.4 mg/kg (in sarcoma).

Renal impairment: Reduce dose by 50%.

Reconstitution: Inj must be prepared fresh. Keep to a minimum (<60 min) the time between reconstitution/dilution and admin. Dissolve powder initially with diluent 10 ml to a concentration of 5 mg/ml. Shake vigorously to dissolve. Immediately dilute in 250-500 ml normal saline to a concentration of 0.1-0.45 mg/ml.

Incompatibility: Dextrose 5% in water, Lactated Ringer's; variable stability in normal saline.

Administration

Should be taken on an empty stomach. (Take on an empty stomach 1 hr before or 2 hr after meals.)

Overdosage

Symptoms: Hypocalcaemia, hyponatraemia, pulmonary fibrosis, severe nausea and vomiting, diarrhoea, GI haemorrhage, mucositis, stomatitis, bone marrow suppression. Deaths have been reported (IV). Management:

	Symptoms: Hypocalcaemia, hyponatraemia, pulmonary fibrosis, severe nausea and vomiting, diarrhoea, GI haemorrhage, mucositis, stomatitis, bone marrow suppression. Deaths have been reported (IV). Management: Symptomatic and supportive. Closely monitor haematologic function for 3-6 wk. Growth factor support, transfusions and antibiotics may be considered. Not removed by haemodialysis.
Contraindications	Hypersensitivity. Severe bone marrow suppression. Pregnancy.
Special Precautions	Renal impairment. Lactation. Prior bone marrow suppression, prior chemotherapy or irradiation. May mask signs of infection e.g. fever and increased WBC. Elderly.
Adverse Drug Reactions	Diarrhoea, stomatitis, vomiting; haemolytic anaemia, vasculitis, pulmonary fibrosis, hepatic disorders, suppression of ovarian function in premenopausal women, temporary or permanent sterility in male patients. Allergic reactions. Potentially Fatal: Bone marrow suppression. Secondary malignancy, cardiac arrest. Anaphylaxis.
Food Interaction	Food significantly reduces oral absorption. Avoid excessive alcohol intake.
Lab Interference	False-positive Coombs' test.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at room temperature (15-30°C). Protect from light. Oral: Store in a refrigerator at 2-8°C (36-46°F). Protect from light.
Mechanism of Action	Melphalan, a mechlorethamine derivative, is an alkylating antineoplastic agent. It forms carbonium ions, resulting in

	Melphalan, a mechlorethamine derivative, is an alkylating antineoplastic agent. It forms carbonium ions, resulting in DNA and RNA synthesis inhibition. It cross-links DNA strands and acts on both resting and rapidly dividing tumour cells. Absorption: Variable absorption from the GI tract; absorption reduced by food (oral). Distribution: Rapid throughout body water. Protein-binding: 50-60%, mainly to albumin. Metabolism: Inactivated by hydrolysis. Excretion: Via urine (10%, as unchanged drug); 30-150 min (terminal half-life).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01AA03 - melphalan; Belongs to the class of alkylating agents, nitrogen mustard analogues. Used in the treatment of cancer.

menotrophin

CIMS Class : (Trophic Hormones & Related Synthetic Drugs)
menotrophin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related menotrophin information

Indication & Dosage

Parenteral

Female infertility

Adult: Dosage and schedule depends on patient's needs. Dose is given via IM/SC admin to provide 75-150 units of FSH daily. Adjust dose gradually until adequate response is achieved. Once reached, stop menotrophin admin and induce ovulation by administering chorionic gonadotrophin 1-2 days later at doses of 5,000-10,000 units. In menstruating patients, start treatment within the 1st 7 days of the menstrual cycle; may repeat cycle at least twice more if needed. Alternatively, admin 3 equal doses of menotrophin (each providing 225-375 units of FSH) on alternate days, followed by chorionic gonadotrophin 1 wk after the 1st dose.

Parenteral

In vitro fertilisation procedures or other assisted conception techniques

Adult: As monotherapy or in conjunction with clomiphene citrate or gonadorelin agonist: Dose providing 75-300 units of FSH is admin daily via IM/SC inj to stimulate follicular growth,

Conception techniques

Adult: As monotherapy or in conjunction with clomiphene citrate or gonadorelin agonist: Dose providing 75-300 units of FSH is admin daily via IM/SC inj to stimulate follicular growth, usually started on the 2nd or 3rd of the menstrual cycle and continued until adequate response is obtained. After the final inj of menotrophin, this is followed by chorionic gonadotrophin 1-2 days later to stimulate egg maturation. Admin human chorionic gonadotrophin only if there are at least 3 follicles >17 mm in diameter with 17- β -oestradiol levels =3500 pmol/L (920 picograms/ml). Egg retrieval may be carried out 32-36 hr after the human chorionic gonadotrophin inj.

Parenteral

Male infertility

Adult: In conjunction with chorionic gonadotrophin (1000 - 2000 IU 2-3 times wkly): Menotrophin is admin at a dose providing 75 or 150 units of FSH via IM/SC inj 2-3 times wkly, continue treatment for at least 3-4 mth.

Reconstitution: Reconstitute with the provided diluent before use.

Overdosage

Symptoms: Ovarian hyperstimulation, ranging from mild to severe. Management: In mild to moderate hyperstimulation: Bed rest, close observation and symptomatic relief. In severe hyperstimulation: Treatment is conservative and aims at restoring blood volume and preventing shock. If conception does not occur, acute symptoms will go away after several days and ovaries return to normal in 20 - 40 days. If conception occurs, symptoms may be prolonged.

Contraindications

Pregnancy & lactation. Ovarian cysts or enlarged ovaries (not due to polycystic ovarian syndrome), uncontrolled thyroid and adrenal dysfunction, organic intracranial lesions

	Pregnancy & lactation. Ovarian cysts or enlarged ovaries (not due to polycystic ovarian syndrome), uncontrolled thyroid and adrenal dysfunction, organic intracranial lesions (e.g. pituitary tumours), abnormal genital bleeding of unknown cause, presence of other causes of infertility other than anovulation (unless they are candidates of in vitro-fertilisation), hormone sensitive tumours e.g. breast, uterus, prostate, ovaries or testes. Primary ovarian failure, malformation of sexual organs or fibroid tumours of the uterus incompatible with pregnancy, structural abnormalities such as tubal occlusion (unless superovulation is to be induced), ovarian dysgenesis, absent uterus or premature menopause.
Special Precautions	In females: Monitor ovarian activity and measure urinary oestrogen at regular intervals, until stimulation occurs. Discontinue menotrophin treatment and withhold human chorionic gonadotrophin if urinary oestrogen levels >540 nmol/24 hr, or if plasma 17 β-oestradiol levels >3000 pmol/l, or if there is any sharp rise in values. Refrain from sexual intercourse or use barrier contraception methods for at least 4 days and pelvic examinations to be avoided or carried out with care.
Adverse Drug Reactions	Ovarian enlargement, ovarian cysts, enlarged abdomen, GI disturbances (e.g. nausea, vomiting, diarrhoea, abdominal pain or cramps, bloating), inj site reactions, headache, dizziness, tachycardia, dyspnoea, tachypnoea, hypersensitivity reactions. Multiple births and miscarriages. Potentially Fatal: Ovarian Hyperstimulation Syndrome, severe pulmonary conditions (e.g atelectasis, acute respiratory distress syndrome) and thromboembolic events.
Drug Interactions	Increased follicular response with clomiphene citrate. Higher dose of menotrophin needed when gonadotropin-releasing

	Increased follicular response with clomiphene citrate. Higher dose of menotrophin needed when gonadotropin-releasing hormone agonist is used for pituitary desensitisation.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Parenteral: Store =25°C. Protect from light.
Mechanism of Action	Menotrophins, a purified extract of human post-menopausal urine, contain follicle-stimulating hormone (FSH) and luteinising hormone (LH) in a ratio of 1:1. The biological effectiveness of menotrophins is mainly due to its FSH content. In the ovaries, the FSH-component increases the quantity of growing follicles and stimulates their development. Under the influence of LH, FSH increases oestradiol production in the granulosa cells. In the testes, FSH induces the maturation of Sertoli cells and the seminal canals and the development of the spermatozoa. Absorption: Max FSH serum levels reached: 18 hr (IM inj) and 12 hr (SC inj). Excretion: Half-life: 55 hr (IM inj) and 50 hr (SC inj). Mainly excreted by kidneys.
CIMS Class	Trophic Hormones & Related Synthetic Drugs

mephentermine

CIMS Class : (Vasoconstrictors)
mephentermine

P - Caution when used during pregnancy

L - Caution when used during lactation

related mephentermine information

Indication & Dosage	<i>Intravenous</i> Maintenance of blood pressure in hypotensive states Adult: 30-45 mg as a single dose, repeated as necessary or followed by IV infusion of 0.1% mephentermine in 5% dextrose, rate and duration of administration will depend on patient's response. <i>Intravenous</i> Hypotension secondary to spinal anaesthesia in obstetric patients Adult: 15 mg as a single dose, repeat if needed.
Contraindications	Hypotension caused by phenothiazines. Hypertension. Phaeochromocytoma.
Special Precautions	Patient on MAOIs. For shock due to loss of blood or fluid, give fluid replacement therapy primarily, CVS disease, hypertension, hyperthyroidism, chronic illnesses. Lactation, pregnancy.
Adverse Drug Reactions	Drowsiness, incoherence, hallucinations, convulsions, tachycardia. Fear, anxiety, restlessness, tremor, insomnia,

	Drowsiness, incoherence, hallucinations, convulsions, tachycardia. Fear, anxiety, restlessness, tremor, insomnia, confusion, irritability and psychosis. Nausea, vomiting, reduced appetite, urinary retention, dyspnoea, weakness. Potentially Fatal: AV block, CNS stimulation. Cerebral haemorrhage and pulmonary oedema, ventricular arrhythmias.
Drug Interactions	Antagonises effect of hypotensive agents. Severe hypertension with MAOIs and possibly TCAs. Additive vasoconstricting effects with ergot alkaloids, oxytocin. Potentially Fatal: Risk of arrhythmia in patients undergoing anesthesia with cyclopropane and halothane.
Mechanism of Action	Mephentermine appears to act by indirect stimulation of β-adrenergic receptors causing the release of norepinephrine from its storage sites. It has a positive inotropic effect on the myocardium. AV conduction and refractory period of AV node is shortened with an increase in ventricular conduction velocity. It dilates arteries and arterioles in the skeletal muscle and mesenteric vascular beds, leading to an increase in venous return. Onset: 5-15 minutes (IM), immediate (IV). Duration: 4 hr (IM), 30 minutes (IV). Metabolism: Rapidly demethylated in the body followed by hydroxylation. Excretion: Via urine (as unchanged and metabolites); more rapid in acidic urine.
CIMS Class	Vasoconstrictors
ATC Classification	C01CA11 - mephentermine; Belongs to the class of adrenergic and dopaminergic cardiac stimulants excluding glycosides. Used in the treatment of heart failure.

mercaptopurine

CIMS Class : (Cytotoxic Chemotherapy)
mercaptopurine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related mercaptopurine information

Indication & Dosage	<i>Oral</i> Acute lymphatic leukaemia Adult: Usual maintenance dose: Initially, 1.5-2.5 mg/kg daily as a single dose, usually used in combination with methotrexate. Dose may vary individually based on response and tolerance. Monitor blood counts at least once wkly. Withdraw treatment immediately if there is a sharp drop in the white cell count or severe bone-marrowdepression. May resume treatment slowly and carefully if white cell count remains constant for 2-3 days or rises. Reduce dose when used with allopurinol. Child: Usual maintenance dose: Initially, 1.5-2.5 mg/kg daily as a single dose, usually used in combination with methotrexate. Dose may vary individually based on response and tolerance. Monitor blood counts at least once wkly. Withdraw treatment immediately if there is a sharp drop in the white cell count or severe bone-marrow depression. May resume treatment slowly and carefully if white cell count remains constant for 2-3 days or rises.

	why. Withdraw treatment immediately if there is a sharp drop in the white cell count or severe bone-marrow depression. May resume treatment slowly and carefully if white cell count remains constant for 2-3 days or rises. Reduce dose when used with allopurinol. Renal impairment: Dosage may need to be reduced. Hepatic impairment: Dosage may need to be reduced <i>Oral</i> Crohn's disease Adult: Initially 1-1.5 mg/kg daily, may increase to 125 mg daily. Child: Initially 1-1.5 mg/kg daily increased to a max of 75 mg daily Renal impairment: Dosage may need to be reduced. Hepatic impairment: Dosage may need to be reduced. Special Populations: Dosage adjustment in patients with thiopurine-S-methyl transferase (TPMT) deficiency to prevent life-threatening myelotoxicity. For patients with homozygous TPMT deficiency: Substantial reduction is required. For patients with heterozygous TPMT deficiency: Some may require reduction but most will tolerate the usual dosages.
Administration	Should be taken on an empty stomach. (Best taken on an empty stomach 1 hr before or 2 hr after meals. Ensure adequate fluid intake.)
Contraindications	Pregnancy and lactation. Prior resistance to mercaptopurine or thioguanine; severe liver disease; severe bone marrow suppression.
Special Precautions	Hepatic or renal dysfunction; monitor hepatic function periodically. Mercaptopurine is potentially carcinogenic. Thiopurine S-methyl transferase (TPMT) deficiency; porphyria.

	Hepatic or renal dysfunction; monitor hepatic function periodically. Mercaptopurine is potentially carcinogenic. Thiopurine S-methyl transferase (TPMT) deficiency; porphyria.
Adverse Drug Reactions	Hyperuricaemia, bone marrow toxicity, hypoplasia, anorexia, diarrhoea, leukopenia, thrombocytopenia, intestinal ulceration, crystalluria with haematuria, immunosuppression, interstitial pneumonitis. Cutaneous hyperpigmentation, alopecia. Potentially Fatal: Myelosuppression; hepatotoxicity, cholestatic jaundice.
Drug Interactions	Anticoagulant action of warfarin may be inhibited by mercaptopurine. Enhanced toxicity with myelosuppressive drugs. Potentially Fatal: Effects enhanced by allopurinol (reduce dose of mercaptopurine). Other hepatotoxic drugs (e.g. doxorubicin) potentiate toxicity.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 20-25°C
Mechanism of Action	Mercaptopurine is a purine antagonist which is converted intracellularly into its active nucleotides, including thioinosinic acid. The nucleotides inhibit several reactions which ultimately interferes with nucleic acid synthesis and prevents the formation of RNA and DNA. Absorption: Variable and incomplete; peak plasma concentrations within 2 hr (oral). Distribution: Widely distributed; crosses the blood-brain barrier and CSF.

	concentrations within 2 hr (oral). Distribution: Widely distributed; crosses the blood-brain barrier and CSF. Metabolism: Hepatic by methylation, oxidation and formation of inorganic sulfates. Excretion: Urine (as metabolites and unchanged drug).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01BB02 - mercaptopurine; Belongs to the class of antimetabolites, purine analogues. Used in the treatment of cancer.

meropenem

CIMS Class : (Other Beta-lactams)
meropenem

P - Caution when used during pregnancy

L - Caution when used during lactation

related meropenem information

Indication & Dosage

Intravenous

Susceptible infections

Adult: 0.5-1 g every 8 hr.

Child: Neonate: <7 days: 20 mg/kg 12 hrly (severe infection 40 mg/kg 12 hrly); 7-28 days: 20 mg/kg 8 hrly (severe infection 40 mg/kg 8 hrly). 1-3 mth: 10 mg/kg 8 hrly; >3 mth and <50 kg: 10-20 mg/kg 8 hrly.

Renal impairment: Haemodialysis: Usual dose after dialysis session.

CrCl (ml/min)	Dosage Recommendation
26-50	Normal dose 12 hrly.
10-25	Half normal dose 12 hrly.
<10	Half normal dose 24 hrly.

Intravenous

Meningitis

Adult: 2 g every 8 hr.

Child: >3 mth and <50 kg: 40 mg/kg every 8 hr.

Renal impairment: Haemodialysis: Usual dose after dialysis session.

Adult: 2 g every 8 hr.

Child: >3 mth and <50 kg: 40 mg/kg every 8 hr.

Renal impairment: Haemodialysis: Usual dose after dialysis session.

CrCl (ml/min)	Dosage Recommendation
26-50	Normal dose 12 hrly.
10-25	$\frac{1}{2}$ normal dose 12 hrly.
<10	$\frac{1}{2}$ normal dose 24 hrly

Intravenous

Cystic fibrosis

Adult: Up to 2 g every 8 hr.

Child: 4-18 yr: 25-40 mg/kg every 8 hr.

Renal impairment: Haemodialysis: Usual dose after dialysis session.

CrCl (ml/min)	Dosage Recommendation
26-50	Normal dose 12 hrly.
10-25	$\frac{1}{2}$ normal dose 12 hrly
<10	$\frac{1}{2}$ normal dose 24 hrly

Intravenous

Skin and skin structure infections

Adult: 500 mg every 8 hr.

Child: =3 mth: <50 kg: 10 mg/kg (max: 500 mg) every 8 hr;
>50 kg: 500 mg every 8 hr.

Renal impairment: Haemodialysis: Usual dose after dialysis session.

CrCl (ml/min)	Dosage Recommendation
26-50	Normal dose 12 hrly.
10-25	Half normal dose 12 hrly.
<10	Half normal dose 24 hrly.

Intravenous

Intra-abdominal infections

Adult: 1 g every 8 hr.

Child: =3 mth: <50 kg: 20 mg/kg (max: 1 g) every 8 hr; >50

	Intra-abdominal infections	
	Adult: 1 g every 8 hr.	
	Child: =3 mth: <50 kg: 20 mg/kg (max: 1 g) every 8 hr; >50 kg: 1 g every 8 hr.	
	Renal impairment: Haemodialysis: Usual dose after dialysis session.	
	CrCl (ml/min)	Dosage Recommendation
	26-50	Normal dose 12 hrly.
	10-25	Half normal dose 12 hrly.
	<10	Half normal dose 24 hrly.
	Intravenous	
	Diabetic foot infection	
	Adult: 1 g every 8 hr.	
	Child: =3 mth: <50 kg: 20 mg/kg (max: 1 g) every 8 hr; >50 kg: 1 g every 8 hr.	
	Renal impairment: Haemodialysis: Usual dose after dialysis session.	
	CrCl (ml/min)	Dosage Recommendation
	26-50	Normal dose 12 hrly.
	10-25	Half normal dose 12 hrly.
	<10	Half normal dose 24 hrly.
	Reconstitution: Direct inj or infusion: add 10 ml of sterile water to 500 mg or 20 ml of sterile water to 1 g. Can be further diluted with compatible IV solution (50-200 ml).	
	Incompatibility: Admixture: Amphotericin B, metronidazole and multivitamins. Y-site: Amphotericin B, diazepam and metronidazole. Syringe: Pantoprazole.	
Overdosage	Treatment: symptomatic. In normal patients, rapid renal elimination will occur. In patients with renal impairment, haemodialysis will remove meropenem and metabolite.	
Contraindications	Hypersensitivity.	

	Hypersensitivity.
Special Precautions	History of hypersensitivity to carbapenem, pencillins or other β -lactam antibiotics; infants <3 mth; renal insufficiency; neurological disorders; pregnancy, lactation. Not recommended for use in MRSA.
Adverse Drug Reactions	Diarrhoea, nausea, vomiting, abdominal pain; headache; constipation; rash, pruritus, urticaria; apnoea; phlebitis, thrombophlebitis, swelling and pain at inj site; disturbances in LFTs (may cause increases in serum transaminases, alkaline phosphatase, lactic dehydrogenase). Rarely: erythema multiforme; eosinophilia, thrombocytopenia, leucopenia, neutropenia; seizures and CNS effects reported in patients with underlying CNS disorders or renal impairment. Potentially Fatal: Anaphylaxis; pseudomembranous colitis; Stevens-Johnsons syndrome.
Drug Interactions	Serum levels may be increased by probenecid. May reduce serum valproic acid levels; sub-therapeutic levels may be reached in some patients.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Once reconstituted, up to 2 hr at 15-25°C or up to 12 hr at 4°C.
Mechanism of Action	Meropenem is a carbapenem that works by inhibiting the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls by binding to one or more of the

	Meropenem is a carbapenem that works by inhibiting the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls by binding to one or more of the penicillin-binding proteins (PBPs), thus inhibiting cell wall biosynthesis resulting to bacterial lysis. Distribution: Widely distributed into body tissues and fluids; CSF; bile. Metabolism: More stable to renal dehydropeptidases; converted to one inactive metabolite. Excretion: Via urine within 12 hr by glomerular filtration and tubular secretion (70% unchanged). Elimination half-life: 1 hr. Removed by dialysis.
CIMS Class	Other Beta-lactams
ATC Classification	J01DH02 - meropenem; Belongs to the class of carbapenems. Used in the treatment of systemic infections.

mesalazine

CIMS Class : (GIT Regulators, Antiflatulents & Anti-inflammatories)
mesalazine

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab - Lab interference

related mesalazine information

Indication & Dosage

Oral

Ulcerative colitis

Adult: Dose is dependant on preparation and brand used.

Pentasa® tablets: Acute attack: Initially, up to 4 g daily in 2-3 divided doses; maintenance of remission: Initially, 1.5 g daily in 2-3 divided doses, adjust subsequently based on

response. Pentasa® granules: Acute attack: Initially, up to 4 g daily in 2-4 doses; maintenance of remission: 2 g daily in 2 divided doses. Asacol® tablets: Acute attack: Initially, 2.4 g daily in divided doses; maintenance of remission: 1.2-2.4 g daily in divided doses. Salofalk® tablets: Acute attack:

Initially, 1.5 g daily in 3 divided doses; maintenance of remission: 0.75-1.5 g daily in divided doses. Salofalk® granules: Acute attack: Initially, 1.5-3 g daily in 1-3 divided doses; maintenance of remission: 1.5 g daily in 3 divided doses.

Child: Dose is dependant on preparation and brand used.

Pentasa® tablets: 5-15 yr: Acute attack: 15-20 mg/kg (max:

doses.

Child: Dose is dependant on preparation and brand used.

Pentasa® tablets: 5-15 yr: Acute attack: 15-20 mg/kg (max: 1 g) tid; maintenance of remission: 10 mg/kg (max: 500 mg) 2-3 times daily.

Pentasa® granules: 5-12 yr: Acute attack: 15-20 mg/kg (max: 1 g) tid; maintenance of remission: 10 mg/kg (max: 500 mg) 2-3 times daily. Asacol® tablets: 12-18 yr: Acute attack: Initially, 2.4 g daily in divided doses; maintenance of remission: 1.2-2.4 g daily in divided doses.

Salofalk® tablets: 12-18 yr: Acute attack: Initially, 1.5 g daily in 3 divided doses; maintenance of remission: 250-500 mg 2-3 times daily. Salofalk® granules: 6-12 yr: Acute attack: 10-15 mg/kg (max: 1 g) tid; maintenance of remission: 7.5-15 mg/kg (max: 500 mg) bid or 250 mg tid for patients weighing <40 kg.

CrCl (ml/min)	Dosage Recommendation
<20	Avoid.

Hepatic impairment: Avoid in severe impairment.

Rectal

Ulcerative proctitis

Adult: Pentasa® suppository or suspension enema: 1 g daily. Asacol® suppository: 0.75-1.5 g daily in divided doses; Asacol® foam enema: 1 g daily if disease affects the rectosigmoid regions or 2 g daily if disease affects the descending colon. Salofalk® suppository: 0.5-1 g bid-tid; Salofalk® foam or suspension enema: 2 g daily.

Child: As suppository: Pentasa®: 12-18 yr: 1 g daily for 2-4 wk. Salofalk®: 12-18 yr: 0.5-1 g bid-tid according to response.

CrCl (ml/min)	Dosage Recommendation
<20	Avoid.

Hepatic impairment: Avoid in severe impairment.

Administration

Should be taken with food. (Take after meals.)

Administration	Should be taken with food. (Take after meals.)
Contraindications	Hypersensitivity to mesalazine, salicylates and sulfasalazine. Severe impaired renal (CrCl < 20 ml/min) or hepatic function. Children <2 yr.
Special Precautions	Mild to moderate impaired renal or hepatic function (test serum creatinine before treatment, every 3 mth for 1st yr, every 6 mth for next 4 yr, then annually). Elderly; active peptic ulcer; pregnancy, lactation; patients predisposed to pericarditis or myocariditis. Counsel patients to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise during treatment; perform blood count and stop treatment if blood dyscrasias suspected. Counsel patients taking delayed release tablets to report repeatedly unbroken or partially broken tablets in their faeces. Pyloric stenosis may delay release into colon.
Adverse Drug Reactions	Abdominal pain (if new abdominal pain - consider pancreatitis); headache, nausea; flu; fatigue; fever, rash; sore throat; diarrhoea; joint pain; dizziness; bloating; back pain; haemorrhoids; itching; rectal pain, constipation; hair loss; intolerance syndrome; peripheral oedema; UTI; myocarditis, pre-existing pericarditis; pancreatitis; nephritis; hepatitis; lupus-like syndrome; alopecia; myalgia, arthralgia; increased liver enzyme values. Potentially Fatal: Blood dyscrasias, aplastic anaemia, agranulocytosis; renal toxicity.
Drug Interactions	Do not give with lactulose or other drugs which lower pH for they prevent release of mesalazine. May decrease digoxin absorption.
Lab Interference	Interferes with tests for glucosuria using copper reagents and

	Interferes with tests for glucosuria using copper reagents and for urobilinogen using Ehrlick's reagent.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Tablets: store at below 25°C. Capsule: protect from light and store at 15-30°C. Rectal: Store <25°C; may be refrigerated; do not freeze. Protect from direct heat, light and humidity.
Mechanism of Action	Mesalazine is considered to be the active moiety of sulfasalazine. The mechanism of action is uncertain, but may be due to its ability to inhibit local chemical mediators of the inflammatory response especially leukotriene synthesis in the GI mucosa. Action may be topical in terminal ileum and colon rather than systemic. Absorption: Absorption variable, depending on formulation and route of admin. Distribution: Enters breast milk and crosses placenta (small amounts) after oral dosing; protein-binding: 40-80%. Distribution into other tissues: variable depending on route of admin. Metabolism: Exact metabolism pathways not established. Main site of metabolism is probably liver with some N-acetylation occurring in the intestinal wall and/or lumen (where intestinal flora are involved in the acetylation). Excretion: Dependant upon route of admin. Eliminated via urine <8% as unchanged metabolites) and faeces (<2%).

	(where intestinal flora are involved in the acetylation). Excretion: Dependant upon route of admin. Eliminated via urine <8% as unchanged metabolites) and faeces (<2%).
CIMS Class	GIT Regulators, Antiflatulents & Anti-inflammatories
ATC Classification	A07EC02 - mesalazine; Belongs to the class of aminosalicyclic acid and similar antiinflammatory. Used in the treatment of intestinal inflammation.

mesna

CIMS Class : (Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence) , (Cough & Cold Preparations)
mesna

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab - Lab interference

related mesna information

Indication & Dosage

Oral

Prophylaxis against urothelial toxicity

Adult: Refer to individual and local protocol. Dose calculated according to cytotoxic dose. Normally given at a dose =cytotoxic dose. Duration of treatment should be as long as cytotoxic treatment; plus the time it takes for concentration of antineoplastic metabolites in urine to fall.

Child: Refer to individual and local protocol.

Intravenous

Prophylaxis against urothelial toxicity

Adult: Refer to individual and local protocol. Dose calculated according to cytotoxic dose. Normally given at a dose =cytotoxic dose. Duration of treatment should be as long as cytotoxic treatment; plus the time it takes for concentration of antineoplastic metabolites in urine to fall. Administered either by short (15-30 minutes) or continuous (24 hr) infusion.

Child: Refer to individual and local protocol. Has been used

	antineoplastic metabolites in urine to fall. Administered either by short (15-30 minutes) or continuous (24 hr) infusion. Child: Refer to individual and local protocol. Has been used in children >4 mth. <i>Inhalation</i> Mucolytic in cystic fibrosis Adult: Used when other mucolytics have failed to reduce sputum viscosity. 3-6 ml of 20% solution is nebulised bid. Child: Used when other mucolytics have failed to reduce sputum viscosity. 3-6ml of 20% solution is nebulised bid. Reconstitution: Dilute in flavoured syrup, water, milk, carbonated drinks or apple or orange juice.
Administration	May be taken with or without food.
Contraindications	Hypersensitivity to thiol-containing compounds.
Special Precautions	Protective effect applies only to the urinary tract; pregnancy, lactation. Patients with auto-immune disorders. IV formulation may contain benzyl alcohol as a preservative; avoid in neonates or infants. Instruct patients to seek medical attention if discolouration of urine occurs. During treatment, monitor urine for erythrocytes and haematuria. Maintain adequate hydration in all patients. Patients who vomit within 2 hr of oral dose should repeat dose or receive IV dose.
Adverse Drug Reactions	Nausea, vomiting, colic, diarrhoea, anorexia, dyspepsia, unpleasant taste, constipation; headache, malaise, fatigue, depression, irritability, somnolence, hyperaesthesia, dizziness, confusion; rash, pruritus, generalised urticaria, alopecia, inj site reactions, flushing; leucopenia, thrombocytopenia, anaemia, granulocytopenia, chest pain, oedema (peripheral, facial and periorbital), hypotension, tachycardia, hypertension, increased heart rate, ST-segment elevation; dyspnoea, coughing, pneumonia, tachypnea;

	oedema (peripheral, facial and periorbital), hypotension, tachycardia, hypertension, increased heart rate, ST-segment elevation; dyspnoea, coughing, pneumonia, tachypnea; fever; hypocalcaemia; increased sweating; back pain, limb pain, myalgia; increased hepatic enzyme concentrations; pharyngitis; ulceration of mucous membranes. In patients receiving oral and/or IV mesna and were specifically not treated with concurrent cytotoxic therapy: flatulence; rhinitis; rigors; back pain; rash; conjunctivitis; arthralgia. Inhalation: bronchospasm. Potentially Fatal: May cause haemorrhagic cystitis, systemic anaphylactic reactions.
Lab Interference	False-positive result in diagnostic tests for urinary ketones and may produce a false-positive or negative result in diagnostic tests for urinary erythrocytes.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Inhalation: Inj: 15-30°C. Multi-dose vials may be used for 8 days after 1st entry. Discard single use vials immediately after use; mesna is easily oxidised when exposed to the atmosphere. After dilution with a suitable diluent, concentrations of mesna 20 mg/ml are chemically and physically stable for 24 hr at 25°C. Intravenous: Inj: 15-30°C. Multi-dose vials may be used for 8 days after 1st entry. Discard single use vials immediately after use; mesna is easily oxidised when exposed to the atmosphere. After dilution with a suitable diluent, concentrations of mesna 20 mg/ml are chemically and physically stable for 24 hr at 25°C.

easily oxidised when exposed to the atmosphere. After dilution with a suitable diluent, concentrations of mesna 20 mg/ml are chemically and physically stable for 24 hr at 25°C. Do store in glass or plastic syringes with Luer-Lok® fittings for >12 hr as particulates may form. Chemically stable for at least 24 hr when admixed with ifosfamide and cyclophosphamide in 5% dextrose or lactated Ringer's. **Oral:** Tablet: Store at 20-25°C. Oral solution: Solutions containing mesna 20 or 50 mg/ml in flavoured syrup are stable for 7 days at 25°C. Solutions containing mesna 2, 10 or 50 mg/ml in carbonated drinks or apple or orange juice are stable for at least 24 hr at 5°C.

Mechanism of Action

Mesna is used to prevent urothelial toxicity associated with oxazaphosphorine, ifosfamide or cyclophosphamide. It acts in the kidney; reacting with thiol groups of urotoxic metabolites (e.g. acrolein) of ifosfamide and cyclophosphamide. It is used as a mucolytic in the management of some respiratory tract conditions e.g. cystic fibrosis where other mucolytics have failed. It acts by reducing the viscosity of pulmonary secretions; the drug's free sulfhydryl group is thought to reduce disulfide linkages of mucoproteins.

Absorption: Oral bioavailability: 45-79%. Time to plasma peak: 2-3 hr.

Distribution: No tissue penetration. Protein-binding: 69-75%.

Metabolism: In blood, rapidly oxidised to mesna disulfide and then reduced back to mesna after glomerular filtration into renal tubules.

Excretion: Via urine: As unchanged drug (18-26%) and metabolites. Half-life elimination: Mesna: 24 minutes; Mesna disulfide: 72 minutes.

	Excretion: Via urine: As unchanged drug (18-26%) and metabolites. Half-life elimination: Mesna: 24 minutes; Mesna disulfide: 72 minutes.
CIMS Class	Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence / Cough & Cold Preparations
ATC Classification	R05CB05 - mesna; Belongs to the class of mucolytics. Used in the treatment of wet cough. V03AF01 - mesna; Belongs to the class of detoxifying agents used in antineoplastic treatment.

mesterolone

CIMS Class : (Androgens & Related Synthetic Drugs)
mesterolone

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related mesterolone information

Indication & Dosage	<i>Oral</i> Androgen deficiency, Infertility due to hypogonadism Adult: Initially, 75-100 mg daily in divided doses. Maintenance: 50-75 mg daily in divided doses.
Administration	May be taken with or without food.
Contraindications	Prostatic or breast carcinoma. Previous or existing hepatic tumours. Pregnancy and lactation.
Special Precautions	Regularly examine the prostate and breast during treatment. CV disorders, renal or hepatic impairment, epilepsy, migraine, DM or other conditions that may be exacerbated by the possible fluid retention or oedema. Skeletal metastases (risk of hypercalcaemia). Children. Monitor skeletal maturation during therapy.
Adverse Drug Reactions	Frequent or persistent erections. Potentially Fatal: Malignant liver tumours.
Drug Interactions	Enhances effects of ciclosporin, antidiabetics, levothyroxine, anticoagulants e.g. warfarin. Resistance to the effects of

	Enhances effects of ciclosporin, antidiabetics, levothyroxine, anticoagulants e.g. warfarin. Resistance to the effects of neuromuscular blockers may occur.
Lab Interference	May Interfere with glucose tolerance and thyroid function tests.
Mechanism of Action	Mesterolone is an androgen with less inhibitory effects on intrinsic testicular function compared to testosterone. Absorption: Rapidly and almost completely absorbed (oral); peak serum levels in about 1.6 hr. Distribution: Protein-binding: About 40% to albumin and 58% to sex-hormone binding globulin. Metabolism: Rapidly metabolised; absolute bioavailability: 3% of the oral dose. Not metabolised to oestrogenic compounds. Excretion: Via urine (approx 77% of the metabolites); via faeces (approx 13%); 12-13 hr (terminal half-life).
CIMS Class	Androgens & Related Synthetic Drugs
ATC Classification	G03BB01 - mesterolone; Belongs to the class of 5-androstanon (3) derivative androgens used in androgenic hormone preparations.

metadoxine

CIMS Class : (Cholagogues, Cholelitholytics & Hepatic Protectors)
metadoxine

P - Contraindicated in pregnancy
L - Contraindicated in lactation

related metadoxine information

Indication & Dosage	<i>Oral</i> Acute alcohol intoxication Adult: 500-1000 mg daily. <i>Oral</i> Alcoholic fatty liver Adult: 1000 mg daily. <i>Oral</i> Supportive treatment of acute and chronic liver diseases Adult: 1000 mg daily. <i>Parenteral</i> Acute alcohol intoxication Adult: 300-600 mg daily IM/IV. <i>Parenteral</i> Alcoholic fatty liver Adult: 300 mg daily IM/IV. <i>Parenteral</i> Supportive treatment of acute and chronic liver diseases Adult: 300 mg daily IM/IV.
	Pregnancy and lactation.

Contraindications	Pregnancy and lactation.
Drug Interactions	May reduce effects of levodopa; administer levodopa with a dopa-decarboxylase inhibitor to minimise interaction.
Mechanism of Action	Metadoxine enhances the elimination of alcohol from blood and tissues, which leads to faster recovery from alcohol intoxication. In the early stages of alcoholic liver disease, metadoxine has been suggested to prevent the redox imbalance of the hepatocytes and to prevent TNF- α induction.
CIMS Class	Cholagogues, Cholelitholytics & Hepatic Protectors

metformin

CIMS Class : (Antidiabetic Agents)
metformin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related metformin information

Indication & Dosage

Oral

Type 2 diabetes mellitus

Adult: Initiate therapy slowly in order to minimise adverse gastric events. Initially 500 mg bid-tid or 850 mg 1-2 times daily, may increase doses in steps of 500 mg at intervals of at least 1 wk. Max: 2.25 g daily.

Child: ≥10 yr: Initiate therapy slowly in order to minimise adverse gastric events. Initially 500 or 850 mg once daily, increase doses either wkly by 500 mg daily or every 2 wk by 850 mg daily to a maintenance dose of 1500 - 2000 mg daily in 2 or 3 divided doses. Max dose 2000 mg daily.

Elderly: Doses may need to be reduced by around a third in elderly patients.

Oral

Polycystic ovarian syndrome

Adult: Initially 500 mg daily in the morning for 1 wk, then 500 mg bid for 1 wk, then 1.5-1.7 g daily in 2-3 divided doses.

Administration

Should be taken with food.

	Should be taken with food.
Overdosage	Lactic acidosis may occur. Accumulated drug may be removed by haemodialysis.
Contraindications	Acute or chronic metabolic acidosis with or without coma (including diabetic ketoacidosis). Renal failure, severe renal or hepatic impairment, acute conditions which may affect renal function e.g. dehydration, severe infection or shock. Cardiac failure, CHF, IDDM, severe impairment of thyroid function; acute or chronic alcoholism. Acute or chronic diseases which may cause tissue hypoxia e.g. cardiac or respiratory failure, recent MI or shock. Pregnancy, lactation.
Special Precautions	Caution when used in patients with CHF especially in those with unstable or acute heart failure. Risk of lactic acid accumulation increases with the degree of renal impairment. May need to discontinue treatment in patients with stress-related states e.g. fever, trauma, infection or surgery. Metformin should be temporarily discontinued for 48 hr in patients undergoing radiologic studies involving intravascular admin of iodinated contrast materials. Elderly. Monitor renal function regularly. May impair ability to drive or operate machinery.
Adverse Drug Reactions	Anorexia, nausea, vomiting, diarrhoea, wt loss, flatulence, occasional metallic taste; weakness; hypoglycaemia; rash, malabsorption of vit B ₁₂ . Chest discomfort, flushing, palpitation, chills, headache, lightheadedness, indigestion, abdominal discomfort. Potentially Fatal: Lactic acidosis in presence of renal failure and alcoholism.
Drug Interactions	Additive effect with sulphonylureas. Glycaemic control may be affected by diuretics, corticosteroids,

	Additive effect with sulphonylureas. Glycaemic control may be affected by diuretics, corticosteroids, phenothiazines, thyroid products, oestrogens, oral contraceptives, phenytoin, nicotinic acid, sympathomimetics, calcium channel blockers, chlorpromazine and isoniazid. Metformin effects may be increased by ACE inhibitors, disopyramide, MAOIs. Cimetidine may increase the serum levels of metformin. Concurrent use with contrast agents may increase the risk of metformin-induced lactic acidosis. May decrease the anticoagulant effect of phenprocoumon, therefore routine anticoagulant monitoring is recommended. Potentially Fatal: Lactic acidosis with alcohol. Thrombocytopenia has been reported with ketotifen.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 20-25°C.
Mechanism of Action	The exact mechanism of action of metformin is unclear but it appears to reduce glucose absorption from the GI tract, reduce gluconeogenesis and enhance insulin sensitivity by increasing peripheral glucose uptake and utilisation. Absorption: Slow and incomplete from the GI tract (oral); reduced if taken with food. Distribution: Protein-binding: Negligible. Excretion: Urine (as unchanged drug).
CIMS Class	Antidiabetic Agents

ATC
Classification

A10BA02 - metformin; Belongs to the class of biguanides.
Used in the treatment of diabetes.

methocarbamol

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related methocarbamol information

Indication & Dosage

Oral

Painful muscle spasm associated with musculoskeletal conditions

Adult: Initially: 1.5 g 4 times daily, reduced according to response after 2-3 days. Maintenance: 2.25-4 g daily in divided doses. Max dose 8 g daily.

Elderly: Dose may need to be reduced by half.

Intravenous

Painful muscle spasm associated with musculoskeletal conditions

Adult: 1 g administered by slow inj or infusion at a rate not faster than 300 mg/min. In cases where patients are not able to continue with oral therapy, additional doses of 1 g every 8 hr may be used for up to 3 consecutive days. Max 3 g daily.

Elderly: Dose may need to be reduced by half.

Intramuscular

Painful muscle spasm associated with musculoskeletal conditions

Intramuscular

Painful muscle spasm associated with musculoskeletal conditions

Adult: Up to 500 mg into each gluteal region at intervals of 8 hr. In cases where patients are not able to continue with oral therapy, additional doses of 1 g every 8 hr may be used for up to consecutive 3 days. Max 3 g daily.

Elderly: Dose may need to be reduced by half.

Intravenous

Tetanus

Adult: Initial total dose: 3 g with 1–2 g via direct inj at a rate of 300 mg/minute and the remainder 1-2 g may be administered via infusion. Repeat infusion of 1-2 g every 6 hr until a nasogastric tube can be inserted. Tablets may be crushed and suspended in water or saline solutions and administered through the nasogastric tube. Total oral dosage of up to 24 g daily may be needed.

Child: 15 mg/kg or 500 mg/m² given by IV inj (suggested rate 180 mg/m²/min). Dose may be repeated every 6 hr if necessary by IV inj or infusion. Max dose 1.8 g/m² daily for 3 consecutive days.

Administration	May be taken with or without food. (May be taken w/ meals to reduce GI discomfort.)
Overdosage	Manage with symptomatic and supportive treatment.
Contraindications	Coma or pre-coma states, brain damage, myasthenia gravis Do not admin parenteral solutions in patients with renal impairment, epilepsy or history of epilepsy.
Special Precautions	Renal or hepatic impairment; acidosis. Pregnancy and lactation. May impair ability to drive or operate machinery. Children =12 yr.
Adverse Drug Reactions	Nausea, anorexia, lassitude, drowsiness, dizziness,

Adverse Drug Reactions	Nausea, anorexia, lassitude, drowsiness, dizziness, restlessness, anxiety, confusion, fever, headache, blurred vision, convulsions; hypersensitivity reactions e.g. rashes, pruritus, urticaria, angiodema. Parenteral: Flushing and a metallic taste; incoordination, diplopia, nystagmus, vertigo; sloughing and thrombophlebitis at the site of inj. Potentially Fatal: Parenteral: Syncope, hypotension, bradycardia, anaphylaxis.
Drug Interactions	Action potentiated by alcohol and other CNS depressants. May inhibit effect of pyridostigmine, use with caution with anticholinesterase agents.
Lab Interference	May cause colour interference in screening tests for 5-hydroxyindoleacetic acid using nitrosonaphthol reagent and in screening tests for urinary vanillylmandelic acid using the Gitlow method.
Storage	Intramuscular: Store at 20-25°C Intravenous: Store at 20-25°C Oral: Store at 20-25°C
Mechanism of Action	Methocarbamol is a centrally acting skeletal muscle relaxant whose precise mode of action is not known. It is said to cause general depression of the central nervous system. Absorption: Rapidly and almost completely absorbed from the GI tract. Peak plasma concentration in 1-2 hr (oral). Distribution: Plasma protein bound 46-50%. Crosses placenta. Metabolism: Metabolised by dealkylation and hydroxylation. Excretion: Via urine as metabolites and unchanged drug. 1-2 hr (elimination half-life).
CIMS Class	Muscle Relaxants
ATC Classification	M03BA03 - methocarbamol; Belongs to the class of

ATC
Classification

M03BA03 - methocarbamol; Belongs to the class of carbamic esters used as centrally-acting muscle relaxants.

methotrexate

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food $\square$ - Food interaction

related methotrexate information

Indication & Dosage

Oral

Burkitt's lymphoma

Adult: 10-25 mg daily for 4-8 days, repeated after 7-10 days.

CrCl (ml/min)	Dosage Recommendation
61-80	75% of dose
51-60	70% of dose
10-50	30-50% of dose
<10	Avoid use

Hepatic impairment: Bilirubin 3.1-5 mg/dl: Administer 75% of dose; Bilirubin >5 mg/dl: Avoid use.

Oral

Acute lymphoblastic leukaemia

Adult: Maintenance: 15 mg/m² once or twice wkly, with other agents.

CrCl (ml/min)	Dosage Recommendation
61-80	75% of dose
51-60	70% of dose
10-50	30-50% of dose
<10	Avoid use

Hepatic impairment: Bilirubin 3.1-5 mg/dl: Administer 75%

Hepatic impairment: Bilirubin 3.1-5 mg/dl: Administer 75% of dose; Bilirubin >5 mg/dl: Avoid use.

Oral

Choriocarcinoma

Adult: 15-30 mg daily for 5 days, repeat after an interval of $\approx$ 1 wk for 3-5 courses.

CrCl (ml/min)	Dosage Recommendation
61-80	75% of dose
51-60	70% of dose
10-50	30-50% of dose
<10	Avoid use

Hepatic impairment: Bilirubin 3.1-5 mg/dl: Administer 75% of dose; Bilirubin >5 mg/dl: Avoid use.

Oral

Mycosis fungoides

Adult: 2.5-10 mg daily to induce remission.

CrCl (ml/min)	Dosage Recommendation
61-80	75% of dose
51-60	70% of dose
10-50	30-50% of dose
<10	Avoid use

Hepatic impairment: Bilirubin 3.1-5 mg/dl: Administer 75% of dose; Bilirubin >5 mg/dl: Avoid use.

Oral

Psoriasis

Adult: 10-25 mg wkly as a single dose, adjust subsequent doses based on response.

CrCl (ml/min)	Dosage Recommendation
61-80	75% of dose
51-60	70% of dose
10-50	30-50% of dose
<10	Avoid use

Hepatic impairment: Bilirubin 3.1-5 mg/dl: Administer 75% of dose; Bilirubin >5 mg/dl: Avoid use.

Oral

Hepatic impairment: Bilirubin 3.1-5 mg/dl: Administer 75% of dose; Bilirubin >5 mg/dl: Avoid use.

Oral

Rheumatoid arthritis

Adult: 7.5 mg once wkly, adjust by response. Not more than 20 mg/wk.

CrCl (ml/min)	Dosage Recommendation
61-80	75% of dose
51-60	70% of dose
10-50	30-50% of dose
<10	Avoid use

Hepatic impairment: Bilirubin 3.1-5 mg/dl: Administer 75% of dose; Bilirubin >5 mg/dl: Avoid use.

Oral

Crohn's disease

Adult: 12.5-22.5 mg once wkly for up to 1 yr.

CrCl (ml/min)	Dosage Recommendation
61-80	75% of use
51-60	70% of use
10-50	30-50% of use
<10	Avoid use

Hepatic impairment: Bilirubin 3.1-5 mg/dl: Administer 75% of dose; Bilirubin >5 mg/dl: Avoid use.

Intrathecal

Meningeal leukaemia

Adult: 12 mg/m² (max 15 mg) once wkly for 2-3 wk, then once mthly. Alternatively, 200-500 mcg/kg every 2-5 day until CSF cell count is normalised.

Child: <1 yr: 6 mg, 1 yr: 8 mg, 2 yr: 10 mg, >3 yr: 12 mg.

Patients <3 yr should be treated in accordance with combination chemotherapy protocols. Admin is at wkly intervals and repeated until the CSF cell count is normal.

CrCl (ml/min)	Dosage Recommendation
61-80	75% of dose
51-60	70% of dose

intervals and repeated until the CrCl level again is normal.

10-50	30-50% of dose
<10	Avoid use

Hepatic impairment: Bilirubin 3.1-5 mg/dl: Administer 75% of dose; Bilirubin >5 mg/dl: Avoid use.

Intravenous

Osteosarcoma

Adult: Initial recommended dose: 12 g/m² as a 4-hr infusion, followed by folinic acid, as part of combined therapy. May increase dose to 15 g/m² in subsequent treatments if initial dosage is insufficient to achieve peak serum methotrexate levels of 454 mcg/mL at the end of the infusion. Methotrexate infusion is administered on postoperative wk 4, 5, 6, 7, 11, 12, 15, 16, 29, 30, 44 and 45; in combination with other chemotherapy agents. Folinic acid can be given orally, IM or IV inj starting 24 hr after the beginning of the methotrexate infusion. Give via parenteral routes if patient experiences GI toxicity (e.g., nausea, vomiting). Usual dosage of folinic acid: 15 mg every 6 hr for a total of 60 hr or a total of 10 doses.

CrCl (ml/min)	Dosage Recommendation
61-80	75% of dose
51-60	70% of dose

	Hepatic impairment: Bilirubin 3.1-5 mg/dl: Administer 75% of dose; Bilirubin >5 mg/dl: Avoid use.	
	<i>Intramuscular</i>	
	Crohn's disease	
	Adult: 25 mg once wkly for 16 wk. Maintenance: 15 mg wkly.	
	CrCl (ml/min)	Dosage Recommendation
	61-80	75% of dose
	51-60	70% of dose
	10-50	30-50% of dose
	<10	Avoid use
	Hepatic impairment: Bilirubin 3.1-5 mg/dl: Administer 75% of dose; Bilirubin >5 mg/dl: Avoid use.	
	Reconstitution: Reconstitute to 2.5-5 mg/ml with normal saline, D ₅ W, lactated Ringer's, or Elliott's B solution. Use preservative-free preparations.	
Administration	May be taken with or without food. (May be taken w/ meals to minimise GI discomfort.)	
Overdosage	Nausea, vomiting, alopecia, melena, and renal failure.	
Contraindications	Severe renal or hepatic impairment, pre-existing profound bone marrow suppression in patients with psoriasis or rheumatoid arthritis, alcoholic liver disease, AIDS, pre-existing blood dyscrasias, pregnancy (in patients with psoriasis or rheumatoid arthritis), breast-feeding.	
Special Precautions	Hepatic or renal impairment, bone marrow depression, elderly, neonates. Ulcerative disorders of the GI tract. Monitor haematological, renal and hepatic function, and GI toxicity regularly.	
Adverse Drug Reactions	Ulceration of the mouth and GI disturbances (e.g. stomatitis and diarrhoea), bone marrow depression, hepatotoxicity,	

	Ulceration of the mouth and GI disturbances (e.g. stomatitis and diarrhoea), bone marrow depression, hepatotoxicity, renal failure, skin reactions, alopecia, ocular irritation, arachnoiditis in intrathecal use, megaloblastic anaemia, osteoporosis, precipitation of diabetes, arthralgias, necrosis of soft tissue and bone, anaphylaxis, impaired fertility. Potentially Fatal: Pulmonary reactions (e.g. interstitial lung disease); neurotoxicity (e.g. leukoencephalopathy, paresis, demyelination) with intrathecal use; foetal deaths.
Drug Interactions	Decreased effectiveness with folic acid and its derivatives. Potentially Fatal: Increased toxicity with NSAIDs and salicylates; probenecid; some penicillins; aminoglycosides neomycin and paromomycin; sulfonamides such as sulfafurazole and sulfamethoxazole; co-trimoxazole or trimethoprim; nephrotoxic agents (e.g. cisplatin); ciclosporin; etretinate. Synergistic enhancement of effects with fluorouracil. Increased bioavailability of mercaptopurine. Reduces serum-valproate concentrations. Reduced serum concentrations with colestyramine. Increased serum concentrations withomeprazole.
Food Interaction	May be given with meals to minimise GI discomfort. Serum levels may be decreased if taken with food. Decreased absorption in milk-rich food, decreased drug response with folate. Avoid ethanol (may be associated with increased liver injury). Avoid echinacea (has immunostimulant properties).
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Intramuscular: Store intact vials at room temperature

Storage	Intramuscular: Store intact vials at room temperature (15-25°C). Protect from light. Solutions diluted in D₅W or normal saline are stable at room temperature (21-25°C) for 24 hr. Reconstituted solutions with a preservative may be stored under refrigeration for up to 3 mth, and up to 4 wk at room temperature. Intrathecal: Store intact vials at room temperature (15-25°C). Protect from light. Solutions diluted in D₅W or normal saline are stable at room temperature (21-25°C) for 24 hr. Reconstituted solutions with a preservative may be stored under refrigeration for up to 3 mth, and up to 4 wk at room temperature. Dilutions are stable for 7 days at room temperature, but are recommended to be used within 4-8 hr. Intravenous: Store intact vials at room temperature (15-25°C). Protect from light. Solutions diluted in D₅W or normal saline are stable at room temperature (21-25°C) for 24 hr. Reconstituted solutions with a preservative may be stored under refrigeration for up to 3 mth, and up to 4 wk at room temperature. Oral: Store tablets at room temperature (15-25°C). Protect from light. Parenteral: Store intact vials at room temperature (15-25°C). Protect from light. Solutions diluted in D₅W or normal saline are stable at room temperature (21-25°C) for 24 hr. Reconstituted solutions with a preservative may be stored under refrigeration for up to 3 mth, and up to 4 wk at room temperature.
Mechanism of Action	Methotrexate is a folic acid antagonist that inhibits DNA synthesis. It irreversibly binds to dihydrofolate reductase, inhibiting the formation of reduced folates, and thymidylate synthetase, resulting in inhibition of purine and thymidylic acid synthesis.

inhibiting the formation of reduced folates, and thymidylate synthetase, resulting in inhibition of purine and thymidylic acid synthesis.

Absorption: Rapidly absorbed from the GI tract at low doses, higher doses are less well absorbed. Rapidly and completely absorbed after IM doses. Peak plasma concentrations after 1-2 hr (oral), 30-60 min (IM).

Distribution: Tissues and extracellular fluids; crosses the blood-brain barrier and placenta; enters breast milk. Small amounts in saliva and breastmilk. 50% bound to plasma proteins. Bound as polyglutamate conjugates, bound drug may remain in the body for several mth, particularly in the liver .

Metabolism: Partly by intestinal flora. Does not undergo significant metabolism at low dose therapy; 7-hydroxy metabolite is detected at high-doses.

Excretion: Primarily via urine; small amounts in bile, faeces. Some evidence of enterohepatic recirculation. Interindividual variation exists, patients with delayed clearance are at an increased risk of toxicity.

CIMS Class	Cytotoxic Chemotherapy / Immunosuppressants
ATC Classification	L01BA01 - methotrexate; Belongs to the class of antimetabolites, folic acid analogues. Used in the treatment of cancer. L04AX03 - methotrexate; Belongs to the class of other immunosuppressive agents. Used to induce immunosuppression.

methoxsalen

CIMS Class : (Psoriasis, Seborrhea & Ichthyosis Preparations) , (Other Dermatologicals)
methoxsalen

- P - Caution when used during pregnancy
- L - Caution when used during lactation
- Food ⚠ - Food interaction

related methoxsalen information

Indication & Dosage	<i>Oral</i> Repigmentation of vitiliginous areas Adult: 20 mg or up to 600 mcg/kg 2-4 hr before measured periods of sunlight or UVA exposure depending on the preparation. Treatment is usually given twice a wk or on alternate days, with at least 48-hr intervals. Child: >12 yr: 20 mg or up to 600 mcg/kg 2-4 hr before measured periods of sunlight or UVA exposure depending on the preparation. Treatment is usually given twice a wk on alternate days, with at least 48-hr intervals. <i>Oral</i> Psoriasis Adult: Up to 600 mcg/kg 1.5-3 hr before UVA exposure, depending on the preparation. Treatment is usually given twice a wk or increased as necessary, with at least 48-hr intervals between doses. If there is no or minimal response after the 15th PUVA treatment, dose may be increased by
---------------------	---

twice a wk or increased as necessary, with at least 48-hr intervals between doses. If there is no or minimal response after the 15th PUVA treatment, dose may be increased by 10 mg and this dose used for the remainder of the treatment course.

Topical/Cutaneous

Severe psoriasis

Adult: Apply a 0.15% preparation (or diluted to 0.015%) if necessary onto affected skin areas 15 min before UVA exposure. Alternatively, patient may take a whole body bath in methoxsalen solution (2.6 mg/l or up to 3.7 mg/l) followed by immediate UVA exposure. For treating affected areas, immerse the affected areas for 15 min into 3 mg/l solution of hand and foot soaks followed by a 30-min delay before UVA exposure twice a wk.

Topical/Cutaneous

Repigmentation of vitiliginous areas

Adult: Apply a 1% solution which is usually diluted to 0.1-0.01% (to avoid adverse effects) to the lesions; expose to UVA immediately after application or wait up to 2 hr. Area surrounding the lesion should be protected with a sunscreen. Wash and protect lesions from light after treatment; protection may be up to =48 hr. Treatment is usually repeated once a wk. Substantial repigmentation usually requires 6-9 mth of treatment.

Administration

Should be taken with food.

Overdosage

Symptoms: Nausea and severe burns. Management: In acute oral intoxication, induction of emesis is beneficial within the first 2-3 hr of ingestion. Follow accepted treatment of severe burns. Keep room darkened until reaction subsides (=8-24 hr).

Contraindications

Diseases associated with light sensitivity e.g. porphyria.

Contraindications	Diseases associated with light sensitivity e.g. porphyria. Aphakia, melanoma or a history of melanoma, invasive squamous cell carcinoma. PUVA therapy in children.
Special Precautions	Certain photosensitivity disorders. Hepatic impairment. Do not sunbathe for 24 hr before and 48 hr after PUVA treatment. Avoid exposure to sunlight for at least 8 hr after admin and patient should wear wrap-around UVA absorbing glasses for 24 hr after admin. Shield male genitalia during PUVA therapy unless specific treatment is required. Perform ophthalmic exam prior to therapy and at regular intervals thereafter, especially in those at increased risk of cataracts. Regularly examine patients for signs of premalignant or malignant skin lesions. Pregnancy and lactation.
Adverse Drug Reactions	Nausea, insomnia, depression, nervousness. Photochemotherapy or PUVA may cause pruritus, mild transient erythema, oedema, dizziness, headache, vesiculation, bulla formation, acneiform eruption, severe skin pain; pigmentation alterations of skin or nails, onycholysis. Hypersensitivity reactions e.g. fever, bronchoconstriction, contact dermatitis. Potentially Fatal: Increased risk of skin cancers e.g. squamous cell carcinoma, basal cell carcinoma, malignant melanoma. Isolated reports of leukaemia.
Drug Interactions	Additive effects with drugs known to cause photosensitisation e.g. anthralin, coal tar or derivatives, griseofulvin, phenothiazines, nalidixic acid, sulfonamides., tetracyclines and thiazide diuretics. May increase the levels/effects of aminophylline, fluvoxamine, mexiletine, mirtazapine, ropinirole, theophylline, trifluoperazine, dexmedetomidine and

	increase the levels/effects of aminophylline, fluvoxamine, mexiletine, mirtazapine, ropinirole, theophylline, trifluoperazine, dexmedetomidine and ifosfamide.
Food Interaction	Food containing photosensitisers e.g. figs, limes, parsley, mustard, carrots, cloves, lemon, celery may potentiate its effects. Absorption and serum concentrations appear to increase with food.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Methoxsalen increases skin reactivity to long-wavelength UV rays. It bonds covalently to DNA inhibiting DNA synthesis and cell division, which can lead to cell injury. This effect is used in photochemotherapy or PUVA [psoralen (P) and high-intensity long-wavelength UVA irradiation]. Onset: 1 hr (depending on oral formulation). Duration: About 8 hr. Absorption: Well but variably absorbed from the GI tract (oral); peak plasma concentrations after 1-4 hr. Distribution: Reversibly and highly bound to albumin; taken up by epidermal cells; diffuses into eye lens. Metabolism: Hepatic; converted to metabolites. Excretion: Via urine (about 95%, as metabolites).
CIMS Class	Psoriasis, Seborrhea & Ichthyosis Preparations / Other Dermatologicals
ATC Classification	D05AD02 - methoxsalen; Belongs to the class of topical psoralens used in the treatment of psoriasis. D05BA02 - methoxsalen; Belongs to the class of systemic

D05AD02 - methoxsalen; Belongs to the class of topical psoralens used in the treatment of psoriasis.

D05BA02 - methoxsalen; Belongs to the class of systemic psoralens used in the treatment of psoriasis.

related methyldopa information

Indication & Dosage

Oral

Hypertension

Adult: Monotherapy: Initially, 250 mg bid-tid for 2 days; adjust according to response not more than every 2 days. Maintenance: 0.5-2 g daily. Max: 3 g daily. Combination therapy: Initial dose should not exceed 500 mg daily in divided doses.

Child: Initially, 10 mg/kg or 300 mg/m² daily in 2-4 divided doses; increase as necessary. Max: 65 mg/kg, 2 g/m² or 3 g daily, whichever is least.

Elderly: Initially, 125 mg bid; gradually increase according to response. Max: 2 g daily.

Renal impairment: May respond to smaller doses.

Intravenous

Hypertension

Adult: As methyldopate hydrochloride: 250-500 mg in 100 ml of 5% glucose injected over 30-60 min every 6 hr. Max: 1 g every 6 hr.

Child: As methyldopate hydrochloride: 20-40 mg/kg/24 hr or

	Adult: As methyldopate hydrochloride: 200-600 mg in 100 ml of 5% glucose injected over 30-60 min every 6 hr. Max: 1 g every 6 hr. Child: As methyldopate hydrochloride: 20-40 mg/kg/24 hr or 0.6-1.2 g/m²/24 hr in equally divided doses every 6 hr. Max 65 mg/kg, 2 g/m² or 3 g daily, whichever is least. Renal impairment: May respond to smaller doses. Incompatibility: Incompatible with amphotericin B, methohexital.
Administration	May be taken with or without food.
Overdosage	Symptoms: Hypotension, sedation, bradycardia, dizziness, constipation or diarrhoea, flatus, nausea, vomiting. Management: Supportive and symptomatic. Can be removed by hemodialysis.
Contraindications	Phaeochromocytoma, active liver disease. Patients in whom previous methyldopa treatment resulted in liver abnormalities or direct Coombs' positive haemolytic anaemia.
Special Precautions	History of haemolytic anaemia, depression, parkinsonism, renal or hepatic impairment. May impair ability to drive or operate machinery. Monitor blood counts and perform LFTs. Elderly.
Adverse Drug Reactions	Peripheral oedema; drug fever, mental depression, anxiety, nightmares, drowsiness, headache; dry mouth; orthostatic hypotension, sinus bradycardia, sodium retention, sexual dysfunction, gynaecomastia, hyperprolactinaemia, thrombocytopenia, positive Coombs' test, transient leukopenia or granulocytopenia, cholestasis or hepatitis and hepatocellular injury, increased liver enzymes, jaundice, cirrhosis, dyspnoea, SLE-like syndrome. Potentially Fatal: Hepatic necrosis, haemolytic anaemia.

	heptocellular injury, increased liver enzymes, jaundice, cirrhosis, dyspnoea, SLE-like syndrome. Potentially Fatal: Hepatic necrosis, haemolytic anaemia.
Drug Interactions	Reduced hypotensive effects with phenothiazines, TCAs and possibly, amphetamines. Additive hypotensive effects with levodopa; psychosis may also occur. Reduced absorption and effects with oral iron preparations. Reduced doses of general anaesthetics may be required. Effect of ephedrine may be reduced. Potentially Fatal: Increased risk of severe hypertension with MAOIs. Increased lithium toxicity.
Food Interaction	Hypertension may be exacerbated with ephedra, yohimbe and ginseng. CNS depression may be increased when used with valerian, St John's wort, kava kava and gotu kola. Natural licorice causes sodium and water retention and increases potassium loss. Garlic may increase antihypertensive effect.
Lab Interference	Positive Coombs' test. May interfere with serum creatinine measurement by the alkaline picrate method and with AST estimation by colourimetric methods. May result in falsely high value for urinary catecholamines.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Methyldopa stimulates α_2-adrenoceptors which results in reduced sympathetic tone and fall in BP. Onset: 4-6 hr. Duration: 48 hr (oral); 10-16 hr (IV). Absorption: Variable and incomplete from the GI tract, via

	reduced sympathetic tone and fall in BP. Onset: 4-6 hr. Duration: 48 hr (oral); 10-16 hr (IV). Absorption: Variable and incomplete from the GI tract, via amino acid active transport system (oral). Distribution: Crosses the placenta; penetrates the blood-brain barrier; enters the breast milk. Protein-binding: Minimal. Metabolism: Extensively hepatic. CNS: Decarboxylation to α-methyl-noradrenaline. Excretion: Via urine (as unchanged drug and as o-sulfate conjugate); prolonged in renal impairment; 1.7 hr (elimination half-life).
CIMS Class	Other Antihypertensives
ATC Classification	C02AB - Methyldopa; Used in the treatment of hypertension.

methylergometrine

CIMS Class : (Drugs Acting on the Uterus)
methylergometrine

P - Contraindicated in pregnancy
L - Caution when used during lactation
Food α - Food interaction

related methylergometrine information

Indication & Dosage	<i>Oral</i> Prophylaxis of postpartum haemorrhage Adult: 200 mcg 3-4 times daily in the puerperium for 2-7 days. <i>Intramuscular</i> Treatment and prophylaxis of postpartum and postabortal haemorrhage Adult: 200 mcg. May repeat every 2-4 hr. Max: 5 doses. <i>Intravenous</i> Treatment and prophylaxis of postpartum and postabortal haemorrhage Adult: As an emergency measure: 200 mcg by slow inj over at least 1 min, repeat every 2-4 hr, up to a max of 5 doses.
Overdosage	Symptoms: Prolonged gangrene, numbness in extremities, acute nausea, vomiting, abdominal pain, respiratory depression, changes in BP, seizures Management: Symptomatic and supportive.
Contraindications	Hypertension, eclamptic or previously hypertensive patients, heart disease, venoatrial shunts, mitral valve stenosis, obliterative vascular disease. Do not use in cases of threatened spontaneous abortion. Pregnancy.
Special Precautions	Captivation of the placenta may occur if given during the 2nd or 3rd stage

Special Precautions	Captivation of the placenta may occur if given during the 2nd or 3rd stage prior to delivery of the placenta; use in this situation should only be done by qualified personnel. Avoid prolonged use. Caution in patients with sepsis, or renal impairment. Lactation.
Adverse Drug Reactions	Headache, dizziness, hallucinations; tinnitus; nausea, vomiting, foul taste, diarrhoea; hypertension, temporary chest pain, palpitations, bradycardia; pulmonary congestion, dyspnoea; diaphoresis; thrombophlebitis; haematuria; water intoxication; leg cramps; allergic reactions. Potentially Fatal: Shock.
Drug Interactions	Possible increase in serum levels and risk of severe vasoconstrictive effects with potent CYP3A4 inhibitors (e.g. erythromycin, troleandomycin, clarithromycin, ritonavir, indinavir, nelfinavir, zalcitabine, ketoconazole, itraconazole, voriconazole) and less potent CYP3A4 inhibitors (e.g. saquinavir, nefazodone, fluconazole, fluoxetine, fluvoxamine, zileuton, clotrimazole).
Food Interaction	Possible increase in serum levels and risk of severe vasoconstrictive effects with grapefruit juice.
Storage	Intramuscular: Store under refrigeration at 2-8°C (36-46°F). Protect from light. Intravenous: Store under refrigeration at 2-8°C (36-46°F). Protect from light. Oral: Store below 25°C (77°F).
Mechanism of Action	Methylergometrine is an ergot alkaloid, which directly stimulates contractile uterine and vascular smooth muscle. Onset: 5-15 min (oral); 2-5 min (IM); immediate (IV). Duration: ≈3 hr (oral/IM); 45 min (IV). Absorption: Rapidly absorbed (oral; IM). Distribution: Mainly distributed into plasma and extracellular fluid; rapidly distributed into tissues. Enters the breast milk. Metabolism: Hepatic: Undergoes first-pass metabolism. Excretion: Mainly via faeces; via urine (small amounts as unchanged drug) (elimination half-life).

	distributed into tissues. Enters the breast milk. Metabolism: Hepatic: Undergoes first-pass metabolism. Excretion: Mainly via faeces; via urine (small amounts as unchanged drug) (elimination half-life).
CIMS Class	Drugs Acting on the Uterus
ATC Classification	G02AB01 - methylergometrine; Belongs to the class of ergot alkaloids. Used to induce abortion or augment labour and to minimize blood loss from the placental site.

methylphenidate

CIMS Class : (Other CNS Drugs & Agents for ADHD)
methylphenidate

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related methylphenidate information

Indication & Dosage

Oral

Narcolepsy

Adult: 20-30 mg daily in divided doses. Effective dose may be 10-60 mg daily.

Oral

Hyperactivity disorders

Child: Conventional forms: ≥6 yr: Initially, 5 mg once or bid before breakfast or lunch. Increase, as necessary, by 5-10 mg at wkly intervals to a max of 60 mg daily in divided doses. Consider a later dose in the evening if the effect wears off. Discontinue periodically to re-evaluate or if there is no improvement within 1 mth. Modified-release forms: Dose depends on brand.

Transdermal

Hyperactivity disorders

Child: 6-12 yr: Apply once daily to the hip area 2 hr before an effect is needed and remove after a max of 9 hr. Start patient on the lowest patch strength, then titrate according to

	Child: 6-12 yr: Apply once daily to the hip area 2 hr before an effect is needed and remove after a max of 9 hr. Start patient on the lowest patch strength, then titrate according to response. Increase at wkly intervals as needed. Max: 3.3 mg/hr at wk 4.
Administration	Methylphenidate (ritalin): Should be taken on an empty stomach. (Take 30-45 mins before meals.) Methylphenidate (concerta): May be taken with or without food. (Swallow whole, do not divide/chew/crush.)
Overdosage	Symptoms: Vomiting, tremor, agitation, muscle twitching, hyperpyrexia, hallucinations, tachycardia, mydriasis, palpitations, sweating. Management: No specific antidote; symptomatic supportive. Transdermal: Remove patch and thoroughly cleanse area; absorption may continue in absence of patch.
Contraindications	Marked anxiety, tension, agitation; glaucoma; Tourette's syndrome or tics. Known severe structural cardiac abnormalities, cardiomyopathy, serious heart rhythm abnormalities, or other serious cardiac disorders that could increase the risk of sudden death. Extended-release form: Severe hypertension, heart failure, arrhythmia, hyperthyroidism, recent MI or angina.
Special Precautions	Pregnancy and lactation. History of alcohol or drug abuse. Hypertension and other CV disorders that might be exacerbated by increases in BP or heart rate. Pre-existing psychosis or bipolar disorder; monitor for symptoms of aggression or hostility. History of seizure disorder. Children <6 yr (growth suppression); monitor growth during therapy. May impair ability to drive or operate machinery. Transdermal: Avoid exposure of application site to any direct external heat source.

	May impair ability to drive or operate machinery. Transdermal: Avoid exposure of application site to any direct external heat source.
Adverse Drug Reactions	Angina, arrhythmia, cerebral arteritis, cerebral occlusion, changes in BP, MI, necrotising vasculitis, palpitation, pulse changes, tachycardia; depression, dizziness, drowsiness, fever, headache, insomnia, nervousness, neuroleptic malignant syndrome (NMS), Tourette's syndrome, toxic psychosis; erythema multiforme, exfoliative dermatitis, hair loss, rash, urticaria; growth retardation; abdominal pain, anorexia, diarrhoea, nausea, vomiting, weight loss; anaemia, leukopenia, thrombocytopenic purpura, thrombocytopenia; abnormal LFTs, hepatic coma, increased transaminases; arthralgia, dyskinesia; blurred vision, visual accommodation disturbance; cough, pharyngitis, sinusitis, upper respiratory tract infection; accidental injury, hypersensitivity. Transdermal: Insomnia, decreased appetite; nausea; tic, emotional instability; vomiting, anorexia; nasal congestion, nasopharyngitis; weight loss.
Drug Interactions	May reduce effects of antihypertensive agents. Reduced serum level with carbamazepine. Increased serum levels or effects with CYP2D6 inhibitors e.g. chlorpromazine, delavirdine, fluoxetine, miconazole, paroxetine, pergolide, quinidine, quinine, ritonavir, ropinirole. May increase serum levels of phenytoin, TCAs. Possible severe hypertension and tachycardia with sibutramine. CNS depression with alcohol. Potentially Fatal: Severe toxic reactions with clonidine. Increased risk of hypertensive crisis with MAOIs.
Food Interaction	Food may increase oral absorption of methylphenidate. Hypertension or arrhythmias may occur when used with ephedra and additive CNS stimulation may occur with yohimbe.

	Hypertension or arrhythmias may occur when used with ephedra and additive CNS stimulation may occur with yohimbe.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Chewable tablet/Solution: Store at 20-25°C (68-77°F). Extended-release capsule: Store in dose pack provided at 25°C (77°F). Immediate-release/Sustained-release tablet: Do not store above 30°C (86°F). Osmotic-controlled release tablet: Store at 25°C (77°F). Protect from humidity. Transdermal: at 15-30°C (59-86°F). Store in protective pouch.
Mechanism of Action	Methylphenidate is a central stimulant and indirect-acting sympathomimetic. Onset: Immediate-release forms/Transdermal: Approx 2 hr. Sustained-release forms: 4-7 hr. Duration: Immediate-release forms: 3-6 hr. Sustained-release forms: 8 hr. Extended-release forms: 8-12 hr. Absorption: Oral: Readily absorbed from the GI tract. Food enhances rate of absorption. Peak plasma levels in about 2 hr. Transdermal: Absorption increased when applied to inflamed skin or exposed to heat; absorption continuous for 9 hr after application. Distribution: Protein-binding: Low. Distributed into breast milk. Metabolism: Undergoes extensive first-pass metabolism. Via de-esterification to minimally active metabolite. Major metabolite is ritanilic acid.

	Metabolism: Undergoes extensive first-pass metabolism. Via de-esterification to minimally active metabolite. Major metabolite is ritanilic acid. Excretion: Via urine (90% as metabolites and unchanged drug); via faeces (small amounts); about 2 hr (elimination half-life).
CIMS Class	Other CNS Drugs & Agents for ADHD
ATC Classification	N06BA04 - methylphenidate; Belongs to the class of centrally-acting sympathomimetics. Used as CNS stimulant.

Indication & Dosage

Oral

Anti-inflammatory or immunosuppressive

Adult: Initially, 2-60 mg/day in 1-4 divided doses, followed by gradual reduction in dosage to the lowest possible level consistent with maintaining an adequate clinical response.

Child: As sodium succinate: 0.5-1.7 mg/kg/day or 5-25 mg/m²/day in divided doses every 6-12 hr; "Pulse" therapy: 15-30 mg/kg/dose over ≈30 min given once daily for 3 days.

Intramuscular

Anti-inflammatory or immunosuppressive

Adult: As sodium succinate: 10-80 mg/day once daily; As acetate: 10-80 mg every 1-2 wk.

Child: As sodium succinate: 0.5-1.7 mg/kg/day or 5-25 mg/m²/day in divided doses every 6-12 hr; "Pulse" therapy: 15-30 mg/kg/dose over ≈30 min given once daily for 3 days.

Intravenous

Anti-inflammatory or immunosuppressive

15-30 mg/kg/dose over =30 min given once daily for 3 days.

Intravenous

Anti-inflammatory or immunosuppressive

Adult: As sodium succinate: 10-40 mg over a period of several min and repeated I.V. or I.M. at intervals depending on clinical response; when high dosages are needed, give 30 mg/kg over a period =30 min and may be repeated every 4-6 hr for 48 hr.

Child: As sodium succinate: 0.5-1.7 mg/kg/day or 5-25 mg/m²/day in divided doses every 6-12 hr; "Pulse" therapy: 15-30 mg/kg/dose over =30 min given once daily for 3 days.

Intravenous

Status asthmaticus

Adult: As sodium succinate: Loading dose: 2 mg/kg/dose, then 0.5-1 mg/kg/dose every 6 hr for up to 5 days.

Child: Children: As sodium succinate: Loading dose: 2 mg/kg/dose, then 0.5-1 mg/kg/dose every 6 hr for up to 5 days.

Intravenous

Acute spinal cord injury

Adult: As sodium succinate: 30 mg/kg over 15 min, followed in 45 min by a continuous infusion of 5.4 mg/kg/hr for 23 hr.

Child: As sodium succinate: 30 mg/kg over 15 min, followed in 45 min by a continuous infusion of 5.4 mg/kg/hr for 23 hr.

Intravenous

Lupus nephritis

Adult: As sodium succinate: High-dose "pulse" therapy: 1 g/day for 3 days.

Child: Children: As sodium succinate: 30 mg/kg over =30 min every other day for 6 doses.

Intravenous

Aplastic anaemia

Adult: As sodium succinate: 1 mg/kg/day or 40 mg/day

every other day for 6 doses.

Intravenous

Aplastic anaemia

Adult: As sodium succinate: 1 mg/kg/day or 40 mg/day (whichever dose is higher), for 4 days. After 4 days, change to oral and continue until day 10 or until symptoms of serum sickness resolve, then rapidly reduce over approx 2 wk.

Intravenous

***Pneumocystis (carinii) jiroveci* pneumonia in patients with acquired immunodeficiency syndrome (AIDS)**

Adult: As sodium succinate: 30 mg bid for 5 days, then 30 mg once daily for 5 days, then 15 mg once daily for 11 days.

Intravenous

Life-threatening shock

Adult: As sodium succinate: 30 mg/kg initially and repeated every 4-6 hr if needed or 100-250 mg initially and repeated at 2- 6-hr intervals as required by direct IV inj over a period of 3-15 min. Alternatively, following the initial dose by direct IV inj, 30 mg/kg by slow continuous IV infusion every 12 hr for 24-48 hr.

Intravenous

Croup

Child: 1-2 mg/kg followed by 0.5 mg/kg every 6-8 hr.

Intra-articular

Anti-inflammatory or immunosuppressive

Adult: As acetate: Large joints: 20-80 mg every 1-5 wk;
Small joints: 4-10 mg every 1-5 wk.

Intralesional

Anti-inflammatory or immunosuppressive

Adult: As acetate: 20-60 mg every 1-5 wk.

Topical/Cutaneous

Corticosteroid-responsive dermatoses

Adult: As 0.1% aceponate ointment, fatty ointment or cream

	<i>Topical/Cutaneous</i> Corticosteroid-responsive dermatoses Adult: As 0.1% aceponate ointment, fatty ointment or cream or lotion: Apply a thin coating once daily to the affected area. Duration: <12 wk. Child: >4 mth: As 0.1% aceponate ointment, fatty ointment or cream: Apply a thin coating once daily to the affected area; Lotion: Apply sparingly once daily to the affected area and rub gently. Duration: <4 wk. Reconstitution: Standard diluent: 40 mg/50 ml D₅W; 125 mg/50 ml D₅W. Min volume: 50 ml D₅W. Incompatibility: Y-site incompatibility: Allopurinol, amsacrine, ciprofloxacin, propofol, sargramostim, vinorelbine, docetaxel, etoposide phosphate, filgrastim, gemcitabine, ondansetron, paclitaxel. Syringe incompatibility: Doxapram. Admixture incompatibility: Calcium gluconate, glycopyrrolate, regular insulin, penicillin G sodium, metaraminol, nafcillin.
Administration	Should be taken with food.
Overdosage	Adrenal suppression and immunosuppression in high doses for prolonged periods. Arrhythmias and cardiovascular collapse with rapid IV inj/infusion.
Contraindications	Serious infections except septic shock or tuberculous meningitis; viral, fungal and tubercular skin lesions; admin of live virus vaccines. Preparations containing benzyl alcohol preservative are contraindicated in infants.
Special Precautions	Children and adolescents (possible irreversible growth retardation), elderly (monitoring required on long-term treatment). Frequent monitoring if history of tuberculosis (or X-ray changes), hypertension, recent MI (rupture reported), CHF, liver and renal failure (associated with fluid retention), DM including family history (glucose regulation altered),

	treatment). Frequent monitoring if history of tuberculosis (or X-ray changes), hypertension, recent MI (rupture reported), CHF, liver and renal failure (associated with fluid retention), DM including family history (glucose regulation altered), osteoporosis especially post-menopausal women (associated with increased bone loss and osteoporotic fractures), glaucoma including family history (risk of increased intraocular pressure), corneal perforation, severe affective disorders (particularly if history of steroid-induced psychosis), epilepsy, GI disease (perforation risk), thyroid disease (changes in thyroid status may necessitate dosage adjustments), history of steroid myopathy. Pregnancy and lactation. Avoid abrupt withdrawal after a prolonged period of use. When applied topically to large areas, broken skin, or under occlusive dressings, may cause systemic effects.
Adverse Drug Reactions	Oedema, hypertension, arrhythmia; CNS, endocrine, metabolic and GI effects; hirsutism, acne, skin atrophy, bruising, hyperpigmentation; transient leukocytosis; arthralgia, muscle weakness, osteoporosis, fractures, cataracts, glaucoma; infections, hypersensitivity reactions, avascular necrosis, secondary malignancy, intractable hiccups.
Drug Interactions	Decreases effect of anticholinesterases in myasthenia gravis. May decrease the hypoglycaemic effects of antidiabetic agents. Decreases serum concentrations of salicylates. Increased hypokalemic effects of potassium-depleting diuretics (thiazides or furosemide), amphotericin B, bronchodilator therapy with xanthines or β_2 agonists. Increase incidence of GI bleeding and ulceration with NSAIDs. May increase the anticoagulant effects of warfarin. Decreased levels/effects with CYP3A4 inducers (aminoglutethimide, carbamazepine, nafcillin, nevirapine, phenobarbital, phenytoin, and rifamycins).

	NSAIDs. May increase the anticoagulant effects of warfarin. Decreased levels/effects with CYP3A4 inducers (aminoglutethimide, carbamazepine, nafcillin, nevirapine, phenobarbital, phenytoin, and rifamycins). Increased levels/effects with CYP3A4 inhibitors (azole antifungals, clarithromycin, diclofenac, doxycycline, erythromycin, imatinib, isoniazid, nefazodone, nicardipine, propofol, protease inhibitors, quinidine, telithromycin, and verapamil). May decrease the effects of vaccines (dead organism) or increase the risk of vaccinal infection (live organism). Antacids and bile sequestrants may decrease the absorption of corticosteroids, separate admin by 2 hr. Increased risk of myopathy with neuromuscular-blocking agents, tendinopathies with fluoroquinolones.
Food Interaction	Interferes with calcium absorption. Limit caffeine.
Lab Interference	Interferes with skin test.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intra-articular: Store at a temperature <40°C, preferably between 15-30 °C. As acetate: freezing of sterile solution suspension should be avoided; store at controlled room temperature of 20-25°C. Intralesional: Store at a temperature <40°C, preferably between 15-30 °C. As acetate: freezing of sterile solution suspension should be avoided; store at controlled room temperature of 20-25°C. Intramuscular: Store at a temperature <40°C, preferably between 15-30 °C. As acetate: Freezing of sterile solution suspension should be avoided; store at controlled

20-25°C. **Intramuscular:** Store at a temperature <40°C, preferably between 15-30 °C. As acetate: Freezing of sterile solution suspension should be avoided; store at controlled room temperature of 20-25°C. As sodium succinate: Store unconstituted sterile powder and reconstituted solutions at a controlled room temperature of 20-25°C. Reconstituted solutions should not be used unless they are clear, and unused solutions should be discarded after 48 hr. **Intravenous:** Store at a temperature <40°C, preferably between 15-30 °C. As acetate: freezing of sterile solution suspension should be avoided; store at controlled room temperature of 20-25°C. As sodium succinate: Store unconstituted sterile powder and reconstituted solutions at a controlled room temperature of 20-25°C. Reconstituted solutions should not be used unless they are clear, and unused solutions should be discarded after 48 hr. **Oral:** Store at a temperature <40°C, preferably between 15-30 °C. **Topical/Cutaneous:** Ointment or cream: <25°C, stable for 3 yr from date of manufacture; Fatty ointment or lotion: <30°C, stable for 5 yr from date of manufacture.

Mechanism of Action

Methylprednisolone is a synthetic corticosteroid with mainly glucocorticoid activity and minimal mineralocorticoid properties. It decreases inflammation by suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability.

Onset: Peak effect: Oral: 1-2 hr; IM: 4-8 days; Intra-articular: 1 wk.

Duration: Oral: 30-36 hr; IM: 1-4 wk; Intra-articular: 1-5 wk; As acetate, has a low solubility and has sustained IM effect.

Absorption: Methylprednisolone is fairly rapidly distributed after oral doses; plasma half-life:=3.5 hr; tissue half-life: 18-36 hr. As acetate, it is absorbed from joints over a wk but

	Absorption: Methylprednisolone is fairly rapidly distributed after oral doses; plasma half-life:=3.5 hr; tissue half-life: 18-36 hr. As acetate, it is absorbed from joints over a wk but is more slowly absorbed following deep IM inj. As sodium succinate ester, it is rapidly absorbed after IM doses, with peak plasma concentrations in 2 hr. Distribution: Volume of distribution: 0.7-1.5 L/kg ; crosses the placenta. Excretion: Half-life elimination: 3-3.5 hr; clearance reduced in obese.
CIMS Class	Corticosteroid Hormones / Topical Corticosteroids
ATC Classification	D07AA01 - methylprednisolone; Belongs to the class of weak (group I) corticosteroids. Used in the treatment of dermatological diseases. D10AA02 - methylprednisolone; Belongs to the class of topical corticosteroids used in the treatment of acne. H02AB04 - methylprednisolone; Belongs to the class of glucocorticoids. Used in systemic corticosteroid preparations.

metoclopramide

CIMS Class : (GIT Regulators, Antiflatulents & Anti-inflammatories) , (Antiemetics)
metoclopramide

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ✖ - Lab interference

Food ✖ - Food interaction

related metoclopramide information

Indication & Dosage

Oral

Diabetic gastric stasis

Adult: 10 mg 4 times/day. To be given 30 minutes before meals and at bedtime. Usual treatment duration: 2-8 wk.

Renal impairment: Moderate to severe: Reduce dose by at least 50%

CrCl (ml/min)	Dosage Recommendation
<40	Reduce dose by at least 50%.

Hepatic impairment: Dose reduction may be necessary.

Oral

Nausea and vomiting associated with cancer chemotherapy or radiotherapy

Adult: 2 mg/kg/dose, given 1 hr before start of treatment. Repeat dose 3 times at 2-hrly intervals. May repeat 2 additional doses at 3-hrly intervals if needed. Max: 12 mg/kg/day.

Child: Neonate: 100 mcg/kg every 6-8 hr; 1 mth-1 yr (up to

additional doses at 3-hrly intervals if needed. Max: 12 mg/kg/day.

Child: Neonate: 100 mcg/kg every 6-8 hr; 1 mth-1 yr (up to 10 kg): 100 mcg/kg (max 1 mg) bid; 1-3 yr (10-14 kg): 1 mg bid-tid; 3-5 yr (15-19 kg): 2 mg bid-tid; 5-9 yr (20-29 kg): 2.5 mg tid; 9-14 yr (=30 kg): 5 mg tid; 15-19 yr (30-59 kg): 5 mg tid; 15-19 yr (=60 kg): 10 mg tid. Where wt is less than that specified for a given age group, use the dose corresponding to the wt rather than the age, so that a lower dose is given. Max: 500 mcg/kg.

Renal impairment: Moderate to severe: Reduce dose by at least 50%.

CrCl (ml/min)	Dosage Recommendation
<40	Reduce dose by at least 50%.

Hepatic impairment: Dose reduction may be necessary.

Oral

Gastro-oesophageal reflux disease

Adult: 10-15 mg up to 4 times/day, given 30 minutes before meals and at bedtime, depending on severity of symptoms. If symptoms are intermittent, may give single doses of 20 mg prior to the provoking situation.

Max Dosage: 500 mcg/kg

Renal impairment: Moderate to severe: Reduce dose by at least 50%

CrCl (ml/min)	Dosage Recommendation
<40	Reduce dose by at least 50%

Hepatic impairment: Dose reduction may be necessary.

Oral

Prevent delayed emesis following chemotherapy

Adult: 20-40 mg 2-4 times/day for 3-4 days.

Oral

Premedication in diagnostic procedures

Adult:

Oral

Premedication in diagnostic procedures

Adult:

Child: 1 mth–3 yr and up to 14 kg: 100 mcg/kg (max 1 mg);

3–5 yr and 15–19 kg: 2 mg; 5–9 yr and 20–29 kg: 2.5 mg;

9–15 yr and 30–60 kg: 5 mg; 15–18 yr and >60 kg: 10 mg.

To be given as a single dose 5–10 minutes before examination.

Parenteral

Diabetic gastric stasis

Adult: 10 mg 4 times/day via IM/IV admin; to be given 30 minutes before meals and at bedtime. Convert to oral admin when symptoms have subsided sufficiently. Usual treatment duration: 2–8 wk.

Max Dosage: 500 mcg/kg

Renal impairment: Moderate to severe: Reduce dose by at least 50%

CrCl (ml/min)	Dosage Recommendation
<40	Reduce dose by at least 50%

Hepatic impairment: Dose reduction may be necessary.

Intravenous

Nausea and vomiting associated with cancer chemotherapy

Adult: For highly emetogenic drugs/regimens: 2 mg/kg as IV infusion to be given 30 minutes before start of treatment.

Repeat twice at 2-hrly intervals after the 1st dose. For less emetogenic drugs/regimens: 1 mg/kg may be used. If vomiting is not well-controlled, may continue with 3 additional doses at 2 mg/kg/dose at 3-hrly intervals; if vomiting is well-controlled with the 1st 3 doses, may reduce dose to 1 mg/kg given at 3-hrly intervals for 3 additional doses.

Child: Neonate: 100 mcg/kg every 6–8 hr; 1 mth–1 yr (up to 10 kg): 100 mcg/kg (max 1 mg) bid; 1–3 yr (10–14 kg): 1 mg

mg/kg given at 3-hrly intervals for 3 additional doses.

Child: Neonate: 100 mcg/kg every 6-8 hr; 1 mth-1 yr (up to 10 kg): 100 mcg/kg (max 1 mg) bid; 1-3 yr (10-14 kg): 1 mg bid-tid; 3-5 yr (15-19 kg): 2 mg bid-tid; 5-9 yr (20-29 kg): 2.5 mg tid; 9-14 yr (=30 kg): 5 mg tid; 15-19 yr (30-59 kg): 5 mg tid; 15-19 yr (=60 kg): 10 mg tid. Where wt is less than that specified for a given age group, use the dose corresponding to the wt rather than the age, so that a lower dose is given.

Max: 500 mcg/kg.

Renal impairment: Moderate to severe: Reduce dose by at least 50%

CrCl (ml/min)	Dosage Recommendation
<40	Reduce dose by at least 50%

Hepatic impairment: Dose reduction may be necessary.

Intravenous

Intubation of the small intestine

Adult: 10 mg. To be given as a single direct IV inj.

Child: <6 yr: 100 mcg/kg; 6-14 yr: 2.5-5 mg. To be given as a single direct IV inj.

Renal impairment: Moderate to severe: Reduce dose by at least 50%.

CrCl (ml/min)	Dosage Recommendation
<40	Reduce dose by at least 50%

Hepatic impairment: Dose reduction may be necessary

Intravenous

Premedication for radiologic examination of the upper gastrointestinal tract

Adult: 10 mg. To be given as a single direct IV inj.

Child: <6 yr: 100 mcg/kg; 6-14 yr: 2.5-5 mg. To be given as a single direct IV inj.

Renal impairment: Moderate to severe: Reduce dose by at least 50%.

CrCl (ml/min)	Dosage Recommendation
<40	Reduce dose by at least 50%

	Renal impairment. Moderate to severe. Reduce dose by at least 50%. <40 Reduce dose by at least 50%. Hepatic impairment: Dose reduction may be necessary <i>Intramuscular</i> Postoperative nausea and vomiting Adult: 10 mg, given near the end of the procedure. May repeat every 4-6 hr when necessary. Incompatibility: Incompatible with cephalothin sodium, chloramphenicol sodium, and sodium bicarbonate.	
Overdosage	Drowsiness, ataxia, extrapyramidal symptoms, seizures, methemoglobinaemia (in infants).	
Contraindications	GI haemorrhage, mechanical obstruction and perforation; phaeochromocytoma; history of seizures.	
Special Precautions	Children, elderly. Renal or hepatic impairment, porphyria, epilepsy, Parkinson's disease, history of depression. Ability to drive or operate machineries may be impaired. Pregnancy and lactation. Monitor patients on prolonged therapy. Increased risk of tardive dyskinesia in patients on prolonged or high-dose treatment.	
Adverse Drug Reactions	Extrapyramidal symptoms, restlessness, drowsiness, anxiety, diarrhoea, hypotension, hypertension, headache, depression, blood disorders (e.g. agnucytosis, methaemoglobinaemia), hypersensitivity reactions (e.g. bronchospasm, rash), galactorrhoea or related disorders, transient increase in plasma aldosterone levels. Potentially Fatal: Neuroleptic malignant syndrome; cardiac conduction disorders may occur with IV dosage form.	
Drug Interactions	Increased sedative effects with CNS depressants. GI effects antagonised by antimuscarinics and opioids. Reduces	

	Increased sedative effects with CNS depressants. GI effects antagonised by antimuscarinics and opioids. Reduces absorption of digoxin. Increases absorption of ciclosporin, levodopa, aspirin, paracetamol. Interferes with hypoprolactinaemic effect of bromocriptine. Inhibits serum cholinesterase and prolongs neuromuscular blockade produced by suxamethonium and mivacurium. Potentially Fatal: Serotonin syndrome with sertraline (SSRI).
Food Interaction	Avoid ethanol (may increase CNS depression).
Lab Interference	Increased aminotransferase, increased amylase.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Store intact vial at controlled room temperature. Protect from light. Dilutions with D₅<190W or normal saline are stable for at least 24 hr and do not require light protection if used within 24 hours. Parenteral: Store intact vial at controlled room temperature. Protect from light. Dilutions with D<209>5<190W or normal saline are stable for at least 24 hr and do not require light protection if used within 24 hr.
Mechanism of Action	Metoclopramide enhances the motility of the upper GI tract and increases gastric emptying without affecting gastric, biliary or pancreatic secretions. It increases duodenal peristalsis which decreases intestinal transit time, and increases lower oesophageal sphincter tone. It is also a potent central dopamine-receptor antagonist and may also have serotonin-receptor (5-HT₃) antagonist properties. Absorption: Rapidly and almost completely absorbed from

	potent central dopamine-receptor antagonist and may also have serotonin-receptor (5-HT₃) antagonist properties. Absorption: Rapidly and almost completely absorbed from the GI tract (oral); peak plasma concentrations after 1-2 hr. Distribution: Widely distributed; crosses the blood-brain barrier and placenta; enters breast milk. Metabolism: Extensively hepatic. Excretion: Via urine (as unchanged drug, sulfate or glucuronide conjugates and metabolites), faeces; 4-6 hr (terminal elimination half-life).
CIMS Class	GIT Regulators, Antiflatulents & Anti-inflammatories / Antiemetics

metolazone

CIMS Class : (Diuretics)
metolazone

P - Contraindicated in pregnancy
L - Caution when used during lactation
Food α - Food interaction

related metolazone information

Indication & Dosage

Oral

Hypertension

Adult: Initially, 1.25 mg daily, adjusted after 3-4 wk according to response. Usual dose: 2.5-5 mg daily, either alone or with other antihypertensives. Maintenance dose: 5 mg on alternate days. Formulations with enhanced bioavailability: 0.5-1 mg daily.

Elderly: Initially, 2.5 mg/day or every other day.

Oral

Oedema

Adult: 5-10 mg daily, increased if necessary to 20 mg daily. Max: 80 mg in 24 hr.

Elderly: Initially, 2.5 mg/day or every other day.

Administration

Should be taken with food. (Take after breakfast.)

Overdosage

Symptoms: Orthostatic hypotension, dizziness, drowsiness, syncope, haemoconcentration and haemodynamic changes due to plasma volume depletion. Management: Symptomatic

	Symptoms: Orthostatic hypotension, dizziness, drowsiness, syncope, haemoconcentration and haemodynamic changes due to plasma volume depletion. Management: Symptomatic and supportive.
Contraindications	Anuria; hepatic coma or pre-coma. Pregnancy.
Special Precautions	Pre-diabetes or DM; gout; SLE; hepatic and renal impairment; hypercholesterolaemia. Correct electrolyte disturbances prior to therapy. Risk of cross-sensitivity with sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides and loop diuretics. Lactation.
Adverse Drug Reactions	Chest pain, palpitation, necrotising angiitis, orthostatic hypotension, syncope, venous thrombosis, vertigo, volume depletion; depression, dizziness, chills, drowsiness, fatigue, restlessness, headache, lightheadedness; petechiae, photosensitivity, hypersensitivity reactions; gout attacks, electrolyte disturbances; abdominal bloating, diarrhoea, abdominal pain, anorexia, constipation, epigastric distress, nausea, xerostomia, pancreatitis, vomiting; impotence; aplastic anaemia, thrombocytopenia, haemoconcentration, leukopenia; cholestatic jaundice, hepatitis; joint pain, muscle cramps, weakness, neuropathy, paraesthesia; blurred vision; increased BUN, glucosuria. Potentially Fatal: Stevens-Johnson syndrome, toxic epidermal necrolysis.
Drug Interactions	Hypotensive and nephrotoxic effects of ACE inhibitors may be enhanced. Absorption may be reduced with bile acid sequestrants. Hyperglycaemic effect may be enhanced with diazoxide. May increase serum concentration and QTc-prolonging effect of dofetilide. May reduce lithium excretion. Hypotensive effect may be increased with alcohol. Potentially Fatal: Increased risk of nephrotoxicity

	reduce lithium excretion. Hypotensive effect may be increased with alcohol. Potentially Fatal: Increased risk of nephrotoxicity with ciclosporin. Severe electrolyte disturbances may occur with furosemide.
Food Interaction	Photosensitisation may occur with dong quai, St John's wort. Hypertension may be exacerbated with ephedra, yohimbe, ginseng. Antihypertensive effect may be increased with garlic. Avoid natural licorice.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). if used in pregnancy-induced hypertension. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Metolazone is a thiazide-like diuretic. It inhibits reabsorption of sodium in the distal tubules resulting in increased excretion of sodium and water, as well as potassium and hydrogen ions. Onset: Approx 60 min. Duration: =24 hr. Absorption: Incompletely absorbed from the GI tract (oral). Distribution: Crosses the placenta and enters breast milk. Protein-binding: 95%.

	Absorption: Incompletely absorbed from the GI tract (oral). Distribution: Crosses the placenta and enters breast milk. Protein-binding: 95%. Metabolism: Not metabolised to a substantial extent. Excretion: Via urine (80-95% unchanged); via bile and some undergo enterohepatic recycling; 6-20 hr (elimination half-life).
CIMS Class	Diuretics
ATC Classification	C03BA08 - metolazone; Belongs to the class of low-ceiling sulfonamide diuretics. Used to promote excretion of urine.

metoprolol

CIMS Class : (Beta-Blockers) , (Antimigraine Preparations)
metoprolol

P - Contraindicated in pregnancy

Food $\square$ - Food interaction

related metoprolol information

Indication & Dosage

Oral

Hypertension

Adult: Conventional preparation: Initially, 50-100 mg daily in single or 2 divided doses; may increase wkly to 400 mg daily depending on response
Maintenance: 100-200 mg daily; up to 400 mg daily. Extended-release preparation: 25-100 mg once daily.

Hepatic impairment: Reduce dose.

Oral

Angina pectoris

Adult: 50-100 mg bid-tid.

Hepatic impairment: Reduce dose.

Oral

Cardiac arrhythmias

Adult: 50 mg bid-tid; increased to 300 mg daily in divided doses if needed

Hepatic impairment: Reduce dose.

Oral

Adjunct in hyperthyroidism

Adult: 50 mg 4 times daily.

Hepatic impairment: Reduce dose.

Oral

Adjunct in hyperthyroidism

Adult: 50 mg 4 times daily.

Hepatic impairment: Reduce dose.

Oral

Prophylaxis of migraine

Adult: 100-200 mg daily in divided doses.

Hepatic impairment: Reduce dose.

Oral

Stable symptomatic heart failure

Adult: As a modified-release preparation of metoprolol succinate: Initially 12.5-25 mg of equivalent metoprolol tartrate dose. Increase, as tolerated, 2-wk intervals to a max of 20 mg once daily.

Hepatic impairment: Reduce dose.

Intravenous

Emergency treatment of cardiac arrhythmias

Adult: Initially, up to 5 mg at a rate of 1-2 mg/min; may repeat at 5-minute intervals if needed up to a total dose of 10-15 mg. When acute arrhythmias are controlled, initiate maintenance therapy 4-6 hr after IV therapy using c therapy not exceeding 50 mg tid.

Hepatic impairment: Reduce dose.

Intravenous

Prophylaxis or control of arrhythmias on induction of anaesthesia

Adult: 2-4 mg as slow inj; may repeat injections of 2 mg as necessary up a max total dose of 10 mg.

Hepatic impairment: Reduce dose.

Intravenous

Adjunct in the early management of acute myocardial infarction

Adult: Admin within 12 hr of the onset of chest pain, 5 mg at 2-minute intervals to a total of 15 mg, if tolerated. After 15 minutes, for patients who have received full IV dose: Initiate oral therapy of 50 mg every 6 hr for 2 days; for patients who did not tolerate the full IV dose: Reduced oral dose should be given as and when their condition permits. Subsequent

	have received full IV dose: Initiate oral therapy of 50 mg every 6 hr for 2 days; for patients who did not tolerate the full IV dose: Reduced oral dose should be given as and when their condition permits. Subsequent maintenance: 100 mg bid via oral route. Hepatic impairment: Reduce dose.
Administration	May be taken with or without food.
Overdosage	Symptoms: Hypotension, bradycardia, AV block, intraventricular conduction disturbances, cardiogenic shock, asystole, bronchospasm, hypoglycaemia, hyperkalaemia., convulsions, coma, respiratory arrest. Management: Supportive and symptomatic.
Contraindications	2nd or 3rd degree AV block; sick sinus syndrome; decompensated heart failure; clinically relevant sinus bradycardia. Severe peripheral arterial circulatory disorders. Cardiogenic shock. Asthma. Pheochromocytoma (without α-blockade), systolic BP <100 mmHg. Metabolic acidosis. Pregnancy (2nd and 3rd trimesters).
Special Precautions	Compensated heart failure, bronchospastic disease, hepatic impairment, conduction disorders, bradycardia, peripheral arterial circulatory disorders An α-blocker should be given concurrently in patients with pheochromocytoma. May mask signs of acute hypoglycaemia. May mask symptoms of hyperthyroidism. Caution when used in patients with history cardiac failure or those with minimal cardiac reserve. Avoid using anaesthetic agents that may depress the myocardium. May impair ability to drive or operate machinery. Myasthenia gravis; history of psychiatric disorder. Lactation. Avoid abrupt drug withdrawal.
Adverse Drug Reactions	Bradycardia, hypotension, arterial insufficiency, chest pain, CHF, oedema, palpitation, syncope, gangrene; dizziness, fatigue, depression, confusion, headache, insomnia, short-term memory loss, nightmares, somnolence; pruritus, rash, increased psoriasis, reversible alopecia; sexual dysfunction/impotence, Peyronie's disease; diarrhoea, constipation, flatulence, GI pain, heartburn, nausea, xerostomia; agranulocytosis (rare) musculoskeletal pain; blurred vision, dry eyes, oculomucocutaneous syndrome; tinnitus; dyspnoea, bronchospasm, wheezing, rhinitis; cold

	dysfunction/impotence, Peyronie's disease; diarrhoea, constipation, flatulence, GI pain, heartburn, nausea, xerostomia; agranulocytosis (rare) musculoskeletal pain; blurred vision, dry eyes, oculomucocutaneous syndrome; tinnitus; dyspnoea, bronchospasm, wheezing, rhinitis; cold extremities. Potentially Fatal: Heart failure, heart block, bronchospasm.
Drug Interactions	Additive effect with catecholamine-depleting drugs e.g. reserpine and MAOIs. May antagonise β_1-adrenergic stimulating effects of sympathomimetics. Additive negative effects on SA or AV nodal conduction with cardiac glycosides, nondihydropyridine calcium-channel blockers. Increased oral bioavailability with aluminium/magnesium-containing antacids. Paradoxical response to epinephrine may occur. Increased plasma concentrations with CYP2D6 inhibitors (e.g. bupropion, cimetidine, diphenhydramine, fluoxetine, hydroxychloroquine, paroxetine, propafenone, quinidine, ritonavir, terbinafine, thioridazine). Increased risk of hypotension and heart failure with myocardial depressant general anaesthetics (e.g. diethyl ether). Risk of pulmonary hypertension with vasodilators e.g. hydralazine in uraemic patients. Reduced plasma levels with rifampicin. May increase negative inotropic and negative chronotropic effect of anti-arrhythmic drugs e.g. quinidine and amiodarone. Propafenone may increase serum levels of metoprolol. Concurrent use with indomethacin may reduce the antihypertensive efficacy of β-blocker. May reduce clearance of lidocaine. May increase effects of hypoglycaemics. Efficacy may be reduced by isoprenaline. Concurrent use with digoxin may lead to additive bradycardia. Potentially Fatal: Additive or synergistic effects with verapamil; increased oral bioavailability with verapamil. Exacerbation of rebound hypertension during abrupt clonidine withdrawal.
Food Interaction	Increased absorption with food. Bayberry, blue cohosh, cayenne, ephedra, ginger, American ginseng, gotu kola, licorice, yohimbe may exacerbate hypertension. Black cohosh, California poppy, coleus, garlic, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse have antihypertensive activity and may have an additive effect with metoprolol.

	ginger, American ginseng, gotu kola, licorice, yohimbe may exacerbate hypertension. Black cohosh, california poppy, coleus, garlic, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse have antihypertensive activity and may have an additive effect with metoprolol.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Do not store above 30°C (86°F). Protect from light. Oral: Store at 15-30°C (59-86°F).
Mechanism of Action	Metoprolol selectively inhibits β_1-adrenergic receptors but has little or no effect on β_2-receptors except in high doses. It has no membrane-stabilising nor intrinsic sympathomimetic activity. Duration: 10-20 hr. Absorption: Absorbed readily and completely for the GI tract (oral); peak plasma concentrations after 1.5-2 hr. Distribution: Distributed widely, crosses the placenta and enters breast milk. Protein-binding: 12%. Metabolism: Hepatic: By oxidative deamination, O-dealkylation followed by oxidation and aliphatic hydroxylation. Undergoes significant first-pass metabolism. Excretion: Via urine (as metabolites and unchanged drug). Elimination half-life: 3-4 hr (fast hydroxylators), 7 hr (poor hydroxylators).
CIMS Class	Beta-Blockers / Antimigraine Preparations
ATC	C07AB02 - metoprolol; Belongs to the class of selective beta-blocking

ATC
Classification

C07AB02 - metoprolol; Belongs to the class of selective beta-blocking agents. Used in the treatment of cardiovascular diseases.

metoprolol + hydrochlorothiazide

CIMS Class : (Beta-Blockers) , (Diuretics)
metoprolol + hydrochlorothiazide

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food α - Food interaction

related metoprolol + hydrochlorothiazide information

Indication & Dosage

Oral

Hypertension

Adult: Metoprolol (tartrate) 100mg + hydrochlorothiazide 12.5mg, 1-3 tab daily as a single or in divided doses.

CrCl (ml/min)	Dosage Recommendation
<30	Avoid

Hepatic impairment: Reduction in dose may be necessary.

Severe impairment: avoid.

Overdosage

Symptoms: hypotension, bradycardia, bronchospasm, cardiac failure; cyanosis; hypoglycaemia; nausea, thirst; muscle cramps; confusion; normally occur 20 min- 2 hr after ingestion.

Hydrochlorothiazide overdose produces acute loss of fluid and electrolytes. Treatment: symptomatic and supportive; fluids; induction of vomiting, gastric lavage, activated charcoal may be required; electrolytes, ECG and renal function should be monitored.

Contraindications

2nd or 3rd degree AV block, sinus bradycardia, cardiogenic shock, congestive heart failure; anuria; systolic hypotension (<100

	2nd or 3rd degree AV block, sinus bradycardia, cardiogenic shock, congestive heart failure; anuria; systolic hypotension (<100 mmHg); severe kidney or liver failure; therapy resistant hypokalaemia and hyponatraemia; hypercalcaemia; symptomatic hyperuricaemia; lactation.
Special Precautions	Renal or hepatic impairment; DM; hyperlipidaemia; hyperuricaemia; left ventricular hypertension and ventricular ectopics; thyrotoxicosis; major surgery; gradual withdrawal; pregnancy; Prinzmetal's angina; reversible obstructive airways disease; elderly; psoriasis; general anaesthesia; not recommended for initial treatment of hypertension.
Adverse Drug Reactions	Fluid and electrolyte imbalance; dizziness, headache, tiredness (do not drive if affected), depression; bradycardia; cold extremities; Raynaud's type phenomena; congestive failure; reduced exercise tolerance; dyspnoea, bronchospasm; gout; impotence; pruritus; rash; nightmares; insomnia; azotemia in renal disease; paraesthesia; palpitation; cough; abdominal pain, anorexia, diarrhoea, nausea, vomiting; arthralgia, myalgia; QTc interval prolongation. Potentially Fatal: Hypersensitivity reactions, hypotension and severe bradycardia.
Drug Interactions	Effects of tubocurarine may be prolonged while corticosteroids may increase the risk of hypokalaemia; may precipitate azotemia in renal patients; increased hypotensive effects with: alcohol, α-blockers, general anaesthetics, hydralazine, levodopa, MAOIs, methyldopa, nitrates, phenothiazines, ACE inhibitors, adrenergic neurone blockers, aldesleukin, alprostadil, antiotensin-II receptor antagonists, TCAs, anxiolytics and hypnotics, baclofen, calcium-channel blockers, clonidine, diazoxide, minoxidil, moxislyte, moxonidine, sodium nitroprusside, tizanidine; hydrochlorothiazide increases

angiotensin II receptor antagonists, TCAs, anxiolytics and hypnotics, baclofen, calcium-channel blockers, clonidine, diazoxide, minoxidil, moxislyte, moxonidine, sodium nitroprusside, tizanidine; hydrochlorothiazide increases plasma concentration of fluconazole; β -blockers may mask warning signs of hypoglycaemia with antidiabetics, increased hypoglycaemic effect of insulin; hypotensive effect antagonised by corticosteroids, NSAIDs, oestrogens, indomethacin, ketorolac; reduced metoprolol plasma concentration with barbiturates, rifampicin; increased metoprolol plasma concentration with cimetidine, citalopram, escitalopram, paroxetine, propafenone; hypokalaemia potentially caused by hydrochlorothiazide may antagonise action of lidocaine, mexiletine, reboxetine; increased risk of hypokalaemia with acetazolamide, amphotericin, corticosteroids, theophylline; increased risk of hyponatraemia with carbamazepine, chlorpropamide; increased risk of sensitivity with allopurinol (especially in renal impairment); increased risk of hypercalcaemia with calcium salts, toremifene, vitamin D; increased risk of hypermagnesaemia with ciclosporin (and risk of nephrotoxicity); absorption of thiazides reduced by colestipol and colestyramine (take at least 2 hr apart).

Potentially Fatal: Catecholamine - depleting drugs such as reserpine, may cause additive effects and precipitate marked hypotension or bradycardia; β -blockers may increase patients' response to allergens and reduce the effectiveness of usual doses of adrenaline in treating allergic reactions; increased levels of metoprolol with artemether/lumefantrine (manufacturer advises to avoid); possible severe hypotension and heart failure with nifedipine, nisoldipine, verapamil; risk of severe hypertension with adrenaline, noradrenaline (norephedrine); increased risk of bradycardia, AV block and myocardial depression with amiodarone (potential risk may last several weeks due to

	adrenaline, noradrenaline(norephedrine); increased risk of bradycardia, AV block and myocardial depression with amiodarone(potential risk may last several weeks due to amiodarone's long half life), antiarrhythmics (including cardiac glycosides), diltiazem, flecainide, mefloquine (bradycardia); hydrochlorothiazide may reduce the excretion of lithium, increasing the risk of lithium toxicity; hypokalaemia potentially caused by metoprolol and/or hydrochlorothiazide may increase risk of ventricular arrhythmias with amisulpride, pimozide, atomoxetine, sertindole, cardiac glycosides, disopyramide, flecainide, sotalol; increased risk of nephrotoxicity and ototoxicity with platinum compounds and aminoglycosides.
Food Interaction	Avoid dong quai as it may cause photosensitization and has estrogenic activity. Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), gotu kola, licorice and yohimbe as they may worsen hypertension. Avoid black cohosh, californian poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse and garlic as they may increase antihypertensive effect.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store in airtight containers and protect from light.
Mechanism of Action	Metoprolol is a cardioselective β-blocker causing reduction in heart rate, cardiac output and blood pressure. Hydrochlorothiazide increases renal excretion of sodium and chloride and reduces cardiac load. The two drugs exert additive effects in hypertension. Onset: metoprolol: Peak effect: 1.5-4 hr; hydrochlorothiazide: approx 2 hr for diuresis, peak effect: 4-6 hr. Duration: metoprolol: 10-20 hr; hydrochlorothiazide: 6-12 hr.

	Onset: metoprolol: Peak effect: 1.5-4 hr; hydrochlorothiazide: approx 2 hr for diuresis, peak effect: 4-6 hr. Duration: metoprolol: 10-20 hr; hydrochlorothiazide: 6-12 hr. Absorption: Metoprolol: 95%, rapid and complete; hydrochlorothiazide: approx 50-80%. Absorption and bioavailability of both metoprolol and hydrochlorothiazide are increased when taken with food. Distribution: Protein binding: metoprolol: 12% to albumin. Hydrochlorothiazide: 68%. Distribution of hydrochlorothiazide: 3.6-7.8 l/kg. Metabolism: Metoprolol: extensively 1st pass hepatic metabolism via CYP2D6; bioavailability: approx 50%. Hydrochlorothiazide: not metabolized; bioavailability: 50-80%. Excretion: Metoprolol: half life elimination: 3-8 hr; excreted via urine (<5-10% as unchanged drug). Hydrochlorothiazide: half life elimination: 5.6-14.8 hr; excretion via urine as unchanged drug.
CIMS Class	Beta-Blockers / Diuretics
ATC Classification	C03AA03 - hydrochlorothiazide; Belongs to the class of low-ceiling thiazide diuretics. Used to promote excretion of urine. C07AB02 - metoprolol; Belongs to the class of selective beta-blocking agents. Used in the treatment of cardiovascular diseases.

metronidazole

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab - Lab interference

related metronidazole information

Indication & Dosage

Oral

Amoebiasis

Adult: 400-800 mg tid for 5-10 days or 1.5-2.5 g as a single daily dose for 2-3 days. Alternatively, 1.5-2.5 g as a single dose for 2-3 days.

Child: 1-3 yr: $\frac{1}{4}$ adult dose; 3-7 yr: $\frac{1}{3}$ adult dose; 7-10 yr: $\frac{1}{2}$ adult dose. Alternatively, 35-50 mg/kg daily in divided doses.

Elderly: Use lower end of adult dose recommendations. Do not administer as a single dose.

CrCl (ml/min)	Dosage Recommendation
<10	Consider reducing dose during long-term therapy.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Oral

Balantidiasis

Adult: 400-800 mg tid for 5-10 days or 1.5-2.5 g as a single daily dose for 2-3 days. Alternatively, 1.5-2.5 g as a single dose for 2-3 days.

Child: 1-3 yr: $\frac{1}{4}$ adult dose; 3-7 yr: $\frac{1}{3}$ adult dose; 7-10 yr: $\frac{1}{2}$ adult dose. Alternatively, 35-50 mg/kg daily in divided doses.

Elderly: Use lower end of adult dose recommendations. Do not administer

for 2-3 days. Alternatively, 2.0-2.5 g as a single dose for 2-3 days.

Child: 1-3 yr: $\frac{1}{4}$ adult dose; 3-7 yr: $\frac{1}{3}$ adult dose; 7-10 yr: $\frac{1}{2}$ adult dose. Alternatively, 35-50 mg/kg daily in divided doses.

Elderly: Use lower end of adult dose recommendations. Do not administer as a single dose.

CrCl (ml/min)	Dosage Recommendation
<10	Consider reducing dose during long-term therapy.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Oral

***Blastocystis hominis* infection**

Adult: 400-800 mg tid for 5-10 days or 1.5-2.5 g as a single daily dose for 2-3 days. Alternatively, 1.5-2.5 g as a single dose for 2-3 days.

Child: 1-3 yr: $\frac{1}{4}$ adult dose; 3-7 yr: $\frac{1}{3}$ adult dose; 7-10 yr: $\frac{1}{2}$ adult dose. Alternatively, 35-50 mg/kg daily in divided doses.

Elderly: Use lower end of adult dose recommendations. Do not administer as a single dose.

CrCl (ml/min)	Dosage Recommendation
<10	Consider reducing dose during long-term therapy.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Oral

Trichomoniasis

Adult: 2 g as a single dose, or 800 mg in the morning and 1.2 g in the evening for 2 days, or 0.6-1 g daily in 2-3 divided doses for 7 days. There should be an interval of 4-6 wk if treatment needs to be repeated.

Child: 1-3 yr: 50 mg tid; 3-7 yr: 100 mg bid; 7-10 yr: 100 mg tid. All doses to be taken for 7 days. Alternatively, 15 mg/kg daily in divided doses for 7 days.

Elderly: Use lower end of adult dose recommendations. Do not administer as a single dose.

CrCl (ml/min)	Dosage Recommendation
<10	Consider reducing dose during long-term therapy.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Oral

Giardiasis

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Oral

Giardiasis

Adult: 2 g once daily for 3 consecutive days, or 400 mg tid for 5 days, or 500 mg bid for 7-10 days.

Child: 1-3 yr: $\frac{1}{4}$ adult dose; 3-7 yr: $\frac{1}{3}$ adult dose; 7-10 yr: $\frac{1}{2}$ adult dose. Alternatively, 15 mg/kg daily in divided doses.

Elderly: Use lower end of adult dose recommendations. Do not administer as a single dose.

CrCl (ml/min)	Dosage Recommendation
<10	Consider reducing dose during long-term therapy.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Oral

Bacterial vaginosis

Adult: 2 g as a single dose, or 400-500 mg bid for 5-7 days.

Elderly: Use lower end of adult dose recommendations. Do not administer as a single dose.

CrCl (ml/min)	Dosage Recommendation
<10	Consider reducing dose during long-term therapy.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Oral

Acute necrotising ulcerative gingivitis

Adult: 200 mg tid for 3 days.

Elderly: Dose reductions may be required.

CrCl (ml/min)	Dosage Recommendation
<10	Consider reducing dose during long-term therapy.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Oral

Acute dental infections

Adult: 200 mg tid for 3 days.

Elderly: Dose reductions may be required.

CrCl (ml/min)	Dosage Recommendation
<10	Consider reducing dose during long-term therapy.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Elderly: Dose reductions may be required.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Oral

Anaerobic bacterial infections

Adult: Initially, 800 mg followed by 400 mg 8 hly for about 7 days.

Other recommended doses: 500 mg 8 hrly or 7.5 mg/kg 6 hrly (max: 4 g in 24 hr).

Child: 7.5 mg/kg 8 hrly.

Elderly: Use lower end of adult dose recommendations. Do not admin as a single dose.

CrCl (ml/min)	Dosage Recommendation
<10	Consider reducing dose during long-term therapy.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Oral

Prophylaxis of postoperative anaerobic bacterial infections

Adult: 400 mg by mouth 8 hrly in the 24 hr prior to surgery followed postoperatively by IV or rectal admin until oral therapy is possible.

Other sources recommend that oral doses be initiated only 2 hr prior to surgery and that number of doses for all admin routes be limited to a total of 4.

Elderly: Dose reduction may be necessary.

CrCl (ml/min)	Dosage Recommendation
<10	Consider reducing dose during long-term therapy.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Oral

Eradication of H. pylori associated with peptic ulcer disease

Adult: In combination with another antibacterial (e.g. clarithromycin) plus either a proton pump inhibitor (e.g. lansoprazole) or ranitidine bismuth citrate: 400 mg bid. In combination with omeprazole and amoxicillin: 400 mg tid. Continue treatment for 1 wk.

Elderly: Dose reduction may be necessary.

CrCl (ml/min)	Dosage Recommendation
---------------	-----------------------

amoxicillin: 400 mg tid. Continue treatment for 1 wk.

Elderly: Dose reduction may be necessary.

<10	Consider reducing dose during long-term therapy.
-----	--

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Oral

Leg ulcers and pressure sores

Adult: 400 mg tid for 7 days.

Elderly: Dose reduction may be necessary.

CrCl (ml/min)	Dosage Recommendation
<10	Consider reducing dose during long-term therapy.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Oral

Antibiotic-associated colitis

Adult: 250-500 mg bid-tid for 10-14 days. Transfer to oral vancomycin is recommended if there is no clear clinical response after 2 days of treatment.

Child: 20 mg/kg/day 6 hrly. Max dose: 2 g/day. Transfer to oral vancomycin is recommended if there is no clear clinical response after 2 days of treatment.

Elderly: Use lower end of adult dose recommendations. Do not administer as a single dose.

CrCl (ml/min)	Dosage Recommendation
<10	Consider reducing dose during long-term therapy.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Intravenous

Anaerobic bacterial infections

Adult: 500 mg infused as 100 ml of a 5 mg/ml solution at 5 ml/min 8 hrly. Alternatively, 15 mg/kg infusion followed by 7.5 mg/kg 6 hrly; infuse over 1 hr (max: 4 g in 24 hr). Substitute oral therapy as soon as possible.

Child: 7.5 mg/kg 8 hrly.

Elderly: Use lower end of adult dose recommendations. Do not administer as a single dose.

Child: 7.5 mg/kg 8 hrly.

Elderly: Use lower end of adult dose recommendations. Do not administer as a single dose.

CrCl (ml/min)	Dosage Recommendation
<10	Consider reducing dose during long-term therapy.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Intravenous

Prophylaxis of postoperative anaerobic bacterial infections

Adult: 500 mg by IV infusion shortly before operation and repeated 8 hrly; oral doses of 200 or 400 mg 8 hrly being substituted as soon as possible. Patient undergoing colorectal surgery: 15 mg/kg infused over 30-60 min, completed about 1 hr prior to surgery, followed by 2 further IV doses of 7.5 mg/kg infused at 6 and 12 hr after the initial dose.

Elderly: Use lower end of adult dose recommendations. Do not administer as a single dose.

CrCl (ml/min)	Dosage Recommendation
<10	Consider reducing dose during long-term therapy.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Topical/Cutaneous

Bacterial vaginosis

Adult: Apply 5 g of a 0.75% gel once or bid for 5 days.

Rectal

Anaerobic infections

Adult: As a 1-g suppository 8 hrly for 3 days, then 12 hrly. Substitute oral therapy as soon as possible. May be unsuitable for initiating therapy in severe infections.

Child: <1 yr: 125 mg; 1-5 yr: 250 mg; 5-10 yr: 500 mg. All doses to be given 8 hrly for 3 days, then 12 hrly thereafter. May be unsuitable for initiating therapy in severe infections.

Elderly: Dose reduction may be necessary.

CrCl (ml/min)	Dosage Recommendation
<10	Consider reducing dose during long-term therapy.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Rectal

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose given once daily.

Rectal

Prophylaxis of postoperative anaerobic bacterial infections

Adult: 1 g 8 hrly starting 2 hr before surgery.

Elderly: Dose reduction may be necessary.

CrCl (ml/min)	Dosage Recommendation
<10	Consider reducing dose during long-term therapy.

Topical/Cutaneous

Fungating tumours

Adult: Apply as a 0.75 or 0.8% gel to the affected area.

Topical/Cutaneous

Rosacea

Adult: Apply and rub a thin film once daily (1% formulation) or bid (0.75% formulation) to entire affected areas after washing. Significant response should be noticed within 3 wk. Clinical studies have demonstrated continuing improvement through 9 wk of therapy.

Reconstitution: Reconstitute powder for inj by adding 4.4 ml of sterile or bacteriostatic water for inj, 0.9% sodium chloride inj or bacteriostatic sodium chloride inj to a vial labeled as containing 500 mg metronidazole. Reconstituted solution contains approx 100 mg/ml metronidazole and must be further diluted with 0.9% sodium chloride inj, 5% dextrose inj or lactated Ringer's inj to a concentration of = 8 mg/ml metronidazole. Neutralise reconstituted and diluted metronidazole hydrochloride solution by adding approx 5 mEq of sodium bicarbonate inj for each 500 mg metronidazole.

Incompatibility: Incompatible with aztreonam, dopamine, meropenem.

Administration

Tab: Should be taken with food.

Susp: Should be taken on an empty stomach. (Take at least 1 hr before meals.)

	I ab: Should be taken with food. Susp: Should be taken on an empty stomach. (Take at least 1 hr before meals.)
Overdosage	Symptoms: Nausea, vomiting, ataxia, seizures, peripheral neuropathy. Management: Symptomatic and supportive.
Contraindications	History of hypersensitivity to metronidazole or other nitroimidazole derivatives. Pregnancy (1st trimester) and lactation.
Special Precautions	Patients with CNS diseases; discontinue IV therapy if abnormal neurologic symptoms occur. History of seizure disorder. Evidence or a history of blood dyscrasias; perform total and differential leukocyte counts before and after treatment. Severe hepatic impairment; monitor plasma levels. Predisposition to oedema (inj contains sodium). Prolonged use may result in fungal or bacterial superinfection.
Adverse Drug Reactions	GI disturbances e.g. nausea, unpleasant metallic taste, vomiting, diarrhoea or constipation. Furred tongue, glossitis, and stomatitis due to overgrowth of Candida. Rarely, antibiotic-associated colitis. Weakness, dizziness, ataxia, headache, drowsiness, insomnia, changes in mood or mental state. Numbness or tingling in the extremities, epileptiform seizures (high doses or prolonged treatment). Transient leucopenia and thrombocytopenia. Hypersensitivity reactions. Urethral discomfort and darkening of urine. Raised liver enzyme values, cholestatic hepatitis, jaundice. Thrombophlebitis (IV). Potentially Fatal: Anaphylaxis.
Drug Interactions	Acute psychoses or confusion with disulfiram. Additive/synergistic effect with other antimicrobials. Effects reduced with phenobarbital or phenytoin. Potentially Fatal: Disulfiram-like reaction with alcohol. Increased risk of adverse effects of coumarin anticoagulants, phenytoin, lithium, ciclosporin, fluorouracil. Increased risk of neurological effects with cimetidine.
Lab Interference	May interfere with tests for aspartate aminotransferase (AST), alanine aminotransferase (ALT), triglycerides, glucose and lactate

	May interfere with tests for aspartate aminotransferase (AST), alanine aminotransferase (ALT), triglycerides, glucose and lactate dehydrogenase (LDH).
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Store at 15-30°C and protect from light.
Mechanism of Action	Metronidazole is converted to reduction products that interact with DNA to cause destruction of helical DNA structure and strand leading to a protein synthesis inhibition and cell death in susceptible organisms. It is effective against a wide range of organisms including E. histolytica, T. vaginalis, Giardia, anaerobes e.g. Bacterioides sp, Fusobacterium sp, Clostridium sp, Peptococcus sp and Peptostreptococcus sp, and moderately active against Gardnerella sp and Campylobacter sp. Absorption: Readily absorbed from the GI tract (oral), poorly absorbed from the vagina (intravaginal); peak plasma concentrations after 1-2 hr (oral), 5-12 hr (rectal), 8 hr (intravaginal). May be delayed by the presence of food. Distribution: Protein-binding: <20%. Widely distributed in body tissues and fluids e.g. bile, bone, breast milk, cerebral abscesses, CSF, liver and liver abscesses, saliva, seminal fluid, vaginal secretions (concentrations similar to those in plasma); crosses the placenta and rapidly enters fetal circulation. Metabolism: Hepatic via side-chain oxidation and glucuronide formation. Excretion: Mainly via urine (as metabolites); via faeces (small amounts). Elimination half-life: 8 hr; longer in neonates and severe

	formation. Excretion: Mainly via urine (as metabolites); via faeces (small amounts). Elimination half-life: 8 hr; longer in neonates and severe hepatic impairment.
CIMS Class	Other Antibiotics / Topical Antibiotics / Antiamoebics / Preparations for Vaginal Conditions
ATC Classification	A01AB17 - metronidazole; Belongs to the class of local antiinfective and antiseptic preparations. Used in the treatment of diseases of the mouth. D06BX01 - metronidazole; Belongs to the class of other topical chemotherapeutics used in the treatment of dermatological diseases. G01AF01 - metronidazole; Belongs to the class of imidazole derivative antiinfectives. Used in the treatment of gynecological infections. J01XD01 - metronidazole; Belongs to the class of imidazole derivative antibacterials. Used in the treatment of systemic infections. P01AB01 - metronidazole; Belongs to the class of nitroimidazole derivatives antiprotozoals. Used in the treatment amoebiasis and other protozoal diseases.

metronidazole + norfloxacin

CIMS Class : (Antidiarrheals) , (Antibacterial Combinations)
metronidazole + norfloxacin

P - Caution when used during pregnancy

L - Contraindicated in lactation

related metronidazole + norfloxacin information

Indication & Dosage	<i>Oral</i> Diarrhoea caused by <i>E.coli</i>, salmonella and shigella <i>Child:</i> Per tablet contains metronidazole 500 mg and norfloxacin 400 mg: 1 tablet bid. Per 5 mL syrup contains metronidazole 100 mg and norfloxacin 100 mg: 5-10 mL bid.
Contraindications	Hypersensitivity, blood dyscrasias, active CNS disease, serious neurological disease, neurological disease, seizures, alcohol, children, convulsions
Special Precautions	Pregnancy, lactation renal/hepatic impairment. H/O convulsions. Ensure adequate hydration, urinary output. Patients predisposed to seizures.
Adverse Drug Reactions	Peripheral neuropathies. GI disturbances, rash, urticaria, pruritus, superinfection (candida), metallic taste, headache, dizziness, transient leucopaenia, paraesthesias, tongue, glossitis, pseudomembranous colitis (rare). Reduced serum levels of cholesterol, and triglycerides, nausea, vomiting, heart burn, constipation/diarrhoea, headache, dizziness, depression, insomnia, dry mouth, fever, arthralgia and

	levels of cholesterol, and triglycerides, nausea, vomiting, heart burn, constipation/diarrhoea, headache, dizziness, depression, insomnia, dry mouth, fever, arthralgia and anaemia. Elevated liver enzymes, urea and creatinine. Potentially Fatal: Seizures, eosinophilia, neutropaenia, thrombocytopaenia.
Drug Interactions	Acute psychoses when metronidazole co-administered with disulfiram. It has additive/synergistic effect with other antimicrobials. Blood levels increased by cimetidine. Antacids reduce absorption of norfloxacin from GIT. Potentially Fatal: Disulfiram-like reaction when metronidazole is administered with alcohol. Enhances action of coumarin anticoagulants. Norfloxacin raises theophylline and cyclosporin levels. Effects of warfarin are potentiated. Probenecid reduces urinary excretion of norfloxacin.
Mechanism of Action	Metronidazole is amoebicidal, bactericidal, and trichomonocidal. It is a nitroimidazole, active against various anaerobic bacteria and protozoa. It enters the cells of microorganisms that contain nitroreductase, where its nitro group is reduced. Unstable intermediate compounds are formed which bind to DNA and inhibit synthesis, causing cell death. Norfloxacin inhibits the action of DNA gyrase in DNA replication, transcription, repair, recombination and transposition.
CIMS Class	Antidiarrheals / Antibacterial Combinations
ATC Classification	A01AB17 - metronidazole; Belongs to the class of local anti-infective and antiseptic preparations. Used in the treatment of diseases of the mouth. D06BX01 - metronidazole; Belongs to the class of other topical chemotherapeutics used in the treatment of dermatological diseases.

treatment of diseases of the mouth.

D06BX01 - metronidazole; Belongs to the class of other topical chemotherapeutics used in the treatment of dermatological diseases.

G01AF01 - metronidazole; Belongs to the class of imidazole derivative antiinfectives. Used in the treatment of gynecological infections.

J01MA06 - norfloxacin; Belongs to the class of quinolones, fluoroquinolone. Used in the treatment of systemic infections.

J01XD01 - metronidazole; Belongs to the class of imidazole derivative antibacterials. Used in the treatment of systemic infections.

P01AB01 - metronidazole; Belongs to the class of nitroimidazole derivatives antiprotozoals. Used in the treatment amoebiasis and other protozoal diseases.

S01AX12 - norfloxacin; Belongs to the class of other antiinfectives. Used in the treatment of eye infections.

mianserin

CIMS Class : (Antidepressants)
mianserin

L - Contraindicated in lactation

related mianserin information

Indication & Dosage	<i>Oral</i> Depression Adult: Initially, 30-40 mg daily gradually increased if necessary. Maintenance: 30-90 mg daily as a single dose at night or in divided doses. Max: 200 mg/day. Elderly: Initially, 30 mg slowly increased if necessary.
Administration	May be taken with or without food.
Overdosage	Symptoms are prolonged sedation, tachycardia and/or bradycardia. Treat with gastric lavage and supportive treatment.
Contraindications	lactation, porphyria.
Special Precautions	Concurrent CNS depression; epilepsy; MAOIs withdrawal (at least 14 days after discontinuation); hepatic, renal or cardiac insufficiency; heart block or recent MI; angle-closure glaucoma; prostatic hyperplasia; diabetes mellitus; monitor blood count regularly.
Adverse Drug Reactions	Drowsiness; liver dysfunction and jaundice; gynaecomastia; convulsions; hypomania; hypotension; hypertension; coma;

	Drowsiness; liver dysfunction and jaundice; gynaecomastia; convulsions; hypomania; hypotension; hypertension; coma; arthralgia; oedema; tachycardia; bradycardia; vomiting; dizziness and ataxia; anticholinergic effects. Potentially Fatal: Bone marrow suppression.
Drug Interactions	Blood levels decreased by phenobarbitone, carbamazepine and phenytoin. Monitor blood pressure with antihypertensive therapy. Mianserin may antagonise the action of antiepileptics by lowering the convulsive threshold. CNS depressant effects enhance by alcohol, sedatives. Potentially Fatal: Avoid MAOIs (and for 14 days after discontinuation).
Mechanism of Action	Mianserin is a structural analogue of serotonin (5-HT) with antagonistic effects at 5-HT_{2A}, 5-HT_{2C} and 5-HT₃ receptors. Mianserin also blocks the inhibitory α₂-receptors, thus leading to an increase in noradrenaline release. Absorption: Readily absorbed from the GIT (oral). Distribution: Widely distributed; crosses the blood-brain barrier; enters breast milk. Protein-binding: Extensive. Metabolism: Extensively hepatic by aromatic hydroxylation, N-oxidation, N-demethylation. Excretion: Urine (as metabolites), faeces (small amounts); 6-40 hrs (elimination half-life).
CIMS Class	Antidepressants
ATC Classification	N06AX03 - mianserin; Belongs to the class of other agents used in the management of depression.

miconazole

CIMS Class : (Preparations for Vaginal Conditions) , (Topical Antifungals & Antiparasites) , (Mouth/Throat Preparations)
miconazole

P - Caution when used during pregnancy
L - Caution when used during lactation

related miconazole information

Indication & Dosage

Mouth/Throat

Intestinal or oropharyngeal candidiasis

Adult: As oral gel containing 20 mg/g (24 mg/ml): 5-10 ml after food 4 times a day. Retain near oral lesions before swallowing. Continue treatment until 48 hr after lesions have healed. For treatment of oral lesions, apply directly onto the lesions 4 times a day for 5-7 days. Continue treatment until 48 hr after lesions have healed.

Child: As oral gel containing 20 mg/g: 1 mth-2 y: 2.5 ml bid. 2-6 yr: 5 ml bid. >6 yr: 5 ml 4 times a day. Retain near oral lesions before swallowing. Continue treatment until 48 hr after lesions have healed.

Vaginal

Vaginal candidiasis

Adult: 100 mg (as pessary or 5 g of 2% cream) inserted at night for 7-14 days. Alternatively, 100 mg bid for 7 days; 200 or 400 mg (as pessaries) daily for 3 days or 1200 mg (as pessary) as a single dose.

	night for 7-14 days. Alternatively, 100 mg bid for 7 days; 200 or 400 mg (as pessaries) daily for 3 days or 1200 mg (as pessary) as a single dose. <i>Topical/Cutaneous</i> Skin fungal infections Adult: Apply 2% cream once daily. Child: Apply 2% cream once daily.
Contraindications	Hypersensitivity; hepatic impairment (oral gel). Porphyria.
Special Precautions	For external use only; discontinue if sensitization or irritation occurs. Pregnancy and lactation.
Adverse Drug Reactions	Nausea, vomiting, febrile reactions, rash, drowsiness, diarrhoea, anorexia and flushing, hepatitis. Local irritation and sensitisation, contact dermatitis. Potentially Fatal: IV: Anaphylactic reaction and cardiac arrest.
Drug Interactions	Increased toxicity reported with carbamazepine. Miconazole acts as an inhibitor of CYP3A4 and CYP2D6 and may, therefore, interact with a large number of drugs e.g. statins, HIV protease inhibitors, ciclosporin, tacrolimus, sildenafil, quinidine, pimozide. Potentially Fatal: Potentiates anticoagulant effect of warfarin. Increased risk of cardiotoxicity with cisapride, astemizole or terfenadine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Miconazole inhibits ergosterol biosynthesis thus damaging fungal cell wall membrane and increases its permeability, allowing leakage of nutrients.

	Miconazole inhibits ergosterol biosynthesis thus damaging fungal cell wall membrane and increases its permeability, allowing leakage of nutrients. Absorption: Incomplete from the GI tract (oral); minimal (topical). Metabolism: Hepatic; converted to inactive metabolites. Excretion: 10-20% of an oral dose will be excreted in urine (as metabolites), 50% of an oral dose is excreted as unchanged drug in the faeces. Elimination half-life: 40 minutes (initial), 126 minutes (secondary), 24 hr (terminal).
CIMS Class	Preparations for Vaginal Conditions / Topical Antifungals & Antiparasites / Mouth/Throat Preparations
ATC Classification	A01AB09 - miconazole; Belongs to the class of local antiinfective and antiseptic preparations. Used in the treatment of diseases of the mouth. A07AC01 - miconazole; Belongs to the class of imidazole derivative antiinfectives. Used for the treatment of intestinal infections. D01AC02 - miconazole; Belongs to the class of imidazole and triazole derivatives for topical use. Used in the treatment of fungal infection. G01AF04 - miconazole; Belongs to the class of imidazole derivative antiinfectives. Used in the treatment of gynecological infections. J02AB01 - miconazole; Belongs to the class of systemic imidazole derivative antimycotics. Used in the treatment of mycotic infections. S02AA13 - miconazole; Belongs to the class of antiinfectives used in the treatment of ear infections.

related midazolam information

related midazolam information	
Indication & Dosage	<i>Oral</i>
	Short-term management of insomnia
	Adult: 7.5-15 mg given at night.
	<i>Oral</i>
	Sedation for dental and minor surgical procedures
	Child: =6 mth: Single dose of 250-500 mcg/kg, up to a max of 20 mg. You
	patients (6 mth-<6 yr) may require up to 1 mg/kg.
	<i>Oral</i>
	Premedication in surgery
	Child: =6 mth: Single dose of 250-500 mcg/kg, up to a max of 20 mg. You
	patients (6 mth-<6 yr) may require up to 1 mg/kg.
	<i>Intramuscular</i>
	Premedication in surgery
	Adult: 70-100 mcg/kg (usual dose: 5 mg) given 20-60 minutes before sur
	deep IM inj.
	Child: =1 yr: 80-200 mcg/kg given 20-60 minutes before surgery by deep
	Elderly: 20-50 mcg/kg given 20-60 minutes before surgery by deep IM inj
	<i>Parenteral</i>

Child: =1 yr: 80-200 mcg/kg given 20-60 minutes before surgery by deep

Elderly: 20-50 mcg/kg given 20-60 minutes before surgery by deep IM inj
Parenteral

Sedation for dental and minor surgical procedures

Adult: IV admin: Initially, up to 2.5 mg given over at least 2-5 minutes, 5-10 minutes before procedure. Repeat after at least 2 minutes if necessary. U total: 3.5-5 mg. Max total: 7.5 mg.

Child: IV admin: 6 mth-5 yr: Initial: 50-100 mcg/kg given over 2 minutes, i slowly at 2-minute intervals up to a total of 600 mcg/kg, max total dose: 6 yr: 25-50 mcg/kg given over 2 minutes and increase slowly at 2-minute int to a total of 400 mcg/kg; max total dose: 10 mg. IM admin (used only in exceptional cases): 1-15 yr: 50-150 mcg/kg; max: 10 mg.

Elderly: Initially 1-1.5 mg given over 2 min, increased by increments of 0.2 mg at 2 min intervals as needed.

Intravenous

Induction of anaesthesia

Adult: 150-200 mcg/kg by slow inj in premedicated patients and at least 300 mcg/kg for those who have not received a premedicant. Additional doses required to complete induction, up to 600 mcg/kg in resistant cases.

Child: >7 yr: 150 mcg/kg. Max total: 500 mcg/kg (not >25 mg).

Elderly: 100-200 mcg/kg in divided doses at 2-minute intervals.

Intravenous

Sedation in critical care

Adult: Loading dose: 30-300 mcg/kg given as infusion over 5 minutes to i sedation. Maintenance dose: 20-200 mcg/kg/hr. For patients with hypothe hypovolaemia or vasoconstriction: Reduce or omit loading dose, and redu maintenance dose.

Child: Neonates with gestational age <32 wk: 30 mcg/kg/hr by continuous infusion. Neonates with gestational age >32 wk and who are <6 mth: 60 n =6 mth: Initial loading dose of 50-200 mcg/kg given by slow IV inj; mainter dose of 60-120 mcg/kg/hr given as IV infusion. In obese paediatric patient calculate dose based on ideal wt.

	=6 mth: Initial loading dose of 50-200 mcg/kg given by slow IV inj; mainter dose of 60-120 mcg/kg/hr given as IV infusion. In obese paediatric patient calculate dose based on ideal wt. Elderly: Dosage may need to be reduced. <i>Rectal</i> Sedation for dental and minor surgical procedures Child: >6 mth: 300-500 mcg/kg as a single dose. May dilute with water for a total volume of 10 mL if the volume is too small. <i>Rectal</i> Premedication in surgery Child: >6 mth: 300-500 mcg/kg as a single dose. May dilute with water for a total volume of 10 mL if the volume is too small. Special Populations: Dosage in intensive care may need to be reduced patients with hypovolaemia, vasoconstriction or hypothermia. Reconstitution: Midazolam solution for injection may be administered rectally. The inj solution may be diluted with Water for Injections up to a total volume of 10 mL if the volume is too small.
Administration	May be taken with or without food.
Overdosage	Symptoms of overdose include sedation, confusion, impaired coordination, relaxation or paradoxical excitation. More serious symptoms would be hypotension, cardiorespiratory depression, apnoea and coma. Treatment generally supportive and symptomatic. The benzodiazepine antagonist flumazenil is indicated in cases of severe intoxication accompanied with coma or respiratory depression. Caution should be observed in the use of flumazenil in cases of drug overdose and in patients with epilepsy already treated with benzodiazepines.
Contraindications	Acute narrow-angle glaucoma; coma or patients in shock; acute alcohol intoxication; intrathecal and epidural admin. Acute pulmonary insufficiency; marked neuromuscular respiratory weakness including unstable myasthenia gravis; severe respiratory depression.

	intoxication; intrathecal and epidural admin. Acute pulmonary insufficiency marked neuromuscular respiratory weakness including unstable myasthenia gravis; severe respiratory depression.
Special Precautions	Paediatric patients with cardiovascular instability; chronic renal failure; open angle glaucoma; cardiac disease; respiratory disease; myasthenia gravis; neonates with history of drug or alcohol abuse; elderly and debilitated (reduce dose); avoid prolonged use or abrupt withdrawal; hepatic impairment; severe fluid or electrolyte disturbances. May impair ability to drive or operate machinery; titrate dose carefully; monitor for early signs of hypoventilation, airway obstruction, or respiratory depression. Pregnancy, lactation
Adverse Drug Reactions	Physical and psychological dependence with withdrawal symptoms; decreased tidal volume and respiration rate; apnoea; headache; hiccup; nausea, increased salivation, decreased appetite, vomiting; cough; oversedation; seizure-like activity (paediatrics); paradoxical reactions; kernicterus; nystagmus; skin rash, pruritus; reduced alertness, confusion, euphoria, hallucinations, fatigue, dizziness, ataxia, post-operative sedation, anterograde amnesia; jaundice; cardiac arrest, heart block, changes, thrombosis; anaphylaxis; laryngospasm, bronchospasm. Potentially Fatal: Respiratory depression, respiratory arrest; hypotension
Drug Interactions	Increased CNS depression with alcohol, opioids, barbiturates, other sedative anaesthetics. Increased respiratory depression with opiates, phenobarbital, benzodiazepines. Plasma concentrations increased by CYP3A4 inhibitors such as cimetidine, erythromycin, clarithromycin, diltiazem, verapamil, ketoconazole, itraconazole, antiretroviral agents, quinupristin with dalfopristin. Midazolam concentration decreased by phenytoin, carbamazepine, phenobarbital, rifampicin. Halothane, thiopental requirements may be reduced during concurrent use.
Food Interaction	Bioavailability of oral midazolam increased by grapefruit juice. Avoid concurrent use.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefit from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which

	Category D: There is positive evidence of human foetal risk, but the benefit from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which other drugs cannot be used or are ineffective).
Storage	Intramuscular: Store at 20-25°C. At a final concentration of 0.5 mg/ml, midazolam is stable for up to 24 hr when diluted with 0.9% sodium chloride or 5% dextrose in water. Intravenous: Store at 20-25°C. At a final concentration of 0.5 mg/ml, midazolam is stable for up to 24 hr when diluted with 0.9% sodium chloride or 5% dextrose in water. Parenteral: Store at 20-25°C. At a final concentration of 0.5 mg/ml, midazolam is stable for up to 24 hr when diluted with 0.9% sodium chloride or 5% dextrose in water. Rectal: Store at 20-25°C.
Mechanism of Action	Midazolam is a short-acting benzodiazepine. It exerts sedative and hypnotic, muscle relaxant, anxiolytic and anticonvulsant actions. While the probable anxiolytic action might be as a result of the drug's ability to increase glycine inhibitory neurotransmitter level, the hypnotic/anaesthetic action may be due to occupation of the benzodiazepine and GABA receptors leading to membrane hyperpolarisation and neuronal inhibition, and further interfering with the release of GABA at the synapses. Absorption: Rapidly absorbed (any route); peak plasma concentrations are reached in 20-60 min (depending on route). Distribution: Crosses the placenta; enters breast milk. Protein-binding: 96%. Metabolism: Extensively hepatic via CYP3A4 isoenzyme; converted to hydroxymethylmidazolam. Excretion: Urine (as glucuronide conjugates); 2 hr (elimination half-life), 10-12 hr in neonates, elderly and hepatic impairment.
CIMS Class	Anxiolytics / Hypnotics & Sedatives / Anticonvulsants
ATC Classification	N05CD08 - midazolam; Belongs to the class of benzodiazepine derivative used as hypnotics and sedatives.

mifepristone

CIMS Class : (Drugs Acting on the Uterus)
mifepristone

P - Caution when used during pregnancy

L - Contraindicated in lactation

related mifepristone information

Indication & Dosage

Oral

Termination of pregnancy (49 days or less duration)

Adult: 600 mg as a single dose followed 2 days later by 400 mcg of misoprostol as single dose.

Oral

Postcoital contraception

Adult: 600 mg single dose within 72 hr of unprotected intercourse.

Oral

Termination of pregnancy up to 63 days

Adult: 600 mg as a single dose followed by 1 mg gemeprost vaginally after 36-48 hr.

Oral

Induction of labour following intrauterine fetal death

Adult: 600 mg daily for 2 consecutive days.

Oral

Termination of pregnancy between 13-24 wk of gestation

Adult: 600 mg as a single dose given 36-48 hr prior to prostaglandin therapy.

	Termination of pregnancy between 13-24 wk of gestation Adult: 600 mg as a single dose given 36-48 hr prior to prostaglandin therapy. <i>Oral</i> Softening and dilatation of cervix prior to surgical termination of pregnancy Adult: 600 mg as a single dose given 36-48 hr prior to the procedure.
Administration	May be taken with or without food. (Avoid grapefruit juice.)
Contraindications	Confirmed or suspected ectopic pregnancy, chronic adrenal failure, concurrent long-term corticosteroid therapy, history of allergy to mifepristone, misoprostol or other prostaglandin, haemorrhagic disorders or concurrent anticoagulant therapy, porphyria, hepatic or renal impairment; pregnancy and lactation; IUD in place; undiagnosed adnexal mass.
Special Precautions	Asthma, COPD; women smokers >35 yr; CV disease or risk factors; smoking; alcoholism; prosthetic heart valve; history of infective endocarditis.
Adverse Drug Reactions	Excessive vaginal bleeding; UTI; uterine haemorrhage; uterine infections; unusual tiredness or weakness; back pain; diarrhoea, nausea, vomiting; fever; dizziness; headache; anxiety; GI cramps.
Drug Interactions	Decreased efficacy with aspirin and NSAIDs. Efficacy of corticosteroids (including inhaled) decreased, monitor patients during co-admin and for several days afterwards.
Mechanism of Action	Mifepristone is a progesterone antagonist with antiglucocorticoid activity. It binds to the intracellular progesterone receptor where it competitively inhibits progesterone attachment. It is also a partial progesterone agonist. Absorption: Peak plasma concentrations after 1.3 hr.

	progesterone receptors is comparatively minute progesterone attachment. It is also a partial progesterone agonist. Absorption: Peak plasma concentrations after 1.3 hr. Distribution: Protein-binding: 98%. Metabolism: Hepatic: Undergoes first-pass metabolism. Excretion: Faeces (as metabolites); urine (small amounts); 18 hr (elimination half-life).
CIMS Class	Drugs Acting on the Uterus
ATC Classification	G03XB01 - mifepristone; Belongs to the class of antiprogestogens. Used as other hormone preparations.

miglitol

CIMS Class : (Antidiabetic Agents)
miglitol

L - Contraindicated in lactation

related miglitol information

Indication & Dosage	<i>Oral</i> Type 2 diabetes mellitus Adult: Initially, 25 mg tid, to be taken at the start (with the 1st bite) of each main meal. Increase if necessary after 4-8 wk to usual maintenance dose 50 mg tid. Max dose 100 mg tid.
Contraindications	Renal clearance <25 ml/min, GI motility disorders or the presence of inflammatory bowel disease, diabetic ketoacidosis, colonic ulceration, or partial intestinal obstruction. Lactation.
Special Precautions	Hypoglycaemia, renal impairment.
Adverse Drug Reactions	Abdominal pain, diarrhoea, flatulence, skin rash. To minimise GI effects, treatment may be initiated at 25 mg once daily and increased gradually to three times daily.
Drug Interactions	Miglitol may significantly reduce the bioavailability of ranitidine and propranolol. Intestinal adsorbents (e.g, charcoal) and digestive enzyme preparations containing carbohydrate-splitting enzymes (e.g, amylase, pancreatin)

	of ranitidine and propranolol. Intestinal adsorbents (e.g, charcoal) and digestive enzyme preparations containing carbohydrate-splitting enzymes (e.g, amylase, pancreatin) may reduce the effect and should not be taken concomitantly.
Storage	Oral: Store at 15-30°C
Mechanism of Action	Miglitol inhibits of alpha-glucosidase enzymes present in the intestine. It delays carbohydrate metabolism, decreases carbohydrate absorption, and thereby smoothens the postprandial increase in plasma glucose. Absorption: Absorption from GI tract is saturable at high doses. Peak concentrations reached in 2-3 hr. Distribution: <4% protein bound Excretion: Eliminated in the urine as unchanged drug. Elimination half life is around 2 hr.
CIMS Class	Antidiabetic Agents
ATC Classification	A10BF02 - miglitol; Belongs to the class of alpha glucosidase inhibitors. Used in the treatment of diabetes.

milrinone

CIMS Class : (Cardiac Drugs)
milrinone

P - Caution when used during pregnancy

L - Caution when used during lactation

related milrinone information

Indication & Dosage

Intravenous

Short-term management of severe heart failure, Acutely decompensated heart failure

Adult: Initially, a loading dose of 50 mcg/kg by slow IV injection over 10 min then continuous maintenance infusion of 0.375-0.75 mcg/kg/min. Adjust according to haemodynamics and clinical response. Max dose 1.13 mcg/kg/day.

Child: Initial loading dose of 75 mcg/kg by IV injection over 10-60 min followed by continuous infusion of 0.5-0.75 mcg/kg/min.

CrCl (ml/min)	Dosage Recommendation
50	0.43 mcg/kg/min
40	0.38 mcg/kg/min
30	0.33 mcg/kg/min
20	0.28 mcg/kg/min
10	0.23 mcg/kg/min
5	0.20 mcg/kg/min

Reconstitution: Use 0.45% sodium chloride, 0.9% sodium

	Reconstitution: Use 0.45% sodium chloride, 0.9% sodium chloride or 5% dextrose inj as diluents. Incompatibility: Y-site incompatibility: Imipenem-cilastin, furosemide, procainamide. Syringe incompatibility: Furosemide. Admixture incompatibility: Furosemide, procainamide, bumetanide.	
Contraindications	Heart valve stenosis, acute myocardial infarction.	
Special Precautions	Severe obstructive aortic or pulmonary valvular disease, hypertrophic cardiomyopathy, atrial flutter or fibrillation. Monitor blood pressure, heart rate, ECG, fluid and electrolyte balance. Pregnancy and lactation. Use for >48 hr.	
Adverse Drug Reactions	Angina-like chest pain, headache, hypokalaemia, tremor, thrombocytopenia, bronchospasm. Potentially Fatal: Supraventricular and ventricular arrhythmias; hypotension.	
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.	
Storage	Intravenous: Store at 15-30°C.	
Mechanism of Action	Milrinone is a selective phosphodiesterase III inhibitor with positive inotropic and vasodilator activity. It selectively inhibits cyclic adenosine monophosphate (cAMP) phosphodiesterase activity in cardiac and vascular muscles resulting in increased intracellular concentrations of cAMP. It also acts directly on vascular smooth muscle. Onset: IV: 5-15 minutes.	

	phosphodiesterase activity in cardiac and vascular muscles resulting in increased intracellular concentrations of cAMP. It also acts directly on vascular smooth muscle. Onset: IV: 5-15 minutes. Distribution: Protein binding: About 70%. Volume of distribution at steady-state: 0.32-0.45 L/kg. Metabolism: About 12% metabolised hepatically. Excretion: Eliminated via urine (85% as unchanged drug). Elimination half life: About 2.5 hr.
CIMS Class	Cardiac Drugs
ATC Classification	C01CE02 - milrinone; Belongs to the class of phosphodiesterase inhibitors. Used in the treatment of heart failure.

minocycline

CIMS Class : (Tetracyclines) , (Acne Treatment Preparations) , (Topical Antibiotics)
minocycline

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related minocycline information

Indication & Dosage

Oral

Susceptible infections

Adult: Initially, 200 mg followed by 100 mg every 12 hr.

Alternatively, 100-200 mg initially, followed by 50 mg 4 times daily. Max: 400 mg/day.

Child: >8 yr: Initially, 4 mg/kg followed by 2 mg/kg every 12 hr.

Renal impairment: Reduce dose or increase dosing interval. Max total daily dose: 200 mg.

Oral

Acne

Adult: 50 mg bid or 100 mg once daily. Alternatively, 1 mg/kg once daily as a modified-release preparation to patients weighing ≥45 kg.

Child: ≥12 yr: 45-59 kg: 45 mg once daily; 60-90 kg: 90 mg once daily; 91-136 kg: 135 mg once daily. Continue treatment for 12 wk.

patients weighing ≥ 45 kg.

Child: ≤ 12 yr: 45-59 kg: 45 mg once daily; 60-90 kg: 90 mg once daily; 91-136 kg: 135 mg once daily. Continue treatment for 12 wk.

Renal impairment: Reduce dose or increase dosing interval.

Oral

As part of multidrug therapy for multibacillary leprosy

Adult: Patients intolerant to rifampicin: Regimen includes clofazimine (50 mg daily), ofloxacin (400 mg daily), and minocycline (100 mg daily) for 6 mth, followed by a regimen of clofazimine (50 mg daily) and minocycline (100 mg daily) for at least an additional 18 mth. Patients intolerant to clofazimine: Once-mthly multiple-drug regimen includes rifampicin (600 mg), ofloxacin (400 mg) and minocycline (100 mg) for 24 mth.

Oral

Asymptomatic meningococcal carriers

Adult: 100 mg bid for 5 days followed by a course of rifampicin.

Renal impairment: Reduce dose or increase dosing interval. Max total daily dose: 200 mg.

Oral

As part of multidrug therapy for single-lesion

paucibacillary leprosy

Adult: Regimen includes a single 600-mg dose of rifampicin, a single 400-mg dose of ofloxacin, and a single 100-mg dose of minocycline.

Child: 5-14 yr: Regimen includes a single 300-mg dose of rifampicin, a single 200-mg dose of ofloxacin, and a single 50-mg dose of minocycline; < 5 yr: Appropriately adjust dose of each drug.

Oral

50-mg dose of minocycline; <5 yr: Appropriately adjust dose of each drug.

Oral

Nongonococcal urethritis

Adult: 100 mg every 12 hr for at least 7 days.

Renal impairment: Reduce dose or increase dosing interval. Max total daily dose: 200 mg.

Oral

Uncomplicated gonorrhoea

Adult: Initially, 200 mg, followed by 100 mg every 12 hr for a min of 4 days; follow-up cultures should be done within 2-3 days after completion of therapy.

Renal impairment: Reduce dose or increase dosing interval. Max total daily dose: 200 mg.

Oral

Uncomplicated urethral gonorrhoea in men

Adult: 100 mg every 12 hr for 5 days.

Renal impairment: Reduce dose or increase dosing interval. Max total daily dose: 200 mg.

Oral

Mycobacterium marinum infections

Adult: 100 mg every 12 hr for 6-8 wk. Cutaneous infection: 100 mg bid for at least 3 mth; a min of 4-6 wk of therapy is necessary to ascertain whether or not the infection is responding.

Renal impairment: Reduce dose or increase dosing interval. Max total daily dose: 200 mg.

Oral

Nocardiosis

Adult: 200 mg initially, followed by 100 mg every 12 hr in conjunction with a sulfonamide for 12-18 mth.

Renal impairment: Reduce dose or increase dosing

Adult: 200 mg initially, followed by 100 mg every 12 hr in conjunction with a sulfonamide for 12-18 mth.

Renal impairment: Reduce dose or increase dosing interval. Max total daily dose: 200 mg.

Oral

Rheumatoid arthritis

Adult: 100 mg bid.

Renal impairment: Reduce dose or increase dosing interval. Max total daily dose: 200 mg.

Oral

Syphilis

Adult: 200 mg initially, followed by 100 mg every 12 hr for 10-15 days.

Renal impairment: Reduce dose or increase dosing interval. Max total daily dose: 200 mg.

Oral

Cholera

Adult: Initially, 200 mg followed by 100 mg every 12 hr for 48-72 hr in conjunction with fluid and electrolyte replacement.

Renal impairment: Reduce dose or increase dosing interval. Max total daily dose: 200 mg.

Intravenous

Susceptible infections

Adult: Initially, 200 mg followed by 100 mg every 12 hr by slow IV infusion.

Renal impairment: Reduce dose or increase dosing interval. Max total daily dose: 200 mg.

Intrapleural

As sclerosing agent to control pleural effusions associated with metastatic tumours

Adult: Dilute 300 mg in 40-50 ml of 0.9% sodium chloride inj and instil into the pleural space through a thoracostomy

	associated with metastatic tumours Adult: Dilute 300 mg in 40-50 ml of 0.9% sodium chloride inj and instil into the pleural space through a thoracostomy tube, followed by clamping of the tube and subsequent removal of the fluid. <i>Topical/Cutaneous</i> Periodontitis Adult: As a modified-release subgingival gel: Insert into the periodontal pocket as an adjunct to scaling and root planing. Total number of cartridges to be used depends on the size, shape and number of pockets being treated. <i>Topical/Cutaneous</i> Periodontal infections Adult: Apply 2% gel to affected area.
Administration	Pellet-filled cap: Should be taken on an empty stomach. (Take w/ a full glass of water on an empty stomach at least 1 hr before or 2 hr after meals.) May be taken with or without food. (May be taken w/ meals to reduce GI discomfort.)
Overdosage	Symptoms: Diabetes insipidus, nausea, anorexia, dizziness, vomiting, diarrhoea. Management: Symptom-directed and supportive; not dialysable.
Contraindications	Hypersensitivity to minocycline, other tetracyclines. Pregnancy and lactation.
Special Precautions	May cause photosensitivity; discontinue at the 1st signs of erythema. May impair ability to drive or operate machinery. Monitor renal, hepatic and haematologic functions during therapy. Hepatic and renal impairment. Children ≥8 yr. Oral forms should be taken with plenty of fluids with the patient in an upright position.
Adverse Drug Reactions	Oesophageal ulceration; vestibular disturbances e.g.

Adverse Drug Reactions	Oesophageal ulceration; vestibular disturbances e.g. dizziness or vertigo, tinnitus and decreased hearing; hyperpigmentation of the skin; SLE or lupus-like symptoms; GI disturbances; benign intracranial hypertension; abnormal LFTs, hyperbilirubinaemia or jaundice; teeth discolouration in children. Potentially Fatal: Hypersensitivity syndrome. Hepatitis or liver damage. Pneumonitis.
Drug Interactions	Oral absorption may be impaired by calcium-containing antacids and other divalent or trivalent cations. Decreases effectiveness of oral contraceptives. May increase plasma levels of lithium, theophylline. Pseudotumour cerebri may occur when used with isotretinoin. Additive facial pigmentation with ethinylestradiol. Potentially Fatal: May increase effects of oral anticoagulants.
Food Interaction	May cause additive photosensitivity reactions with St John's wort and dong quai.
Lab Interference	May cause false elevations in urinary catecholamines with fluorescence test.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 20-25°C. Protect from light, moisture and excessive heat.
Mechanism of Action	Minocycline inhibits protein synthesis by binding to 30S and possibly 50S ribosomal subunits of susceptible bacteria. It is active against <i>Streptococcus aureus</i>, streptococci, <i>Neisseria</i>

	Minocycline inhibits protein synthesis by binding to 30S and possibly 50S ribosomal subunits of susceptible bacteria. It is active against <i>Streptococcus aureus</i>, streptococci, <i>Neisseria meningitidis</i>, various enterobacteria, <i>Acinetobacter</i>, <i>Bacteroides</i>, <i>Haemophilus</i> and <i>Nocardia</i> spp, <i>M. leprae</i> and some mycobacteria. Absorption: Absorbed readily from the GI tract (oral); absorption not significantly affected by food and milk. Distribution: Protein-binding: 70-75%. Widely distributed in body tissues and fluids; high concentrations in hepatobiliary tract, lungs, sinuses, tonsils, tears, saliva, sputum. CSF (poor penetration). Crosses the placenta and enters breast milk. Metabolism: Some hepatic metabolism; converted to 9-hydroxyminocycline. Excretion: Via faeces (34%); via urine (5-10%). Elimination half-life: 11-26 hr; prolonged in renal impairment.
CIMS Class	Tetracyclines / Acne Treatment Preparations / Topical Antibiotics
ATC Classification	A01AB23 - minocycline; Belongs to the class of local antiinfective and antiseptic preparations. Used in the treatment of diseases of the mouth. J01AA08 - minocycline; Belongs to the class of tetracyclines. Used in the treatment of systemic infections.

minoxidil

CIMS Class : (Other Dermatologicals) , (Other Antihypertensives)
minoxidil

P - Caution when used during pregnancy

Food $\square$ - Food interaction

related minoxidil information

Indication & Dosage

Oral

Severe hypertension unresponsive to standard therapy

Adult: In conjunction with a β -blocker or methyldopa, and a diuretic: Initially, 2.5-5 mg daily; gradually increase at intervals of at least 3 days to 40 or 50 mg daily depending on response. Max: 100 mg daily. Give daily dose in 1-2 divided doses. For a more rapid control of BP: Dose changes may be made every 6 hr with careful monitoring.

Child: In conjunction with a β -blocker or methyldopa, and a diuretic: <12 yr: Initially, 100-200 mcg/kg daily; increase in increments of 100-200 mcg/kg at intervals of at least 3 days, until BP is controlled. Max: 1 mg/kg or 50 mg daily.

Elderly: In conjunction with a β -blocker or methyldopa, and a diuretic: Initially, 2.5 mg daily; increase gradually.

Renal impairment: Initiate at smaller doses or at longer dosage intervals.

Topical/Cutaneous

Male pattern baldness

Adult: Apply 1 ml of a 2% or 5% solution to the scalp bid. 4

	usage intervals. <i>Topical/Cutaneous</i> Male pattern baldness Adult: Apply 1 ml of a 2% or 5% solution to the scalp bid. 4 mth of treatment may be necessary.
Administration	May be taken with or without food.
Overdosage	Symptoms: Hypotension, tachycardia, headache, nausea, dizziness, weakness syncope, warm flushed skin and palpitations; lethargy and ataxia (in children). Management: Trendelenburg positioning, vasoconstrictor or IV fluids may be used for hypotension; treatment is mainly supportive and symptomatic.
Contraindications	Pheochromocytoma, acute MI, dissecting aortic aneurysm.
Special Precautions	Significant renal dysfunction; coronary artery disease; recent MI; pulmonary hypertension; angina pectoris; chronic CHF; porphyria. Monitor fluid and electrolyte balance, body wt. Restrict topical application to the scalp. Pregnancy.
Adverse Drug Reactions	Reflex tachycardia, fluid retention (accompanied by wt gain, oedema, and sometimes deterioration of existing heart failure and changes in the ECG), hypertrichosis. Headache, nausea, gynaecomastia and breast tenderness, polymenorrhoea, skin rash, thrombocytopenia. Topical: Systemic effects may also occur; contact dermatitis, pruritus, local burning, flushing; changes in hair colour or texture. Potentially Fatal: Ischaemic heart disease; pericardial effusion progressing to tamponade and death; angina pectoris may be aggravated or uncovered; pulmonary hypertension. Rebound hypertension (in patients with severe hypertension). Stevens-Johnson syndrome.
Drug Interactions	Antihypertensive effect may be enhanced by other hypotensive drugs. Topical: Absorption may be increased with corticosteroids, retinoids, occlusive ointment bases.

	Antihypertensive effect may be enhanced by other hypotensive drugs. Topical: Absorption may be increased with corticosteroids, retinoids, occlusive ointment bases. Potentially Fatal: Severe orthostatic hypotension may occur with guanethidine.
Food Interaction	Avoid natural licorice as it may aggravate fluid retention.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 20-25°C (68-77°F). Topical/Cutaneous: Store at 20-25°C (68-77°F).
Mechanism of Action	Minoxidil is an antihypertensive with direct vasodilating property. It reduces elevated BP accompanied by reflex tachycardia, increased cardiac output and elevated plasma renin. Applied topically, minoxidil stimulates hair growth secondary to vasodilation, increases cutaneous blood flow and stimulates resting hair follicles. Onset: Oral: Approx 30 min. Max effect in 2-3 hr. Duration: Oral: 2-5 days. Absorption: 90% absorbed from the GI tract (oral); 0.3-4.5% from intact scalp (topical). Distribution: Enters breast milk. Metabolism: Extensively hepatic via glucuronidation. Excretion: Via urine (as metabolites); 3.5-4.2 hr (elimination half-life).
CIMS Class	Other Dermatologicals / Other Antihypertensives
ATC Classification	C02DC01 - minoxidil; Belongs to the class of pyrimidine derivative agents acting on arteriolar smooth muscle. Used in the treatment of hypertension.

C02DC01 - minoxidil; Belongs to the class of pyrimidine derivative agents acting on arteriolar smooth muscle. Used in the treatment of hypertension.

D11AX01 - minoxidil; Belongs to the class of other dermatologicals. Used in the treatment of dermatological diseases.

mirtazapine

CIMS Class : (Antidepressants)
mirtazapine

P - Caution when used during pregnancy
L - Caution when used during lactation

related mirtazapine information

Indication & Dosage	<i>Oral</i> Depression Adult: Initially, 15 mg daily; may be increased gradually depending on clinical response. Change dose at intervals of at least 1-2 wk. Usual effective dose: 15-45 mg daily given as single dose, preferably at bedtime, or in 2 divided doses.
Administration	May be taken with or without food.
Overdosage	Symptoms: Disorientation, drowsiness, impaired memory, tachycardia. Management: Ensure an adequate airway, oxygenation, and ventilation. Monitor cardiac functions. General supportive and symptomatic measures are also recommended. Do not induce emesis. Gastric lavage may be used if done soon after ingestion, or in symptomatic patients. Administer activated charcoal. No specific antidotes are known.
Special Precautions	Epilepsy or history of seizures; avoid completely in unstable cases. Hepatic or renal impairment, cardiac disorders e.g. conduction disturbances, angina pectoris, recent MI. Hypotension, DM, psychoses, history of bipolar disorder. Stop

	cases. Hepatic or renal impairment, cardiac disorders e.g. conduction disturbances, angina pectoris, recent MI. Hypotension, DM, psychoses, history of bipolar disorder. Stop treatment if jaundice develops. Micturition disturbances, angle-closure glaucoma, raised intraocular pressure. Monitor patient for signs of bone marrow depression. Monitor patient for suicidal tendency. Avoid abrupt withdrawal. May impair ability to drive or operate machinery. Pregnancy and lactation. Elderly.
Adverse Drug Reactions	Increase in appetite and wt, oedema; drowsiness or sedation; dizziness, headache, increased liver enzyme levels; jaundice. Orthostatic hypotension, rash, nightmares, agitation, mania, hallucinations, paraesthesia, convulsions, tremor, myoclonus, akathisia, restless legs syndrome, arthralgia, myalgia, reversible agranulocytosis, leucopenia, granulocytopenia, hyponatraemia.
Drug Interactions	Potentialiation of sedative effects with alcohol or benzodiazepines. Increased plasma levels with potent CYP3A4 inhibitors (e.g. HIV-protease inhibitors, azole antifungals including ketoconazole, erythromycin, nefazodone). Reduced plasma levels with carbamazepine and other inducers of CYP3A4. Increased bioavailability with cimetidine. Potentially Fatal: Do not use with or within 2 wk of stopping an MAOI; at least 1 wk should elapse between discontinuing mirtazapine and initiating any drug which may provoke a serious reaction (e.g. phenelzine).
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C. Protect from light and moisture.
Mechanism of Action	Mirtazapine, a piperazinoazepine tetracyclic antidepressant, enhances noradrenergic and serotonergic activity through

	Mirtazapine, a piperazinoazepine tetracyclic antidepressant, enhances noradrenergic and serotonergic activity through blockade of central presynaptic adrenergic α_2-receptors. Absorption: Well absorbed from the GI tract (oral); peak plasma concentrations after 2 hr. Distribution: Protein-binding: 85%. Metabolism: Hepatic by demethylation and oxidation followed by glucuronidation. Excretion: Via urine and faeces; 20-40 hr (elimination half-life).
CIMS Class	Antidepressants
ATC Classification	N06AX11 - mirtazapine; Belongs to the class of other agents used in the management of depression.

misoprostol

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants) , (Drugs Acting on the Uterus)
misoprostol

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related misoprostol information

Indication & Dosage

Oral

NSAID-associated ulceration

Adult: 800 mcg daily in 2-4 divided doses for at least 4 wk, up to 8 wk if needed.

Elderly: Reduce dose if patients are unable to tolerate usual adult dose.

Renal impairment: Reduce dose if patients are unable to tolerate usual adult dose.

Oral

Benign gastric and duodenal ulceration

Adult: 800 mcg daily in 2-4 divided doses for at least 4 wk, up to 8 wk if needed.

Elderly: Reduce dose if patients are unable to tolerate usual adult dose.

Renal impairment: Reduce dose if patients are unable to tolerate usual adult dose.

Oral

Prophylaxis of NSAID-induced ulcers

	tolerate usual adult dose. <i>Oral</i> Prophylaxis of NSAID-induced ulcers Adult: 200 mcg 2-4 times daily. Patient not tolerating high dose: Reduce dose to 100 mcg 2-4 times daily. Elderly: Reduce dose if patients are unable to tolerate usual adult dose. Renal impairment: Reduce dose if patients are unable to tolerate usual adult dose. <i>Oral</i> Cervical ripening before surgical termination of pregnancy in the 1st trimester Adult: 400 mcg as a single dose 3-4 hr before surgery. <i>Oral</i> Termination of pregnancy (49 days or less duration) Adult: 400 mcg as a single dose 36-48 hr after mifepristone.
Administration	Should be taken with food.
Overdosage	Symptoms: Sedation, tremor, convulsions, dyspnoea, abdominal pain, diarrhoea, hypotension, bradycardia. Management: Symptom-directed and supportive
Contraindications	Women of childbearing potential. Pregnancy and lactation.
Special Precautions	Conditions where hypotension might precipitate severe complications e.g. cerebrovascular or CV disease. Inflammatory bowel disease. Patients prone to dehydration. Elderly. Renal impairment.
Adverse Drug Reactions	Diarrhoea, abdominal pain, dyspepsia, constipation, flatulence, nausea and vomiting; abnormal vaginal bleeding, cramps, increased uterine contractility, headache.
Drug Interactions	May increase effects of oxytocin. Increased risk of misoprostol-induced diarrhoea with magnesium-containing

	May increase effects of oxytocin. Increased risk of misoprostol-induced diarrhoea with magnesium-containing antacids.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Oral: Store at or below 25°C (77°F).
Mechanism of Action	Misoprostol, a synthetic prostaglandin E₁ analogue, exerts its antisecretory activity by directly acting on specific prostaglandin receptors found on the surface of gastric parietal cells. It exerts its protective effects on the mucosa by replacing the prostaglandins consumed during prostaglandin-inhibiting therapies e.g. NSAIDs. Absorption: Rapidly absorbed from the GI tract (oral). Peak plasma concentration in 15-30 min. Metabolism: Rapidly metabolised to misoprostol acid (active form). Excretion: Mainly via urine. Elimination half-life: 20-40 min.
CIMS Class	Antacids, Antireflux Agents & Antiulcerants / Drugs Acting on the Uterus
ATC Classification	A02BB01 - misoprostol; Belongs to the class of prostaglandins. Used in the treatment of peptic ulcer and gastro-oesophageal reflux disease (GERD). G02AD06 - misoprostol;

mitomycin

CIMS Class : (Cytotoxic Chemotherapy)
mitomycin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related mitomycin information

Indication & Dosage

Intravenous

Solid tumours

Adult: Refer to published protocols. Suggested regimen: Initially, 10-20 mg/m²; may be repeated every 6-8 wk depending on blood count. Reduce dose depending on previous haematological response. Another suggested regimen is 2 mg/m² daily for 5 days, repeated after 2 days. Adjust dose according to the effect on bone marrow. Do not repeat treatment unless leucocyte and platelet counts are above acceptable levels. Do not re-administer if the nadir of the leucocyte count is <2000 cells/mm³. Dose may need to be reduced when used with other antineoplastics.

Intravesical

Superficial bladder tumours

Adult: Instil 10-40 mg is instilled into the bladder 1-3 times a wk for a total of 20 doses. Doses are usually given in 10-40 ml of water for inj. Retain the solution in the bladder for at least 1 hr.

Intravesical

	wk for a total of 20 doses. Doses are usually given in 10-40 ml of water for inj. Retain the solution in the bladder for at least 1 hr. <i>Intravesical</i> Prophylaxis of recurrent bladder tumours Adult: Instil 20 mg every 2 wk or 40 mg mthly or 3-mthly. Alternatively, 4-10 mg 1-3 times a wk. Doses are usually given in 10-40 ml of water for inj. Retain the solution in the bladder for at least 1 hr. Reconstitution: Dilute to a concentration of 0.5-1 mg/ml with 0.9% sodium chloride or sterile water for inj. Incompatibility: Incompatible with aztreonam, cefepime, etoposide phosphate, filgrastim, gemcitabine, piperacillin/tazobactam, sargramostim, topotecan, vinorelbine, bleomycin.
Overdosage	Symptoms: Bone marrow suppression, nausea, vomiting, alopecia. Management: Symptom-directed and supportive.
Contraindications	Thrombocytopenia, coagulation disorders, increase in bleeding tendency due to other causes. Renal impairment, potentially severe infections. Pregnancy and lactation.
Special Precautions	Repeated haematologic studies are necessary during treatment and for at least 7 wk after discontinuation of the drug. Discontinue use when the leucocyte count decreases to $<4000/\text{mm}^3$ or the platelet count decreases to $<150,000/\text{mm}^3$ or if a progressive decline in either occurs. Monitor patient for signs of renal or pulmonary toxicity.
Adverse Drug Reactions	CHF; fever; alopecia, nail banding/discolouration; nausea, vomiting, anorexia; anaemia; rash; stomatitis; paraesthesia; increased creatinine; interstitial pneumonitis, infiltrates, dyspnoea, cough; malaise, pruritus, extravasation, bladder fibrosis/contraction (intravesical admin).

	increased creatinine; interstitial pneumonitis, infiltrates, dyspnoea, cough; malaise, pruritus, extravasation, bladder fibrosis/contraction (intravesical admin). Potentially Fatal: Myelosuppression, haemolytic-uraemic syndrome.
Storage	Intravenous: Store at controlled room temperature; solution is stable for 7 days at room temperature or 14 days under refrigeration if protected from light. Intravesical: Store at controlled room temperature; solution is stable for 7 days at room temperature or 14 days under refrigeration if protected from light.
Mechanism of Action	Mitomycin is an antineoplastic antibiotic which is enzymatically reduced to its active metabolite within susceptible cells. The active metabolite appears to cause cross-linking of DNA (primarily with guanine and cytosine pairs). It also active against gram-positive bacteria and some viruses, but its antineoplastic activity precludes its use as an antibiotic. Distribution: Widely distributed but does not cross the blood-brain barrier; rapidly disappears in the blood (IV). Metabolism: Hepatic. Excretion: Via urine (as unchanged drug), faeces (small amounts). Half-life elimination: 23-78 min; terminal: 50 min.
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01DC03 - mitomycin; Belongs to the class of other cytotoxic antibiotics. Used in the treatment of cancer.

mitoxantrone

CIMS Class : (Cytotoxic Chemotherapy)
mitoxantrone

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related mitoxantrone information

Indication & Dosage

Intravenous

Acute myeloid leukaemia

Adult: 12 mg/m² daily for 5 days to induce remission.

Alternatively, 12 mg/m² for 3 days in combination with cytarabine.

Intravenous

Breast cancer

Adult: Initially, 14 mg/m², then repeat every 3 wk. Adjust subsequent dose according to degree of myelosuppression. Debilitated patients or those who had previous chemotherapy: May reduce initial dose to 12 mg/m². As part of a combination regimen: May reduce initial dose to 10-12 mg/m².

Intravenous

Prostate cancer

Adult: Initially, 14 mg/m², then repeat every 3 wk. Adjust subsequent dose according to degree of myelosuppression. Debilitated patients or those who had previous

Adult: Initially, 14 mg/m², then repeat every 3 wk. Adjust subsequent dose according to degree of myelosuppression. Debilitated patients or those who had previous chemotherapy: May reduce initial dose to 12 mg/m². As part of a combination regimen: May reduce initial dose to 10-12 mg/m².

Intravenous

Lymphoma

Adult: Initially, 14 mg/m², then repeat every 3 wk. Adjust subsequent dose according to degree of myelosuppression. Debilitated patients or those who had previous chemotherapy: May reduce initial dose to 12 mg/m². As part of a combination regimen: May reduce initial dose to 10-12 mg/m².

Intravenous

Liver cancer

Adult: Initially, 14 mg/m², then repeat every 3 wk. Adjust subsequent dose according to degree of myelosuppression. Debilitated patients or those who had previous chemotherapy: May reduce initial dose to 12 mg/m². As part of a combination regimen: May reduce initial dose to 10-12 mg/m².

Intravenous

Multiple sclerosis

Adult: 12 mg/m² by IV infusion over 5-15 min. Initially, dose may be given once every 3 mth provided neutrophil count is >1500 cells/mm³ and LVEF >50%.

Reconstitution: Dilute to at least 50 ml in sodium chloride 0.9% or glucose 5% solution and inj over at least 3 min into a freely running IV infusion of either solution.

Incompatibility: Do not mix in the same infusion as heparin.

	0.9% or glucose 5% solution and inj over at least 3 min into a freely running IV infusion of either solution. Incompatibility: Do not mix in the same infusion as heparin.
Overdosage	Symptoms: Leucopenia, tachycardia, marrow hypoplasia, infection. Management: No known antidote; symptom-directed and supportive.
Contraindications	Pregnancy and lactation. Multiple sclerosis with LVEF <50% or clinically significant reduction in LVEF.
Special Precautions	Preexisting myelosuppression. Perform periodic blood counts. Monitor cardiac function, especially after a cumulative dose of >160 mg/m² and in patients with prior radiotherapy of the chest and concomitant cytotoxic therapy. Hepatic impairment. Discontinue admin if extravasation occurs. May impair ability to drive or operate machinery.
Adverse Drug Reactions	Arrhythmia, oedema, ECG changes; pain, fatigue, fever, headache; alopecia, nail bed changes; amenorrhoea, menstrual disorder, hyperglycaemia; abdominal pain, anorexia, nausea, constipation, diarrhoea, GI bleeding, mucositis, stomatitis, dyspepsia, vomiting, wt gain/loss; abnormal urine, UTI; haematologic disorders; elevated LFTs; weakness; increased BUN and creatinine, haematuria; cough, dyspnoea, upper respiratory tract infection; fungal infection, infection, sepsis. Potentially Fatal: Myelosuppression; cardiotoxicity.
Drug Interactions	Impaired immune response to vaccines may occur; infection after admin of live vaccines in patients on immunosuppressants is also possible.
Lab Interference	Blue-green discolouration of urine for 24 hr after dosing may interfere with urine tests.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal

Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 15-25°C (59-77°F); do not freeze. Store opened vials at room temperature for 7 days or under refrigeration for up to 14 days.
Mechanism of Action	Mitoxantrone, an analogue of the anthracyclines, intercalates DNA and inhibits topoisomerase II causing DNA strand breakage which leads to decreased cell replication. Absorption: Poor (oral). Distribution: Rapidly and extensively distributed to body tissues; does not appear to cross the blood-brain barrier; distributes into breast milk. Metabolism: Hepatic. Excretion: Via urine and bile (as unchanged drug and metabolites). 5-18 days (elimination half-life).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01DB07 - mitoxantrone; Belongs to the class of cytotoxic antibiotics, anthracyclines and related substances. Used in the treatment of cancer.

mizolastine

CIMS Class : (Antihistamines & Antiallergics)
mizolastine

P - Caution when used during pregnancy

L - Caution when used during lactation

related mizolastine information

Indication & Dosage	<i>Oral</i> Allergic conditions Adult: 10 mg daily. Child: ≥12 yr: 10 mg daily. Elderly: 10 mg daily.
Overdosage	General symptomatic treatment with cardiac monitoring including QT interval and cardiac rhythm for at least 24 hr is recommended. Haemodialysis may not be helpful.
Contraindications	Significant cardiac or hepatic disease; electrolyte imbalance, particularly hypokalaemia; known or suspected QT prolongation. Clinically significant bradycardia.
Special Precautions	May impair ability to drive or operate machinery. Elderly. Pregnancy (avoid in 1st trimester) and lactation.
Adverse Drug Reactions	Dry mouth, diarrhoea, abdominal pain, nausea; transient drowsiness, headache, dizziness; anxiety and depression; raised liver enzymes: low neutrophil count; transient asthenia, increased appetite associated with wt gain; allergic reactions e.g. angioedema, generalised rash/urticaria,

	anorexia, headache, dizziness, anxiety and depression; raised liver enzymes: low neutrophil count; transient asthenia, increased appetite associated with wt gain; allergic reactions e.g. angioedema, generalised rash/urticaria, pruritus and hypotension; tachycardia, palpitations; vasovagal attack; arthralgia and myalgia. Potentially Fatal: Anaphylaxis.
Drug Interactions	Antidepressants and anxiolytics may enhance sedative effect. Potent inhibitors of or substrates for the hepatic metabolism of mizolastine (e.g. cimetidine, ciclosporin, nifedipine) may alter its metabolism. Potentially Fatal: Increased risk of cardiac arrhythmias with drugs known to prolong the QT interval e.g. class I and III antiarrhythmics. Increased plasma concentrations with macrolide antibiotics and imidazole antifungals.
Storage	Oral: Do not store above 25°C.
Mechanism of Action	Mizolastine, a non-sedating antihistamine, blocks histamine H₁-receptors on effector cells of the GI tract, blood vessels and respiratory tract. It also has mast-cell stabilising properties. Absorption: Absorbed rapidly from the GI tract (oral); peak plasma concentrations after 1.5 hr. Distribution: Protein-binding: 98%. Metabolism: By glucuronidation (main pathway) or by cytochrome P450 isoenzyme CYP3A4 forming inactive hydroxylated metabolites. Excretion: 13 hr (elimination half-life).
CIMS Class	Antihistamines & Antiallergics
ATC Classification	R06AX25 - mizolastine; Belongs to the class of other agents used as systemic antihistamines.

***mizolastine information:**

moclobemide

CIMS Class : (Antidepressants)
moclobemide

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related moclobemide information

Indication & Dosage

Oral

Depression

Adult: Initially, 300 mg daily in divided doses; increase up to 600 mg daily according to patient's response. Maintenance: 150 mg daily.

Hepatic impairment: Reduce to $\frac{1}{2}$ or $\frac{1}{3}$ of recommended dose.

Oral

Social anxiety disorder

Adult: Initially, 300 mg daily; increase to 600 mg daily in 2 divided doses after 3 days. Continue for 8-12 wk.

Hepatic impairment: Reduce to $\frac{1}{2}$ or $\frac{1}{3}$ of recommended dose.

Administration

Should be taken with food. (Take immediately after meals.)

Overdosage

Agitation, amnesia, convulsions, disorientation, drowsiness, hypertension, nausea, reduced reflexes, slurred speech, vomiting. Management: Symptomatic and supportive care;

	Agitation, amnesia, convulsions, disorientation, drowsiness, hypertension, nausea, reduced reflexes, slurred speech, vomiting. Management: Symptomatic and supportive care; there is no antidote.
Contraindications	Acute confusional states and phaeochromocytoma.
Special Precautions	Excited or agitated patients; bipolar disorders; hepatic impairment; thyrotoxicosis. Early antidepressant therapy; close monitoring particularly during periods of dosage adjustments. May impair ability to drive or operate machinery. Pregnancy and lactation. Withdrawal should be gradual.
Adverse Drug Reactions	Tachycardia, hypotension, dizziness, headache, drowsiness, sleep disturbances, agitation, nervousness, sedation, somnolence, anxiety, increased appetite, xerostomia, nausea, constipation, abdominal pain, diarrhoea, vomiting, weakness, blurred vision, increased sweating, increased transaminases, elevated creatine kinase (CK) and creatine phosphokinase (CPK). Potentially Fatal: Hypertensive crisis.
Drug Interactions	Increased plasma concentrations with cimetidine. Behavioural and neurologic syndromes with tryptophan. Excessive sedation and acute hypotension with CNS depressants (opiates or others analgesics, barbiturates or other sedatives, anaesthetics or alcohol). Marked hypotensive effects with diuretics and hypotensive agents. Worsening of depression and/or suicidality with antidepressants. Potentially Fatal: Serotonin syndrome with sympathomimetic agents (e.g. amphetamines, dopamine, epinephrine, norepinephrine, methylphenidate) or related substances (e.g. methyl dopa, levodopa, L-tryptophan, L-tyrosine, phenylalanine), MAOI, meperidine, TCA,

	epinephrine, norepinephrine, methylphenidate) or related substances (e.g. methyldopa, levodopa, L-tryptophan, L-tyrosine, phenylalanine), MAOI, meperidine, TCA, serotonergic drugs (SSRI). Do not use until at least a wk after discontinuation of an SSRI or SSRI-related antidepressant, a TCA or TCA-related, or a non-selective MAOI.
Food Interaction	Avoid large amounts of tyramine-rich food (e.g. certain cheeses, tofu, soybeans, fish, lima beans, coffee) as the pressor effect of tyramine may be potentiated. Avoid ginkgo (may lead to MAOI toxicity). Avoid ephedra, yohimbe (can cause hypertension). Avoid kava (may increase CNS depression).
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Moclobemide acts by reversible inhibition of the isoenzyme monoamine oxidase type A and thus preferentially increasing the availability of the neurotransmitters serotonin, epinephrine, and norepinephrine. Absorption: Readily and 98% from the GI tract; peak plasma concentrations within 1 hr (oral). Distribution: 50% bound to plasma proteins; enters breast milk. Metabolism: Extensively hepatic by oxidative reactions. Excretion: Via urine as metabolites (95%); 1-2 hr (elimination half-life).
CIMS Class	Antidepressants
ATC Classification	N06AG02 - moclobemide; Belongs to the class of monoamine oxidase A inhibitors. Used in the management of depression.

mometasone

CIMS Class : (Topical Corticosteroids) , (Antiasthmatic & COPD Preparations) , (Nasal Decongestants & Other Nasal Preparations)
mometasone

P - Caution when used during pregnancy
L - Caution when used during lactation

related mometasone information

Indication & Dosage

Nasal

Treatment and prophylaxis of allergic rhinitis

Adult: 100 mcg in each nostril once daily, increased to 200 mcg into each nostril once daily if needed. Maintenance: 50 mcg in each nostril daily.

Child: 2-11 yr: 50 mcg in each nostril daily; ≥12 yr: 100 mcg in each nostril daily.

Nasal

Nasal polyps

Adult: 100 mcg in each nostril once daily; may increase to bid after 5-6 wk if needed.

Inhalation

Asthma prophylaxis

Adult: Mild to moderate: Initially, 400 mcg once daily in the evening. Maintenance: 200 mcg once to bid. Severe: Initially, 400 mcg bid, then titrated to lowest effective dose once controlled.

Child: Mild to moderate: Initially, 400 mcg once daily.

Maintenance: 200 mcg once to bid. Severe: Initially, 400 mcg bid,

	mcg bid, then titrated to lowest effective dose once controlled. Child: Mild to moderate: Initially, 400 mcg once daily. Maintenance: 200 mcg once to bid. Severe: Initially, 400 mcg bid, then titrated to lowest effective dose once controlled. <i>Topical/Cutaneous</i> Corticosteroid-responsive dermatoses Adult: As 0.1% cream/ointment/lotion: Apply onto the affected areas as directed. Child: Cream/Ointment: ≥2 yr: Apply thin film to affected area once daily. Do not use for > 3 wk. Lotion: ≥12 yr: Apply a few drops to affected area once daily.
Overdosage	Systemic corticosteroid effects.
Special Precautions	Discontinue if irritation or sensitisation occurs. Systemic absorption increases when area of application is extensive or an occlusive dressing is used. Pregnancy and lactation. DM, hepatic and renal diseases, myasthenia gravis, CV disease, ocular diseases, osteoporosis, GI diseases, history of seizure disorders. Not for status asthmaticus or relief of acute bronchospasm. Requires dosage adjustments with thyroid status. May reduce growth velocity in children; monitor growth. Taper withdrawal.
Adverse Drug Reactions	Nasal/Oral inhalation: Headache, fatigue, depression; musculoskeletal pain, arthralgia; sinusitis, rhinitis, upper respiratory infection, pharyngitis, cough, epistaxis; viral infection, nasal and oral candidiasis; chest pain; abdominal pain, dry throat, vomiting, diarrhoea, dyspepsia, flatulence, gastroenteritis, nausea, vomiting; dysmenorrhoea; back pain, myalgia; conjunctivitis; earache, otitis media; asthma, bronchitis, dysphonia; nasal irritation, burning and septal perforation; wheezing; nasal ulcers; growth suppression. Topical: Bacterial skin infection, burning, furunculosis, pruritus, skin atrophy, tingling/stinging, folliculitis, moniliasis, paraesthesia, skin depigmentation, rosacea, cataract, growth suppression.

	skin infection, burning, furunculosis, pruritus, skin atrophy, tingling/stinging, folliculitis, moniliasis, paraesthesia, skin depigmentation, rosacea, cataract, growth suppression. Potentially Fatal: Adrenal suppression, immunosuppression, Kaposi's sarcoma in prolonged periods, anaphylaxis.
Drug Interactions	Increased risk of hypokalaemia with amphotericin B, potassium-wasting diuretics. Decreases hypoglycaemic effects of antidiabetic drugs. Increased serum levels with antifungals (imidazole). Increased risk of tendinopathies with fluoroquinolones.
Storage	Inhalation: Store at 15-30°C. Discard when counter reads "0" or 45 days after opening. Nasal: Store at 15-30°C. Protect from light. Topical/Cutaneous: Cream: Store at 2-25°C. Lotion: Store at 2-30°C. Ointment: Store at 15-30°C.
Mechanism of Action	Mometasone depresses the formation, release and activity of endogenous inflammatory chemical mediators (e.g. kinins, histamine, liposomal enzymes and prostaglandin). It inhibits the margination and subsequent cell migration to the injury site, reverses vascular dilatation and permeability, resulting in decreased access of cells to the area of injury. Absorption: Ointment: 0.7%; increased with occlusive dressings. Nasal spray: Undetectable in plasma. Oral inhalation: <1%. Distribution: Protein-binding: 98-99%. Metabolism: Hepatic. Excretion: Via faeces, bile, urine.
CIMS Class	Topical Corticosteroids / Antiasthmatic & COPD Preparations / Nasal Decongestants & Other Nasal Preparations
ATC Classification	D07AC13 - mometasone; Belongs to the class of potent (group III) corticosteroids. Used in the treatment of dermatological diseases. D07XC03 - mometasone; Belongs to the class of potent (group

III) corticosteroids. Used in the treatment of dermatological diseases.

D07XC03 - mometasone; Belongs to the class of potent (group III) corticosteroids in other combinations. Used in the treatment of dermatological diseases.

R01AD09 - mometasone; Belongs to the class of topical corticosteroids used as nasal decongestants.

R03BA07 - mometasone; Belongs to the class of other inhalants used in the treatment of obstructive airway diseases, glucocorticoids.

montelukast

CIMS Class : (Antiasthmatic & COPD Preparations) , (Antihistamines & Antiallergics)
montelukast

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ∇ - Food interaction

related montelukast information

Indication & Dosage	<i>Oral</i>
	Chronic asthma
	Adult: 10 mg once daily in the evening.
	Child: 2-5 yr: 4 mg daily; 6-14 yr: 5 mg daily; $\geq$ 15 yr: 10 mg once daily. All doses to be taken in the evening.
	<i>Oral</i>
	Allergic rhinitis
	Adult: 10 mg once daily in the evening.
	<i>Oral</i>
	Prophylaxis of exercise-induced asthma
	Adult: 10 mg at least 2 hr prior to exercise; do not admin additional doses within 24 hr.
	Child: $\geq$ 15 yr: 10 mg at least 2 hr prior to exercise; do not admin additional doses within 24 hr.
Overdosage	Symptoms: Abdominal pain, headache, psychomotor hyperactivity, vomiting, somnolence, thirst. Management: Symptom-directed and supportive. Not known if dialysis would be

	Symptoms: Abdominal pain, headache, psychomotor hyperactivity, vomiting, somnolence, thirst. Management: Symptom-directed and supportive. Not known if dialysis would be helpful.
Special Precautions	Not for the relief of acute bronchospasm. Not to be used as monotherapy for the prevention of exercise-induced bronchospasm. Patients in whom asthma is precipitated by aspirin or other NSAIDs should continue to avoid aspirin and NSAIDs. Do not abruptly substitute for oral or inhaled corticosteroids. Be alert for any signs of Churg-Strauss syndrome. Pregnancy and lactation. Children <6 mth.
Adverse Drug Reactions	Dizziness, fatigue, fever; rash; abdominal pain, dyspepsia, dental pain, gastroenteritis; increased AST; weakness; cough, nasal congestion. Aggression, agitation, angioedema, arthralgia, bleeding tendency, bruising, cholestasis, diarrhoea, dream abnormalities, drowsiness, oedema, eosinophilia, hallucinations, hepatic eosinophilic infiltration (rare), hepatitis, hypersensitivity, hypoaesthesia, insomnia, irritability, muscle cramps, myalgia, nausea, palpitation, pancreatitis, paraesthesia, pruritus, restlessness, seizure, urticaria, vasculitis, vomiting. Potentially Fatal: Anaphylaxis, Churg-Strauss syndrome.
Drug Interactions	Metabolism may be increased with rifampicin, phenobarbital, phenytoin. Peripheral oedema may occur with prednisone.
Food Interaction	Serum levels may be reduced with St John's wort.
Storage	Oral: Store at 15-30°C (59-86°F). Protect from moisture and light.
Mechanism of Action	Montelukast is a selective leukotriene receptor antagonist that blocks the effects of cysteinyl leukotrienes in the airways. Absorption: Rapidly absorbed from the GI tract (oral). Peak plasma concentrations in 2-4 hr. Mean oral bioavailability: 64%. Distribution: Protein-binding: >99%.

	Absorption: Rapidly absorbed from the GI tract (oral). Peak plasma concentrations in 2-4 hr. Mean oral bioavailability: 64%. Distribution: Protein-binding: >99%. Metabolism: Extensively hepatic by CYP3A4, CYP2A6 and CYP2C9 isoenzymes. Excretion: Principally via faeces; elimination half-life prolonged in mild to moderate hepatic impairment.
CIMS Class	Antiasthmatic & COPD Preparations / Antihistamines & Antiallergics
ATC Classification	R03DC03 - montelukast; Belongs to the class of other systemic drugs used in the treatment of obstructive airway diseases, leukotriene receptor antagonists.

related morphine information

Indication & Dosage

Oral

Pain relief

Adult: Initially, 5-20 mg every 4 hr (or equivalent for modified release formulations). Start with low dose and adjust according to response.

Elderly: Dosage may need to be reduced.

Renal impairment: Dosage may need to be reduced.

Hepatic impairment: Dosage may need to be reduced.

Oral

Intractable cough associated with lung cancer

Adult: Initially, 5 mg oral solution given every 4 hr. Adjust according to response.

Intravenous

Pain associated with myocardial infarction

Adult: 10 mg at a rate of 2 mg/minute followed by a further dose of 5-10 mg if necessary.

Elderly: 5 mg at a rate of 2 mg/min followed by a further dose of 2.5-5 mg if necessary.

Renal impairment: Dosage may need to be reduced.

dose of 5-10 mg if necessary.

Elderly: 5 mg at a rate of 2 mg/min followed by a further dose of 2.5-5 mg if necessary.

Renal impairment: Dosage may need to be reduced.

Hepatic impairment: Dosage may need to be reduced.

Intravenous

Acute pulmonary oedema

Adult: 5-10 mg via slow inj at a rate of 2 mg/minute.

Elderly: Dosage may need to be reduced.

Renal impairment: Dosage may need to be reduced.

Hepatic impairment: Dosage may need to be reduced.

Parenteral

Acute pain

Adult: IM or SC admin:: 10 mg every 4 hr (or more frequently during titration); adjust according to response. IV admin: Initially, 2.5 mg every 4 hr (or more frequently during titration), adjust according to response

Child: By IM or SC inj: <1 mth: 150 mcg/kg 6 hrly; 1-12 mth: 200 mcg/kg 6 hrly; 1-5 yr: 2.5-5 mg 4 hrly; 5-12 yr: 5-10 mg 4 hrly. Repeat doses should only be given when necessary. Adjust according to response.

Elderly: Dosage may need to be reduced.

Renal impairment: Dosage may need to be reduced.

Hepatic impairment: Dosage may need to be reduced.

Intraspinal

Moderate to severe pain

Adult: Initially, 5 mg epidural inj; after 1 hr, additional doses of 1-2 mg may be given if pain relief is unsatisfactory up to a total dose of 10 mg/24 hr. Alternatively, 2-4 mg/24 hr continuous infusion, increased by further 1-2 mg increments if necessary.

Elderly: Dosage may need to be reduced.

Renal impairment: Dosage may need to be reduced.

	if necessary. Elderly: Dosage may need to be reduced. Renal impairment: Dosage may need to be reduced. Hepatic impairment: Dosage may need to be reduced. <i>Intrathecal</i> Moderate to severe pain Adult: 0.2-1 mg, to be injected on a single occasion. <i>Parenteral</i> Premedication in surgery Adult: IM/SC inj: Up to 10 mg 60-90 minutes before operation. Child: IM inj: 150 mcg/kg before operation. Elderly: Lower dose may be required. Renal impairment: Dosage may need to be reduced. Hepatic impairment: Dosage may need to be reduced. <i>Intravenous</i> Unstable angina not responsive to anti-ischaemic therapy Adult: 2-5 mg repeated every 5-30 minutes as needed for symptom relief. <i>Parenteral</i> Analgesia during labour Adult: 10 mg by IM or SC inj. <i>Rectal</i> Chronic pain Adult: Initially, 15-30 mg suppository every 4 hr, adjusted according to response.
Administration	May be taken with or without food. (May be taken w/ meals to reduce GI discomfort.)
Overdosage	Characterised by respiratory depression and sometimes CNS depression. Maintain adequate respiratory function. Naloxone may be used as an antidote (repeated admin may

	Characterised by respiratory depression and sometimes CNS depression. Maintain adequate respiratory function. Naloxone may be used as an antidote (repeated admin may be necessary following intrathecal or epidural overdosage).
Contraindications	Respiratory depression, acute or severe asthma; paralytic ileus; obstructive airway disease; acute liver disease; comatose patients; increased intracranial pressure; acute alcoholism. Pulmonary oedema resulting from a chemical respiratory irritant.
Special Precautions	Elderly; hypothyroidism; renal and liver disease; head injury, intracranial lesions; hypotension, circulatory shock; adrenocortical insufficiency; asthma; prostatic hyperplasia; inflammatory or obstructive bowel disease; myasthenia gravis; infants <3 mth; pregnancy, lactation; hypovolaemia, biliary tract disorders.
Adverse Drug Reactions	Convulsions; nausea, vomiting, dry mouth, constipation; urinary retention; headache, vertigo; palpitations; hypothermia; pruritus, urticaria; tachycardia, bradycardia; blurred vision; miosis; dependency; drowsiness; lightheadedness; dizziness; sweating; dysphoria; euphoria. Potentially Fatal: Respiratory depression; circulatory failure; hypotension; deepening coma; anaphylactic reactions.
Drug Interactions	May potentiate effects of TCAs; increased risk of serotonin syndrome with serotonergic drugs; risk of cardiac arrhythmias with QT prolonging drugs; sedative effects may be increased by metoclopramide; antagonises efficacy of diuretics; morphine levels decreased by rifampicin. Potentially Fatal: Increased CNS depression with other CNS depressants (e.g. other opioids, general anaesthetics, benzodiazepines, barbiturates), alcohol. Risk of severe hypotension with MAOIs.

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. if used for prolonged periods or in high doses at term. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 20-25°C.
Mechanism of Action	Morphine is a phenanthrene derivative which acts mainly on the CNS and smooth muscles. It binds to opiate receptors in the CNS altering pain perception and response. Analgesia, euphoria and dependence are thought to be due to its action at the mu-1 receptors while respiratory depression and inhibition of intestinal movements are due to action at the mu-2 receptors. Spinal analgesia is mediated by morphine agonist action at the K receptor. Cough is suppressed by direct action on cough centre. Onset: 1 hr (oral); 5-10 minutes (IV); 20-60 minutes (rectal); 50-90 minutes (SC); 30-60 minutes (IM). Duration: 4 hr. Absorption: Variably absorbed from the GI tract (oral); readily absorbed into blood (IM/SC). Distribution: Kidneys, liver, lungs, spleen, brain and

	Absorption: Variably absorbed from the GI tract (oral); readily absorbed into blood (IM/SC). Distribution: Kidneys, liver, lungs, spleen, brain and muscles (low concentrations); crosses the blood-brain barrier and placenta; enters breast milk. Protein-binding: 20-35%. Metabolism: Hepatic and gut by glucuronidation; extensive first-pass metabolism. Excretion: Faeces, urine (as metabolites and unchanged drug) Elimination half-life of around 2 hr but varies between individuals.
CIMS Class	Cough & Cold Preparations / Analgesics (Opioid)
ATC Classification	N02AA01 - morphine; Belongs to the class of natural opium alkaloids. Used to relieve pain.

mosapride

CIMS Class : (GIT Regulators, Antiflatulents & Anti-inflammatories)
mosapride

related mosapride information

Indication & Dosage	<i>Oral</i> Disorders associated with reduced gastrointestinal motility Adult: As anhydrous citrate: 5 mg tid.
Special Precautions	Continuous admin of this drug is not recommended if no improvement in GI symptoms is observed after 2 wk of admin. Elderly, renal impairment, hepatic impairment.
Adverse Drug Reactions	Diarrhoea, abdominal pain; dizziness; constipation; headache; insomnia; nausea.
Drug Interactions	Mosapride concentration increased by erythromycin. May increase risk of QT prolongation with QT prolonging drugs.
Mechanism of Action	Mosapride is a 5-HT ₄ receptor agonist which increases the release of acetylcholine and stimulates GI motility. It also has 5-HT ₃ antagonist properties.
CIMS Class	GIT Regulators, Antiflatulents & Anti-inflammatories

moxifloxacin

CIMS Class : (Quinolones) , (Eye Anti-infectives & Antiseptics)
moxifloxacin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related moxifloxacin information

Indication & Dosage

Oral

Acute bacterial sinusitis

Adult: 400 mg once daily for 10 days.

Oral

Acute bacterial exacerbation of chronic bronchitis

Adult: 400 mg once daily for 5-10 days.

Oral

Community-acquired pneumonia

Adult: 400 mg once daily for 7-14 days.

Oral

Skin and skin structure infections

Adult: Complicated: 400 mg once daily for 7-21 days;
uncomplicated: 400 mg once daily for 7 days.

Intravenous

Acute bacterial sinusitis

Adult: 400 mg by IV infusion over 60 minutes every 24 hr for
10 days.

Intravenous

Acute bacterial exacerbation of chronic bronchitis

	Adult: 400 mg by IV infusion over 60 minutes every 24 hr for 10 days. <i>Intravenous</i> Acute bacterial exacerbation of chronic bronchitis Adult: 400 mg by IV infusion over 60 minutes every 24 hr for 5-10 days. <i>Intravenous</i> Community-acquired pneumonia Adult: 400 mg by IV infusion over 60 minutes every 24 hr for 7-14 days. <i>Intravenous</i> Skin and skin structure infections Adult: Complicated: 400 mg once daily for 7-21 days; uncomplicated: 400 mg once daily for 7 days. Dose to be infused over 60 minutes. <i>Intravenous</i> Intra-abdominal infections Adult: 400 mg for 5-14 days. May change to oral therapy when clinically appropriate. Dose to be infused over 60 minutes. <i>Ophthalmic</i> Bacterial conjunctivitis Adult: As 0.5% ophthalmic solution: instil 1 drop in the affected eye tid for 7 days. Child: >1 yr as 0.5% ophthalmic solution: instil 1 drop in the affected eye tid for 7 days.
Administration	May be taken with or without food.
Overdosage	Stomach should be emptied and hydration maintained. Activated charcoal may be useful soon after oral overdosage. Treatment should be supportive, dialysis may be of some limited use.
Contraindications	Hypersensitivity; child, adolescent; pregnancy, lactation.

	Hypersensitivity; child, adolescent; pregnancy, lactation.
Special Precautions	Maintain adequate fluid intake; exposure to strong sunlight/sunlamp. Epilepsy, history of CNS disorders, DM. Not recommended in severe hepatic impairment. May worsen myasthenia gravis. Discontinue in case of tendon pain, inflammation or rupture. High level of resistance with <i>S. aureus</i> infections. Increased risk of tendon inflammation/rupture especially in elderly taking corticosteroids. Caution in patients with proarrhythmic conditions e.g. clinically significant bradycardia or acute MI. Existing QT prolongation, bradycardia, heart failure with reduced left ventricular ejection fraction; uncorrected hypokalaemia. Avoid concomitant usage with drugs that are known to prolong QT interval. Prolonged use may increase risk of fungal or bacterial superinfection.
Adverse Drug Reactions	GI disturbances, CNS effects, hypersensitivity-type reactions, reversible arthralgia, abnormal liver function tests, hepatitis, haematological disturbances, tachycardia, superinfection, pain and irritation at the Inj site, tendon damage, phlebitis and thrombophlebitis, peripheral neuropathy, photosensitivity, abdominal pain, headache, vaginitis.
Drug Interactions	Moxifloxacin should be taken 4 hr before or 8 hr after admin of magnesium or aluminium containing antacids or iron and zinc containing products. Increased risk of CNS stimulation and convulsions with NSAIDs. May increase adverse effects of corticosteroids when used together. May increase anticoagulant effect of coumarin derivatives. May reduce serum levels of mycophenolate. Didanosine, sevelamer, sucralfate and quinalapril may reduce the absorption of orally-administered

	reduce serum levels of mycophenolate. Didanosine, sevelamer, sucralfate and quinalapril may reduce the absorption of orally-administered moxifloxacin. Potentially Fatal: Risk of torsade de pointes with QT prolonging drugs e.g. class Ia or class III antiarrhythmics, terfenadine, cisapride, astemizole.
Storage	Intravenous: Store at 25°C. Ophthalmic: Store at 2-25°C. Oral: Store at 25°C.
Mechanism of Action	Moxifloxacin inhibits the topoisomerase II (DNA gyrase) and topoisomerase IV required for bacterial DNA replication, transcription, repair and recombination. Absorption: Well absorbed from GI tract. Distribution: Widely distributed throughout the body. 30-50% protein bound. Metabolism: Metabolised via glucuronide and sulfate conjugation. Excretion: Excreted in urine and faeces as unchanged drug and metabolite. Elimination half life of around 12 hr.
CIMS Class	Quinolones / Eye Anti-infectives & Antiseptics
ATC Classification	J01MA14 - moxifloxacin; Belongs to the class of quinolones, fluoroquinolone. Used in the treatment of systemic infections. S01AX22 - moxifloxacin;

mupirocin

CIMS Class : (Topical Antibiotics)
mupirocin

P - Caution when used during pregnancy

L - Caution when used during lactation

related mupirocin information

Indication & Dosage

Nasal

Eradication of nasal colonisation with *Staphylococci aureus*

Adult: As 2% nasal ointment: Apply into each nostril bid-tid for a max of 7 days. After application, the nostrils should be closed by pressing together and releasing the sides of the nose.

Child: Adolescents (=12 yr): Apply nasal ointment to the inner surface of both nostrils 2-3 times daily for 5-14 days. After application, the nostrils should be closed by pressing together and releasing the sides of the nose for approximately 1 min.

Topical/Cutaneous

Impetigo

Adult: Apply a 2% ointment tid for 10 days. If no improvement is seen after 3-5 days, consider alternative treatment.

Child: Apply a 2% ointment tid for 10 days. If no improvement is seen after 3-5 days, consider alternative

	improvement is seen after 3-5 days, consider alternative treatment. Child: Apply a 2% ointment tid for 10 days. If no improvement is seen after 3-5 days, consider alternative treatment. <i>Topical/Cutaneous</i> Secondary skin infections Adult: Apply a 2% cream tid for 10 days. If no improvement is seen after 3-5 days, consider alternative treatment. Child: Apply a 2% ointment tid for 10 days. If no improvement is seen after 3-5 days, consider alternative treatment.
Contraindications	Hypersensitivity to mupirocin or polyethylene glycol.
Special Precautions	Mucosal surfaces of eye; renal impairment; extensive burns or open wounds. Pregnancy, lactation, children <3 mth.
Adverse Drug Reactions	Burning, stinging, pain, itching, erythema, dryness, tenderness, dermatitis and rash.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Nasal: Store at or below 25°. Do not freeze. Topical/Cutaneous: Store at or below 25°. Do not freeze.
Mechanism of Action	Mupirocin inhibits protein synthesis of the bacteria by binding to isoleucyl transfer RNA-synthetase. It is active against gram-positive and some gram-negative bacteria. Absorption: Minimal systemic absorption through intact skin (<0.3%). Distribution: Protein-binding: 95%

	Absorption: Minimal systemic absorption through intact skin (<0.3%). Distribution: Protein-binding: 95% Metabolism: Hepatic, converted to monic acid. Excretion: Urine; 17-36 min (elimination half-life).
CIMS Class	Topical Antibiotics
ATC Classification	D06AX09 - mupirocin; Belongs to the class of other topical antibiotics used in the treatment of dermatological diseases. R01AX06 - mupirocin; Belongs to the class of other topical preparations used as nasal decongestants.

mycophenolic acid

CIMS Class : (Immunosuppressants)
mycophenolic acid

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related mycophenolic acid information

related mycophenolic acid information	
Indication & Dosage	<i>Oral</i> Prophylaxis of acute renal graft rejection Adult: As mycophenolate mofetil: 1 g bid starting within 72 hr of transplantation. Max: 2 g/day. As mycophenolic acid: 720 mg bid. Child: As mycophenolate mofetil: 2-18 yr: 600 mg/m² bid. Max: 1 g bid. BSA 1.25-1.5 m²: 750 mg bid; >1.5 m²: 1 g bid. As mycophenolic acid: 5-16 yr: 400 mg/m² bid (max: 720 mg bid). BSA 1.19-1.58 m²: 540 mg bid (max: 1,080 mg); >1.58 m²: 720 mg bid (max: 1,440 mg). Elderly: As mycophenolic acid: Max: 720 mg bid. Renal impairment: Severe chronic renal impairment (GFR <25 ml/min/1.73 m²): Avoid >1 g bid of mycophenolate mofetil. <i>Oral</i> Prophylaxis of cardiac graft rejection Adult: As mycophenolate mofetil: 1.5 g bid starting within 5 days after transplantation.

	Prophylaxis of cardiac graft rejection Adult: As mycophenolate mofetil: 1.5 g bid starting within 5 days after transplantation. <i>Intravenous</i> Prophylaxis of acute renal graft rejection Adult: As mycophenolate mofetil: 1 g bid by IV infusion over 2 hr starting within 24 hr after transplantation for up to 14 days, convert to oral therapy as soon as possible. Renal impairment: Severe chronic renal impairment (GFR <25 ml/min/1.73 m²): Avoid >1 g bid of mycophenolate mofetil. <i>Intravenous</i> Prophylaxis of hepatic transplant rejection Adult: As mycophenolate mofetil: 1 g bid by IV infusion over 2 hr for the first 4 days (up to a max of 14 days) following transplantation. To be started within 24 hr of transplantation. Subsequently, convert to oral admin at 1.5 g bid as soon as possible. <i>Intravenous</i> Prophylaxis of cardiac graft rejection Adult: As mycophenolate mofetil: 1.5 g bid starting within 5 days after transplantation, convert to oral admin as soon as possible. Reconstitution: Reconstitute in glucose 5% to a final concentration of 6 mg/ml mycophenolate mofetil.
Overdosage	No reported cases. At plasma levels >100 mcg/ml, small amounts of the inactive metabolite may be removed by haemodialysis. Excretion of MPA may be enhanced by bile acid sequestrants (e.g. colestyramine).
Contraindications	Pregnancy, lactation. Rare hereditary deficiency of hypoxanthine-guanine phosphoribosyltransferase (HGPRT),

	Pregnancy, lactation. Rare hereditary deficiency of hypoxanthine-guanine phosphoribosyltransferase (HGPRT), including Kelley-Seegmiller or Lesch-Nyhan syndrome.
Special Precautions	Teratogenic in animals; avoid inhalation or direct skin contact. Monitor patients for lymphoproliferative disorders; advise patient to limit exposure to sunlight/UV light. Active peptic ulcer disease. Severe renal impairment. Mycophenolate mofetil and mycophenolate sodium are not interchangeable. Perform CBCs; monitor for neutropenia.
Adverse Drug Reactions	Diarrhoea, vomiting, GI haemorrhage and perforation; leucopenia; asthenia, pain, headache, anaemia, thrombocytopenia, renal tubular necrosis, haematuria, BP changes, hyperglycaemia, disturbances of electrolytes and blood lipids, peripheral oedema, dyspnoea, cough, acne, rash, alopecia, dizziness, insomnia, paraesthesia, tremor, hypersensitivity reactions, pancreatitis, hepatitis. Potentially Fatal: Angioedema, anaphylaxis, fatal pulmonary fibrosis.
Drug Interactions	Increased plasma levels of both drugs when combined with aciclovir, valaciclovir, ganciclovir and valganciclovir. Reduced absorption with colestyramine, magnesium- and aluminium hydroxide-containing products, sevelamer and other calcium-free phosphate binders. Reduced plasma levels with ciclosporin, metronidazole, quinolones, rifamycins. May reduce plasma levels of progestins; may reduce efficacy of oral contraceptives. Increased plasma levels with probenecid. May reduce efficacy of live vaccines.
Food Interaction	Food reduces MPA peak serum levels by 40% and 33% following mycophenolate mofetil and mycophenolate sodium admin, respectively. Extent of absorption is not affected.

	Food reduces MPA peak serum levels by 40% and 33% following mycophenolate mofetil and mycophenolate sodium admin, respectively. Extent of absorption is not affected. Avoid cat's claw and echinacea as they have immunostimulant effects.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store vials and reconstituted solution at 15-30°C (59-86°F). Begin infusion within 4 hr of reconstitution. Oral: Store at 15-30°C (59-86°F). Protect tablet from light. Do not freeze oral suspension.
Mechanism of Action	Mycophenolic acid acts by blocking purine synthesis of human lymphocytes through reversible inhibition of inosine monophosphate dehydrogenase. It also inhibits proliferation of both T- and B- lymphocytes. Absorption: Mycophenolate mofetil/mycophenolate sodium: Both extensively absorbed from the GI tract. Distribution: Mycophenolic acid (MPA): 97% bound to plasma proteins. Metabolism: Mycophenolate is converted to active MPA, which undergoes enterohepatic recirculation. MPA is metabolised by glucuronidation to the inactive glucuronide. Excretion: Via urine (as the glucuronide and negligible amounts of MPA); via faeces (about 6% of a dose). Mean half-life of MPA: 17.9 hr (as oral mycophenolate mofetil) and 16.6 hr (as IV mycophenolate mofetil); 12 hr (as mycophenolate sodium).
CIMS Class	Immunosuppressants
ATC	L04AA06 - mycophenolic acid; Belongs to the class of

ATC
Classification

L04AA06 - mycophenolic acid; Belongs to the class of selective immunosuppressive agents. Used to induce immunosuppression.

nabumetone

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
nabumetone

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related nabumetone information

Indication & Dosage

Oral

Pain and inflammation associated with musculoskeletal and joint disorders

Adult: 1 g as a single dose in the evening, followed by 0.5-1 g in the morning if necessary. Patients <50 kg: Less likely to require >1 g daily.

Elderly: 500 mg daily may be adequate in certain patients.

Max: 1 g daily.

CrCl (ml/min)	Dosage Recommendation
30-49	Max initial dose: 750 mg once daily. Increase if needed to a max dose of 1.5 g daily.
<30	Max initial dose: 500 mg once daily. Increase if needed to a max dose of 1 g daily.

Administration

May be taken with or without food. (May be taken w/ meals to reduce GI distress.)

Overdosage

Symptoms: Drowsiness, epigastric pain, lethargy, nausea, vomiting. Rarely, acute renal failure, coma, hypertension and respiratory depression. Management: Supportive and

	Symptoms: Drowsiness, epigastric pain, lethargy, nausea, vomiting. Rarely, acute renal failure, coma, hypertension and respiratory depression. Management: Supportive and symptomatic. 6-MNA is not dialysable.
Contraindications	Active peptic ulceration; severe hepatic impairment; hypersensitivity; patients in whom other NSAIDs or aspirin are likely to induce asthma, angioedema, pruritus or urticaria. Pregnancy (3rd trimester), lactation. Perioperative pain in the setting of CABG.
Special Precautions	Pre-existing CV risk factors or disease; fluid retention, CHF, hypertension. History of GI disease (bleeding or ulcers). Elderly or debilitated patients. Other forms of asthma. Hepatic impairment; closely monitor patients with any abnormal LFT. Renal impairment; rehydrate patient prior to therapy and closely monitor renal function. Withhold for at least 4-6 half-lives prior to surgical or dental procedures.
Adverse Drug Reactions	Abdominal pain, dyspepsia, diarrhoea, nausea, flatulence, gastritis, vomiting, xerostomia, stomatitis; headache, tinnitus, dizziness; rash, pruritus; constipation; oedema; insomnia, fatigue, nervousness, somnolence; diaphoresis. Potentially Fatal: Exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN). Severe hepatic reactions (e.g. fulminant hepatitis, liver failure). Anaphylactoid reactions.
Drug Interactions	Antihypertensive effects of hypotensive agents may be reduced. May increase ciclosporin levels. Increased risk of seizures with fluoroquinolones. May reduce efficacy of diuretics. May diminish the cardioprotective effect of acetylated salicylates. Alcohol may enhance gastric mucosal irritation. Potentially Fatal: Increased risk of GI ulceration with corticosteroids. May increase lithium levels/toxicity. Severe

	irritation. Potentially Fatal: Increased risk of GI ulceration with corticosteroids. May increase lithium levels/toxicity. Severe bone marrow suppression, aplastic anaemia and GI toxicity may occur with methotrexate. Increased risk of bleeding with anticoagulants (e.g. warfarin, heparin, LMWHs) and antiplatelet agents (e.g. ticlopidine, clopidogrel, aspirin, abciximab, dipyridamole, eptifibatide, tirofiban). Absorption may be reduced with colestyramine (and other bile acid sequestrants).
Food Interaction	Bioavailability of 6-MNA is unaffected by food; peak serum concentrations may be increased. Avoid herbs/food with antiplatelet activity e.g. alfalfa, anise, bilberry, grapeseed, green tea, bladderwrack, turmeric, bromelain, cat's claw, celery, ginkgo biloba, coleus, cordyceps, dong quai, evening primrose, feverfew, fenugreek, garlic, ginger, red clover, horse chestnut, ginseng, guggul, horse chestnut seed, horseradish, licorice, prickly ash, reishi, sweet clover, white willow.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 3rd trimester or near delivery. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which

	risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 20-25°C (68-77°F).
Mechanism of Action	Nabumetone is a weak cyclooxygenase (COX) inhibitor and is converted in the liver to 6-methoxy-2-naphthylacetic acid (6-MNA), a potent inhibitor of COX, the enzyme responsible for prostaglandin synthesis. This results in the reduction of prostaglandin levels and alleviation of pain and inflammation. Absorption: Well absorbed from the GI tract (oral). Distribution: Diffuses into synovial fluid; crosses the placenta; enters breast milk. Protein-binding: >99% (6-MNA). Metabolism: Extensively hepatic; rapidly metabolised to 6-MNA; further metabolism by O-methylation and conjugation. Excretion: Via urine (as inactive or conjugated metabolites). Elimination half-life of 6-MNA: 22-27 hr (adult), 25-34 hr (elderly).
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AX01 - nabumetone; Belongs to the class of other non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism.

nadroparin calcium

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
nadroparin calcium

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related nadroparin calcium information

related nadroparin calcium information	
Indication & Dosage	<i>Subcutaneous</i> Prophylaxis of venous thromboembolism during surgical procedures Adult: Moderate-risk patients: 2850 units daily for 7 days or until the patient is ambulant; give the 1st dose 2-4 hr before surgery. High-risk patients: 38 units/kg 12 hr before surgery, 12 hr post-operatively and then daily until 3 days after surgery; increase dose by 50% to 57 units/kg daily. Total duration of treatment: At least 10 days. Renal impairment: Moderate to severe: Dose reduction may be required. <i>Subcutaneous</i> Thromboembolic disorders Adult: 85 units/kg every 12 hr for up to 10 days or 171 units/kg/day once daily. Renal impairment: Moderate to severe: Dose reduction may be required. <i>Intra-arterial</i>

Subcutaneous

Prophylaxis of venous thromboembolism during surgical procedures

Adult: Moderate-risk patients: 2850 units daily for 7 days or until the patient is ambulant; give the 1st dose 2-4 hr before surgery. High-risk patients: 38 units/kg 12 hr before surgery, 12 hr post-operatively and then daily until 3 days after surgery; increase dose by 50% to 57 units/kg daily. Total duration of treatment: At least 10 days.

Renal impairment: Moderate to severe: Dose reduction may be required.

Subcutaneous

Thromboembolic disorders

Adult: 85 units/kg every 12 hr for up to 10 days or 171 units/kg/day once daily.

Renal impairment: Moderate to severe: Dose reduction may be required.

Intra-arterial

	Renal impairment: Moderate to severe: Dose reduction may be required. <i>Intra-arterial</i> Prophylaxis of clotting in the extracorporeal circulation during haemodialysis sessions of <4 hr Adult: <50 kg: 2850 units; 50-69 kg: 3800 units; ≥70 kg: 5700 units. Administer in the arterial line of the circuit at the start of dialysis. Patients at high risk of haemorrhage: Reduce dose. <i>Parenteral</i> Unstable angina Adult: 86 units/kg SC every 12 hr for about 6 days. An initial dose of 86 units/kg may be given IV. Low-dose aspirin should also be given. Renal impairment: Dose reduction may be required.
Overdosage	Symptoms: Haemorrhage. Management: Monitor platelet count and other coagulation parameters. Protamine sulfate may be used in severe cases; 6 mg (0.6 ml) neutralises approx 0.1 ml of nadroparin. Do not exceed a rate of 20 mg/min.
Contraindications	Acute infective endocarditis; haemorrhage or haemostasis disorder; active peptic ulceration; haemorrhagic cerebrovascular event; severe uncontrolled hypertension; diabetic or haemorrhagic retinopathy; injuries to or operations on the CNS, eyes or ears; history of thrombocytopenia with nadroparin. Lactation. Not for IM admin.
Special Precautions	Patients with recent or anticipated neuraxial anaesthesia; history of heparin-induced thrombocytopenia, congenital or drug-induced thrombocytopenia or platelet defects; patients at increased risk of bleeding; severe hepatic or renal disease. Monitor for signs of bleeding; hyperkalaemia.

	history of heparin-induced thrombocytopenia, congenital or drug-induced thrombocytopenia or platelet defects; patients at increased risk of bleeding; severe hepatic or renal disease. Monitor for signs of bleeding; hyperkalaemia. Pregnancy.
Adverse Drug Reactions	Hypoaldosteronism; bleeding, thrombocytopenia; rash; haematoma and pain at inj site; allergic reactions; osteopaenic effects; increased ALT/AST.
Drug Interactions	Increased risk of bleeding with thrombolytic agents, oral anticoagulants and antiplatelet drugs.
Food Interaction	Additive anticoagulant or antiplatelet effects may occur with cat's claw, dong quai, evening primrose, garlic and ginseng.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intra-arterial: Store at 15-30°C (59-86°F). Do not freeze or refrigerate. Parenteral: Store at 15-30°C (59-86°F). Do not freeze or refrigerate. Subcutaneous: Store at 15-30°C (59-86°F). Do not freeze or refrigerate.
Mechanism of Action	Nadroparin possesses high anti-factor Xa activity but has low anti-factor IIa (antithrombin) activity, potentially providing equivalent antithrombotic efficacy with less bleeding complications. Duration: 18 hr. Absorption: =89% of dose is absorbed (subcutaneous). Peak plasma concentrations in 3-5 hr. Excretion: Via urine. Elimination half-life: 3.5 hr; prolonged to 6 hr in renal impairment.
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)

nalidixic acid

CIMS Class : (Quinolones)
nalidixic acid

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related nalidixic acid information

related nalidixic acid information	
Indication & Dosage	<i>Oral</i> Uncomplicated lower urinary tract infections Adult: 1 g 4 times daily for 1-2 wk. Long-term therapy: Reduce daily dose to 2 g. Child: >3 mth: 50 mg/kg daily in 4 equally divided doses. Long-term therapy: Reduce dose to 30 mg/kg daily. Prophylaxis: 15 mg/kg bid. Renal impairment: Reduced doses should be considered. Hepatic impairment: Reduced doses should be considered. <i>Oral</i> Shigellosis Adult: 1 g 4 times daily for 5 days. Child: =3 mth: 15 mg/kg 4 times daily for 5 days. Renal impairment: Reduced doses should be considered. Hepatic impairment: Reduced doses should be considered.
Administration	Should be taken with food.
Overdosage	Symptoms: Toxic psychosis, convulsions, increased

	Symptoms: Toxic psychosis, convulsions, increased intracranial pressure, metabolic acidosis, vomiting, nausea, lethargy. Management: Increase fluid admin; supportive measures. Anticonvulsants may be used in severe cases.
Contraindications	Hypersensitivity. History of convulsive disorders or porphyria. Infants <3 mth. Severe renal impairment.
Special Precautions	Hepatic or moderate renal impairment, severe cerebral arteriosclerosis, G6PD deficiency. Monitor blood counts, renal and hepatic function for treatment >2 wk. Children <18 yr. Elderly. Avoid exposure to sunlight or sunlamps. Pregnancy and lactation.
Adverse Drug Reactions	Nausea, vomiting, diarrhoea, abdominal pain; photosensitivity reactions, allergic rash, urticaria, pruritus; visual disturbances, headache, dizziness or vertigo, drowsiness, confusion, depression, excitement, hallucinations, toxic psychoses or convulsions (especially after large doses), intracranial hypertension (especially in infants and young children), metabolic acidosis; peripheral neuropathies, muscular weakness, myalgia; arthralgia, tendon damage; cholestatic jaundice, thrombocytopenia, leucopenia. Potentially Fatal: Erythema multiforme and Stevens-Johnson syndrome; anaphylactoid reactions. Auto-immune haemolytic anaemia (particularly in elderly patients).
Drug Interactions	Absorption reduced by sucralfate, and divalent and trivalent cations e.g. aluminium, calcium, iron, magnesium, zinc. Excretion reduced and plasma concentrations increased with probenecid. Reduced effects with chloramphenicol, nitrofurantoin, tetracycline.

	Excretion reduced and plasma concentrations increased with probenecid. Reduced effects with chloramphenicol, nitrofurantoin, tetracycline. Potentially Fatal: Fatal haemorrhagic enterocolitis may occur when used with high-dose melphalan in children. Increased risk of nephrotoxicity with ciclosporin. May increase effects of oral anticoagulants e.g. warfarin.
Lab Interference	May cause false-positive urinary glucose tests using copper reduction methods. May also interfere with 17-ketosteroids and ketogenic steroids determinations.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at room temperature, up to 25°C (77°F).
Mechanism of Action	Nalidixic acid is a 4-quinolone antibacterial. It interferes with the replication of bacterial DNA by inhibiting DNA gyrase activity. It acts against gram-negative bacteria including E. coli, Proteus, Klebsiella, Enterobacter, Salmonella and Shigella spp. Absorption: Rapidly and almost completely absorbed from the GI tract. (oral); peak plasma concentrations after 1-2 hr (oral). Distribution: Crosses the placenta; enters the breast milk. Protein-binding: 93% (nalidixic acid); 63% (hydroxynalidixic acid). Metabolism: Partially converted in the liver to hydroxynalidixic acid. Excretion: Via urine (80-90% as inactive metabolites); faeces (4%); 1-2.5 hr (elimination half-life).

	hydroxynalidixic acid. Excretion: Via urine (80-90% as inactive metabolites); faeces (4%); 1-2.5 hr (elimination half-life).
CIMS Class	Quinolones
ATC Classification	J01MB02 - nalidixic acid; Belongs to the class of other quinolones. Used in the treatment of systemic infections.

naloxone

CIMS Class : (Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence)
naloxone

P - Caution when used during pregnancy
L - Caution when used during lactation

related naloxone information

Indication & Dosage

Oral

Opioid dependence

Adult: As hydrochloride: 200 mg to 3 g daily.

Intravenous

Opioid overdosage

Adult: As hydrochloride: 0.4-2 mg repeated if necessary at 2-3 min intervals. If there is no response after a total of 10 mg has been given, consider the possibility of overdosage with other drugs. Reduce dose for opioid-dependent patients: 0.1-0.2 mg. IM/SC routes may be used (at IV doses) if IV admin is not feasible.

Child: As hydrochloride: Initially 10 mcg/kg IV followed by 100 mcg/kg IV if necessary. Alternatively, 0.4-0.8 mg IM or SC, repeated as necessary, if IV admin is not feasible.

Parenteral

Opioid-induced depression in neonates due to obstetric analgesia

Child: As hydrochloride: 10 mcg/kg IV, IM or SC repeated at

	Opioid-induced depression in neonates due to obstetric analgesia Child: As hydrochloride: 10 mcg/kg IV, IM or SC repeated at 2-3 min intervals if necessary or 60 mcg/kg as a single IM dose. <i>Intravenous</i> Reversal of central depression from opioid use during surgery Adult: As hydrochloride: 100-200 mcg at intervals of 2-3 minute, titrate dose according to response while maintaining analgesia. Child: As hydrochloride: 5-10 mcg IV at 2-3 min intervals. Reconstitution: Stable in 0.9% sodium chloride and 5% dextrose inj at 4 mcg/ml for 24 hr. Incompatibility: Preparations containing bisulfite, metabisulfite, long-chain or high-molecular wt anions, or solutions with an alkaline pH.
Special Precautions	Patients physically dependent on opioids, or who have received large doses of opioids (acute withdrawal syndrome may be precipitated). Pregnancy and lactation.
Adverse Drug Reactions	Occur secondarily to reversal (withdrawal) of narcotic analgesia and sedation. Mental depression, apathy, inability to concentrate, sleepiness, irritability, anorexia, nausea, and vomiting in high oral doses during initial treatment of opiate addiction. Potentially Fatal: Severe cardiopulmonary effects (e.g. hypotension, hypertension, ventricular tachycardia and fibrillation, dyspnoea, pulmonary oedema, cardiac arrest) in postoperative patients, most frequently in those with preexisting CV disease. Recurrence of respiratory depression in long-acting opioids.
Drug	Decreased effect of opioid analgesics.

Drug Interactions	Decreased effect of opioid analgesics. Potentially Fatal: Acute withdrawal reaction in physically dependent patients may occur with opioid analgesics. Severe cardiopulmonary effects may occur with cardiotoxic drugs.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Store at 25°C. Protect from light. Oral: Store at 25°C. Protect from light. Parenteral: Store at 25°C. Protect from light.
Mechanism of Action	Naloxone is a pure opioid antagonist that acts competitively at opioid receptors. Onset: 2 min (IV); 2-5 min (endotracheal, IM, SC). Duration: 30-120 min depending on route; IV has a shorter duration than IM. Distribution: Crosses placenta. Metabolism: Extensively hepatic via glucuronidation. Excretion: Urine (as metabolites); elimination half-life: 0.5-1.5 hr (adult); 3-4 hr (neonates).
CIMS Class	Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence
ATC Classification	V03AB15 - naloxone; Belongs to the class of antidotes. Used in opioid analgesic overdose.

naltrexone

CIMS Class : (Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence)
naltrexone

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related naltrexone information

Indication & Dosage

Oral

Opioid dependence

Adult: As hydrochloride: Initially, 25 mg; increase to 50 mg daily if no withdrawal signs occur. Maintenance: 350 mg wkly given as 50 mg daily or divided in 3 doses (given on 3 days of the wk) for improved compliance.

Oral

Adjunct in alcohol dependence

Adult: As hydrochloride: 50 mg daily.

Intramuscular

Adjunct in alcohol dependence

Adult: 380 mg once every 4 wk.

Administration

May be taken with or without food.

Overdosage

Symptoms: Clonic-tonic convulsions and respiratory failure.

Management: Supportive and symptomatic.

Contraindications

Patients concurrently dependent on opioids; acute hepatitis or hepatic failure; acute opioid withdrawal; patients on

	Patients concurrently dependent on opioids; acute hepatitis or hepatic failure; acute opioid withdrawal; patients on therapeutic opioid analgesics.
Special Precautions	Hepatic or renal impairment. Monitor LFTs regularly. Patients should be opioid-free for at least 7-10 days prior to initiating naltrexone therapy. Strictly warn patients against the use of opioids while on naltrexone. Monitor for inj-site reactions. Pregnancy, lactation. History of bleeding disorders (including thrombocytopenia).
Adverse Drug Reactions	Abdominal pain, nausea, vomiting; anxiety, insomnia, lethargy, headache, musculoskeletal pain; anorexia, diarrhoea, constipation; increased thirst; chest pain; chills, dizziness; sexual dysfunction; rash, liver function abnormalities and reversible idiopathic thrombocytopenia. Inj-site reactions.
Drug Interactions	May reduce effects of opiate-containing preparations e.g. those used for cough and cold, diarrhoea and pain. Increased or decreased serum levels with drugs that alter hepatic metabolism. Potentially increased hepatotoxic effects with disulfiram. Increased risk of naltrexone-induced lethargy and somnolence with thioridazine. May increase insulin requirements.
Lab Interference	May interfere in the detection of urinary opiates using some immunoassay or enzymatic methods.
Storage	Intramuscular: Store at 2-8°C (36-46°F); do not freeze. Oral: Store at 20-25°C (68-77°F).
Mechanism of Action	Naltrexone acts as a competitive antagonist at opioid receptor sites. It blocks the action of opioids and precipitates withdrawal symptoms in opioid-dependent individuals. Absorption: Well absorbed from the GI tract. Peak plasma

	naltrexone acts as a competitive antagonist at opioid receptor sites. It blocks the action of opioids and precipitates withdrawal symptoms in opioid-dependent individuals. Absorption: Well absorbed from the GI tract. Peak plasma concentrations after about 1 hr. Distribution: 20% bound to plasma proteins. Metabolism: Extensively metabolised in the liver. Undergoes considerable 1st-pass metabolism and may undergo enterohepatic recycling. Excretion: Via urine (as <1% unchanged drug and as metabolites). Elimination half-life: Approx 4 hr.
CIMS Class	Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence
ATC Classification	N07BB04 - naltrexone; Belongs to the class of drugs used in the management of alcohol dependence.

nandrolone

CIMS Class : (Anabolic Agents)
nandrolone

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related nandrolone information

related nandrolone information	
Indication & Dosage	<i>Intramuscular</i> As anabolic after debilitating illness Adult: As decanoate: 25-100 mg once every 3-4 wk. <i>Intramuscular</i> Postmenopausal osteoporosis Adult: As decanoate: 25-100 mg once every 3-4 wk. <i>Intramuscular</i> Metastatic breast cancer Adult: As decanoate: 25-100 mg once every 3-4 wk. <i>Intramuscular</i> Anaemia of chronic renal failure Adult: As decanoate: 50-200 mg wkly. <i>Intramuscular</i> Anaemia in chemotherapy patients Adult: 50-150 mg wkly.
Contraindications	Prostatic or breast carcinoma (male); nephrosis, porphyria; infants, pregnancy and lactation.

Special Precautions	Monitor diabetic patients carefully. Conditions influenced by oedema (e.g. CV disease, migraine, seizure disorder, renal impairment). Hepatic impairment. Elderly. Discontinue if signs of virilisation in women occur. Monitor skeletal maturation in children.
Adverse Drug Reactions	Male: Postpubertal: Acne, gynaecomastia, bladder irritability, priapism, insomnia, chills, decreased libido, hepatic dysfunction, nausea, diarrhoea, prostatic hyperplasia. Prepubertal: Acne, virilism, chills, insomnia, hyperpigmentation, diarrhoea, nausea. Female: Virilism, hypercalcaemia, nausea, diarrhoea, chills, insomnia, iron deficiency anaemia, hepatic dysfunction.
Drug Interactions	May increase effects of oral anticoagulants, insulin, oral antidiabetic agents, adrenal steroid, adrenocorticotrophic hormone (ACTH).
Lab Interference	May alter glucose tolerance tests.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Mechanism of Action	Nandrolone is an anabolic steroid. It promotes tissue-building processes and protein anabolism. It also stimulates erythropoietin production, causing an increase in haemoglobin and RBC volume. Onset: 3-6 mth. Duration: Up to 30 days. Absorption: 77% (IM).

	Onset: 3-6 mth. Duration: Up to 30 days. Absorption: 77% (IM). Metabolism: Hepatic. Excretion: Via urine.
CIMS Class	Anabolic Agents
ATC Classification	A14AB01 - nandrolone; Belongs to the class of estren derivative anabolic steroids used as systemic anabolic agents. S01XA11 - nandrolone; Belongs to the class of other agents used as ophthalmologicals.

naphazoline

CIMS Class : (Nasal Decongestants & Other Nasal Preparations) , (Ophthalmic Decongestants, Anesthetics, Anti-inflammatories)
naphazoline

P - Caution when used during pregnancy
L - Caution when used during lactation

related naphazoline information

Indication & Dosage

Nasal

Nasal congestion

Adult: 1-2 drops or spray of 0.05-0.1% solution every 6 hr.

Child: ≥12 yr: 1-2 drops or spray of 0.05% solution every 6 hr. Therapy should not exceed 3 days.

Ophthalmic

Conjunctival decongestant

Adult: 1-2 drops of 0.1% solution to the conjunctiva every 3-4 hr as needed. Alternatively, 1-2 drops of a 0.01-0.03% solution to the conjunctiva up to 4 times daily.

Overdosage

Symptoms: CNS depression, hypothermia, bradycardia, CV collapse, apnoea, coma, agitation, tachycardia, hypertension; alternating agitation and hypertension.

Management: Symptom-directed and supportive.

Contraindications

Narrow-angle glaucoma.

Special Precautions

Pregnancy and lactation. Not recommended in infants and young children. Chronic asthma, hypertension, heart failure,

	Pregnancy and lactation. Not recommended in infants and young children. Chronic asthma, hypertension, heart failure, coronary artery disease, cerebral arteriosclerosis, DM, hyperthyroidism, local infection or injury, benign prostatic hyperplasia. Rebound hyperaemia may occur on prolonged use (ophthalmic).
Adverse Drug Reactions	Cardiac abnormalities, hypertension; reduced body temperature, dizziness, drowsiness, headache, nervousness; hyperglycaemia; nausea; transient stinging, nasal mucosa irritation, dryness, rebound congestion; weakness; blurred vision, discomfort, increased intraocular pressure, irritation, lacrimation, mydriasis, punctuate keratitis, redness; sneezing; diaphoresis.
Drug Interactions	Pressor effects may be potentiated by TCAs. Mydriatic effects may be increased by methyldopa, guanadrel. Potentially Fatal: Hypertensive crisis may occur when used with MAOIs.
Storage	Nasal: Store at controlled room temperature. Ophthalmic: Store at controlled room temperature.
Mechanism of Action	Naphazoline, an imidazoline derivative sympathomimetic amine, produces vasoconstriction by stimulating the α-adrenergic receptors in the arterioles of the conjunctiva and the nasal mucosa. Onset: Decongestant: Topical: Approx 10 min. Duration: 2-6 hr. Absorption: Not given systemically, but readily absorbed from the GI tract.
CIMS Class	Nasal Decongestants & Other Nasal Preparations / Ophthalmic Decongestants, Anesthetics, Anti-inflammatories

	Nasal Decongestants & Other Nasal Preparations / Ophthalmic Decongestants, Anesthetics, Anti-inflammatories
ATC Classification	R01AA08 - naphazoline; Belongs to the class of topical sympathomimetic agents used as nasal decongestants. R01AB02 - naphazoline; Belongs to the class of topical sympathomimetic combination preparations, excluding corticosteroids. Used as nasal decongestants. S01GA01 - naphazoline; Belongs to the class of sympathomimetics used as ophthalmologic decongestants.

naproxen

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
naproxen

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related naproxen information

Indication & Dosage

Oral

Rheumatic disorders

Adult: 0.5-1 g as a single dose or in 2 divided doses, up to 1.5 g daily for patients who can tolerate lower doses, for up to 6 mth, if required.

Elderly: Consider dose reductions; use lowest possible effective dose.

Oral

Juvenile idiopathic arthritis

Child: ≥2 yr: 5-7.5 mg/kg bid. Max: 1 g/day.

Oral

Dysmenorrhoea

Adult: Initially, 500 mg followed by 250 mg every 6-8 hr. Max: 1.25 g on the 1st day and 1 g thereafter.

Elderly: Consider dose reductions; use lowest possible effective dose.

Oral

	Elderly: Consider dose reductions; use lowest possible effective dose. <i>Oral</i> Acute musculoskeletal disorders Adult: Initially, 500 mg followed by 250 mg every 6-8 hr. Max: 1.25 g on the 1st day and 1 g thereafter. Elderly: Consider dose reductions; use lowest possible effective dose. <i>Oral</i> Acute gout Adult: Initially, 750 mg followed by 250 mg every 8 hr. Elderly: Consider dose reductions; use lowest possible effective dose. <i>Oral</i> Acute migraine attacks Adult: 750 mg at the onset of attack, followed after at least ½ an hr by further doses of 250-500 mg daily. Max: 1250 mg daily. Elderly: Consider dose reductions; use lowest possible effective dose.
Administration	Should be taken with food.
Overdosage	Symptoms: Drowsiness, heartburn, vomiting, CNS depression, leukocytosis, renal failure. Management: Supportive and symptomatic.
Contraindications	Hypersensitivity. Aspirin or NSAID allergy. Perioperative pain in the setting of CABG surgery. Pregnancy (3rd trimester).
Special Precautions	Pre-existing CV risk factors or disease e.g. fluid retention, CHF, hypertension. History of GI disease (bleeding or ulcers). Other forms of asthma. Hepatic impairment; closely monitor patients with any abnormal LFT. Renal impairment. Elderly. Lactation.

Adverse Drug Reactions	Oedema, palpitation, dizziness, drowsiness, headache, light headedness, vertigo, pruritus, skin eruption, ecchymosis, purpura, rash, fluid retention, abdominal pain, constipation, nausea, heartburn, diarrhoea, dyspepsia, stomatitis, flatulence, gross bleeding/perforation, indigestion, ulcers, vomiting, abnormal renal function, haemolysis, anaemia, increased bleeding time, elevated LFTs, visual disturbances, tinnitus, hearing disturbances, dyspnoea, diaphoresis, thirst. Potentially Fatal: Anaphylactic/anaphylactoid reactions. Exfoliative dermatitis, Stevens-Johnson syndrome (SJS), toxic epidermal necrolysis (TEN).
Drug Interactions	Antihypertensive effects of hypotensive agents may be reduced. May increase ciclosporin levels. Increased risk of seizures with fluoroquinolones. May reduce efficacy of diuretics. May diminish the cardioprotective effect of acetylated salicylates. Alcohol may enhance gastric mucosal irritation. Increased serum levels with probenecid. Potentially Fatal: Increased risk of GI ulceration with corticosteroids. May increase lithium levels/toxicity. Severe bone marrow suppression, aplastic anaemia and GI toxicity may occur with methotrexate. Increased risk of bleeding with anticoagulants (e.g. warfarin, heparin, LMWHs) and antiplatelet agents (e.g. ticlopidine, clopidogrel, aspirin, abciximab, dipyridamole, eptifibatide, tirofiban). Absorption may be reduced with colestyramine (and other bile acid sequestrants).
Food Interaction	Rate of absorption may be reduced with food. Avoid herbs/food with antiplatelet activity e.g. alfalfa, anise,

	Rate of absorption may be reduced with food. Avoid herbs/food with antiplatelet activity e.g. alfalfa, anise, bilberry, grapeseed, green tea, bladderwrack, turmeric, bromelain, cat's claw, celery, ginkgo biloba, coleus, cordyceps, dong quai, evening primrose, feverfew, fenugreek, garlic, ginger, red clover, horse chestnut, ginseng, guggul, horse chestnut seed, horseradish, licorice, prickly ash, reishi, sweet clover, white willow.
Lab Interference	May interfere with 5-hydroxyindole acetic acid (5-HIAA) urinary assays. Discontinue 72 hr before adrenal function testing if the Porter-Silber test is used.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). in 3rd trimester or near delivery. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 15-30°C (59-86°F).
Mechanism of Action	Naproxen has anti-inflammatory, analgesic, antipyretic actions. It reduces prostaglandin synthesis by inhibiting the enzyme cyclooxygenase. It also inhibits platelet aggregation. Onset: Analgesic: 1 hr; anti-inflammatory: Approx 2 wk. Duration: Analgesic: =7 hr; anti-inflammatory: =12 hr. Absorption: Readily absorbed from the GI tract (oral); peak

	enzyme cyclooxygenase. It also inhibits platelet aggregation. Onset: Analgesic: 1 hr; anti-inflammatory: Approx 2 wk. Duration: Analgesic: =7 hr; anti-inflammatory: =12 hr. Absorption: Readily absorbed from the GI tract (oral); peak plasma concentrations after 2-4 hr. Well absorbed rectally. Distribution: Diffuses into synovial fluid; crosses the placenta; enters breast milk. Protein-binding: 99%. Excretion: Via urine (as unchanged drug and metabolites), faeces; 13 hr (elimination half-life).
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	G02CC02 - naproxen; Belongs to the class of antiinflammatory products for vaginal administration used in the treatment and prevention of inflammation. M01AE02 - naproxen; Belongs to the class of propionic acid derivatives of non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism. M02AA12 - naproxen; Belongs to the class of non-steroidal antiinflammatory preparations for topical use. Used in the treatment of joint and muscular pains.

natamycin

CIMS Class : (Antifungals) , (Eye Anti-infectives & Antiseptics) , (Preparations for Vaginal Conditions) , (Topical Antifungals & Antiparasites)
natamycin

P - Caution when used during pregnancy

L - Caution when used during lactation

related natamycin information

Indication & Dosage

Oral

Intestinal candidiasis

Adult: 100 mg 4 times daily.

Child: 100 mg bid.

Oral

Oral candidiasis

Adult: One 10-mg loz every 4-6 hr.

Ophthalmic

Blepharitis, conjunctivitis and keratitis

Adult: Ophthalmic suspension 5%: Instil 1 drop in conjunctival sac every 1-2 hr; reduce to 1 drop 6-8 times a day after 3-4 days. Duration of treatment: 2-3 wk. Ointment 1%: Apply bid-tid.

Vaginal

Trichomoniasis

Adult: One 25-mg vaginal tablet daily for 20 days.

Vaginal

Vulvovaginal candidiasis

	Adult: One 25-mg vaginal tablet daily for 20 days. <i>Vaginal</i> Vulvovaginal candidiasis Adult: One 100-mg vaginal tablet for 3-6 days. <i>Topical/Cutaneous</i> Nail fungal infections Adult: Apply 2% cream to the affected area once or several times a day. <i>Topical/Cutaneous</i> Skin fungal infections Adult: Apply 2% cream to the affected area once or several times a day.
Contraindications	Hypersensitivity.
Special Precautions	Pregnancy and lactation. Porphyria.
Adverse Drug Reactions	GI disturbances (oral). Irritation (local). Conjunctival chemosis and hyperaemia (ophthalmic).
Drug Interactions	Ophthalmic: May increase spread of fungal eye infection when used with topical corticosteroid.
Storage	Ophthalmic: Ophthalmic suspension: Store at 8-24°C (46-75°F); do not freeze. Topical/Cutaneous: Store at 15-25°C.
Mechanism of Action	Natamycin is a polyene antifungal antibiotic which acts by increasing cell membrane permeability in susceptible fungi. It is active against <i>Candida</i> and <i>Fusarium</i> spp, and against the protozoan <i>Trichomonas vaginalis</i>. Absorption: Poorly absorbed from the GI tract (<2%). Not absorbed through the skin or mucous membranes (topical). Present in therapeutic concentrations in corneal stroma but not in intraocular fluid (ocular).
CIMS Class	Antifungals / Eye Anti-infectives & Antiseptics / Preparations for Vaginal Conditions / Topical Antifungals & Antiparasites

	Antifungals / Eye Anti-infectives & Antiseptics / Preparations for Vaginal Conditions / Topical Antifungals & Antiparasites
ATC Classification	A01AB10 - natamycin; Belongs to the class of local antiinfective and antiseptic preparations. Used in the treatment of diseases of the mouth. A07AA03 - natamycin; Belongs to the class of antibiotics. Used for the treatment of intestinal infections. D01AA02 - natamycin; Belongs to the class of antibiotics for topical use. Used in the treatment of fungal infection. G01AA02 - natamycin; Belongs to the class of antibiotics. Used in the treatment of gynecological infections. S01AA10 - natamycin; Belongs to the class of antibiotics. Used in the treatment of eye infections.

nateglinide

CIMS Class : (Antidiabetic Agents)
nateglinide

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related nateglinide information

Indication & Dosage	<i>Oral</i> Type 2 diabetes mellitus Adult: 60-120 mg tid prior to each meal; may be increased to 180 mg tid if necessary.
Administration	Should be taken with food. (Take immediately before or up to ½ hr before meals.)
Overdosage	Symptoms: Hypoglycaemia. Management: Use IV glucose in severe hypoglycaemic reactions. Dialysis is not effective.
Contraindications	Diabetic ketoacidosis; IDDM. Lactation.
Special Precautions	Geriatric patients, debilitated and malnourished patients; adrenal or pituitary insufficiency, moderate to severe hepatic impairment; severe renal impairment. Monitor glycaemic levels during periods of stress. Pregnancy.
Adverse Drug Reactions	Dizziness; back pain; arthropathy; upper respiratory tract infection; flu-like symptoms; bronchitis; cough; hypoglycaemia; accidental trauma; diarrhoea.
Drug Interactions	Increased levels/effects with enzyme inhibitors (e.g.

Drug Interactions	Increased levels/effects with enzyme inhibitors (e.g. fluconazole). Increased hypoglycaemic effects with salicylates, MAOIs, nonselective β -blockers, alcohol, NSAIDs. Decreased levels/effects with enzyme inducers (e.g. rifampicin). Decreased hypoglycaemic effects with thiazide diuretics, corticosteroids, thyroid products and sympathomimetic agents.
Food Interaction	Absorption delayed with food. Hypoglycaemic effects may be increased with alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, American ginseng, gymnema, marshmallow and stinging nettle. Levels/effects may be reduced with St. John's wort.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 25°C (77°F).
Mechanism of Action	Nateglinide, a nonsulfonylurea hypoglycaemic agent, acts by stimulating insulin release from pancreatic β-cells to reduce postprandial hyperglycaemia. This action depends on the amount of existing glucose levels. Onset: Approx 20 min. Duration: 4 hr. Absorption: Rapidly absorbed; peak plasma concentrations within 1 hr (oral). Distribution: Protein-binding: 98%, primarily to albumin. Metabolism: Hepatic via hydroxylation followed by glucuronidation; converted to metabolites.

	Distribution: Protein-binding: 98%, primarily to albumin. Metabolism: Hepatic via hydroxylation followed by glucuronidation; converted to metabolites. Excretion: Via urine (16% unchanged drug); faeces (10%). Elimination half-life: 1.5 hr.
CIMS Class	Antidiabetic Agents
ATC Classification	A10BX03 - nateglinide; Belongs to the class of other oral blood glucose lowering drugs. Used in the treatment of diabetes.

nebivolol

CIMS Class : (Beta-Blockers)
nebivolol

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food $\square$ - Food interaction

related nebivolol information

Indication & Dosage

Oral

Hypertension

Adult: 5 mg daily. May increase dose at intervals of 2 wk to a max of 40 mg once daily, if needed.

Elderly: >65 yr: Initially, 2.5 mg daily.

Renal impairment: Initially, 2.5 mg daily. Maintenance: Increase to 5 mg daily if required.

Oral

Heart failure

Adult: Initially, 1.25 mg once daily. May double dose every 1-2 wk up to a max of 10 mg once daily.

Elderly: Initially 1.25 mg once daily. If tolerated, double the dose every 1-2 wk up to a max of 10 mg once daily.

Administration

May be taken with or without food.

Overdosage

Symptoms: Severe hypotension, bradycardia, heart failure, bronchospasm, hypoglycaemia. Management: Treat initially with IV fluids. Sympathomimetics, glucagon or a pacemaker

	Symptoms: Severe hypotension, bradycardia, heart failure, bronchospasm, hypoglycaemia. Management: Treat initially with IV fluids. Sympathomimetics, glucagon or a pacemaker may be used to treat toxic bradycardia, asystole, and/or hypotension. Other treatment is symptomatic and supportive. Not dialysable.
Contraindications	Hepatic impairment, sick sinus syndrome, 2nd and 3rd degree heart block (without a pacemaker), history of asthma, metabolic acidosis, severe peripheral arterial disease, severe bradycardia, cardiogenic shock or decompensated heart failure, untreated pheochromocytoma. Pregnancy and lactation.
Special Precautions	Elderly. History of anaphylaxis to various allergens, 1st degree AV block, peripheral arterial disease, DM, compensated heart failure, myasthenia gravis, history of psychiatric illness, renal impairment. May mask signs of hyperthyroidism (e.g. tachycardia).
Adverse Drug Reactions	Peripheral oedema, bradycardia, chest pain; headache, fatigue, dizziness, insomnia; rash; hypercholesterolaemia, decreased HDL levels, hyperuricaemia, increased triglyceride levels, increased uric acid levels; diarrhoea, nausea, abdominal pain; thrombocytopenia; paraesthesia, weakness; increased BUN; dyspnoea. Potentially Fatal: Anaphylaxis.
Drug Interactions	Attenuation of reflex tachycardia and increased risk of hypotension with volatile halogenated anaesthetics. Increased risk of hypotension with dihydropyridine-type calcium antagonists. Hypotensive effect may be increased with antipsychotics, TCAs, barbiturates and phenothiazines. Effects may be reduced with sympathomimetic agents. Increased levels/effects with CYP2D6 inhibitors e.g. paroxetine, fluoxetine, thioridazine and quinidine.

	Effects may be reduced with sympathomimetic agents. Increased levels/effects with CYP2D6 inhibitors e.g. paroxetine, fluoxetine, thioridazine and quinidine. Potentially Fatal: Additive negative influence on contractility and AV conduction with verapamil and diltiazemtype drugs; profound hypotension and AV block with IV verapamil. Exacerbation of heart failure with centrally-acting antihypertensive, abrupt withdrawal may increase risk of rebound hypertension. Increased effect on AV conduction with antiarrhythmic drugs. Increased risk of hypertension, severe bradycardia and heart block when used with sympathomimetics with mixed α- and β-adrenergic effects.
Food Interaction	Hypertension may be exacerbated by bayberry, blue cohosh, cayenne, ephedra, ginger, American ginseng, kola and licorice. Antihypertensive effect may be increased by black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine and shepherd's purse.
Storage	Oral: Store at 20-25°C (68-77°F). Protect from light.
Mechanism of Action	Nebivolol exhibits a high selectivity for β_1-adrenergic receptors and acts by reducing the peripheral vascular resistance by modulating nitric oxide release. Absorption: Absorbed rapidly from the GI tract (oral). Peak plasma concentrations after 0.5-4 hr. Distribution: Protein-binding: 98%. Enters breast milk. Metabolism: Hepatic: Extensively by alicyclic and aromatic hydroxylation, N-dealkylation and glucuronidation. Excretion: Via urine and faeces (as metabolites). Elimination half-life: 10 hr (neбиволol), 24 hr (hydroxy metabolites).
CIMS Class	Beta-Blockers
ATC Classification	C07AB12 - neбиволol; Belongs to the class of selective beta-blocking agents. Used in the treatment of

C07AB12 - nebivolol; Belongs to the class of selective beta-blocking agents. Used in the treatment of cardiovascular diseases.

nebivolol + hydrochlorothiazide

CIMS Class : (Beta-Blockers) , (Diuretics)
nebivolol + hydrochlorothiazide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related nebivolol + hydrochlorothiazide information

Indication & Dosage

Oral

Hypertension

Adult: Per tablet contains nebivolol 5 mg and hydrochlorothiazide 12.5 mg: 1 tablet once daily.

Contraindications

Hypersensitivity, liver impairment, anuria, sulphonamide allergy. Pregnancy, lactation.

Special Precautions

History of allergies, psoriasis, hyperthyroidism, peripheral arterial disease, diabetes, existing electrolyte disturbances, oedema, renal impairment, hyperlipidemia, hyperuricaemia. Elderly.

Adverse Drug Reactions

Nebivolol - Headache, fatigue, parasthesias, dizziness.
Hydrochlorothiazide - Hypotension including orthostatic hypotension, pancreatitis, intrahepatic cholestatic jaundice, diarrhoea, vomiting, sialadenitis, cramping, constipation, gastric irritation, nausea, anorexia, thrombocytopenia, photosensitivity, fever, urticaria, rash, purpura, hyperglycemia, glycosuria, hyperuricemia, restlessness,

	gastric irritation, nausea, anorexia, thrombocytopenia, photosensitivity, fever, urticaria, rash, purpura, hyperglycemia, glycosuria, hyperuricemia, restlessness, impotence. Potentially Fatal: Seizures, may unmask diabetes mellitus. Hyponatraemia and idiosyncratic, hypersensitivity reactions.
Drug Interactions	Symptomatic hyponatraemia when combined with carbamazepine. Predisposes to allopurinol sensitivity reactions and impaired renal function. Potentiates hypotensive effect of beta blockers and ACE inhibitors; these also reduce diuretic-induced hypokalaemia. Potentially Fatal: Enhance neuromuscular blocking action of competitive muscle relaxants. Cross-allergy with sulphonamides and sulphonylurea hypoglycaemics with resultant acute interstitial nephritis and vasculitis. Potentiates bone-marrow suppression caused by anticancer drugs. Potentiates aminoglycoside nephrotoxicity. Impaired control of diabetes by oral hypoglycaemic agents. May precipitate digitalis toxicity and lithium toxicity. Increased risk of hypokalaemia with corticosteroids. Prolongs paralysis caused by tubocurarine.
Lab Interference	Discontinued before carrying parathyroid function.
Mechanism of Action	Nebivolol exerts its actions by exhibiting a high selectivity for beta-1 adrenergic receptors and also by reducing the peripheral vascular resistance by modulating nitrous oxide release. Hydrochlorothiazide inhibits the reabsorption of Na and chloride at the beginning of distal convoluted tubule. It causes natriuretic effect mainly by decreasing Na and chloride reabsorption in the cortical segment of the ascending limb of the Loop of Henle by inhibition of a specific Na+Cl⁻ co-transporter.
CIMS Class	Beta-Blockers / Diuretics

CIMS Class	Beta-Blockers / Diuretics
ATC Classification	C03AA03 - hydrochlorothiazide; Belongs to the class of low-ceiling thiazide diuretics. Used to promote excretion of urine. C07AB12 - nebivolol; Belongs to the class of selective beta-blocking agents. Used in the treatment of cardiovascular diseases.

nelfinavir

CIMS Class : (Antivirals)
nelfinavir

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related nelfinavir information

Indication & Dosage

Oral

HIV infection

Adult: Combined with other antiretrovirals: 1.25 g bid or 0.75 g tid.

Child: Combined with other antiretrovirals: 2-13 yr: 45-55 mg/kg bid or 25-35 mg/kg tid.

Max Dosage: Child: 0.75 g tid.

Hepatic impairment: Dose reduction may be required.

Administration

Should be taken with food.

Contraindications

Hypersensitivity; lactation.

Special Precautions

Pregnancy. Hepatic and renal impairment; haemophilia A or B; diabetes. Monitor for signs of lipodystrophy.

Adverse Drug Reactions

Hyperglycaemia, dyslipidaemia and redistribution of body fat (protease paunch, buffalo hump, facial atrophy and heart engorgement); hypertriglyceridaemia, hypercholesterolaemia. Diarrhoea, rash, nausea, flatulence, decreased lymphocytes, decreased neutrophils, decreased haemoglobin, increased

	engorgement); hypertriglyceridaemia, hypercholesterolaemia. Diarrhoea, rash, nausea, flatulence, decreased lymphocytes, decreased neutrophils, decreased haemoglobin, increased creatine kinase, increased transaminases.
Drug Interactions	Reduced levels/effects with antacids, phenobarbital, carbamazepine, aminoglutethimide, phenytoin, rifampicin, nafcillin, nevirapine, omeprazole, nevirapine. Increased serum levels/effects with azole antifungal agents, cimetidine, efavirenz. Increased serum levels/effects of azithromycin, calcium channel blockers, clarithromycin, corticosteroids (e.g. fluticasone), mirtazapine, nateglinide, nefazodone, ciclosporin, sirolimus, tacrolimus, venlafaxine, eplerinone, fentanyl, atorvastatin, phosphodiesterase-5 (PDE-5) inhibitors, rifabutin, trazodone, TCAs. Reduced serum levels/effects of hormonal contraceptives, methadone, theophylline derivatives. Potentially Fatal: Increased serum levels/toxicity of amiodarone, cisapride, pimozide, midazolam, triazolam, ergot alkaloids, lovastatin, simvastatin, quinidine.
Food Interaction	Combination with acidic food or juice may produce bitter taste. Plasma concentration time curve (AUC) increased by 2- to 3-fold with food. Reduced serum levels with St John's wort.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-30° (59-86°F).
Mechanism of	Nelfinavir is a selective, competitive, reversible HIV protease

Mechanism of Action	Nelfinavir is a selective, competitive, reversible HIV protease inhibitor. It inhibits HIV-1 protease preventing the cleavage of the gag-pol polyprotein resulting in the production of noninfectious virus. Absorption: Absorbed from the GI tract. Peak plasma levels in 2-4 hr. Absorption increased with food. Distribution: Extensively bound to plasma proteins (98%). Enters breast milk. Metabolism: Hepatic via oxidation. Excretion: Mainly via faeces (as metabolites); via urine (about 1-2%). Terminal half-life: 3.5-5 hr.
CIMS Class	Antivirals
ATC Classification	J05AE04 - nelfinavir; Belongs to the class of protease inhibitors. Used in the systemic treatment of viral infections.

neomycin

CIMS Class : (Aminoglycosides) , (Topical Antibiotics) , (Eye Anti-infectives & Antiseptics) , (Ear Anti-infectives & Antiseptics)
neomycin

P - Contraindicated in pregnancy

L - Caution when used during lactation

related neomycin information

Indication & Dosage

Oral

Preoperative intestinal antisepsis

Adult: 1 g every hr for 4 doses then every 4 hr for 2-3 days; or 1 g at 1 PM, 2 PM and 11 PM on the day before surgery as an adjunct to mechanical cleansing of the intestine and in combination with oral erythromycin; or 6 g/day divided every 4 hr for 2-3 days.

Child: 90 mg/kg/day divided every 4 hr for 2 days; or 25 mg/kg at 1 PM, 2 PM and 11 PM on the day before surgery as an adjunct to mechanical cleansing of the intestine and in combination with erythromycin base.

Renal impairment: Dose modification required.

Oral

Adjunct in hepatic encephalopathy

Adult: 4-12 g daily in divided doses for 5-7 days.

Child: 50-100 mg/kg/day in divided doses every 6-8 hr or 2.5-7 g/m²/day divided every 4-6 hr for 5-6 days. Max: 12 g/day.

Child: 50-100 mg/kg/day in divided doses every 6-8 hr or 2.5-7 g/m²/day divided every 4-6 hr for 5-6 days. Max: 12 g/day.

Renal impairment: Dose modification required.

Oral

Chronic hepatic insufficiency

Adult: 4 g/day for an indefinite period.

Renal impairment: Dose modification required.

Otic/Aural

Otic infections

Adult: Per ml solution contains neomycin sulfate 3.5 mg, polymyxin B sulfate 10,000 units and hydrocortisone acetate 10 mg: Instill 4 drops into the affected ear(s) 3 or 4 times daily. Treatment duration should be limited to 10 consecutive days.

Ophthalmic

Susceptible ophthalmic infections

Adult: Per ml solution contains neomycin sulfate 3.5 mg, polymyxin B sulfate 10,000 units and dexamethasone 1 mg: Instill 1-2 drops into the affected eye(s) 4-6 times daily, up to hrly admin in severe cases.

Topical/Cutaneous

Skin infections

Adult: Per g cream contains neomycin sulfate 3.5 mg, polymyxin B sulfate 10,000 units and hydrocortisone acetate 5 mg: Apply onto affected area 2-4 times daily as needed. May gently rub cream into affected areas if conditions permit.

Child: In combination with anti-infectives: Apply ointment or cream to affected area 1-3 times/day. In combination with corticosteroids and other anti-infectives: Apply ointment or cream to affected area 2-4 times/day. As irrigation: Topical solutions of 0.1-1% have been used.

	cream to affected area 1-3 times/day. In combination with corticosteroids and other anti-infectives: Apply ointment or cream to affected area 2-4 times/day. As irrigation: Topical solutions of 0.1-1% have been used.
Administration	May be taken with or without food.
Overdosage	Rare due to poor oral absorption. Symptoms: Ototoxicity, nephrotoxicity, neuromuscular toxicity. Treatment: Single acute overdose: Maintain urine output of at least 3 ml/kg/hr during the acute treatment phase. Haemodialysis is preferred over peritoneal dialysis in patients with normal renal function. Chelation with penicillin may be useful.
Contraindications	Do not use for intestinal disinfection if there is intestinal obstruction. Hypersensitivity to aminoglycosides. Infants <1 yr. Inflammatory or ulcerative GI disease (oral). Pregnancy. Not to be used topically or for urological purposes in doses >1 g daily or urologically for >10 days. Extensive skin damage or perforation of the eardrum (otic application). Do not admin parenterally or as peritoneal lavage.
Special Precautions	Kidney or liver disease; neuromuscular disorders (e.g. myasthenia gravis, parkinsonism); impaired hearing (pre-existing vertigo, tinnitus, hearing loss). Monitor auditory and renal function in patients with additional risk factors. Monitor patients on high doses or prolonged courses. Elderly, dehydrated patients. Avoid prolonged use. Lactation.
Adverse Drug Reactions	Oral: Nausea, diarrhoea, vomiting, irritation or soreness of the mouth or rectal area; dyspnoea, eosinophilia, nephrotoxicity, neurotoxicity, ototoxicity (auditory and vestibular). Topical: Contact dermatitis. Potentially Fatal: Neuromuscular blockade and respiratory paralysis.
Drug Interactions	Synergistic effects with penicillins. Additive toxicity with neurotoxic, ototoxic or nephrotoxic drugs. May decrease

	Synergistic effects with penicillins. Additive toxicity with neurotoxic, ototoxic or nephrotoxic drugs. May decrease absorption of digoxin and methotrexate. May increase effects of oral anticoagulants.
Storage	Ophthalmic: Store at 15-30°C (59-86°F). Oral: Store at 20-25°C (68-77°F). Otic/Aural: Store at 15-30°C (59-86°F). Topical/Cutaneous: Store at 15-30°C (59-86°F).
Mechanism of Action	Neomycin is an aminoglycoside antibiotic. It binds to 30S ribosomal subunits of bacterial ribosome thus inhibiting protein synthesis and generating errors in genetic code transcription causing cell death. It acts against many gram-negative aerobes and some gram-positive aerobes. It lacks activity against fungi, viruses and most anaerobic bacteria. Absorption: Poorly absorbed from the GI tract; increased in the presence of damaged or inflamed mucosa. Absorption may occur from the peritoneum, respiratory tract, bladder, wounds, and inflamed skin. Distribution: Low levels in intestinal wall and muscles. Excretion: Via faeces (about 97% of an oral dose unchanged); via urine (active form). Half-life: 2-3 hr; 12-24 hr in adults with severe renal impairment.
CIMS Class	Aminoglycosides / Topical Antibiotics / Eye Anti-infectives & Antiseptics / Ear Anti-infectives & Antiseptics
ATC Classification	A01AB08 - neomycin; Belongs to the class of local antiinfective and antiseptic preparations. Used in the treatment of diseases of the mouth. A07AA01 - neomycin; Belongs to the class of antibiotics. Used for the treatment of intestinal infections. B05CA09 - neomycin; Belongs to the class of antiinfectives

A07AA01 - neomycin; Belongs to the class of antibiotics.
Used for the treatment of intestinal infections.

B05CA09 - neomycin; Belongs to the class of antiinfectives
used as irrigating solutions.

D06AX04 - neomycin; Belongs to the class of other topical
antibiotics used in the treatment of dermatological diseases.

J01GB05 - neomycin; Belongs to the class of other
aminoglycosides. Used in the treatment of systemic
infections.

R02AB01 - neomycin; Belongs to the class of antibiotics
used in throat preparations.

S01AA03 - neomycin; Belongs to the class of antibiotics.
Used in the treatment of eye infections.

S02AA07 - neomycin; Belongs to the class of antiinfectives
used in the treatment of ear infections.

S03AA01 - neomycin; Belongs to the class of antiinfectives
used in ophthalmologic and otologic preparations.

neostigmine

CIMS Class : (Neuromuscular Disorder Drugs) , (Antiglaucoma Preparations)
neostigmine

P - Caution when used during pregnancy

L - Caution when used during lactation

related neostigmine information

Indication & Dosage

Oral

Myasthenia gravis

Adult: As bromide: 15 mg every 3-4 hr. Total daily dose is 75-300 mg in divided doses. Individualise dosing intervals to maximal response.

Child: As bromide: 2 mg/kg daily, divided into doses and given every 3-4 hr. Total daily dose is 15-90 mg.

CrCl (ml/min)	Dosage Recommendation
10-50	50% of normal dose.
<10	25% of normal dose.

Oral

Paralytic ileus and postoperative urinary retention

Adult: As bromide: 15-30 mg.

CrCl (ml/min)	Dosage Recommendation
10-50	50% of normal dose.
<10	25% of normal dose.

Oral

Neonatal myasthenia gravis

Oral

Neonatal myasthenia gravis

Child: As bromide: 1-5 mg every 4 hr.

CrCl (ml/min)	Dosage Recommendation
10-50	50% of normal dose.
<10	25% of normal dose.

Parenteral

Myasthenia gravis

Adult: As metilsulfate: 0.5-2.5 mg IM/SC at intervals, up to a total daily dose of 5-20 mg.

Child: As metilsulfate: 200-500 mcg IM/SC as single daily dose.

CrCl (ml/min)	Dosage Recommendation
10-50	50% of normal dose.
<10	25% of normal dose.

Parenteral

Paralytic ileus and postoperative urinary retention

Adult: As metilsulfate: 0.5 mg IM/SC.

CrCl (ml/min)	Dosage Recommendation
10-50	50% of normal dose.
<10	25% of normal dose.

Intravenous

Reversal of neuromuscular blockade

Adult: As metilsulfate: 50-70 mcg/kg by IV inj over 60 sec. Alternatively, 0.5-2 mg up to a max of 5 mg.

Child: As metilsulfate: Children: 0.025-0.08 mg/kg/dose. Infants: 0.025-0.1 mg/kg/dose.

CrCl (ml/min)	Dosage Recommendation
10-50	50% of normal dose.
<10	25% of normal dose.

Parenteral

	<i>Parenteral</i> Neonatal myasthenia gravis Child: As metilsulfate: 50-250 mcg IM/SC every 4 hr. <table><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr><tr><td>10-50</td><td>50% of normal dose.</td></tr><tr><td><10</td><td>25% of normal dose.</td></tr></table>	CrCl (ml/min)	Dosage Recommendation	10-50	50% of normal dose.	<10	25% of normal dose.	
CrCl (ml/min)	Dosage Recommendation							
10-50	50% of normal dose.							
<10	25% of normal dose.							
	<i>Intramuscular</i> Diagnosis of myasthenia gravis Adult: As metilsulfate: 0.02 mg/kg as a single dose. Discontinue all anticholinesterase medications for at least 8 hr prior to admin. Child: As metilsulfate: 0.04 mg/kg as a single dose. Discontinue all anticholinesterase medications for at least 8 hr prior to admin. <i>Ophthalmic</i> Glaucoma Adult: Instil 1-2 drops of 0.5% solution into the eyes 1-4 times daily.							
Overdosage	Symptoms: Muscle weakness, blurred vision, excessive sweating, tearing and salivation, nausea, vomiting, diarrhoea, hypertension, bradycardia, muscle weakness, paralysis. Management: Atropine sulfate inj should be readily available.							
Contraindications	Mechanical GI or urinary tract obstruction, peritonitis.							
Special Precautions	Patients with epilepsy, bronchial asthma, bradycardia, recent MI, hypotension, vagotonia, hyperthyroidism, recent intestinal or bladder surgery, renal impairment, arrhythmias, peptic ulcer. Distinguish cholinergic crisis due to overdosage from myasthenic crisis. Pregnancy and lactation. Atropine should always be available when given by inj.							

	ulcer. Distinguish cholinergic crisis due to overdosage from myasthenic crisis. Pregnancy and lactation. Atropine should always be available when given by inj.
Adverse Drug Reactions	Increased salivation and sweating, nausea and vomiting, abdominal cramps, diarrhoea, allergic reactions, rash (bromide salt), miosis, increased bronchial secretions, bradycardia, bronchospasm, weakness, muscle cramps, fasciculation, hypotension. Potentially Fatal: Anaphylaxis.
Drug Interactions	May reduce effects of anticholinergics. May increase effects of cholinergic agonists. Increased risk of bradycardia with digoxin, diltiazem, verapamil or β-blockers without intrinsic sympathomimetic activity. Increased muscle weakness and decreased response to anticholinesterases with corticosteroids. May increase effects of depolarising neuromuscular blockers. Effects may be antagonised by drugs with neuromuscular blocking activity e.g. aminoglycosides, clindamycin, colistin, cyclopropane, halogenated inhalational anaesthetics. Effects may be reduced by quinine, chloroquine, hydroxychloroquine, quinidine, procainamide, propafenone, lithium, β-blockers. Possible additive toxicity with ophthalmic use of anticholinesterases e.g. ecothiopate.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intramuscular: Store at 15-30°C. Protect from light. Do not freeze. Intravenous: Store at 15-30°C. Protect from light. Do not freeze. Oral: Store at 15-30°C. Parenteral: Store at 15-30°C. Protect from light. Do not freeze.

	Intramuscular: Store at 15-30°C. Protect from light. Do not freeze. Intravenous: Store at 15-30°C. Protect from light. Do not freeze. Oral: Store at 15-30°C. Parenteral: Store at 15-30°C. Protect from light. Do not freeze.
Mechanism of Action	Neostigmine reversibly inhibits acetylcholinesterase and thus potentiates the nicotinic and muscarinic effects of acetylcholine. This facilitates the transmission of impulses across myoneural junction. Onset: IM: 20-30 min. IV: 1-20 min. Duration: IM: 2.5-4 hr. IV: 1-2 hr. Absorption: Poorly absorbed from the GI tract (oral). Distribution: CNS (poor penetration), crosses the placenta and enters breast milk (small amounts). Protein-binding: 15-25%. Metabolism: Hepatic; hydrolysis by cholinesterases. Excretion: Parenteral: Rapidly eliminated via urine (as unchanged drug and metabolites).
CIMS Class	Neuromuscular Disorder Drugs / Antiglaucoma Preparations
ATC Classification	N07AA01 - neostigmine; Belongs to the class of anticholinesterase used as parasympathomimetics. S01EB06 - neostigmine; Belongs to the class of parasympathomimetics used in the treatment of glaucoma and miosis.

netilmicin

CIMS Class : (Aminoglycosides)
netilmicin

P - Caution when used during pregnancy

L - Caution when used during lactation

related netilmicin information

Indication & Dosage	<i>Parenteral</i> Susceptible infections Adult: 4-6 mg/kg once daily or in equally divided doses given every 8 or 12 hr. Life-threatening infections: Increase to up to 7.5 mg/kg daily every 8 hr. All doses may be given as IM, slow IV (over 3-5 min) or as 50-200 ml infusion over 0.5-2 hr. Treatment is usually given for 7-14 days. Child: Premature infants and neonates <1 wk: 6 mg/kg daily in divided doses every 12 hr. Infants and neonates >1 wk: 7.5-9 mg/kg daily in divided doses every 8 hr. Older children: 6-7.5 mg/kg daily in divided doses every 8 hr. Alternative regimen: Neonates <6 wk: 4-6.5 mg/kg daily in divided doses every 12 hr. Older infants and children: 5.5-8 mg/kg daily in divided doses every 8 or 12 hr. Renal impairment: Dose reduction or lengthening of interval between doses may be necessary. Haemodialysis: 50% of initial loading dose is required after dialysis. <i>Parenteral</i> Urinary tract infections

	interval between doses may be necessary. Haemodialysis: 50% of initial loading dose is required after dialysis. <i>Parenteral</i> Urinary tract infections Adult: 150 mg as a single daily dose for 5 days. Complicated UTI: 3-4 mg/kg daily in divided doses every 12 hr. All doses may be given as IM, slow IV (over 3-5 min) or as a 50-200 ml infusion over 0.5-2 hr. Treatment is usually given for 7-14 days. Renal impairment: Dose reduction or lengthening of interval between doses may be necessary. Haemodialysis: 50% of initial loading dose is required after dialysis. Incompatibility: Do not mix in the same syringe with penicillins or cephalosporins.
Overdosage	Haemodialysis will be beneficial. Institute appropriate supportive therapy.
Contraindications	Hypersensitivity to the drug or other aminoglycosides.
Special Precautions	Renal impairment; monitor renal, vestibular and auditory function. Monitor peak serum levels. Myasthenia gravis, parkinsonism, infant botulism; conditions predisposing to ototoxicity and nephrotoxicity. Premature and neonatal infants, dehydration, elderly. Pregnancy and lactation.
Adverse Drug Reactions	Headache, malaise, visual disturbances, disorientation, tachycardia, hypotension, palpitations, thrombocytosis, paraesthesia, rash, chills, fever, fluid retention, vomiting, diarrhoea. Increased blood sugar; increased alkaline phosphatase; increased liver enzymes, bilirubin; increased potassium; other abnormal LFTs; decreased haemoglobin, WBCs and platelets; eosinophilia, anaemia and increase in prothrombin time. Potentially Fatal: Nephrotoxicity; ototoxicity; anaphylaxis.

	WBCs and platelets; eosinophilia, anaemia and increase in prothrombin time. Potentially Fatal: Nephrotoxicity; ototoxicity; anaphylaxis.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Parenteral: Store at 2-30°C. Do not freeze.
Mechanism of Action	Netilmicin, an aminoglycoside antibiotic, binds to 30S and to some extent to 50S ribosomal subunit of susceptible bacteria disrupting photosynthesis, thus rendering the bacterial cell membrane defective. Absorption: Rapidly and completely absorbed (IM). Peak plasma concentrations after 0.5-1 hr (IM), 1 hr (IV infusion). Excretion: Via urine within 24 hr (80% of a dose); 2-2.5 hr (elimination half-life).
CIMS Class	Aminoglycosides
ATC Classification	J01GB07 - netilmicin; Belongs to the class of other aminoglycosides. Used in the treatment of systemic infections. S01AA23 - netilmicin; Belongs to the class of antibiotics. Used in the treatment of eye infections.

nevirapine

CIMS Class : (Antivirals)
nevirapine

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related nevirapine information

Indication & Dosage

Oral

HIV infection

Adult: Combined with other antiretrovirals: 200 mg once daily for the first 14 days; increase to 200 mg bid if rash does not develop. Interrupting the treatment for >7 days necessitate reintroduction at a lower dose for the first 14 days.

Child: Combined with other antiretrovirals: 2 mth to 8 yr: 4 mg/kg once daily for the first 14 days; increase to 7 mg/kg bid if no rash is present. 8-16 yr: 4 mg/kg once daily for 14 days followed by 4 mg/kg bid. Max: 400 mg daily. Interrupting the treatment for >7 days necessitate reintroduction at a lower dose for the first 14 days.

Renal impairment: Haemodialysis: A further 200-mg dose is recommended after dialysis.

Administration

May be taken with or without food.

Overdosage

Symptoms: Oedema, erythema nodosum, fatigue, fever,

	Symptoms: Oedema, erythema nodosum, fatigue, fever, headache, insomnia, nausea, pulmonary infiltrates, rash, vertigo, wt loss. Management: No known antidote.
Contraindications	Hypersensitivity. Lactation. Severe hepatic impairment.
Special Precautions	Pregnancy. Interrupt treatment if severe hepatotoxicity or life-threatening skin reactions develop. Renal or hepatic insufficiency. Monitor liver function periodically.
Adverse Drug Reactions	Skin rash, nausea, vomiting, headache, abnormal LFT, fatigue, diarrhoea, abdominal pain. Potentially Fatal: Severe and life-threatening hepatotoxic and skin reactions.
Drug Interactions	Mutually increased levels effects when used with drugs extensively metabolised by CYP3A. Reduced levels/effects of methadone.
Food Interaction	Reduced serum levels with St John's wort.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C (59-86°F).
Mechanism of Action	Nevirapine is a non-nucleoside reverse transcriptase inhibitor that acts against HIV-1. It binds directly to reverse transcriptase and thereby blocks the RNA-dependent and DNA-dependent DNA polymerase activities by disrupting the enzyme's catalytic site. Absorption: Readily absorbed from the GI tract; peak plasma concentrations after 4 hr (oral). Distribution: Crosses the placenta; enters breast milk.

	Absorption: Readily absorbed from the GI tract; peak plasma concentrations after 4 hr (oral). Distribution: Crosses the placenta; enters breast milk. Protein-binding: Approx 60%. Metabolism: Hepatic by microsomal enzymes. Excretion: Via urine (as glucuronide conjugates of the hydroxylated metabolites).
CIMS Class	Antivirals
ATC Classification	J05AG01 - nevirapine; Belongs to the class of non-nucleoside reverse transcriptase inhibitors. Used in the systemic treatment of viral infections.

nicergoline

CIMS Class : (Peripheral Vasodilators & Cerebral Activators)
nicergoline

P - Caution when used during pregnancy

related nicergoline information

Indication & Dosage	<i>Oral</i>
	Peripheral vascular disease
	Adult: 10 mg tid. Maintenance: 5-10 mg tid. Max: Up to 60 mg daily in divided doses.
	Renal impairment: Reduce dose.
	<i>Oral</i>
	Mental deterioration associated with cerebrovascular insufficiency
	Adult: 10 mg tid. Maintenance: 5-10 mg tid. Max: Up to 60 mg daily in divided doses.
	Renal impairment: Reduce dose.
	<i>Intramuscular</i>
	Peripheral vascular disease
	Adult: 2-4 mg bid.
	Renal impairment: Reduce dose.
	<i>Intramuscular</i>
	Symptoms of mental deterioration associated with cerebrovascular insufficiency
	Adult: 2-4 mg bid.
	Renal impairment: Reduce dose.

	Symptoms of mental deterioration associated with cerebrovascular insufficiency Adult: 2-4 mg bid. Renal impairment: Reduce dose. <i>Intravenous</i> Peripheral vascular disease Adult: 4-8 mg by slow IV infusion (over 30 min). Renal impairment: Reduce dose. <i>Intravenous</i> Symptoms of mental deterioration associated with cerebrovascular insufficiency Adult: 4-8 mg by slow IV infusion (over 30 min). Renal impairment: Reduce dose. Reconstitution: Dilute in 250 ml saline solution.
Administration	Should be taken on an empty stomach. (Take on an empty stomach.)
Special Precautions	Porphyria. Pregnancy.
Adverse Drug Reactions	GI disturbances; hypotension (especially after parenteral admin). Hot flushes, malaise, hyperacidity, nausea, diarrhoea, dizziness, somnolence.
Drug Interactions	May potentiate action of antihypertensives. May increase cardiac depressant effects of propranolol.
Mechanism of Action	Nicergoline is an ergot derivative. It has a-adrenergic blocking activity and produces vasodilatation. Onset: 1-1.5 hr (oral). Absorption: Rapidly absorbed from the GI tract (oral). Distribution: Protein-binding: 82-87%. Metabolism: Undergoes significant 1st-pass effect. Excretion: Via urine (80%), via faeces (20%).
CIMS Class	Peripheral Vasodilators & Cerebral Activators

	Peripheral Vasodilators & Cerebral Activators
ATC Classification	C04AE02 - nicergoline; Belongs to the class of ergot alkaloids. Used as peripheral vasodilators.

nicorandil

CIMS Class : (Anti-Anginal Drugs)
nicorandil

P - Caution when used during pregnancy

L - Contraindicated in lactation

related nicorandil information

Indication & Dosage	<i>Oral</i> Angina pectoris Adult: 10 mg bid, increase if necessary. Usual dose: 10-20 mg bid. May use 5 mg bid for patients prone to headache. Max dose: 30 mg bid. Hepatic impairment: Dose reduction may be necessary.
Administration	May be taken with or without food.
Contraindications	Cardiogenic shock; hypotension; left ventricular failure with low filling pressure; lactation.
Special Precautions	Hypovolaemia, low systolic BP, acute pulmonary oedema, pregnancy. May impair ability to drive or operate machinery.
Adverse Drug Reactions	Headache (usually transitory), flushing, dizziness, nausea, vomiting and weakness. Hypotension and reflex tachycardia at high doses.
Drug Interactions	Hypotensive interaction may occur with alcohol, TCAs, antihypertensives and other vasodilators. Potentially Fatal: Enhanced hypotensive effect with sildenafil and other phosphodiesterase type-5 inhibitors.

	Hypotensive interaction may occur with alcohol, TCAS, antihypertensives and other vasodilators. Potentially Fatal: Enhanced hypotensive effect with sildenafil and other phosphodiesterase type-5 inhibitors.
Mechanism of Action	Nicorandil dilates arterioles and large coronary arteries by opening the potassium channels, and stimulates guanylate cyclase causing venous vasodilatation. It therefore reduces preload and afterload, and improves coronary blood flow. Absorption: Absorbed well from the GI tract (oral); peak plasma concentrations after 30-60 min. Distribution: Protein-binding: Slightly bound. Metabolism: Denitration. Excretion: Via urine (as metabolites); 1 hr (elimination half-life).
CIMS Class	Anti-Anginal Drugs
ATC Classification	C01DX16 - nicorandil; Belongs to the class of other vasodilators. Used in the treatment of cardiac disease.

***nicorandil information:**

nicotine

CIMS Class : (Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence)
nicotine

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ∇ - Food interaction

related nicotine information

Indication & Dosage

Buccal

Smoking cessation

Adult: Chewing gum: Smokers of > 20 cigarettes/day: Start with 4 mg gum (chewed slowly and parked on the gum) over 30 min when the urge to smoke occurs; reduce to 2 mg gum when able. Smokers of = 20 cigarettes/day: Start with 2 mg gum. Not more than 15 pieces of either strength daily.

Lozenges: Initially, 1 every 1-2 hr; max daily dose 30 mg (i.e. 15 x 2 mg lozenges or 30 x 1 mg lozenges). Sublingual tablets (each tab is equivalent to 2 mg of nicotine as β -cyclodextrin complex): 1-2 tab/hr, max 40 tab daily if necessary. Reduce usage of nicotine replacement therapy gradually until no longer needed.

Buccal

Smoking cessation

Adult: 2 mg or 4 mg gum: Chew (and park on the gum) one piece when urge to smoke occurs between smoking

Smoking cessation

Adult: 2 mg or 4 mg gum: Chew (and park on the gum) one piece when urge to smoke occurs between smoking episodes; reduce smoking within 6 wk and attempt smoking cessation within 6 mth.

Nasal

Smoking cessation

Adult: Nasal spray: 1 spray of 500 mcg administered into each nostril as required. Max use twice hrly and 64 sprays daily. Reduce usage gradually until no longer needed.

Transdermal

Smoking cessation

Adult: 1 patch for 16 or 24 hr daily applied to dry, hair free skin on the hip, trunk or upper arm. Site patch on a different area each day, leaving several days before using area again. Start with the highest strength (21 mg/24 hr or 15 mg/16 hr) and reduce gradually over several wk to lower strengths (14 mg/24 hr or 10 mg/16 hr then 7 mg/24 hr or 5 mg/16 hr). Lighter smokers may start with the lower strength patches.

Inhalation

Smoking cessation

Adult: Inhalator with 10 mg/cartridge nicotine: Inhale when urge to smoke occurs. Initial use of 6-12 cartridges daily, reduced gradually until no longer needed.

Inhalation

Smoking cessation

Adult: Inhalator with 10 mg/cartridge nicotine: Inhale when urge to smoke occurs between smoking episodes; reduce smoking within 6 wk and attempt smoking cessation within 6 mth.

Administration

Loz: May be taken with or without food. (Suck until the taste becomes strong. Then, lodge the loz between the gum & cheek. When the taste fades, start sucking it again. Repeat

	Loz: May be taken with or without food. (Suck until the taste becomes strong. Then, lodge the loz between the gum & cheek. When the taste fades, start sucking it again. Repeat until the loz completely dissolves (about 30 mins). Do not swallow. Avoid coffee, acidic drinks or soft drinks for 15 mins prior to sucking the loz.) Gum: May be taken with or without food. (Chew gum until the taste becomes strong, then rest it between the gums & the cheek. When the taste fades, start chewing it again. Repeat the chewing routine for 30 mins.)
Overdosage	Characterised by initial stimulation followed by depression of the autonomic nervous system. Symptoms include burning of mouth and throat, nausea and salivation, abdominal pain, vomiting, diarrhoea, hypertension or hypotension, headache, convulsions, dizziness, confusion, dyspnoea, faintness and sweating. Severe overdose may result in respiratory failure and death. If nicotine was taken orally, gastric lavage and activated charcoal may be used. Treatment is supportive; atropine may be used to reduce features of parasympathomimetic stimulation.
Contraindications	Nonsmokers, children and occasional smokers. Recent cerebrovascular accident, acute MI, unstable or worsening angina pectoris, severe cardiac arrhythmias, active temporomandibular joint disease (gum).
Special Precautions	Use with caution in oropharyngeal inflammation and in patients with cerebrovascular disease, heart failure and renal impairment. History of oesophagitis, peptic ulcer, CV disease, hyperthyroidism, hepatic dysfunction; myasthenia gravis; DM (monitor blood glucose concentrations); pregnancy, lactation; peripheral vascular disease; skin disease (should not be applied on broken skin).

	gravis; DM (monitor blood glucose concentrations); pregnancy, lactation; peripheral vascular disease; skin disease (should not be applied on broken skin).
Adverse Drug Reactions	Headache, cold and flu-like symptoms; insomnia; nausea; myalgia and dizziness; palpitations; dyspepsia, hiccups; vivid dreams; chest pain; anxiety and irritability; somnolence and impaired concentration; abnormal hunger; dysmenorrhoea; rash. Patches: Skin reactions (discontinue if severe), vasculitis. Spray: Nasal irritation, nose bleeds, watery eyes, ear sensations. Gum, lozenges, SL tab or inhalator: Aphthous ulceration, throat irritation. Inhalator: Cough, rhinitis, pharyngitis, stomatitis, sinusitis, dry mouth.
Drug Interactions	Nicotine increases the haemodynamic and AV blocking effects of adenosine. Monitor for treatment-emergent hypertension in patients treated with combination of nicotine patch and bupropion. Smoking cessation may increase response to various drugs e.g. theophylline, imipramine, oxazepam, pentazocine, some β-blockers; monitor for increased toxicity.
Food Interaction	Acidic foods/beverages decrease absorption of nicotine.
Mechanism of Action	Nicotine is a potent ganglionic and CNS stimulant. It paralyses all autonomic ganglia after stimulation of the respiratory system (a central effect of small doses). Larger doses produce medullary-type convulsions then paralysis. The actions of nicotine are mediated via nicotine-specific receptors. Onset: Formulation specific. Duration: Formulation specific. Distribution: Crosses the placenta and present in breast milk. Metabolism: Metabolised principally in the liver via oxidation. Excretion: Excreted in the urine (10-20% as unchanged

	milk. Metabolism: Metabolised principally in the liver via oxidation. Excretion: Excreted in the urine (10-20% as unchanged drug). Excretion is pH dependant with increased excretion in acidic urine.
CIMS Class	Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence
ATC Classification	N07BA01 - nicotine; Belongs to the class of drugs used in the management of nicotine dependence.

nicotinic acid

CIMS Class : (Dyslipidaemic Agents) , (Other Cardiovascular Drugs) , (Vitamin B-Complex / with C)
nicotinic acid

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab - Lab interference

related nicotinic acid information

Indication & Dosage	<i>Oral</i>
	Treatment and prophylaxis of nicotinic acid deficiency
	Adult: Up to 500 mg daily in divided doses. May also be given by IM or slow IV inj.
	<i>Oral</i>
	Hyperlipidaemias
	Adult: As immediate-release preparation: Initially, 600 mg daily in 3 divided doses, gradually increased over 2-4 wk to max 6 g daily (usual dose 1-2 g bid-tid). As modified-release preparation: Initially, 375 or 500 mg at night gradually increased by no more than 500 mg in 4 wk according to patient's response. Maintenance: 1-2 g at bedtime.
	<i>Oral</i>
	Vasodilation
	Adult: As immediate-release preparation: 100-150 mg 3-5 times daily. As extended release preparation: 300-400 mg 12 hrly.

	Adult: As immediate-release preparation: 100-150 mg 3-5 times daily. As extended release preparation: 300-400 mg 12 hrly.
Administration	Nicotinic acid: Should be taken with food. (Take at bedtime after a low-fat snack.)
Contraindications	Liver disease; active peptic ulcer; severe hypotension; arterial bleeding.
Special Precautions	Gout; cases of severe hepatic toxicity, including fulminant hepatic necrosis have occurred in patients who have substituted SR nicotinic acid products for immediate-release nicotinic acid at equivalent doses. Monitor LFT. DM, diabetic patients may experience a dose-related rise in glucose intolerance. Children, adolescents. Pregnancy, lactation (contraindicated at high doses).
Adverse Drug Reactions	Vomiting, diarrhoea, peptic ulceration, jaundice, abnormal LFTs, decreased glucose-tolerance, hyperuricaemia, gout, toxic amblyopia, flushing, pruritus, hyperpigmentation, dry skin and headache, atrial fibrillation, orthostasis, cystoid macular oedema.
Drug Interactions	Potentiates the effects of ganglionic blocking agents and vasoactive drugs resulting in postural hypotension. Increased risk of rhabdomyolysis with concomitant admin of HMG-CoA reductase inhibitors. Alcohol or hot drinks may increase the side effects of flushing and pruritus and should be avoided at the time of drug ingestion.
Lab Interference	False-positive results in urine glucose determination e.g. Benedict's test. False elevations in some fluorometric determinations of urinary catecholamines due to production of fluorescent substances in the urine.
Mechanism of Action	Nicotinic acid is a derivative of vitamin B ₃ and is incorporated into coenzymes nicotinamide adenine

	Nicotinic acid is a derivative of vitamin B₃ and is incorporated into coenzymes nicotinamide adenine dinucleotide (NAD) and nicotinamide adenine dinucleotide phosphate (NADP), which are involved in multiple cellular metabolic pathways. Nicotinic acid also reduces total serum cholesterol, LDL, VLDL, and triglycerides, and increases HDL cholesterol. It appears to decrease hepatic synthesis of VLDL, however, the exact mechanisms of nicotinic acid's antilipemic effects are unknown and are unrelated to its role as a vitamin. Absorption: Readily absorbed from the GI tract (oral). Distribution: Widely in body tissues; enters breast milk. Metabolism: Converted to N-methylnicotinamide, 2-pyridine and 4-pyridine derivatives. Excretion: Urine (small amounts as unchanged drug).
CIMS Class	Dyslipidaemic Agents / Other Cardiovascular Drugs / Vitamin B-Complex / with C
ATC Classification	C04AC01 - nicotinic acid; Belongs to the class of nicotinic acid agents used as peripheral vasodilators. C10AD02 - nicotinic acid; Belongs to the class of nicotinic acid and derivatives. Used in the treatment of hyperlipidemia.

nifedipine

CIMS Class : (Anti-Anginal Drugs) , (Calcium Antagonists)
nifedipine

P - Caution when used during pregnancy

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related nifedipine information

Indication & Dosage

Oral

Hypertension

Adult: Long-acting preparation: 10-40 mg bid, or 20-90 mg once daily.

Child: 1 mth–12 yr: 200–300 mcg/kg tid (max: 3 mg/kg daily or 90 mg daily); 12–18 yr: 5–20 mg tid (max: 90 mg daily).

Dose frequency may vary based on the preparation used.

For hypertensive crisis: 1 mth-18 yr: 250-500 mcg/kg as a single dose.

Elderly: Dose reduction may be necessary.

Hepatic impairment: Reduce dose by 50%-60% in patients with cirrhosis.

Oral

Angina pectoris

Adult: Long-acting preparation: 10-40 mg bid or 30-90 mg once daily. Liquid-filled capsules: 5-20 mg tid.

Child: Angina in Kawasaki disease or progeria: 1 mth–18 yr: 200–300 mcg/kg tid (max: 3 mg/kg/day or 90 mg/day). Dose

	once daily. Liquid-filled capsules: 5-20 mg tid. Child: Angina in Kawasaki disease or progeria: 1 mth–18 yr: 200–300 mcg/kg tid (max: 3 mg/kg/day or 90 mg/day). Dose frequency may vary based on the preparation used. Elderly: Dose reduction may be necessary. Hepatic impairment: Reduce dose by 50%-60% in patients with cirrhosis. <i>Oral</i> Raynaud's syndrome Adult: Liquid-filled capsules: 5-20 mg tid. Child: 2–18 yr: 2.5-10 mg 2–4 times daily; initiate with low doses at night. Increase slowly to prevent postural hypotension. Dose frequency may vary based on the preparation used. Elderly: Dose reduction may be necessary. Hepatic impairment: Reduce dose by 50%-60% in patients with cirrhosis
Administration	Retard, GITS & OROS: May be taken with or without food. (Avoid grapefruit juice. Swallow whole, do not chew/crush.) Immediate-release: May be taken with or without food. (Avoid grapefruit juice.)
Overdosage	Hypotension and bradycardia; hyperglycaemia, metabolic acidosis, coma. Management is mainly supportive and symptomatic.
Contraindications	Acute MI, cardiogenic shock, acute unstable angina, treatment of anginal attack in chronic stable angina.
Special Precautions	Hypotension, poor cardiac reserve, heart failure (deterioration has been noted), severe aortic stenosis, hepatic impairment, DM, porphyric patients, pregnancy. Avoid abrupt withdrawal (associated with exacerbation of angina). Discontinue if with ischaemic pain following

	hepatic impairment, DM, porphyric patients, pregnancy. Avoid abrupt withdrawal (associated with exacerbation of angina). Discontinue if with ischaemic pain following administration.
Adverse Drug Reactions	Peripheral oedema, hypotension, palpitations, tachycardia, flushing, dizziness, headache, nausea, increased micturition frequency, lethargy, eye pain, mental depression, visual disturbances, gingival hyperplasia, myalgia, tremor, impotence, fever, paradoxical increase in ischaemic chest pain during initiation of treatment, rashes, abnormalities in liver function (including cholestasis), GI obstruction in some tablets covered in indigestible membrane.
Drug Interactions	Potentiates antihypertensives. Increases the effects of neuromuscular-blocking agents and CYP1A2 substrates (e.g. theophylline, aminophylline). Enhances toxic effects of magnesium. Enhanced antihypertensive effects with alpha 1-blockers, aldesleukin, and antipsychotics. Reduced effects with calcium. With concurrent use withquinidine, serum concentration is increased while reduced in quinidine. Decreased levels/effects with CYP3A4 inducers (e.g. carbamazepine, nafcillin, phenobarbital, phenytoin, and rifampicin). Increased levels/effects with CYP3A4 inhibitors (e.g. azole antifungals, cimetidine, erythromycin, and HIV-protease inhibitors).
Food Interaction	Serum levels may be decreased with food, St John's wort. Increased levels/effects with grapefruit juice, ethanol, garlic. Avoid ephedra, yohimbe, ginseng (may worsen hypertension).
Lab Interference	Falsely elevated spectrophotometric values of urinary vanillylmandelic acid.
Pregnancy Category (US FDA)	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Nifedipine blocks the slow calcium channels thus preventing the flow of calcium ions into the cell. It produces peripheral and coronary vasodilatation, reduces afterload, peripheral resistance and BP, increases coronary blood flow and causes reflex tachycardia. It has little or no effect on cardiac conduction and rarely has negative inotropic activity. Absorption: Rapidly and completely absorbed from the GI tract (oral); peak plasma concentrations after 30 min (as liquid-filled capsules). Distribution: Enters breast milk. Protein-binding: 92-98%. Metabolism: Extensive hepatic first-pass metabolism. Excretion: Via urine (70-80% as inactive metabolites); 2 hr(elimination half-life).
CIMS Class	Anti-Anginal Drugs / Calcium Antagonists
ATC Classification	C08CA05 - nifedipine; Belongs to the class of selective dihydropyridine derivative calcium-channel blockers with mainly vascular effects. Used in the treatment of cardiovascular diseases.

nimesulide

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
nimesulide

P - Contraindicated in pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related nimesulide information

Indication & Dosage

Oral

Osteoarthritis

Adult: 100 mg bid. Use in the European Union (EU) is limited to a max of 15 days.

Oral

Postoperative pain

Adult: 100 mg bid. Use in the European Union (EU) is limited to a max of 15 days.

Oral

Dysmenorrhoea

Adult: 100 mg bid. Use in the European Union (EU) is limited to a max of 15 days.

Oral

Acute pain

Adult: 100 mg bid. Use in the European Union (EU) is limited to a max of 15 days.

Rectal

Acute pain

	to a max of 15 days. <i>Rectal</i> Acute pain Adult: 200 mg bid <i>Rectal</i> Primary dysmenorrhoea Adult: 200 mg bid <i>Rectal</i> Osteoarthritis Adult: 200 mg bid <i>Topical/Cutaneous</i> Sprains Adult: 3% gel/cream: Apply thin layer to affected area bid-tid. Duration: 7-15 days. <i>Topical/Cutaneous</i> Acute traumatic tendinitis Adult: 3% gel/cream: Apply thin layer to affected area bid-tid. Duration: 7-15 days.
Administration	Should be taken with food. (Take after meals.)
Overdosage	Epigastric pain, nausea, vomiting, drowsiness, lethargy, GI haemorrhage, seizures, hypertension, apnoea, coma, anaphylactic reactions and renal failure. Treatment is supportive.
Contraindications	Hypersensitivity; GI bleeding, active peptic ulcer disease; severe renal and heart failure; hepatic impairment or known liver disease; coagulation disorders; pregnancy; children <12 yr.
Special Precautions	History of GI tract disease, infections, oedema, hypertension, elderly, lactation.
Adverse Drug Reactions	Epigastric discomfort, heartburn or abdominal cramps, nausea, vomiting and diarrhoea; skin rash, pruritus, oedema,

	Epigastric discomfort, heartburn or abdominal cramps, nausea, vomiting and diarrhoea; skin rash, pruritus, oedema, headache, dizziness, drowsiness; hypersensitivity reactions (e.g. bronchospasm, rhinitis, angioedema urticaria); GI haemorrhage/perforation; bullous/erosive stomatitis, purpura, thrombocytopenia, toxic epidermal necrolysis, haematuria, oliguria, and renal failure; increases in liver enzymes. Potentially Fatal: Fatal hepatitis, Stevens Johnson syndrome.
Drug Interactions	Additive hepatotoxic effects with known hepatotoxins: anti-convulsants (e.g. valproic acid), anti-fungals (e.g. ketoconazole), anti-tuberculous drugs (e.g. isoniazid), tacrine, pemoline, amiodarone, methotrexate, methyldopa, amoxicillin/clavulanic acid. May decrease the oral bioavailability of furosemide and the natriuretic and diuretic response to furosemide. Increased risks of GI and hepatic adverse effects with other NSAIDs, including aspirin. May increase anti-coagulant effect of warfarin. Potentiates the action of phenytoin. May be displaced from binding sites with fenofibrate, salicylic acid, and tolbutamide. Interactions between NSAIDs and lithium, probenecid and ciclosporin, have been documented.
Food Interaction	Alcohol increases the risk of hepatic reactions.
Storage	Oral: Protect from heat and humidity; store at <25°C.
Mechanism of Action	Nimesulide is a nonsteroidal anti-inflammatory drug (NSAID) with anti-inflammatory, anti-pyretic, and analgesic properties. It inhibits prostaglandin synthetase/cyclooxygenase, which limits prostaglandin production. Its cyclooxygenase inhibiting potency is intermediate, but is relatively selective for the cyclo-oxygenase-2 (COX-2) thus the potential for gastric injury and intolerance is less. It is also a free radical

	inhibits prostaglandin production. Its cyclooxygenase inhibiting potency is intermediate, but is relatively selective for the cyclo-oxygenase-2 (COX-2) thus the potential for gastric injury and intolerance is less. It is also a free radical scavenger, and helps protect against the tissue damage that occurs during inflammation. Absorption: Well absorbed from GI tract following oral admin. Peak plasma levels:1-3 hr. With bid admin of 100 mg, steady-state is achieved within 24-36 hr. Distribution: 99% bound to plasma protein. Metabolism: Hepatic biotransformation; principal metabolite is 4-hydroxy-nimesulide. Excretion: Elimination half-life: 2-5 hr. Metabolites in urine: 80%, feces: 20% of the administered dose.9% bound to plasma protein.
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AX17 - nimesulide; Belongs to the class of other non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism.

nimesulide + racemethionine

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
nimesulide + racemethionine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related nimesulide + racemethionine information

Indication & Dosage	<i>Oral</i> Pain and inflammation Adult: Per tablet contains nimesulide 100 mg and racemethionine 50 mg: 1 tablet bid. Child: 5 mg/kg/day (Nimesulide) divided in 2-3 daily doses.
Contraindications	Active peptic ulcer, moderate-to-severe hepatic impairment. Pregnancy, lactation.
Special Precautions	Renal impairment, heart failure, cirrhosis; vol or salt depleted patients; elderly patients. Metabolic acidosis, patients with a history of severe hepatic impairment.
Adverse Drug Reactions	Nausea, diarrhoea, vomiting, rash, dizziness, somnolence, headache.
Drug Interactions	Fenofibrate, salicylic acid, valproic acid and tolbutamide displace nimesulide from its plasma binding sites. Nimesulide displaces methotrexate and furosemide from plasma proteins. Nimesulide should be used with caution along with warfarin since efficacy may be increased. Nimesulide may decrease the efficacy of slow release theophylline

	proteins. Nimesulide should be used with caution along with warfarin since efficacy may be increased. Nimesulide may decrease the efficacy of slow release theophylline preparations. Concurrent use of levodopa with racemethionine may decrease the therapeutic effects of levodopa.
Mechanism of Action	Nimesulide leads to inhibition of superoxide anion generation <i>in vitro</i> by activated neutrophils, inhibition of histamine release from tissue mast cells and basophils, it causes inhibition of platelet activating factor synthesis in stimulated human neutrophils and inhibition of synthesis of metalloproteinase thus preventing breakdown of osteoarthritic human cartilage. Racemethionine restores the hepatic concentrations of glutathione. Thus, it serves as a precursor for the synthesis of glutathione and sulfate. It is also a great antioxidant as the sulfur it supplies inactivates free radicals. It thus has a role in the treatment of arthritis pain as well as chronic liver disease. Racemethionine contributes to the synthesis of S-adenosylmethionine, which promotes production of cartilage proteoglycans, and is therapeutically beneficial in osteoarthritis.
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AX17 - nimesulide; Belongs to the class of other non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism.

nimodipine

CIMS Class : (Peripheral Vasodilators & Cerebral Activators) , (Nootropics & Neurotonics)
nimodipine

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ✖ - Food interaction

related nimodipine information

Indication & Dosage

Oral

Prophylaxis of neurological deficit following subarachnoid haemorrhage

Adult: 60 mg every 4 hr beginning within 4 days of onset of haemorrhage and continued for 21 consecutive days.

Hepatic impairment: 30 mg every 4 hr in hepatic cirrhosis.

Intravenous

Ischaemic neurological deficits following subarachnoid hemorrhage

Adult: Initially, 1 mg/hr infusion for 2 hr given via bypass into a central vein, increase to 2 mg/hr if no severe decrease in BP is observed. For <70 kg body weight or unstable BP: Initial dose: =500 mcg/hr. Treatment is started at once and continued for 5-14 days. Total duration should not exceed 21 days if patient has received oral treatment.

Hepatic impairment: Initial dose: =500 mcg/hr.

Administration

Tab: May be taken with or without food. (Take consistently,

Administration	Tab: May be taken with or without food. (Take consistently, either always with or always without meals.) Cap: Should be taken on an empty stomach. (Take on an empty stomach 1 hr before or 2 hr after meals.)
Overdosage	Hypotension and bradycardia; hyperglycemia, metabolic acidosis, coma. Treatment is symptomatic.
Special Precautions	Cerebral oedema, severely raised intracranial pressure, idiopathic hypertrophic subaortic stenosis (IHSS), elderly, severe liver disease. Inadvertent IV admin of the contents of capsules has resulted in CV collapse, hypotension, bradycardia and death. Tablets should not be administered concomitantly with IV solution.
Adverse Drug Reactions	Peripheral oedema, hypotension, palpitations, tachycardia, flushing, dizziness, headache, nausea, increased micturition frequency, lethargy, eye pain, mental depression, visual disturbances, gingival hyperplasia, myalgia, tremor, impotence, fever, paradoxical increase in ischaemic chest pain during initiation of treatment, rashes, abnormalities in liver function (including cholestasis), GI obstruction in some tablets covered in indigestible membrane. Potentially Fatal: Angina/MI, symptomatic hypotension.
Drug Interactions	Potentiates hypotensive effect of antihypertensives. Additive effects with sildenafil, tadalafil, vardenafil. Reduced effects with calcium. Decreased levels/effects with CYP3A4 inducers (e.g aminoglutethimide, carbamazepine, nafcillin, nevirapine, phenobarbital, phenytoin, and rifamycins). Increased levels/effects with cimetidine, sodium valproate, CYP3A4 inhibitors (e.g. azole antifungals, clarithromycin, diclofenac, doxycycline, erythromycin, imatinib, isoniazid, nefazodone, nicardipine, propofol, protease inhibitors, quinidine,

	levels/effects with cimetidine, sodium valproate, CYP3A4 inhibitors (e.g. azole antifungals, clarithromycin, diclofenac, doxycycline, erythromycin, imatinib, isoniazid, nefazodone, nicardipine, propofol, protease inhibitors, quinidine, telithromycin, and verapamil).
Food Interaction	Increased levels/effects with grapefruit juice, garlic. Decreased serum levels with St John's wort. Avoid ephedra, yohimbe, ginseng (may worsen hypertension).
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store <25°C. Protect from light. Oral: Store <25°C. Protect from light.
Mechanism of Action	Nimodipine inhibits inflow of calcium ions into cells by blocking calcium channels or select voltage-sensitive areas resulting in relaxation of vascular smooth muscle. Nimodipine has greater action on the cerebral vessels because of its high lipophilicity. Absorption: Absorbed rapidly from the GI tract (oral). Distribution: Blood-brain barrier. Protein-binding: 95%. Metabolism: Extensive hepatic first-pass metabolism. Excretion: In faeces via bile, via urine (as metabolites). Terminal elimination half-life: 9 hr.
CIMS Class	Peripheral Vasodilators & Cerebral Activators / Nootropics & Neurotonics
ATC Classification	C08CA06 - nimodipine; Belongs to the class of selective dihydropyridine derivative calcium-channel blockers with mainly vascular effects. Used in the treatment of cardiovascular diseases.

nitazoxanide

CIMS Class : (Antiamoebics)
nitazoxanide

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ∇ - Food interaction

related nitazoxanide information

Indication & Dosage	<i>Oral</i> Cryptosporidiosis, Giardiasis Adult: 500 mg every 12 hr for 3 days. Child: 1-3 yr: 100 mg every 12 hr; 4-11 yr: 200 mg every 12 hr; $\geq$ 12 yr: 500 mg every 12 hr. All doses to be taken for 3 days.
Administration	Should be taken with food.
Contraindications	Hypersensitivity.
Special Precautions	Renal and hepatic impairment. Pregnancy and lactation. Children <1 yr.
Adverse Drug Reactions	Headache, abdominal pain, diarrhoea, nausea, vomiting, allergic reactions, anaemia, anorexia, increased appetite, increased creatinine and LFT, diaphoresis, dizziness, eye and urine discolouration, fever, flatulence, hypertension, infection, malaise, nausea, pruritus, rhinitis, enlarged salivary glands, tachycardia.
Drug Interactions	May possibly interact with highly protein-bound drugs e.g.

Drug Interactions	May possibly interact with highly protein-bound drugs e.g. warfarin.
Food Interaction	Increased AUC with food.
Storage	Oral: Suspension: Store at 15-30°C (59-86°F). Tablet: Store at room temperature.
Mechanism of Action	Nitazoxanide is an antiprotozoal agent. Both nitazoxanide and its active metabolite (tizoxanide) interfere with the pyruvate:ferredoxin 2-oxidoreductase (PFOR) enzyme-dependent electron transfer reaction which is essential to anaerobic metabolism in susceptible organisms. Absorption: Absorbed from the GI tract (oral). Extent of absorption enhanced with food; peak plasma concentrations of tizoxanide and glucuronide metabolite after 1-4 hr. Distribution: Protein-binding: >99%. Metabolism: Rapidly hydrolysed to tizoxanide (active desacetyl metabolite) which partially undergoes conjugation, primarily by glucuronidation. Excretion: Via faeces ($\frac{2}{3}$ of an oral dose); via urine (remaining dose).
CIMS Class	Antiamoebics
ATC Classification	P01AX11 - nitazoxanide;

nitrazepam

CIMS Class : (Hypnotics & Sedatives)
nitrazepam

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related nitrazepam information

Indication & Dosage

Oral

Short-term management of insomnia

Adult: 5 mg at night; increase to 10 mg if necessary.

Elderly: and debilitated patients: =normal adult dose.

Oral

Infantile spasms

Child: Infants: 125 mcg/kg bid; gradually increase to 250-500 mcg/kg bid.

Administration

May be taken with or without food.

Overdosage

Symptoms: Somnolence, drowsiness, confusion, ataxia, impaired reflexes, coma, dyspnoea, hypotension, respiratory and cardiovascular depression. Management: Supportive. Gastric lavage may be beneficial if performed soon after ingestion. Flumazenil may reverse benzodiazepine-induced CNS depression.

Contraindications

Myasthenia gravis, narrow-angle glaucoma, severe

	Myasthenia gravis, narrow-angle glaucoma, severe respiratory insufficiency, sleep apnoea syndrome, severe hepatic impairment, porphyria.
Special Precautions	May induce anterograde amnesia; caution patients to have uninterrupted sleep of 7-8 hr after ingestion of dose. May impair ability to drive or operate machinery. Depression, especially if suicidal risk may be present. History of drug abuse or acute alcoholism. Hepatic and renal impairment. Respiratory disease. Debilitated patients. Patients who are at risk of falls. Children, elderly. Pregnancy and lactation.
Adverse Drug Reactions	Hypotension, palpitation; agitation, aggressiveness, amnesia, ataxia, confusion, delusions, disorientation, dizziness, fatigue, hallucination, hangover, headache, irritability, nightmares, psychoses, rage, restlessness, sedation; rash; changes in libido; constipation, diarrhoea, excessive salivation, heartburn, nausea, vomiting; granulocytopenia, leukopenia; falling, muscle weakness; blurred or double vision; tinnitus (associated with withdrawal); aspiration, increased bronchial secretion, dyspnoea.
Drug Interactions	CNS depressant effect increased with alcohol, barbiturates, TCAs, phenothiazines, morphine derivatives. Effects may be antagonised by theophylline. Increased levels/effects with probenecid. Reduced levels/effects with rifampicin. May reduce effects of levodopa.
Food Interaction	Increased CNS depression may occur with valerian, kava kava, St John's wort, gotu kola.
Lab Interference	May cause false elevations (about 15%) in clozapine plasma levels.
Storage	Oral: Store at room temperature. Protect from light and moisture.

	Oral: Store at room temperature. Protect from light and moisture.
Mechanism of Action	Nitrazepam is a benzodiazepine with a pronounced sleep-inducing activity. It depresses the reticular-activating system in the brainstem by enhancing the inhibitory effect of GABA on brain cells, thus preventing excessive brain activity. Onset: 30-60 min. Duration: 6-8 hr. Absorption: Fairly absorbed from the GI tract (oral). Peak plasma levels in 2-3 hr. Distribution: Crosses the blood-brain barrier and placenta; enters breast milk (trace amounts). Protein-binding: 87%. Metabolism: Hepatic by nitroreduction followed by acetylation. Excretion: Urine (as free or conjugated metabolites); 24-30 hr (elimination half-life).
CIMS Class	Hypnotics & Sedatives
ATC Classification	N05CD02 - nitrazepam; Belongs to the class of benzodiazepine derivatives used as hypnotics and sedatives.

nitrofurural

CIMS Class : (Topical Antibiotics)
nitrofurural

related nitrofurural information

Indication & Dosage	<i>Topical/Cutaneous</i> Wounds, burns, ulcers and skin infections, Preparation of surfaces before skin grafting Adult: Apply as 0.2% topical preparation in a water-soluble or water-miscible basis to the affected area.
Contraindications	Hypersensitivity. Cross-sensitisation may occur with other nitrofurural derivatives.
Special Precautions	G6PD deficiency (oral). Renal impairment.
Adverse Drug Reactions	Oral: Severe peripheral neuropathy. Topical: Sensitisation, generalised allergic skin reactions.
Storage	Topical/Cutaneous: Store below 25°C.
Mechanism of Action	Nitrofurural is a nitrofurural derivative bactericidal against a wide spectrum of gram-negative and gram-positive bacteria. It also has activity against trypanosomes.
CIMS Class	Topical Antibiotics
ATC Classification	B05CA03 - nitrofurural; Belongs to the class of anti-infectives used as irrigating solutions. D08AF01 - nitrofurural; Belongs to the class of nitrofurural derivative antiseptics. Used in the treatment of

B05CA03 - nitrofurantoin; Belongs to the class of anti-infectives used as irrigating solutions.

D08AF01 - nitrofurantoin; Belongs to the class of nitrofurantoin derivative antiseptics. Used in the treatment of dermatological diseases.

D09AA03 - nitrofurantoin; Belongs to the class of ointment dressings with anti-infectives. Used in treatment of wounds.

P01CC02 - nitrofurantoin; Belongs to the class of nitrofurantoin derivative agents used in the treatment of leishmaniasis and trypanosomiasis.

S01AX04 - nitrofurantoin; Belongs to the class of other anti-infectives. Used in the treatment of eye infections.

S02AA02 - nitrofurantoin; Belongs to the class of anti-infectives used in the treatment of ear infections.

related nitrofurantoin information

Indication & Dosage

Oral

Acute uncomplicated urinary tract infections

Adult: 50-100 mg 4 times daily for 7 days. Dual-release preparation: 100 mg bid.

Child: >3 mth and older children: 3 mg/kg daily in 4 divided doses.

Oral

Prophylaxis of uncomplicated urinary tract infections

Adult: 50-100 mg at bedtime.

Child: >3 mth and older children: 1 mg/kg once daily.

Administration

Should be taken with food. (Take w/ or immediately after meals.)

Overdosage

Symptoms include vomiting. Management is supportive; dialysable.

Contraindications

Severe renal impairment (anuria, oliguria, significantly elevated serum creatinine, CrCl <60 ml/min).

	Severe renal impairment (anuria, oliguria, significantly elevated serum creatinine, CrCl <60 ml/min). Hypersensitivity to nitrofurans, G6PD deficiency, infants <3 mth. Pregnancy at term, during labour and delivery, or when the onset of labour is imminent.
Special Precautions	Elderly. Monitor hepatic and pulmonary function during prolonged therapy. Pre-existing pulmonary, hepatic, neurological, or allergic disorders, predisposition to peripheral neuropathy e.g. renal impairment, anaemia, DM, electrolyte imbalance, debility, vitamin B deficiency. Withdraw if signs of peripheral neuropathy occur. Lactation.
Adverse Drug Reactions	Nausea, vomiting, anorexia, abdominal pain, diarrhoea; headache, drowsiness, vertigo, dizziness, nystagmus, benign intracranial hypertension; rash, urticaria, pruritus, fever, sialadenitis, angioedema, erythema multiforme, exfoliative dermatitis, pancreatitis, lupus-like syndrome, myalgia, arthralgia; acute pulmonary sensitivity reactions; megaloblastic anaemia, leucopenia, granulocytopenia or agranulocytosis, thrombocytopenia, aplastic anaemia, haemolytic anaemia (in G6PD-deficient patients); transient alopecia; brownish discolouration of urine. Potentially Fatal: Peripheral polyneuropathy, hepatotoxicity, anaphylaxis, Stevens-Johnson syndrome, interstitial pneumonitis, pulmonary fibrosis.
Drug Interactions	Reduced excretion with probenecid or sulfinpyrazone. Absorption reduced by magnesium trisilicate. Antagonistic effects with quinolone antibacterials. Reduced effects with carbonic anhydrase inhibitors or urinary alkalinisers.
Food Interaction	Food may increase bioavailability and prolong therapeutic concentrations in urine.
Lab Interference	False-positive test for urinary glucose using cupric sulfate

Lab Interference	False-positive test for urinary glucose using cupric sulfate solution.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-30°C (59-86°F).
Mechanism of Action	Nitrofurantoin interferes with cell metabolism and cell wall synthesis by inhibiting several enzyme systems including acetyl coenzyme A. It is bactericidal to most gram-positive and gram-negative urinary tract pathogens. Absorption: Readily absorbed from the GI tract. Food may increase bioavailability and prolong the duration of therapeutic urinary concentrations. Distribution: Concentrations in blood and body tissues are low; crosses the placenta and the blood-brain barrier and distributes in breast milk (trace amounts). Metabolism: Hepatic and in most body tissues. Excretion: Via urine (30-40% of a dose excreted rapidly as unchanged drug); some tubular reabsorption may occur in acid urine. Plasma half-life: 0.3-1 hr.
CIMS Class	Other Antibiotics
ATC Classification	J01XE01 - nitrofurantoin; Belongs to the class of nitrofurantoin derivative antibacterials. Used in the treatment of systemic infections.

nonoxinol 9

CIMS Class : (Other Contraceptives)
nonoxinol 9

P - Caution when used during pregnancy
L - Caution when used during lactation

related nonoxinol 9 information

Indication & Dosage	<i>Vaginal</i> Spermicidal contraception Adult: Spread cream over the diaphragm surface which will be in contact with the cervix and on the rim. Allow the diaphragm to remain <i>in situ</i> for at least 6-8 hr after coitus. Apply more cream or other spermicides prior to any subsequent coitus within this period, without removing the diaphragm. Use a vaginal applicator for inserting more cream.
Contraindications	Absence of vaginal sensation e.g. in paraplegics and quadriplegics.
Special Precautions	Pregnancy and lactation. Nonoxinol 9 does not protect against HIV infection and other STDs. Use in conjunction with barrier methods of contraception.
Adverse Drug Reactions	Local irritation, increased susceptibility to <i>E. coli</i> bacteruria, increased risk of genital ulceration. Potentially Fatal: Toxic shock syndrome.
Storage	Vaginal: Do not store above 25 °C.

Storage	Vaginal: Do not store above 25 °C.
Mechanism of Action	Nonoxinol 9 is a spermicide for contraception. It acts by damaging the sperm cell membrane, increasing permeability resulting in loss of cellular components and reduced motility.
CIMS Class	Other Contraceptives

***nonoxinol 9 information:**

norepinephrine

CIMS Class : (Vasoconstrictors)
norepinephrine

P - Contraindicated in pregnancy
L - Caution when used during lactation

related norepinephrine information

Indication & Dosage

Intravenous

Acute hypotensive states

Adult: Initially, 8-12 mcg/minute, up to 8-30 mcg/minute in refractory shock. Infuse using a solution of 4 mcg/ml in glucose 5%, or sodium chloride 0.9% and glucose 5% at a rate of 2-3 ml/minute. Adjust according to BP response.

Average maintenance dose: 0.5-1 ml/minute (2-4 mcg/minute). Infuse via a central venous catheter or into a large vein.

Child: Administer at a rate of 2 mcg/minute. Alternatively, 2 mcg/m²/minute. Adjust rate according to BP response and perfusion.

Elderly: Initial dose should be at low end of dose range.

Injection

Upper gastrointestinal haemorrhage

Adult: Intraperitoneal admin: 8 mg in 250 ml of 0.9% sodium chloride inj. Alternatively, instill 8 mg in 100 ml of 0.9% sodium chloride solution through a nasogastric tube every hr for 6–8 hr, then every 2 hr for 4–6 hr. Withdraw drug

	7. Admin. intraperitoneal admin. 8 mg in 200 ml of 0.9% sodium chloride inj. Alternatively, instill 8 mg in 100 ml of 0.9% sodium chloride solution through a nasogastric tube every hr for 6–8 hr, then every 2 hr for 4–6 hr. Withdraw drug gradually. Reconstitution: Dilute with 5% glucose inj, with or without sodium chloride; dilution with sodium chloride inj alone is not recommended. Incompatibility: Incompatible with alkali and oxidising agents, barbiturates, chlorphenamine, chlorothiazide, nitrofurantoin, novobiocin, phenytoin, sodium bicarbonate, sodium iodide, streptomycin, insulin.
Overdosage	Symptoms: Hypertension, sweating, cerebral haemorrhage, convulsions.
Contraindications	Hypertension. Pregnancy. Patients with peripheral or mesenteric vascular thrombosis unless necessary as a life-saving procedure.
Special Precautions	Not a substitute for replacement of blood, plasma, fluids, and/or electrolytes; correct volume depletion prior to admin. Identify and correct hypoxia, hypercapnia and acidosis prior to or during admin. Avoid extravasation as tissue necrosis may occur. Avoid inj into leg veins, especially in elderly or those with occlusive vascular diseases, arteriosclerosis, DM or Buerger's disease. Hypertensive or hyperthyroid patients. In conjunction with local anaesthetics, do not use in fingers, toes, ears, nose or genitalia. Lactation.
Adverse Drug Reactions	Hypertension, headache, peripheral ischaemia, bradycardia, arrhythmias, anxiety, skin necrosis (with extravasation), dyspnoea, respiratory difficulty.
Drug Interactions	Guanethidine, methyldopa, reserpine, TCAs may increase pressor response to norepinephrine.

	Guanethidine, methyldopa, reserpine, TCAs may increase pressor response to norepinephrine. Potentially Fatal: Increased risk of arrhythmias with cocaine, cyclopropane or halogenated hydrocarbon anaesthetics. Hypertensive crisis may occur with MAOIs. Hypertensive effects may be increased by nonselective β-blockers.
Storage	Intravenous: Store at room temperature (25°C) and protect from light. Store in tight, light-resistant containers as norepinephrine is readily oxidised. Do not use if discoloured (e.g. pink, dark yellow, brown) or if there is a precipitate.
Mechanism of Action	Norepinephrine is a direct-acting sympathomimetic which stimulates β_1- and α-adrenergic receptors. Its α-agonist effects cause vasoconstriction, thereby raising systolic and diastolic BP with reflex slowing of heart rate. Onset: Rapid. Duration: Short; stops within 1-2 min after discontinuing the infusion. Absorption: Oral: Destroyed in the GI tract; SC: Poorly absorbed. Distribution: Mainly localises in sympathetic nervous tissue; crosses the placenta but not the blood-brain barrier. Metabolism: Metabolised in the liver and in other tissues by the enzymes catechol-O-methyltransferase (COMT) and monoamine oxidase (MAO). Excretion: Via urine (mainly as metabolites).
CIMS Class	Vasoconstrictors
ATC Classification	C01CA03 - norepinephrine; Belongs to the class of adrenergic and dopaminergic cardiac stimulants excluding glycosides. Used in the treatment of heart failure.

norethisterone

CIMS Class : (Oestrogens & Progestones & Related Synthetic Drugs)
norethisterone

P - Contraindicated in pregnancy
L - Caution when used during lactation
Lab ⚠ - Lab interference
Food ⚠ - Food interaction

related norethisterone information

Indication & Dosage	<i>Oral</i>
	Menorrhagia
	Adult: 10-15 mg daily in a cyclical regimen. Usual dose: 5 mg tid for 10 days as primary treatment, subsequently 5 mg bid on days 19-26 of cycle to prevent recurrence. As acetate: 2.5-10 mg daily in a cyclical regimen, beginning during the assumed latter half of the cycle.
	<i>Oral</i>
	Endometriosis
	Adult: 10-25 mg daily continuously for 4-9 mth. As acetate: 5-15 mg daily start at 5 mg daily and increase by 2.5 mg at 14 day intervals. Take continuously for 4-9 mth.
	<i>Oral</i>
	Contraception
	Adult: 0.35 mg daily, or 0.5-1 mg daily when combined with oestrogen. As acetate: 0.6 mg daily, or 1-1.5 mg daily when combined with oestrogen.
	<i>Oral</i>
	Progestogen component of menopausal hormonal replacement therapy

	acetate: 0.6 mg daily, or 1-1.5 mg daily when combined with oestrogen. <i>Oral</i> Progestogen component of menopausal hormonal replacement therapy Adult: 0.7 mg as a continuous daily dose. As acetate: 1 mg daily for 10-14 days of a 28-day cycle. <i>Oral</i> Premenstrual syndrome Adult: 5 mg tid on days 16-25 of cycle. <i>Oral</i> Breast cancer Adult: 40 mg daily increasing to 60 mg daily if no regression is noted. <i>Oral</i> Postponement of menstruation Adult: 5 mg tid starting 3 days before expected onset of menstruation. <i>Transdermal</i> Progestogen component of menopausal hormonal replacement therapy Adult: As acetate: 140, 170 or 250 mcg/day (as patch), applied twice weekly for 2 wk of a 4 wk cycle. Lower strength may also be applied twice weekly on a continuous basis. <i>Intramuscular</i> Contraception Adult: As enantate: 200 mg every 8 wk.
Administration	May be taken with or without food.
Overdosage	Symptoms include nausea, vomiting, breast enlargement, vaginal bleeding. Treatment should be symptomatic.
Contraindications	Severe hepatic dysfunction; undiagnosed vaginal bleeding; porphyria; pregnancy; previous idiopathic or current thromboembolism; thromboembolic disease; DVT.
Special Precautions	Hypertension; CVS disease; hepatic impairment; epilepsy; lactation; new onset of migraine-type headache; asthma; renal impairment; history of clinical depression.

Adverse Drug Reactions	Mental depression, cholestatic jaundice, porphyria, epilepsy, migraine, headache, breast discomfort, dizziness, nausea and vomiting, changes in libido, appetite and weight, breakthrough bleeding, changes in menstrual amenorrhoea, oedema, rash, melasma or cholasma, acne, urticaria, abnormal LFTs, moodswings, insomnia, thrombotic and thromboembolic events, optic neuritis, altered lipid profile.
Drug Interactions	Concentration may be reduced by CYP450 inducers (e.g. phenobarbital, phenytoin, carbamazepine, rifampicin, rifabutin, nevirapine, efavirenz, tetracyclines, ampicillin, oxacillin, co-trimoxazole) and ritonavir, nelfinavir (usually inhibitors of CYP450 but have inducing properties when used with steroid hormones). May cause additive fluid retention with NSAIDs, vasodilators. Adjustment in antidiabetic, thyroid hormone and anticoagulant therapy may be required. Potentially Fatal: May increase ciclosporin concentration.
Food Interaction	St John's wort may induce norethisterone metabolism, leading to decreased concentrations.
Lab Interference	Abnormal thyroid function tests, metyropone test and LFTs reported.
Storage	Oral: Store below 25°C. Transdermal: Store below 25°C.
Mechanism of Action	Norethisterone has typical effects of a progestogen and converts the endometrium from the proliferative to the secretory phase. It may also have some oestrogenic, anabolic and androgenic activities, but these may not be significant. Norethisterone delays onset of periods and controls abnormal uterine bleeding. It also has contraceptive effects due to negative feedback inhibition of pituitary gonadotropin thus preventing ovulation. Absorption: Absorbed from the GI tract (oral). Distribution: Highly protein bound Metabolism: Hepatic; extensive first-pass effect. Excretion: Via urine (50-80%); via faeces (40%).
	Oestrogens & Progesterones & Related Synthetic Drugs

CIMS Class	Oestrogens & Progesterones & Related Synthetic Drugs
ATC Classification	G03AC01 - norethisterone; Belongs to the class of progestogens. Used as systemic contraceptives. G03DC02 - norethisterone; Belongs to the class of estren derivative progestogens used in progestogenic hormone preparations.

norfloxacin

CIMS Class : (Quinolones) , (Eye Anti-infectives & Antiseptics)
norfloxacin

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food ∇ - Food interaction

related norfloxacin information

Indication & Dosage

Oral

Uncomplicated gonorrhoea

Adult: 800 mg as a single daily dose.

CrCl (ml/min)	Dosage Recommendation
≥ 30	400 mg single dose

Oral

Chronic bacterial prostatitis

Adult: 400 mg bid for 28 days.

CrCl (ml/min)	Dosage Recommendation
≥ 30	400 mg once daily

Oral

Complicated urinary tract infections

Adult: 400 mg bid for 10-21 days.

CrCl (ml/min)	Dosage Recommendation
≥ 30	400 mg once daily

Oral

Oral

Chronic relapsing urinary tract infections

Adult: 400 mg bid for up to 12 wk, may be reduced to 400 mg once daily if adequate suppression within first 4 wk.

CrCl (ml/min)	Dosage Recommendation
≥30	400 mg once daily

Oral

Gastroenteritis

Adult: 400 mg bid for 3-5 days

CrCl (ml/min)	Dosage Recommendation
≥30	400 mg once daily

Oral

Uncomplicated urinary tract infections

Adult: Infections caused by susceptible *Escherichia coli*, *Klebsiella pneumoniae*, *roteus mirabilis* species: 400 mg bid for 3 days. Infections caused by other susceptible bacteria: 400 mg bid for 7-10 days.

CrCl (ml/min)	Dosage Recommendation
≥30	400 mg once daily

Ophthalmic

Conjunctivitis

Adult: As 0.3% solution: Usual dose, 1 or 2 drops in the eye 4 times daily for up to 7 days. Dosage may be increased to 1 or 2 drops every 2 hr for the 1st day in more severe infections.

Child: ≥1 yr, as 0.3% solution: Usual dose, 1 or 2 drops in the eye 4 times daily for up to 7 days. Dosage may be increased to 1 or 2 drops every 2 hr for the 1st day in more severe infections.

	the eye 4 times daily for up to 7 days. Dosage may be increased to 1 or 2 drops every 2 hr for the 1 st day in more severe infections.	
Administration	Should be taken on an empty stomach. (Take on an empty stomach 1 hr before or 2 hr after meals. Do not take w/dairy products.)	
Overdosage	Empty stomach by vomiting or gastric lavage. Give symptomatic and supportive treatment.	
Contraindications	Hypersensitivity to quinolones; children <18 yr. Lactation.	
Special Precautions	Renal impairment; history of CNS disorders; myasthenia gravis. Pregnancy. QT prolongation; discontinue if signs of neuropathy occur.	
Adverse Drug Reactions	Nausea, vomiting, heartburn, constipation, diarrhoea, abdominal cramping, anorexia; headache, dizziness; depression, insomnia; phototoxicity; rash, fever, arthralgia; elevated liver enzymes, urea and creatinine. Eosinophilia, neutropenia, thrombocytopenia and anaemia; hyperhidrosis; tendon rupture; QT prolongation. Potentially Fatal: Anaphylaxis, acute renal failure, seizures.	
Drug Interactions	Antacids reduce absorption from GI tract. Probenecid reduces urinary excretion of norfloxacin. Norfloxacin may increase concentration of clozapine, ropinirole, tacrine, tizanidine. Severe hypoglycaemia has occurred rarely with glyburide. Increased risk of CNS stimulation and seizures with NSAIDs. Potentially Fatal: Raises theophylline and ciclosporin levels. Effects of warfarin potentiated. Risk of QT prolongation and torsades de pointes with class I and III antiarrhythmics, cisapride, erythromycin, antipsychotics, TCAs.	
Food Interaction	Absorption reduced, especially when taken with dairy products e.g. milk or yogurt.	

	Absorption reduced, especially when taken with dairy products e.g. milk or yogurt.
Pregnancy Category (US FDA)	Caution esp in 1st trimester. Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Ophthalmic: Store at 15-30°C. Oral: Store at 15-30°C.
Mechanism of Action	Norfloxacin inhibits the action of DNA gyrase in DNA replication, transcription, repair, recombination and transposition. Absorption: 30-40% absorbed from the GI tract (oral); peak plasma concentrations after 1-2 hr. May be delayed by the presence of food. Distribution: Genitourinary tract, placenta, bile (high concentrations). Protein-binding: 14%. Metabolism: Hepatic; converted to several metabolites with antibacterial activity. Excretion: Via urine by glomerular filtration and tubular secretion within 24 hr (30% as unchanged); via faeces (30%); 4 hr (elimination half-life); may be prolonged in renal impairment.
CIMS Class	Quinolones / Eye Anti-infectives & Antiseptics
ATC Classification	J01MA06 - norfloxacin; Belongs to the class of quinolones, fluoroquinolone. Used in the treatment of systemic infections. S01AX12 - norfloxacin; Belongs to the class of other anti-infectives. Used in the treatment of eye infections.

norfloxacin + tinidazole

CIMS Class : (Antibacterial Combinations) , (Antidiarrheals)
norfloxacin + tinidazole

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related norfloxacin + tinidazole information

related norfloxacin + tinidazole information	
Indication & Dosage	<i>Oral</i> Diarrhoea and dysentery of amoebic, bacterial or mixed origins Adult: Per tablet contains norfloxacin 400 mg and tinidazole 600 mg: 1 tablet bid for 5 days.
Contraindications	Hypersensitivity, neurological disorders including convulsions, blood dyscrasias, children. Pregnancy and lactation.
Special Precautions	Moderate renal impairment, history of or susceptibility to seizures, alcohol intake. Ensure adequate hydration and urine output.
Adverse Drug Reactions	Nausea, vomiting, heartburn, metallic taste, headache, dizziness, depression, insomnia, rash, dry mouth, fever, arthralgia. Rarely eosinophilia, bone marrow depression. Potentially Fatal: Rarely hypersensitivity reactions, facial and laryngeal oedema, hypotension, bronchospasm.
Drug Interactions	Antacids reduce absorption of norfloxacin from

Drug Interactions	Antacids reduce absorption of norfloxacin from gut. Probenecid reduces urinary excretion of norfloxacin. Potentially Fatal: Increased levels of theophylline and ciclosporin, warfarin effects potentiated, disulfiram-like reactions with alcohol.
Food Interaction	Reduced absorption of norfloxacin esp with milk or yogurt.
Mechanism of Action	Tinidazole is active against protozoa and anaerobic bacterial infections against which norfloxacin is inactive. The combination of norfloxacin and tinidazole has an extended range of antimicrobial spectrum and is effective in mixed gut infections, diarrhoeas and dysentery.
CIMS Class	Antibacterial Combinations / Antidiarrheals
ATC Classification	J01MA06 - norfloxacin; Belongs to the class of quinolones, fluoroquinolone. Used in the treatment of systemic infections. J01XD02 - tinidazole; Belongs to the class of imidazole derivative antibacterials. Used in the treatment of systemic infections. P01AB02 - tinidazole; Belongs to the class of nitroimidazole derivatives antiprotozoals. Used in the treatment amoebiasis and other protozoal diseases. S01AX12 - norfloxacin; Belongs to the class of other anti-infectives. Used in the treatment of eye infections.

nortriptyline

CIMS Class : (Antidepressants)
nortriptyline

P - Caution when used during pregnancy

L - Caution when used during lactation

related nortriptyline information

Indication & Dosage

Oral

Depression

Adult: 75-100 mg daily in 3-4 divided doses, increased gradually up to 150 mg daily in severe depression.

Child: Adolescent: 30-50 mg daily in divided doses.

Elderly: 30-50 mg daily in divided doses.

Oral

Nocturnal enuresis

Child: 6-7 yr (20-25 kg): 10 mg; 8-11 yr (25-35kg): 10-20 mg; >11 yr (35-54 kg): 25-35 mg. All doses are given 30 minutes before bedtime and treatment should continue for not >3 mth.

Administration

May be taken with or without food.

Overdosage

Symptoms include cardiac dysrhythmias, severe hypotension, shock, CHF, pulmonary oedema, convulsions, and CNS depression, including coma. Gastric lavage should be performed, followed by activated charcoal. Emesis is contraindicated. Initiate cardiac monitoring and observe for

	and CNS depression, including coma. Gastric lavage should be performed, followed by activated charcoal. Emesis is contraindicated. Initiate cardiac monitoring and observe for signs of CNS, respiratory depression, hypotension, cardiac dysrhythmias and seizures.
Contraindications	Mania, recent MI, arrhythmias (particularly heart block); severe liver disease; children <6 yr.
Special Precautions	Elderly; hepatic or renal dysfunction; benign prostatic hypertrophy; angle closure glaucoma; pheochromocytoma; CVS disease; epilepsy; history of bowel obstruction; withdraw gradually; monitor for suicidal tendencies during early treatment; DM; thyroid disease; psychoses (may aggravate psychotic symptoms); urinary retention. Pregnancy, lactation.
Adverse Drug Reactions	Tachycardia, slows conduction and prolongation of PR interval, lowers seizure threshold, peripheral neuropathy, dry mouth, constipation, urinary hesitancy, confusion and blurred vision, nausea, sweating, tremor, rashes, hypersensitivity reactions, hypomania or mania, headache, hyponatraemia, abnormal LFT, endocrine disorders, movement disorders, taste disturbances. Potentially Fatal: Rare, blood dyscrasias.
Drug Interactions	May antagonise hypotensive effects of guanethidine and similar compounds, clonidine and rauwolfia alkaloids. May cause additive CNS depression with CNS depressants (e.g. opioids, alcohol, sedatives and hypnotics). Possible increased risk of seizure with tramadol. Nortriptyline concentrations may be increased by quinidine, phenothiazines, haloperidol, inhibitors of CYP3A4, cimetidine, methylphenidate. Concentrations may be decreased by inducers of CYP3A4. Increased toxicity with SSRIs (reduce concentration).

	CYP3A4, cimetidine, methylphenidate. Concentrations may be decreased by inducers of CYP3A4. Increased toxicity with SSRIs (reduce concentration). Potentially Fatal: Severe hyperpyretic reaction with MAOIs, should not be used concomitantly or within 2 wk of stopping MAOIs. Potentiates hypertensive effect of sympathomimetics and anticoagulant action of coumarins.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 20-25°C.
Mechanism of Action	Nortriptyline is the chief active metabolite of amitriptyline. It is a dibenzocycloheptadiene tricyclic antidepressant. It prevents the re-uptake of noradrenaline and serotonin at nerve terminals. Absorption: Peak plasma concentrations within 7-8.5 hr. Distribution: Distributed in milk. Metabolism: Extensively hepatic; converted to 10-hydroxynortriptyline. Excretion: Excreted in the urine (around a third) and faeces (small amounts) as metabolites.
CIMS Class	Antidepressants
ATC Classification	N06AA10 - nortriptyline; Belongs to the class of non-selective monoamine reuptake inhibitors. Used in the management of depression.

octreotide

CIMS Class : (Trophic Hormones & Related Synthetic Drugs)
octreotide

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related octreotide information

Indication & Dosage

Subcutaneous

Secretory neoplasms

Adult: Initially, 50 mcg 1-2 times daily, increased gradually to up to 600 mcg daily in 2-4 divided doses according to response. Continued treatment is not recommended if there is no benefit within a wk of starting treatment for carcinoid tumour. Initial dose may be given via IV admin if a rapid response is required.

Renal impairment: Dosage may need to be reduced in severe renal impairment requiring dialysis.

Subcutaneous

Acromegaly

Adult: Initially 50 mcg tid, increased as necessary to usual dose 100-200 mcg tid. Max: 500 mcg tid.

Renal impairment: Dosage may need to be reduced in severe renal impairment requiring dialysis.

Subcutaneous

Prophylaxis of complications following pancreatic surgery

renal impairment requiring dialysis.

Subcutaneous

Prophylaxis of complications following pancreatic surgery

Adult: 100 mcg tid of a rapid-acting preparation given for 7 consecutive days, starting at least 1 hr before operation.

Renal impairment: Dosage may need to be reduced in severe renal impairment requiring dialysis.

Intravenous

Variceal haemorrhage in patients with cirrhosis

Adult: As continuous IV infusion: 25 mcg/hr for 48 hr (up to 5 days in patients at high risk of re-bleeding).

Child: =1 mth: 1 mcg/kg/hr (up to 50 mcg/hr); given as continuous IV infusion. Higher doses may be needed initially, reduce dose gradually over 24 hr until bleeding has stopped.

Renal impairment: Dosage may need to be reduced in severe renal impairment requiring dialysis.

Subcutaneous

HIV-associated diarrhoea

Adult: Initial dose 100 mcg tid. If symptoms are not controlled after 1 wk, increase dose to 250 mcg tid, if still not effective after 1 wk stop therapy.

Renal impairment: Dosage may need to be reduced in severe renal impairment requiring dialysis.

Intramuscular

Acromegaly

Adult: Following initial control with SC therapy: As a depot preparation, initially 20 mg every 4 wk. Adjust if required after 3 mth to 10-30 mg every 4 wk. Max: 40 mg every 4 wk.

Renal impairment: Dosage may need to be reduced in severe renal impairment requiring dialysis.

Incompatibility: Incompatible with most TPN solutions due to

	renal impairment requiring dialysis. Incompatibility: Incompatible with most TPN solutions due to formation of a glycosyl octreotide conjugate, which may decrease efficacy.
Special Precautions	Renal disease; risk of gall bladder disease; DM; hypothyroidism. Pregnancy, lactation, children, elderly. Monitor levels of vitamin B12 during long term therapy.
Adverse Drug Reactions	Local pain, stinging, tingling at site of inj; anorexia, nausea, vomiting, abdominal pain, bloating, flatulence, loose stools, steatorrhoea; biliary tract abnormalities. Hypoglycaemia and hyperglycaemia, hypothyroidism, cardiac conduction abnormalities, pancreatitis.
Drug Interactions	Dosage adjustment of concurrent therapy may be necessary with calcium channel blockers, oral hypoglycaemics, β-blockers, diuretics. May increase concentration of bromocriptine. Potentially Fatal: Requirements of insulin may be reduced requiring careful blood-glucose monitoring. Reduction in ciclosporin bioavailability and efficacy.
Food Interaction	Schedule injections between meals to decrease adverse GI effects.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intramuscular: Store at 2-8°C. Stable at room temperature for up to 14 days. Intravenous: Store at 2-8°C. Stable at room temperature for up to 14 days. Subcutaneous: Store at 2-8°C. Stable at room temperature for up to 14 days.

	up to 14 days. Intravenous: Store at 2-8°C. Stable at room temperature for up to 14 days. Subcutaneous: Store at 2-8°C. Stable at room temperature for up to 14 days.
Mechanism of Action	Octreotide is a synthetic analogue of somatostatin which acts by suppressing basal and stimulated secretion of growth hormone (GH). It also suppresses LH response to gonadotrophin-releasing hormone and reduces the secretion of gastrin, vasoactive intestinal peptide (VIP), insulin, glucagon, secretin, motilin and pancreatic polypeptide. Absorption: Rapidly absorbed (SC); peak plasma concentrations after 25-30 min. Distribution: 65% plasma protein bound. Excretion: Via urine (as unchanged); 1.5 hr (elimination half-life), prolonged in elderly.
CIMS Class	Trophic Hormones & Related Synthetic Drugs
ATC Classification	H01CB02 - octreotide; Belongs to the class of antigrowth hormone. Used in hypothalamic hormone preparations.

Indication & Dosage

Oral

Leprosy

Adult: As part of a multidrug therapy: 400 mg daily or intermittently, depending on regimen.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr.

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Oral

Uncomplicated gonorrhoea

Adult: 400 mg as a single dose.

Oral

Community-acquired pneumonia

Adult: 400 mg as a single dose.

Oral

Community-acquired pneumonia

Adult: 400 mg bid for 10 days.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Oral

Uncomplicated skin infections

Adult: 400 mg bid for 10 days.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Oral

Acute bacterial exacerbation of chronic bronchitis

Adult: 400 mg bid for 10 days.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Oral

Non-gonococcal cervicitis/urethritis due to *Chlamydia trachomatis*

Adult: 200-300 mg bid for 7 days.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr.

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Oral

Mixed infection of the urethra and cervix due to *C. trachomatis* and *Neisseria gonorrhoeae*

Adult: 200-300 mg bid for 7 days.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr.

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Oral

Pelvic inflammatory disease

Adult: 400 mg bid for 14 days.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only

Renal impairment: Initial dose as normal then reduce.

20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr.

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Oral

Uncomplicated cystitis

Adult: 200 mg bid for 3 days if due to *E. Coli* or *Klebsiella pneumoniae*; 7 days if due to other susceptible organisms.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr.

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Oral

Complicated urinary tract infections

Adult: 200 mg bid for 10 days.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr.

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Oral

Chronic bacterial prostatitis

Adult: 300 mg bid for 6 wk.

Oral

Chronic bacterial prostatitis

Adult: 300 mg bid for 6 wk.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr.

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Oral

Traveller's diarrhoea

Adult: 300 mg bid for 1-3 days.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr.

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Oral

Postexposure prophylaxis after suspected or confirmed exposure to inhalational anthrax

Adult: 400 mg bid for =60 days.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr.

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Oral

Legionnaire's disease

Adult: 400 mg bid for 2-3 wk.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr
<20	100 mg every 24 hr.

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Oral

Typhoid fever

Adult: 200-400 mg bid for 7-14 days.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr.

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Intravenous

Complicated urinary tract infections

Adult: 200 mg daily by IV infusion over at least 30 min. Max: 400 mg bid infused over at least 1 hr.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr.

<20	100 mg every 24 hr.
-----	---------------------

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Intravenous

Lower respiratory tract infections

Adult: 200 mg bid by IV infusion over at least 30 min. Max: 400 mg bid infused over at least 1 hr.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr.

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Intravenous

Septicaemia

Adult: 200 mg bid by IV infusion over at least 30 min. Max: 400 mg bid infused over at least 1 hr.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr.

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Intravenous

Skin and soft tissue infections

Adult: 400 mg bid infused over at least 1 hr.

Renal impairment: Initial dose as normal then reduce.

Skin and soft tissue infections

Adult: 400 mg bid infused over at least 1 hr.

Renal impairment: Initial dose as normal then reduce.

CrCl (ml/min)	Dosage Recommendation
20-50	Reduce dose by half or give usual dose only every 24 hr.
<20	100 mg every 24 hr

Hepatic impairment: Clearance is reduced in severe hepatic impairment, lower doses should be used. Max: 400 mg daily.

Otic/Aural

Otic infections

Adult: Apply 10 drops of 0.3% solution in the affected ear once daily for 7 days. Lie with the affected ear upwards for 5 min to facilitate penetration into the ear canal.

Child: 6 mth-13 yr: 5 drops of 0.3% solution in the affected ear once daily for 7 days. >13 yr: 10 drops of 0.3% solution in the affected ear once daily for 7 days. Lie with the affected ear upwards for 5 min to facilitate penetration into the ear canal.

Ophthalmic

Bacterial conjunctivitis

Adult: As 0.3% ophth solution: 1-2 drops in the affected eye instilled every 2-4 hr for the first 2 days then 4 times daily for the next 5 days of treatment.

Child: >1 yr: 1-2 drops in the affected eye instilled every 2-4 hr for the first 2 days then 4 times daily for the next 5 days of treatment.

Ophthalmic

Bacterial corneal ulcer

Adult: As 0.3% ophth solution: Days 1-2: Instill 1-2 drops into the affected eye every 30 min while awake. Awaken approximately 4 and 6 hr after retiring and instill 1-2 drops.

	Bacterial corneal ulcer: Adult: As 0.3% ophth solution: Days 1-2: Instill 1-2 drops into the affected eye every 30 min while awake. Awaken approximately 4 and 6 hr after retiring and instill 1-2 drops. Days 3-7 (or 9 if necessary): Instill 1-2 drops hrly while awake. Thereafter: Instill 1-2 drops 4 times daily until condition fully resolved. Child: >1 yr: Days 1-2: Instill 1-2 drops into the affected eye every 30 min while awake. Awaken approximately 4 and 6 hr after retiring and instill 1-2 drops. Days 3-7 (or 9 if necessary): Instill 1-2 drops hrly while awake. Thereafter: Instill 1-2 drops 4 times daily until condition fully resolved.
Administration	Should be taken on an empty stomach. (Take on an empty stomach 1 hr before or 2 hr after meals. Do not take w/dairy products.)
Overdosage	Empty stomach, ensure adequate hydration is maintained and observe patient. Treat symptomatically, ofloxacin is not removed efficiently by haemodialysis or peritoneal dialysis.
Contraindications	Hypersensitivity to quinolones; pregnancy and lactation; prolongation of the QT interval; uncorrected hypokalaemia.
Special Precautions	Epilepsy or other predisposition to seizures; known or suspected CNS disorders; renal, hepatic impairment; myasthenia gravis; superinfection; children <18 yr; exposure to strong sunlight and UV light; ensure adequate hydration; elderly.
Adverse Drug Reactions	Nausea, vomiting, abdominal pain, diarrhoea; headache, dizziness, insomnia, hallucinations; leucopenia and eosinophilia; vaginitis; dysgeusia; tendon damage and rupture; anorexia; tremor; photosensitivity; hypersensitivity reactions. Discontinue if psychiatric, neurological or hypersensitivity reactions occur. Potentially Fatal: Anaphylaxis; rarely seizures.

	reactions. Discontinue if psychiatric, neurological or hypersensitivity reactions occur. Potentially Fatal: Anaphylaxis; rarely seizures.
Drug Interactions	Probenecid decreases elimination. Antacids may reduce ofloxacin absorption, avoid for 2 hr either side of administration. Cimetidine may increase ofloxacin concentrations. Monitor blood glucose in patients on antidiabetic medication. Potentially Fatal: Corticosteroids may increase risk of tendon rupture. Increases effects of oral anticoagulants, ciclosporin, theophylline. Increased risk of seizures with NSAIDs. Avoid in patients taking QT prolonging medication (e.g. class Ia or III antiarrhythmics, astemizole, terfenadine, cisapride, erythromycin, pentamidine, phenothiazines and some TCA).
Food Interaction	Absorption delayed in the presence of food.
Lab Interference	May produce false-positive results for opiates in commercially available urine immunoassay kits.
Pregnancy Category (US FDA)	Caution esp in 1st trimester. Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Ophthalmic: Store at 15-25°C. Oral: Store at 20-25°C. Otic/Aural: Store at 15-25°C.
Mechanism of Action	Ofloxacin is a fluoroquinolone which inhibits bacterial topoisomerase IV and DNA gyrase enzymes required for DNA replication, transcription, repair and recombination. It has activity against a wide range of gram-negative and gram-positive microorganisms.

	DNA replication, transcription, repair and recombination. It has activity against a wide range of gram-negative and gram-positive microorganisms. Absorption: Rapidly and well absorbed from the GI tract (oral); peak plasma concentrations after 0.5-2 hr. Rate, but not extent, delayed by the presence of food. Distribution: Widely distributed into body fluids, CSF, tissues, bile (high concentrations); crosses the placenta and enters breast milk. Protein-binding: 20-32%. Metabolism: <10% of a single dose is metabolised. Converted to desmethyl and N-oxide metabolites; desmethylofloxacin has moderate antibacterial activity. Excretion: Via urine within 24-48 hr by tubular secretion and glomerular filtration (75-80% as unchanged, <5% as metabolites); via faeces (4-8%). Elimination is biphasic with half-lives of 4-5 hr and 20-25 hr; prolonged in renal impairment (15-60 hr).
CIMS Class	Quinolones / Eye Anti-infectives & Antiseptics / Ear Anti-infectives & Antiseptics
ATC Classification	J01MA01 - ofloxacin; Belongs to the class of quinolones, fluoroquinolone. Used in the treatment of systemic infections. S01AX11 - ofloxacin; Belongs to the class of other anti-infectives. Used in the treatment of eye infections.

olanzapine

CIMS Class : (Antipsychotics)
olanzapine

P - Caution when used during pregnancy
L - Contraindicated in lactation

related olanzapine information

Indication & Dosage

Oral

Schizophrenia

Adult: Initially, 5-10 mg daily adjusted in steps of 5 mg, according to response. Usual range: 5-20 mg daily. Doses >10 mg should be given only after clinical reassessment. Max: 20 mg daily.

Renal impairment: Initiate at lower dose (5 mg) and increase cautiously.

Hepatic impairment: Initiate at lower dose (5 mg) and increase cautiously.

Oral

Acute mixed or manic episodes in bipolar disorder

Adult: Initially, 10 or 15 mg daily as monotherapy or 10 mg daily when used as part of combination therapy. Adjust dose in steps of 5 mg; usual range: 5-20 mg daily. For prevention of recurrence: Start with 10 mg daily.

Renal impairment: Initiate at lower dose (5 mg) and increase cautiously

Hepatic impairment: Initiate at lower dose (5 mg) and

	or recurrence. Start with 10 mg daily. Renal impairment: Initiate at lower dose (5 mg) and increase cautiously Hepatic impairment: Initiate at lower dose (5 mg) and increase cautiously <i>Intramuscular</i> Rapid control of agitation and disturbed behaviour in schizophrenia or mania Adult: Initially, 5-10 mg followed by 5-10 mg as required 2 hr later. Max: 3 inj per 24-hr period; max (including oral olanzapine): 20 mg/day. May give injections for up to 3 days but should transfer to oral therapy as soon as possible. Hepatic impairment: Dose adjustments may be needed.
Administration	May be taken with or without food.
Overdosage	Symptoms: Tachycardia, agitation/aggressiveness, dysarthria, extrapyramidal symptoms, sedation/coma. Induction of emesis is not recommended, gastric lavage and admin of activated charcoal may be effective. Monitor closely and treat symptomatically.
Contraindications	Angle-closure glaucoma; lactation. IM: History of CVS disease, heart surgery.
Special Precautions	Impaired renal, hepatic, cardiovascular function; prostatic hypertrophy; paralytic ileus; DM; parkinsonism; pregnancy. History of blood dyscrasias, myelosuppression, seizures; dementia; dyslipidaemia. IM: Hypotension, bradyarrhythmia, hypoventilation; monitor BP carefully. Caution when used in adolescents due to increased risk of weight gain and hyperlipidaemia. Efficacy and safety have not been established in paediatric patients <13 yr.
Adverse Drug Reactions	Postural hypotension; constipation; dizziness; wt gain; agitation; insomnia; akathisia; tremor; personality disorders; oedema; somnolence; increased appetite; antimuscarinic

	Postural hypotension; constipation; dizziness; wt gain; agitation; insomnia; akathisia; tremor; personality disorders; oedema; somnolence; increased appetite; antimuscarinic effects; speech difficulty; exacerbation of Parkinson's disease; hallucinations; asthenia; increased body temperature; bradycardia; hyperprolactinaemia; QT prolongation (uncommon); asymptomatic elevations of hepatic transaminases. Potentially Fatal: Exacerbation of preexisting diabetes sometimes leading to ketoacidosis. Neuroleptic malignant syndrome.
Drug Interactions	Olanzapine may antagonise the effects of levodopa and dopamine agonists. Drugs that induce CYP1A2 or glucuronyl transferase enzymes e.g. omeprazole and rifampicin, may increase olanzapine clearance. Inhibitors of CYP1A2 may potentially inhibit olanzapine elimination. Carbamazepine may increase the clearance of olanzapine. Concomitant admin of activated charcoal reduced the oral bioavailability of olanzapine by 50-60%. Caution should be taken when olanzapine is administered with centrally acting drugs and alcohol.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intramuscular: Store at 15-30°C. Oral: Store at 15-30°C.
Mechanism of Action	Olanzapine is an atypical antipsychotic with affinity for serotonin 5-HT_{2A/2C}, dopamine, muscarinic M₁-M₅, histamine H₁ and adrenergic α₁ receptors. Absorption: Well absorbed from the GI tract (oral); peak plasma concentrations after 5-8 hr (oral) or 15-45 min (IM).

	serotonin 5-HT _{1A/2A/2C} , dopamine, muscarinic M ₁ -M ₅ , histamine H ₁ and adrenergic α ₁ receptors. Absorption: Well absorbed from the GI tract (oral); peak plasma concentrations after 5-8 hr (oral) or 15-45 min (IM). Distribution: Protein-binding: 93%. Metabolism: Extensively hepatic by direct glucuronidation and oxidation. Excretion: Urine (as metabolites), faeces; 30-38 hr (elimination half-life).
CIMS Class	Antipsychotics
ATC Classification	N05AH03 - olanzapine; Belongs to the class of diazepines, oxazepines and thiazepines antipsychotics. Used in the management of psychosis.

olmesartan medoxomil

CIMS Class : (Angiotensin II Antagonists)
olmesartan medoxomil

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related olmesartan medoxomil information

Indication & Dosage	<i>Oral</i> Hypertension Adult: 20 mg once daily, dose may be increased to 40 mg once daily after 2 weeks if needed. Reduce dose in patients with lower intravascular volume. Elderly: Initiate at 5-10 mg daily.
Administration	May be taken with or without food.
Overdosage	Symptoms: Hypotension and tachycardia; bradycardia may occur if there is vagal stimulation. Treatment: Symptomatic and supportive therapy.
Contraindications	Pregnancy.
Special Precautions	Renal or hepatic impariment or heart disease. Primary aldosterism, Volume depletion, hyperkalemia. Pediatrics, elderly and lactation.
Adverse Drug Reactions	Dizziness, headache, hyperkalemia, abdominal pain, dyspepsia, diarrhoea, angioedema, chest pain, respiratory tract disorders, arthritis, back pain, fatigue, flu-like symptoms,

	Dizziness, headache, hyperkalemia, abdominal pain, dyspepsia, diarrhoea, angioedema, chest pain, respiratory tract disorders, arthritis, back pain, fatigue, flu-like symptoms, peripheral edema, hyperglycemia, hypertriglyceridemia, haematuria, UTI and rhabdomyolysis. Potentially Fatal: Acute renal failure.
Drug Interactions	Concurrent use with ACE inhibitors, ciclosporin, potassium-sparing diuretics, potassium salts and drospirenone increase the risk of hyperkalemia as these drugs tend to cause hyperkalemia. Use with NSAIDs decrease glomerular filtration and may cause renal impairment. Serum potassium levels may be affected when used with thiazide or loop diuretics. Increased serum concentration of lithium as aldosterone secretion is inhibited resulting in lithium retention. Ephedra, kola and ginseng may antagonise the antihypertensive effect. The antihypertensive effect may be potentiated by black cohosh, quinine and periwinkle.
Lab Interference	Increased creatine phosphokinase.
Storage	Oral: Store at 20-25°C.
Mechanism of Action	Olmesartan medoxomil is an ester prodrug for olmesartan. It is hydrolysed to olmesartan during absorption from the GI tract. Olmesartan is a selective and competitive angiotensin II receptor antagonist and hence it blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II. Absorption: Bioavailability: 26% Distribution: 17 L; protein binding: 99% Metabolism: Olmesartan medoxomil is hydrolysed in the GI tract to olmesartan. Excretion: Excreted unchanged via faeces (50-65%) and urine (35-50%); terminal elimination half-life: 13 hr

	tract to olmesartan. Excretion: Excreted unchanged via faeces (50-65%) and urine (35-50%); terminal elimination half-life: 13 hr
CIMS Class	Angiotensin II Antagonists
ATC Classification	C09CA08 - olmesartan medoxomil;

olopatadine

CIMS Class : (Ophthalmic Decongestants, Anesthetics, Anti-inflammatories) , (Nasal Decongestants & Other Nasal Preparations)
olopatadine

P - Caution when used during pregnancy
L - Caution when used during lactation

related olopatadine information

Indication & Dosage

Nasal

Allergic rhinitis

Adult: =12 yr: As 0.6% nasal spray: Instill 2 sprays into each nostril twice daily.

Ophthalmic

Allergic conjunctivitis

Adult: As 0.1% solution: 1 or 2 drops in the affected eye(s) bid at an interval of 6-8 hr. Alternatively, as a 0.2% solution: 1 drop in the affected eye(s) once daily.

Child: =3 yr: As 0.1% solution: 1 or 2 drops in the affected eye(s) bid at an interval of 6-8 hr. Alternatively, as a 0.2% solution: 1 drop in the affected eye(s) once daily.

Contraindications

Hypersensitivity. Ophthalmic: Children <3 yr. Nasal: Children <12 yr.

Special Precautions

Pregnancy, lactation. Ophthalmic: Remove contact lenses prior to eye admin. Reinsert soft contact lenses 10 min after admin.

Adverse Drug Reactions	Ophthalmic: Headache; asthenia; cold syndrome; pharyngitis; rhinitis; sinusitis; dysgeusia; ocular burning or stinging; dry eye; foreign body sensation; hyperaemia; keratitis; lid oedema; ocular pruritus; blurred vision. Nasal: Bitter taste, nasal ulceration, epistaxis, drowsiness.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Nasal: Store at 4 to 25 °C. Ophthalmic: Store at 2-25°C.
Mechanism of Action	Olopatadine is a relatively selective histamine H ₁ -receptor antagonist and inhibits the release of histamine from mast cells. It shares many of the pharmacologic effects of mast cell stabilisers. Absorption: Ophthalmic: Little systemic absorption. Distribution: Protein-binding: 55% Metabolism: Not extensively metabolised. Excretion: Via urine: 60-70 %, via faeces: 17 %
CIMS Class	Ophthalmic Decongestants, Anesthetics, Anti-inflammatories / Nasal Decongestants & Other Nasal Preparations
ATC Classification	R01AC08 - olopatadine; S01GX09 - olopatadine; Belongs to the class of other agent used as ophthalmologic antiallergics.

omeprazole

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants)
omeprazole

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related omeprazole information

Indication & Dosage

Oral

Peptic ulcer

Adult: 20 mg daily as a single dose or 40 mg daily in severe cases. Treatment duration: Duodenal ulcers: 4 wk; gastric ulcers: 8 wk. Maintenance: 10-20 mg once daily.

Hepatic impairment: Dose reduction may be necessary.

Oral

NSAID-associated ulceration

Adult: 20 mg daily. Same dose may also be used for prophylaxis of ulceration in patients who require continued NSAID therapy.

Hepatic impairment: Dose reduction may be necessary.

Oral

H.pylori infection

Adult: Dose varies with regimen. As triple therapy: 20 mg bid or 40 mg once daily; requires combination therapy with antibiotics. Therapy is given for 1 wk. Omeprazole may be continued for

Adult: Dose varies with regimen. As triple therapy: 20 mg bid or 40 mg once daily; requires combination therapy with antibiotics. Therapy is given for 1 wk. Omeprazole may be continued for another 4-8 wk on its own.

Hepatic impairment: Dose reduction may be necessary.

Oral

Gastro-oesophageal reflux disease

Adult: 20 mg once daily for 4 wk, may continue for another 4-8 wk if necessary. Maintenance: 10 mg daily.

Child: Neonate, 1 mth-2 yr: 700 mcg/kg/day, may increase up to 3 mg/kg/day, or 20 mg daily. >2 yr: <20 kg: 10 mg once daily; ≥20 kg: 20 mg daily. Doses may be doubled if necessary.

Hepatic impairment: Dose reduction may be necessary.

Oral

Zollinger-Ellison syndrome

Adult: Initially, 60 mg once daily, adjust according to response. Maintenance: 20-120 mg daily. Doses >80 mg are administered usually in 2 divided doses.

Hepatic impairment: Dose reduction may be necessary.

Oral

Prophylaxis of acid aspiration during general anaesthesia

Adult: Initially, 40 mg given the evening before surgery and another 40 mg 2-6 hr before the procedure.

Hepatic impairment: Dose reduction may be necessary.

Oral

Acid-related dyspepsia

Adult: 10 or 20 mg daily for 2-4 wk.

Hepatic impairment: Dose reduction may be necessary.

Oral

Erosive oesophagitis

Adult: 20 mg/day for 4-8 wk. Maintenance of healing: 20 mg/day for up to 12 mth of total therapy (including treatment period).

Erosive oesophagitis

Adult: 20 mg/day for 4-8 wk. Maintenance of healing: 20 mg/day for up to 12 mth of total therapy (including treatment period).

Hepatic impairment: Dose reduction may be necessary.

Intravenous

Gastric and duodenal ulcers

Adult: By infusion over 20-30 minutes or slow inj over 5 minutes: 40 mg once daily until oral admin is possible.

Hepatic impairment: Dose adjustment is required; a daily dose of 10-20 mg may be sufficient.

Intravenous

Reflux oesophagitis

Adult: By infusion over 20-30 minutes or slow inj over 5 minutes: 40 mg once daily until oral admin is possible.

Hepatic impairment: Dose adjustment is required; a daily dose of 10-20 mg may be sufficient.

Intravenous

Prophylaxis of acid aspiration during general anaesthesia

Adult: 40 mg, to be given and completed 1 hr before the surgery. May be given via inj over 5 minutes or infusion over 20-30 minutes.

Hepatic impairment: Dose adjustment is required; a daily dose of 10-20 mg may be sufficient.

Reconstitution: The solution for IV inj is obtained by adding to the vial 10 ml of the solvent provided. (No other solvent should be used). The solution should be given over a period of at least 2.5 min at a max rate of 4 ml/minute; use within 4 hr of reconstitution. The solution for IV infusion is obtained by dissolving 1 vial in 100 ml saline for infusion or 100 ml 5% dextrose for infusion. The solution should be used within 12 hr when dissolved in saline and within 6 hr when dissolved in 5%

	dissolving 1 vial in 100 ml saline for infusion or 100 ml 5% dextrose for infusion. The solution should be used within 12 hr when dissolved in saline and within 6 hr when dissolved in 5% dextrose. After reconstitution, start the infusion immediately. The constituted solution should not be mixed or co-administered in the same infusion set with any other drug. Infusion should be given over a period of = 20-30 minutes.
Administration	MUPS tab: May be taken with or without food. Powd for oral susp: Should be taken on an empty stomach. (Take on an empty stomach at least 1 hour before a meal.) Cap: Should be taken with food. (Take immediately before a meal.)
Overdosage	Confusion, drowsiness, blurred vision, tachycardia, nausea, flushing, diaphoresis, headache, and dry mouth. Treatment is supportive; not dialysable.
Special Precautions	Exclude malignancy, prolonged use, hepatic impairment. Pregnancy, lactation, children <1 yr. Elderly and Asians (increased bioavailability).
Adverse Drug Reactions	Diarrhoea, nausea, fatigue, constipation, vomiting, flatulence, acid regurgitation, taste perversion, arthralgia, myalgia, urticaria, dry mouth, dizziness, headache, paraesthesia, abdominal pain, skin rashes, weakness, back pain, upper respiratory infection, cough. Potentially Fatal: Anaphylaxis.
Drug Interactions	Decreases absorption of itraconazole, ketoconazole, dasatinib, oral iron salts. Decreases levels of nelfinavir. Increases levels of benzodiazepines (e.g. diazepam, midazolam, triazolam), HMG-CoA reductase inhibitor, CYP2C19 substrates (e.g. citalopram, diazepam, methsuximide, phenytoin, propranolol, and sertraline), and CYP2C9 substrates (e.g. bosentan, dapsone, fluoxetine, glimepiride, glipizide, losartan,

	(e.g. citalopram, diazepam, methsuximide, phenytoin, propranolol, and sertraline), and CYP2C9 substrates (e.g. bosentan, dapsone, fluoxetine, glimepiride, glipizide, losartan, montelukast, nateglinide, paclitaxel, phenytoin, warfarin, and zafirlukast). Decreased levels/effects with CYP2C19 inducers (e.g. aminoglutethimide, carbamazepine, phenytoin, and rifampin). Decreases excretion of methotrexate. Enhances the adverse/toxic effect of cilostazol. May alter the concentrations/effects of clozapine. Avoid concurrent use with clopidogrel.
Food Interaction	Absorption may be delayed. St John's wort decreases omeprazole levels. Avoid ethanol (may cause gastric mucosal irritation).
Lab Interference	False negative results in the urea breath test.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 15-30 °C. Protect from light. Oral: Store at 15-30 °C. Protect from light.
Mechanism of Action	Omeprazole suppresses gastric acid secretion by specific inhibition of the enzyme system hydrogen/potassium adenosine triphosphatase (H^+/K^+ ATPase) present on the secretory surface of the gastric parietal cell. Onset: Antisecretory: approx 1 hr; peak effect:0.5-3.5 hr. Duration: 72 hr. Absorption: Rapid but variable (oral); dose-dependent. Bioavailability: Oral: approx 30-40%. Distribution: Protein-binding: 95%. Metabolism: Extensively hepatic; converted to hydroxyomeprazole and omeprazole sulfone.

	Distribution: Protein-binding: 95%. Metabolism: Extensively hepatic; converted to hydroxyomeprazole and omeprazole sulfone. Excretion: Via urine (77%) and bile. Elimination half-life: 0.5-3 hr.
CIMS Class	Antacids, Antireflux Agents & Antiulcerants
ATC Classification	A02BC01 - omeprazole; Belongs to the class of proton pump inhibitors. Used in the treatment of peptic ulcer and gastro-oesophageal reflux disease (GERD).

omeprazole + domperidone

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants)
omeprazole + domperidone

P - Contraindicated in pregnancy

related omeprazole + domperidone information

Indication & Dosage	<i>Oral</i> Gastro-oesophageal reflux disease, Dyspepsia Adult: 1 cap bid or as directed by the physician.
Contraindications	Pregnancy. Domperidone is contraindicated in conditions associated with rise in prolactin level. Omeprazole is contraindicated in hypersensitive patients.
Special Precautions	Domperidone can cause a rise in serum prolactin level resulting in galactorrhoea in females and less frequently gynaecomastia in males. Hypertensive crisis may occur in patients with phaeochromocytoma. Renal impairment or those at risk of fluid retention. Hepatic impairment; elderly. Exclude the possibility of malignancy if gastric ulcer is suspected, before initiating treatment with omeprazole, it may mask symptoms and delay diagnosis. Monitor patients on warfarin or phenytoin therapy, reduce dose if necessary.
Adverse Drug Reactions	Domperidone: Dry mouth, transient skin rash, itching, headache, diarrhoea and rarely nervousness. Omeprazole: Anaemia, eosinopaenia, urinary tract infection, skin rash, urticaria and pruritus, diarrhoea, headache, constipation,

	headache, diarrhoea and rarely nervousness. Omeprazole: Anaemia, eosinopaenia, urinary tract infection, skin rash, urticaria and pruritus, diarrhoea, headache, constipation, nausea, vomiting, flatulence and abdominal pain, dizziness and lightheadedness, somnolence, insomnia and vertigo, reversible confusion, agitation, depression and hallucinations, arthritic and myalgic symptoms.
Drug Interactions	Anticholinergics may antagonize beneficial effects of domperidone in reflux oesophagitis and dyspepsia. Decreased bioavailability of domperidone after prior admin of cimetidine or Na bicarbonate. Delayed elimination of diazepam, phenytoin and warfarin with omeprazole.
Mechanism of Action	Domperidone is a peripheral dopamine D₂-receptor antagonist, which regulates the motility of gastric and small intestinal smooth muscle. It increases the duration of antral and duodenal contractions and also LES resting pressure, thus stimulating gastric emptying and is also effective in relief of symptoms of reflux esophagitis. Antiemetic activity is due to the blockade of dopamine receptors in the chemoreceptor trigger zone. Omeprazole inhibits the secretion of gastric acid by irreversibly blocking the enzyme system of H⁺/K⁺ATPase of the gastric parietal cell. It is activated at an acidic pH to a sulphenamide derivative that binds irreversibly to H⁺/K⁺ ATPase, an enzyme system found at the secretory surface of parietal cells. It thereby inhibits the final transport of hydrogen ions (via exchange with K ions) into the gastric lumen.
CIMS Class	Antacids, Antireflux Agents & Antiulcerants
ATC Classification	A02BC01 - omeprazole; Belongs to the class of proton pump inhibitors. Used in the treatment of peptic ulcer and gastro-oesophageal reflux disease (GERD).

A02BC01 - omeprazole; Belongs to the class of proton pump inhibitors. Used in the treatment of peptic ulcer and gastro-oesophageal reflux disease (GERD).

A03FA03 - domperidone; Belongs to the class of propulsives. Used in the treatment of functional gastrointestinal disorders.

ondansetron

CIMS Class : (Supportive Care Therapy) , (Antiemetics)
ondansetron

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related ondansetron information

Indication & Dosage

Oral

Prophylaxis of postoperative nausea and vomiting

Adult: 16 mg taken 1 hr before anaesthesia; or 8 mg taken 1 hr before anaesthesia followed by 2 more doses of 8 mg at 8-hr intervals.

Hepatic impairment: Moderate or severe hepatic impairment: Max: 8 mg daily.

Oral

Nausea and vomiting associated with cancer chemotherapy

Adult: 24 mg, as a single dose, 30 minutes before the start of single-day chemotherapy.

Child: 4-11 yr: 4 mg 30 minutes before chemotherapy; repeat dose at 4 and 8 hr after initial dose, then 4 mg every 8 hr for 1-2 days after completion of chemotherapy.

Hepatic impairment: Moderate or severe hepatic impairment: Max: 8 mg daily.

Oral

Hepatic impairment: Moderate or severe hepatic impairment: Max: 8 mg daily.

Oral

Nausea and vomiting associated with cancer chemotherapy or radiotherapy

Adult: For less emetogenic chemotherapy and/or radiotherapy: 8 mg 2 hr before treatment followed by 8 mg 8-12 hr later.

Hepatic impairment: Moderate or severe hepatic impairment: Max: 8 mg daily.

Oral

Prevent delayed emesis following chemotherapy

Adult: 8 mg bid, for up to 5 days after the end of a course of chemotherapy.

Hepatic impairment: Moderate or severe hepatic impairment: Max: 8 mg daily.

Parenteral

Nausea and vomiting associated with cancer chemotherapy

Adult: For highly emetogenic chemotherapy: 8 mg as a single dose, given via IM or slow IV inj immediately before treatment; or 8 mg IM or slow IV inj given immediately before treatment followed by either continuous IV infusion of 1 mg/hr for up to 24 hr or by a further 2 doses of 8 mg 2-4 hr apart; or 32 mg as a single dose via IV infusion over =15 minutes immediately before treatment; or 150 mcg/kg via IV infusion over 15 minutes (beginning 30 minutes before chemotherapy) and repeated 4 and 8 hr after the 1st dose. Anti-emetic efficacy can be enhanced by giving 20 mg dexamethasone sodium phosphate via IV admin before chemotherapy.

Child: =6 mth: 150 mcg/kg via IV infusion 30 minutes before

dexamethasone sodium phosphate via IV admin before chemotherapy.

Child: =6 mth: 150 mcg/kg via IV infusion 30 minutes before the start of chemotherapy, repeat dose at 4 and 8 hr after the first dose; or 0.45 mg/kg/day as a single dose.

Hepatic impairment: Moderate or severe hepatic impairment: Max: 8 mg daily.

Parenteral

Prophylaxis of postoperative nausea and vomiting

Adult: 4 mg as a single dose via IM or slow IV inj at induction of anaesthesia.

Child: =1 mth: =40 kg: 100 mcg/kg as a single dose; >40 kg: 4 mg as a single dose.

Max Dosage: Child: 4 mg.

Hepatic impairment: Moderate or severe hepatic impairment: Max: 8 mg daily.

Parenteral

Postoperative nausea and vomiting

Adult: 4 mg IM or slow IV inj as a single dose.

Child: =1 mth: 100 mcg/kg slow IV injection, up to a maximum of 4 mg.

Hepatic impairment: Moderate or severe hepatic impairment: Max: 8 mg daily.

Rectal

Nausea and vomiting associated with cancer chemotherapy

Adult: As suppository: 16 mg given 1-2 hr before treatment.

Hepatic impairment: Moderate or severe hepatic impairment: Max: 8 mg daily.

Rectal

Prevent delayed emesis following chemotherapy

Adult: As suppository: 16 mg once daily, for up to 5 days after the end of a course of chemotherapy.

	Prevent delayed emesis following chemotherapy Adult: As suppository: 16 mg once daily, for up to 5 days after the end of a course of chemotherapy. Hepatic impairment: Moderate or severe hepatic impairment: Max: 8 mg daily. Reconstitution: Prior to IV infusion, dilute in 50 ml D5W or normal saline. Incompatibility: Y-site incompatibility: Acyclovir, allopurinol, aminophylline, furosemide, ganciclovir, lorazepam, amphotericin B, amphotericin B cholesteryl sulfate complex, ampicillin, ampicillin/sulbactam, piperacillin, sargramostim, sodium bicarbonate, amsacrine, cefepime, cefoperazone, methylprednisolone sodium succinate.
Administration	May be taken with or without food.
Overdosage	Sudden transient blindness, severe constipation, hypotension, and vasovagal episode with transient secondary heart block. Treatment is supportive.
Contraindications	Use with apomorphine (profound hypotension).
Special Precautions	May cause QT prolongation; caution when used in cardiac diseases, patients who are on medications that can prolong QT or patients with electrolyte abnormalities. Severe hepatic impairment. May mask progressive ileus and/or gastric distension. Pregnancy, lactation.
Adverse Drug Reactions	Headache, malaise/fatigue, constipation; drowsiness, fever, dizziness, anxiety, cold sensation; pruritus, rash; diarrhoea; gynaecological disorder, urinary retention; elevated transaminase; local inj site reaction (pain, redness, burning); paresthesia; hypoxia. Rarely: Anaphylaxis, angina, bronchospasm, ECG changes, extrapyramidal symptoms, grand mal seizure, hypokalaemia, tachycardia, vascular

	paresthesia; hypoxia. Rarely: Anaphylaxis, angina, bronchospasm, ECG changes, extrapyramidal symptoms, grand mal seizure, hypokalaemia, tachycardia, vascular occlusive events.
Drug Interactions	Rifampicin and other CYP3A4 inducers reduce levels/effects of ondansetron. Potentially Fatal: Concurrent use may increase the hypotensive effect of apomorphine; avoid concurrent use.
Food Interaction	Extent of absorption increased with food. St John's wort may reduce serum levels of ondansetron.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Oral solution: Store at 15-30 °C. Protect from light. Tablet: Store at 2-30°C . Parenteral: Vial: Store at 2-30°C. Protect from light. Stable with D5W or normal saline for 48 hr at room temperature.
Mechanism of Action	Ondansetron antagonises 5-HT₃ receptor, blocking serotonin, both peripherally on vagal nerve terminals and centrally in the chemoreceptor trigger zone. Onset: Approx 30 minutes. Absorption: Peak plasma concentrations: Oral: 1.5 hr; rectal: 6 hr. Distribution: Extensively distributed. Protein-binding: 70-75%. Metabolism: Hepatic via multiple enzymatic pathways. Excretion: Via urine (44-60% as metabolites, 5-10% as unchanged), faeces (approx 25%). Terminal elimination half-life: Oral/parenteral: 3 hr; rectal: 6 hr; elderly/renal

	metabolism: Hepatic via multiple enzymatic pathways. Excretion: Via urine (44-60% as metabolites, 5-10% as unchanged), faeces (approx 25%). Terminal elimination half-life: Oral/parenteral: 3 hr; rectal: 6 hr; elderly/renal impairment: prolonged, approx 5 hr; severe hepatic impairment: 15-32 hr.
CIMS Class	Supportive Care Therapy / Antiemetics
ATC Classification	A04AA01 - ondansetron; Belongs to the class of serotonin (5HT3) antagonists. Used for the prevention of nausea and vomiting.

orlistat

CIMS Class : (Anti-obesity Agents)
orlistat

P - Caution when used during pregnancy
L - Contraindicated in lactation

related orlistat information

Indication & Dosage	<i>Oral</i> Obesity Adult: 120 mg tid with each main meal containing fat; omit dose if meal is occasionally missed or has no fat. Child: ≥12 yr: 120 mg tid with each main meal containing fat; omit dose if meal is occasionally missed or has no fat.
Administration	Should be taken with food. (Take immediately before or during or up to 1 hr after each main meal. If a meal is missed or contains no fat, the dose may be omitted.)
Contraindications	Chronic malabsorption syndrome. Cholestasis. Lactation.
Special Precautions	Distribute daily intake of fat over 3 main meals. Fat-soluble vitamins supplements may be required during long-term therapy. Discontinue use if 5% body wt loss is not achieved during the first 12 wk. History of hyperoxaluria or calcium oxalate nephrolithiasis. DM. Pregnancy.
Adverse Drug Reactions	Faecal urgency and incontinence, flatulence, fatty stools or discharge, increased defecation; headache, anxiety, fatigue, menstrual irregularities; abdominal pain/discomfort.

	Faecal urgency and incontinence, flatulence, fatty stools or discharge, increased defecation; headache, anxiety, fatigue, menstrual irregularities; abdominal pain/discomfort. Potentially Fatal: Anaphylaxis; angioedema.
Drug Interactions	May decrease absorption of oral fat-soluble vitamins, amiodarone, propafenone. May decrease plasma levels of ciclosporin. May alter the effects of warfarin (monitor INR). May elevate plasma levels of pravastatin.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-30°C (59-86°F).
Mechanism of Action	Orlistat is a reversible gastric and pancreatic lipase inhibitor. It exerts antiobesity effects by limiting the absorption of dietary fats through inhibition of triglyceride hydrolysis. It does not exert appetite suppressant effects. Onset: 24-48 hr. Duration: 48-72 hr. Absorption: Minimally absorbed (oral). Metabolism: Metabolised to inactive metabolites within the GI wall. Excretion: Mainly via faeces (83% as unchanged drug).
CIMS Class	Anti-obesity Agents
ATC Classification	A08AB01 - orlistat; Belongs to the class of peripherally acting antiobesity products. Used in the treatment of obesity.

ormeloxifene

CIMS Class : (Drugs Acting on the Uterus) , (Oral Contraceptives)
ormeloxifene

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related ormeloxifene information

Indication & Dosage	<i>Oral</i> Dysfunctional uterine bleeding Adult: 60 mg twice a wk for the 1st 12 wk and then 60 mg once a wk for up to next 12 wk. <i>Oral</i> Contraception Adult: Take 1 tablet (30 mg) twice a wk for the 1st 12 wk then 1 tablet (30 mg) once a wk from 13th wk onwards. Take 1st tablet on the 1st day of menstrual cycle. Follow dose irrespective of menstrual periods.
Contraindications	Polycystic ovarian disease, cervical hyperplasia, recent history of jaundice or hepatic impairment, severe allergic states, TB, renal impairment. Pregnancy and lactation.
Special Precautions	Women who desire to be pregnant should discontinue taking the drug.
Adverse Drug Reactions	Delayed menses.
Mechanism of Action	Ormeloxifene acts on oestrogen receptors. It has a weak estrogenic and potent antiestrogenic actions. It is expected

Mechanism of Action	Ormeloxifene acts on oestrogen receptors. It has a weak estrogenic and potent antiestrogenic actions. It is expected to exert a contraceptive effect and normalise the bleeding from uterine cavity by regularising the expression of oestrogen receptors on the endometrium. As a contraceptive, it prevents proliferation and decidualisation of the endometrium, enhances blastocyst formation and slightly increases embryo transport through the oviducts. Absorption: Well absorbed from the GI tract. Peak serum levels achieved in 4 hr. Distribution: Widely distributed in tissues. Little affinity to plasma proteins. Excretion: Terminal half-life: Approx 170 hr.
CIMS Class	Note that there are some more drugs Acting on the Uterus / Oral Contraceptives

ornidazole

CIMS Class : (Antiamoebics) , (Other Antibiotics)
ornidazole

P - Caution when used during pregnancy

L - Caution when used during lactation

related ornidazole information

Indication & Dosage	<i>Oral</i> Amoebiasis Adult: 0.5 g bid for 5-10 days. Child: 25 mg/kg as a single daily dose for 5-10 days. Renal impairment: Haemodialysis patients: Give a supplemental dose (50% of the usual dose) before dialysis. Hepatic impairment: Severe: Double the interval between doses.
	<i>Oral</i> Amoebic dysentery Adult: 1.5 g as a single daily dose for 3 days. Alternatively for patients >60 kg: 1 g bid for 3 days. Child: 40 mg/kg daily. Renal impairment: Haemodialysis patients: Give a supplemental dose (50% of the usual dose) before dialysis. Hepatic impairment: Severe: Double the interval between doses.
	<i>Oral</i> Giardiasis

Hepatic impairment: Severe: Double the interval between doses.

Oral

Giardiasis

Adult: 1-1.5 g as a single daily dose for 1-2 days.

Child: 30-40 mg/kg daily.

Renal impairment: Haemodialysis patients: Give a supplemental dose (50% of the usual dose) before dialysis.

Hepatic impairment: Severe: Double the interval between doses.

Oral

Trichomoniasis

Adult: 1.5 g as a single daily dose or 0.5 g bid for 5 days.

Treat sexual partners concomitantly.

Child: 25 mg/kg as a single dose.

Renal impairment: Haemodialysis patients: Give a supplemental dose (50% of the usual dose) before dialysis.

Hepatic impairment: Severe: Double the interval between doses.

Intravenous

Severe amoebic dysentery

Adult: Initially, 0.5-1 g infusion followed by 0.5 g every 12 hrs for 3-6 days.

Child: 20-30 mg/kg body wt daily.

Renal impairment: Haemodialysis patients: Give a supplemental dose (50% of the usual dose) before dialysis.

Hepatic impairment: Severe: Double the interval between doses.

Intravenous

Amoebic liver abscess

Adult: Initially, 0.5-1 g infusion followed by 0.5 g every 12 hrs for 3-6 days.

Child: 20-30 mg/kg body wt daily.

Adult: Initially, 0.5-1 g infusion followed by 0.5 g every 12 hrs for 3-6 days.

Child: 20-30 mg/kg body wt daily.

Renal impairment: Haemodialysis patients: Give a supplemental dose (50% of the usual dose) before dialysis.

Hepatic impairment: Severe: Double the interval between doses.

Intravenous

Anaerobic bacterial infections

Adult: Initially, 0.5-1 g followed by 1 g daily as a single dose or in 2 divided doses for 5-10 days. Doses to be given via infusion. Substitute with 500 mg every 12 hr orally as soon as possible.

Child: 10 mg/kg every 12 hr for 5-10 days.

Renal impairment: Haemodialysis patients: Give a supplemental dose (50% of the usual dose) before dialysis.

Hepatic impairment: Severe: Double the interval between doses.

Intravenous

Prophylaxis of postoperative anaerobic bacterial infections

Adult: 1 g by IV about 30 minutes before surgery.

Renal impairment: Haemodialysis patients: Give a supplemental dose (50% of the usual dose) before dialysis.

Hepatic impairment: Severe: Double the interval between doses.

Reconstitution: Dilute to a concentration of = 5 mg/ml.

Contraindications

Hypersensitivity to ornidazole or to other nitroimidazole derivatives.

Special Precautions

Renal and hepatic impairment. CNS diseases e.g. epilepsy or multiple sclerosis. May impair ability to drive or operate

	Renal and hepatic impairment. CNS diseases e.g. epilepsy or multiple sclerosis. May impair ability to drive or operate machinery. Pregnancy and lactation.
Adverse Drug Reactions	Somnolence, headache, nausea, vomiting, dizziness, tremor, rigidity, poor coordination, seizures, tiredness, vertigo, temporary loss of consciousness and signs of sensory or mixed peripheral neuropathy, taste disturbances, abnormal LFTs, skin reactions.
Drug Interactions	Potentiates effect of coumarin-type oral anticoagulants. Prolongs the muscle-relaxant effect of vecuronium bromide.
Mechanism of Action	Ornidazole is a 5-nitroimidazole derivative active against protozoa and anaerobic bacteria. It is converted to reduction products that interact with DNA to cause destruction of helical DNA structure and strand leading to a protein synthesis inhibition and cell death in susceptible organisms. Absorption: Readily absorbed (oral and intravaginal); peak plasma concentrations after 2 hr (oral), 12 hr (intravaginal). Distribution: Body tissues and fluids (wide), CSF. Protein-binding: <15%. Metabolism: Hepatic. Excretion: Via urine (as conjugates and metabolites), via faeces (small amounts); 12-14 hr (elimination half-life).
CIMS Class	Antiamoebics / Other Antibiotics
ATC Classification	G01AF06 - ornidazole; Belongs to the class of imidazole derivative anti-infectives. Used in the treatment of gynecological infections. J01XD03 - ornidazole; Belongs to the class of imidazole derivative antibacterials. Used in the treatment of systemic infections. P01AB03 - ornidazole; Belongs to the class of nitroimidazole derivatives antiprotozoals. Used in the treatment amoebiasis

derivative antibacterials. Used in the treatment of systemic infections.

P01AB03 - ornidazole; Belongs to the class of nitroimidazole derivatives antiprotozoals. Used in the treatment amoebiasis and other protozoal diseases.

orphenadrine

CIMS Class : (Antiparkinsonian Drugs) , (Muscle Relaxants)
orphenadrine

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related orphenadrine information

related orphenadrine information	
Indication & Dosage	<i>Oral</i> Muscle spasms Adult: As citrate: 100 mg bid orally. <i>Oral</i> Parkinsonism and drug-induced extrapyramidal syndrome Adult: As hydrochloride: Initially, 150 mg daily in divided doses; increase gradually by 50 mg every 2-3 days depending on response. Maintenance: 150-300 mg/day. Some patients may require up to 400 mg daily. Max Dosage: 400 mg/day. <i>Parenteral</i> Muscle spasms Adult: As citrate: 60 mg every 12 hr by IM or slow IV (over 5 min) inj.
Administration	May be taken with or without food. (May be taken w/ meals if GI upset occurs.)

Overdosage	Symptoms: Blurred vision, tachycardia, confusion, seizures, respiratory arrest, dysrhythmias. 2-3 g may be lethal in adults. Management: Physostigmine 1-2 mg IV slowly may be given to reverse anticholinergic effects. Otherwise, treatment is symptomatic and supportive.
Contraindications	Glaucoma, prostatic hypertrophy, GI obstruction, stenosing peptic ulcer, bladder neck obstruction, cardiospasm, myasthenia gravis.
Special Precautions	Elderly; pregnancy and lactation. May impair ability to drive or operate machinery. CHF, cardiac decompensation, coronary insufficiency, tachycardia, or cardiac arrhythmias. History of drug abuse or acute alcoholism.
Adverse Drug Reactions	Palpitation, tachycardia; agitation, drowsiness, dizziness, euphoria, hallucination, headache, mental confusion; pruritus, urticaria; constipation, gastric irritation, nausea, vomiting, xerostomia; urination hesitancy, urinary retention; aplastic anaemia (rare); tremor, weakness; blurred vision, increased intraocular pressure, nystagmus, pupil dilatation; nasal congestion; hypersensitivity. Potentially Fatal: Anaphylactic reactions (rare).
Drug Interactions	Reduced effect with acetylcholinesterase inhibitors e.g. donepezil, galantamine, rivastigmine, tacrine; may reduce effect of centrally-acting acetylcholinesterase inhibitors. Additive sedative effects with CNS depressants, alcohol. Pramlintide may increase anticholinergic effect on the GI tract. Increased risk of anticholinergic adverse effects with diphenhydramine, TCAs, phenothiazines.
Food Interaction	Additive CNS depression may occur with valerian, St John's wort, kava kava, gotu kola.

	Additive CNS depression may occur with valerian, St John's wort, kava kava, gotu kola.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C (59-86°F). Parenteral: Store at 15-30°C (59-86°F). Protect from light.
Mechanism of Action	Orphenadrine is a tertiary amine antimuscarinic which exerts antiparkinsonian action by inhibiting excess central cholinergic effects that occur due to dopamine deficiency. It reduces muscle spasms possibly by its atropine-like effect on the medulla or on cerebral motor centers. Absorption: Readily absorbed from the GI tract and after IM inj. Metabolism: Almost completely metabolised to at least 8 metabolites. Excretion: Mainly via urine (as metabolites and traces of unchanged drug). Half-life: 14 hr.
CIMS Class	Antiparkinsonian Drugs / Muscle Relaxants

oxaliplatin

CIMS Class : (Cytotoxic Chemotherapy)
oxaliplatin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related oxaliplatin information

Indication & Dosage

Intravenous

Advanced colorectal cancer

Adult: In combination with fluorouracil/leucovorin: 85 mg/m² every 2 wk until disease progression or unacceptable toxicity. Dose to be given by IV infusion over 2-6 hr, dissolved in 250-500 ml of glucose 5%, . After recovery from toxicity, reduce dose to 65 mg/m². Administer before fluoropyrimidines.

Renal impairment: Dose adjustment may be needed.

Intravenous

Adjuvant therapy in stage III colon cancer

Adult: In combination with fluorouracil/leucovorin: 85 mg/m² every 2 wk for 12 cycles. Dose to be given by IV infusion over 2-6 hr, dissolved in 250-500 ml of glucose 5%, every 2 wk; given for 12 cycles. After recovery from toxicity, reduce dose to 75 mg/m². Administer before fluoropyrimidines.

Renal impairment: Dose adjustment may be needed.

	Reduce dose to 75 mg/m². Administer before fluoropyrimidines. Renal impairment: Dose adjustment may be needed. Reconstitution: Reconstitute with 10 ml (for 50 mg vial) or 20 ml (for 100 mg vial) water for inj or 5% dextrose inj. Reconstituted solution must be further diluted with 250-500 ml of 5% dextrose inj before admin. Incompatibility: Admixture incompatibility: Alkaline medications or media.
Overdosage	Extensions of known adverse reaction (e.g. thrombocytopenia, myelosuppression, nausea, vomiting, neurotoxicity, respiratory symptoms). Treatment is supportive.
Contraindications	Pregnancy. Peripheral neuropathy with functional impairment. Severe renal impairment.
Special Precautions	Should be administered under the supervision of an experienced cancer chemotherapy physician. Use appropriate precautions for handling and disposal. Monitor neurological status and dose should be reduced if symptoms are prolonged or severe. Monitor blood counts during treatment and courses should not be repeated until blood counts have recovered. Caution in elderly, moderate degrees of renal impairment. Avoid using aluminum-containing needles or IV admin sets that may come into contact with oxaliplatin as aluminum has been reported to cause degradation of platinum compounds. Lactation.
Adverse Drug Reactions	Fatigue, fever, pain, headache, insomnia, nausea, diarrhea, vomiting, abdominal pain, constipation, anorexia, stomatitis, anemia, thrombocytopenia, leukopenia, aspartate and alanine transaminases increased, total bilirubin increased, peripheral neuropathy, back pain, dyspnoea, cough,

	anemia, thrombocytopenia, leukopenia, aspartate and alanine transaminases increased, total bilirubin increased, peripheral neuropathy, back pain, dyspnoea, cough, oedema, chest pain, peripheral oedema, flushing , thromboembolism, dizziness, rash, alopecia , hand-foot syndrome dehydration, hypokalaemia, dyspepsia, taste perversion, flatulence, mucositis, gastroesophageal reflux, dysphagia, dysuria, neutropenia, inj site reaction, rigors, arthralgia, abnormal lacrimation, serum creatinine increased, rhinitis, epistaxis, pharyngitis, pharyngolaryngeal dysesthesia, allergic reactions, hiccup. Potentially Fatal: Anaphylaxis, pulmonary fibrosis.
Drug Interactions	May decrease plasma levels of digoxin. May increase risk of toxicity with nephrotoxic drugs. When administered as sequential infusions, taxane derivatives (docetaxel, paclitaxel) should be administered before oxaliplatin to limit myelosuppression and enhance efficacy.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store intact vials at 15-30°C; do not freeze. Reconstituted solution: May store at 2-8°C for up to 24 hr. Diluted solutions: Stable up to 6 hr at 20-25°C or up to 24 hr under refrigeration at 2-8°C.
Mechanism of Action	Oxaliplatin, a platinum-containing complex similar to cisplatin, is an alkylating agent. After intracellular hydrolysis, the platinum compound binds to DNA forming cross-links which inhibit DNA replication and transcription, resulting in cell death. Distribution: V_d: 440 L; protein binding: >90% primarily

	which inhibit DNA replication and transcription, resulting in cell death. Distribution: V_d: 440 L; protein binding: >90% primarily albumin and gamma globulin (irreversible binding to platinum). Also binds irreversibly to red blood cells. Metabolism: Rapidly and extensively metabolised to active and inactive compounds. Excretion: Via urine (approx 54%); faeces (approx 2%).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01XA03 - oxaliplatin; Belongs to the class of platinum-containing antineoplastic agents. Used in the treatment of cancer.

related oxazepam information	
Indication & Dosage	<i>Oral</i> Alcohol withdrawal syndrome Adult: 15-30 mg 3 or 4 times daily. Elderly: or debilitated patients: Initially, 10 mg tid; increase up to 10-20 mg 3 or 4 times daily as necessary. <i>Oral</i> Anxiety Adult: 15-30 mg 3 or 4 times daily. Elderly: or debilitated patients: Initially, 10 mg tid; increase up to 10-20 mg 3 or 4 times daily as necessary. <i>Oral</i> Insomnia associated with anxiety Adult: 15-25 mg given 1 hr before bedtime. Up to 50 mg may be occasionally required.
Administration	May be taken with or without food.
Overdosage	Symptoms: Somnolence, confusion, coma, hypoactive reflexes, dyspnoea, hypotension, slurred speech, impaired

	Symptoms: Somnolence, confusion, coma, hypoactive reflexes, dyspnoea, hypotension, slurred speech, impaired coordination. Treatment: Supportive.
Contraindications	Not for the treatment of psychoses. Pregnancy and lactation.
Special Precautions	Cross-sensitivity with other benzodiazepines may occur. Hepatic and renal impairment. Respiratory disease. Debilitated patients, elderly, patients at risk of falls. Withdraw gradually. Porphyria; impaired gag reflex. History of drug abuse or acute alcoholism. May impair ability to drive or operate machinery. CV or cerebrovascular disease, intolerance to transient decreases in BP. Depression or if suicidal risk is present.
Adverse Drug Reactions	Syncope (rare), oedema; drowsiness, ataxia, dizziness, vertigo, memory impairment, headache, paradoxical reactions (excitement, stimulation of effect), lethargy, amnesia, euphoria; rash; decreased libido, menstrual irregularities; incontinence; leukopenia, blood dyscrasias; jaundice; dysarthria, tremor, reflex slowing; blurred vision, diplopia; drug dependence.
Drug Interactions	Reduced sedative effects with theophylline and other CNS stimulants. Increased incidence of headache with zidovudine. May reduce effects of levodopa. Potentially Fatal: Additive CNS depression with alcohol and other CNS depressants.
Food Interaction	Additive CNS depression may occur with valerian, St John's wort, kava kava, gotu kola.
Storage	Oral: Store at 15-30°C (59-86°F).
Mechanism of Action	Oxazepam is a short-acting benzodiazepine. It enhances the activity of GABA, a major inhibitory neurotransmitter in the brain, by binding to specific sites in the GABA receptors.

	Oxazepam is a short-acting benzodiazepine. It enhances the activity of GABA, a major inhibitory neurotransmitter in the brain, by binding to specific sites in the GABA receptors. Absorption: Well absorbed from the GI tract; peak plasma levels in about 2 hr (oral). Distribution: Crosses the placenta and detected in breast milk. Protein-binding: 85-97%. Metabolism: Hepatic; extensively metabolised to inactive glucuronide. Excretion: Via urine as unchanged drug and inactive metabolites. Elimination half-life: 3-21 hr.
CIMS Class	Anxiolytics
ATC Classification	N05BA04 - oxazepam; Belongs to the class of benzodiazepine derivatives anxiolytics. Used in the management of anxiety, agitation or tension.

***oxazepam information:**

oxcarbazepine

CIMS Class : (Anticonvulsants)
oxcarbazepine

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food ∇ - Food interaction

related oxcarbazepine information

Indication & Dosage

Oral

Monotherapy or adjunctive therapy in the treatment of partial seizures with or without secondary generalised tonic-clonic seizures

Adult: Initially, 600 mg daily in 2 divided doses; increase at a max increments of 600 mg daily at wkly intervals depending on response. Maintenance: 600-1,200 mg daily. Adjunctive therapy/refractory patients switched from other anticonvulsants: Up to 2,400 mg daily.

Child: >6 yr: 8-10 mg/kg daily in 2 divided doses; increase as necessary to max increments of 10 mg/kg daily at about wkly intervals to a max of 46 mg/kg daily. Maintenance in adjunctive therapy: 30 mg/kg daily.

CrCl (ml/min)	Dosage Recommendation
<30	Initially, 300 mg daily or 50% of usual dose. Increase at wkly intervals or longer.

Administration

May be taken with or without food.

Overdosage

Symptoms: CNS depression (somnolence, ataxia).

Overdosage	Symptoms: CNS depression (somnolence, ataxia). Treatment: Symptomatic and supportive.
Contraindications	Hypersensitivity. Lactation.
Special Precautions	Cross-sensitivity to carbamazepine may occur. Do not discontinue abruptly. Renal and hepatic impairment. Patients at risk of hyponatraemia. May impair ability to drive or operate machinery. Pregnancy.
Adverse Drug Reactions	Dizziness, somnolence, headache, ataxia, fatigue, vertigo, nervousness, amnesia, abnormal thinking, insomnia, speech disorder, agitation, confusion; vomiting, nausea, abdominal pain, diarrhoea, dyspepsia, constipation, gastritis, wt gain; abnormal gait, tremor, weakness, back pain, abnormal coordination, dysmetria, sprains/strains, muscle weakness; diplopia, nystagmus, abnormal vision and accommodation; hypotension, leg oedema; rash, acne; hyponatraemia; rhinitis, chest infection, epistaxis, sinusitis. Potentially Fatal: Stevens-Johnson syndrome, toxic epidermal necrolysis. Anaphylaxis and angioedema.
Drug Interactions	Reduced serum levels with carbamazepine, phenobarbitone, phenytoin, valproic acid. May reduce levels/effects of CYP3A4 substrates (e.g. benzodiazepines, calcium channel blockers, clarithromycin, ciclosporin, erythromycin, oestrogens, mirtazapine, nateglinide, nefazodone, nevirapine, protease inhibitors, tacrolimus, venlafaxine). May reduce efficacy of oral contraceptives. May reduce levels/effects of maraviroc. May increase levels of phenobarbitone, phenytoin.
Food Interaction	Levels may be reduced with St John's wort. Evening primrose may reduce seizure threshold and reduce the effects of

	Levels may be reduced with St John's wort. Evening primrose may reduce seizure threshold and reduce the effects of oxcarbazepine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 25°C (77°F).
Mechanism of Action	Oxcarbazepine blocks voltage-sensitive sodium channels, which inhibits repetitive firing, stabilises hyperexcited neuronal membranes and decreases release of synaptic impulses. These effects may prevent the spread of epileptic seizures. Absorption: Well absorbed from the GI tract. Distribution: Monohydroxy metabolite: Widely distributed; protein-binding: About 40%, mainly to albumin. Oxcarbazepine and metabolite: Cross the placental barrier and enter breast milk. Metabolism: Metabolised in the liver to 10,11-dihydro-10-hydroxy-carbamazepine (principal metabolite; possesses antiepileptic activity). Excretion: Via urine (mainly as metabolites). Half-life: 2 hr (oxcarbazepine); 9 hr (monohydroxy metabolite).
CIMS Class	Anticonvulsants
ATC Classification	N03AF02 - oxcarbazepine; Belongs to the class of carboxamide derivatives antiepileptic. Used in the management of epilepsy.

oxprenolol

CIMS Class : (Beta-Blockers)
oxprenolol

P - Caution when used during pregnancy

L - Caution when used during lactation

Food α - Food interaction

related oxprenolol information

Indication & Dosage

Oral

Hypertension

Adult: As hydrochloride: 80-160 mg daily in 2-3 divided doses. May increase dose every 1-2 wk until adequate response is obtained. Max: 320 mg daily although up to 480 mg daily has been used. Modified-release tablet: Up to 320 mg once daily.

Oral

Angina pectoris

Adult: As hydrochloride: 80-160 mg daily in 2-3 divided doses. Max: 320 mg daily.

Oral

Cardiac arrhythmias

Adult: As hydrochloride: 40-240 mg daily in 2-3 divided doses.

Oral

Anxiety

Adult: As hydrochloride: 40-80 mg daily as a single dose or

	<i>Oral</i> Anxiety Adult: As hydrochloride: 40-80 mg daily as a single dose or in 2 divided doses.
Administration	May be taken with or without food.
Overdosage	Symptoms: Hypotension, bradycardia, CHF, bronchospasm, hypoglycaemia. Cardiogenic shock, cardiac arrest, impairment of consciousness, and generalised convulsions may occur. Treatment: Symptomatic and supportive. Atropine 1-2 mg IV may be used for bradycardia/hypotension. Pressors, e.g. norepinephrine may be given if outcome is unsatisfactory. Glucagon (1-10 mg) may also be used.
Contraindications	2nd and 3rd degree AV block; sinus bradycardia; uncontrolled heart failure; allergic rhinitis, bronchospasm or asthma; sick sinus syndrome; right ventricular failure secondary to pulmonary hypertension; cardiogenic shock.
Special Precautions	History of severe anaphylaxis to allergens; treatment of anaphylaxis (e.g. epinephrine) may be ineffective in patients on β-blockers. Compensated heart failure, DM, severe hepatic impairment or inflammatory diseases, myasthenia gravis, peripheral vascular disease (including Raynaud's), untreated pheochromocytoma, history of psychiatric illness. Do not withdraw abruptly (particularly in patients with coronary artery disease). May impair ability to drive or operate machinery. Pregnancy and lactation.
Adverse Drug Reactions	Pulmonary oedema, postural hypotension, prolonged PR interval, sinus arrest, palpitation, chest pain, peripheral vascular disorders, hot flashes, syncope; vertigo, lightheadedness, headache, dizziness, anxiety, depression, nervousness, irritability, hallucinations, sleep disturbances,

	vascular disorders, hot flashes, syncope; vertigo, lightheadedness, headache, dizziness, anxiety, depression, nervousness, irritability, hallucinations, sleep disturbances, sedation, slurred speech; dry skin, rash, pruritus; decreased libido, impotence, wt gain, hypoglycaemia; GI disturbances; thrombocytopenia, leukopenia; elevated LFTs; paraesthesia, weakness; keratoconjunctivitis, dry and itching eyes, blurred vision; tinnitus; increased BUN; dyspnoea, wheezing; diaphoresis. Potentially Fatal: CHF, heart block, severe bradycardia, bronchospasm.
Drug Interactions	Bradycardic and hypotensive effects may be enhanced by fentanyl. Excessive reduction of sympathetic activity may occur with MAOIs, reserpine, guanethidine. Effect may be enhanced by cimetidine. Additive CNS depression may occur with opiate analgesics, antihistamines, ethanol, psychoactive drugs. May enhance the vasoconstrictive effects of ergot alkaloids. Effect may be reduced with indometacin (and possibly other NSAIDs). May enhance effects of insulin and oral antidiabetics. Hypertensive reactions may occur with sympathomimetics e.g. epinephrine. Potentially Fatal: Hypotension, cardiac arrhythmias and cardiac arrest may occur with IV diltiazem and verapamil. Myocardial depression may be additive with inhalant anaesthetics. May enhance negative inotropic and negative dromotropic effect of quinidine, amiodarone, disopyramide.
Food Interaction	Ephedra, yohimbe and ginseng may exacerbate hypertension.
Storage	Oral: Store at 30°C (86°F). Protect from heat.
Mechanism of Action	Oxprenolol is a non-cardioselective β-blocker. It competitively antagonises catecholamine-induced tachycardia at cardiac β-receptor sites, resulting in reduced cardiac output. It also

	Oxprenolol is a non-cardioselective β-blocker. It competitively antagonises catecholamine-induced tachycardia at cardiac β-receptor sites, resulting in reduced cardiac output. It also inhibits renin release by the kidneys, and inhibits the vasomotor centres. Absorption: Well absorbed from the GI tract. Peak plasma levels within 1 or 2 hr (oral). Distribution: Protein-binding: About 80%. Crosses the placenta and present in breast milk; crosses the blood-brain barrier. Metabolism: Hepatic; undergoes first-pass metabolism. Excretion: Almost entirely via urine. Elimination half-life: 1-2 hr.
CIMS Class	Beta-Blockers
ATC Classification	C07AA02 - oxprenolol; Belongs to the class of non-selective beta-blocking agents. Used in the treatment of cardiovascular diseases.

oxybutynin

CIMS Class : (Drugs for Bladder & Prostate Disorders)
oxybutynin

P - Caution when used during pregnancy
L - Caution when used during lactation

related oxybutynin information

Indication & Dosage	<i>Oral</i>
	Overactive bladder
	Adult: 2.5-5 mg bid-tid. May be increased to max 5 mg 4 times daily if necessary. As extended-release preparation: Initially, 5 mg once daily increased by 5 mg every wk if necessary to max 30 mg daily.
	Child: >7 yr for nocturnal enuresis: 2.5-3 mg bid increased if necessary to 5 mg bid-tid. Last dose should be given before bedtime. As extended-release preparation: 5 mg once daily, increased by 5 mg wkly if necessary to max 20 mg daily.
	Elderly: Initially, 2.5-3 mg bid increased to 5 mg bid if necessary.
	<i>Oral</i>
	Neurogenic bladder disorders
	Child: >5 yr: 2.5 or 3 mg bid increased to 5 mg bid according to response. Max 5 mg tid.
	<i>Transdermal</i>
	Overactive bladder
	Adult: 1 transdermal system (delivering 3.9 mg per day)

	according to response. max 3 mg tid. <i>Transdermal</i> Overactive bladder Adult: 1 transdermal system (delivering 3.9 mg per day) applied to dry, intact skin on the abdomen, hip, or buttock twice wkly.
Administration	May be taken with or without food.
Overdosage	Anticholinergic effects including CNS excitation (e.g. restlessness, tremor, irritability, convulsions, delirium, hallucinations), flushing, fever, dehydration, cardiac arrhythmia, vomiting, and urinary retention may occur after overdose. Treatment should be symptomatic and supportive. Activated charcoal may be administered.
Contraindications	GI obstruction or atrophy, severe toxic megacolon, significant bladder outflow obstruction, glaucoma, urinary retention.
Special Precautions	Elderly; hepatic or renal impairment; neuropathy; hyperthyroidism; prostatic hyperplasia; hiatus hernia; cardiac disease, reflux oesophagitis, ulcerative colitis, myasthenia gravis; pregnancy and lactation. High environmental temperature might cause heat prostration (fever with heat stroke due to decreased sweating).
Adverse Drug Reactions	Dry mouth, constipation, nausea, abdominal pain; blurred vision; headache, dizziness, drowsiness; dry skin, rash; photosensitivity, diarrhoea, insomnia, palpitation, weakness, dry eyes, confusion, hypertension, UTI, dyspepsia.
Drug Interactions	Co-administration with other anticholinergic drugs may cause undesirable increased anticholinergic effects. Additive sedation with CNS depressants and alcohol. Concentration may be increased by CYP3A4 inhibitors (e.g. imidazole antifungals, macrolide antibiotics).
Pregnancy	

Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-30°C (59-86°F). Transdermal: Store at 15-30°C (59-86°F).
Mechanism of Action	Oxybutynin exerts direct antispasmodic effect on the smooth muscle by inhibiting the muscarinic action of acetylcholine. It exhibits moderate anticholinergic effect, but has potent antispasmodic effects on urinary smooth muscle. Absorption: Peak plasma concentrations after 1 hr. Distribution: Crosses the blood-brain barrier; enters breast milk. Metabolism: Hepatic: Undergoes first-pass metabolism. Excretion: Excreted in urine and faeces as metabolites. Elimination half life 2-3 hr.
CIMS Class	Drugs for Bladder & Prostate Disorders
ATC Classification	G04BD04 - oxybutynin; Belongs to the class of urinary antispasmodics. Used in the treatment of urological problems.

oxyfedrine

CIMS Class : (Anti-Anginal Drugs)
oxyfedrine

related oxyfedrine information

Indication & Dosage	<i>Oral</i> Myocardial infarction, Angina pectoris Adult: 8-24 mg tid.
Contraindications	Aortic insufficiency with marked haemodynamic changes; subvalvular aortic stenosis.
Adverse Drug Reactions	Transient taste impairment
Mechanism of Action	Oxyfedrine is a partial agonist at β -adrenergic receptors and acts as a coronary vasodilator.
CIMS Class	Anti-Anginal Drugs
ATC Classification	C01DX03 - oxyfedrine; Belongs to the class of other vasodilators. Used in the treatment of cardiac disease.

oxymetazoline

CIMS Class : (Nasal Decongestants & Other Nasal Preparations) , (Ophthalmic Decongestants, Anesthetics, Anti-inflammatories)
oxymetazoline

P - Caution when used during pregnancy

L - Caution when used during lactation

related oxymetazoline information

Indication & Dosage	<i>Nasal</i> Nasal congestion Adult: As 0.05% solution: Spray 1-3 times into each nostril bid. Child: =6 yr: Instill or spray 0.05% solution 1-3 times into each nostril bid. <i>Ophthalmic</i> Conjunctival decongestant Adult: Instil 1-2 drops of 0.025% solution into the eye(s) 6 hrly when necessary. Child: =6 yr: Instill 1-2 drops of 0.025% solution into the eye(s) 6 hrly when necessary.
Contraindications	Glaucoma; hyperthyroidism, heart disease (including angina), hypertension, advanced arteriosclerotic conditions. Children <6 yr.
Special Precautions	Pregnancy, lactation. Difficulty in urination secondary to prostate enlargement; DM.

Adverse Drug Reactions	Nasal drops or spray: Local stinging or burning, sneezing, dryness of mouth and throat. Prolonged or frequent use may cause rebound congestion. Headache, insomnia, tachycardia, hypertension, nervousness, nausea, dizziness, palpitation, arrhythmia. Eye drops: Dryness of eye.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Oxymetazoline is a direct-acting sympathomimetic which has vasoconstrictor effect on mucosal blood vessels when applied topically and in turn reduces oedema of the nasal mucosa. Duration: Up to 12 hr.
CIMS Class	Nasal Decongestants & Other Nasal Preparations / Ophthalmic Decongestants, Anesthetics, Anti-inflammatories
ATC Classification	R01AA05 - oxymetazoline; Belongs to the class of topical sympathomimetic agents used as nasal decongestants. R01AB07 - oxymetazoline; Belongs to the class of topical sympathomimetic combination preparations, excluding corticosteroids. Used as nasal decongestants. S01GA04 - oxymetazoline; Belongs to the class of sympathomimetics used as ophthalmologic decongestants.

oxymetholone

CIMS Class : (Anabolic Agents)
oxymetholone

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related oxymetholone information

Indication & Dosage	<i>Oral</i> Anaemia Adult: 1-5 mg/kg/day for 3-6 mth.
Contraindications	Carcinoma of the prostate or breast in males. Carcinoma of the breast in females with hypercalcaemia. Pregnancy, lactation. Nephrosis or the nephrotic phase of nephritis. Severe hepatic impairment.
Special Precautions	CV disorders, renal or hepatic impairment, epilepsy, migraine, DM; elderly. Sleep apnoea in male patients. Monitor signs of virilisation (females) and development of priapism (males). Periodic Hb and haematocrit determinations. Radiographic exam every 6 mth (prepubertal child). Children (extreme care). Report too frequent/persistent penile erections; hoarseness, acne, menstrual changes, growth of facial hair (females); nausea, vomiting, changes in skin color, ankle swelling.
Adverse Drug Reactions	Fluid and electrolyte retention; increased vascularity of the

Adverse Drug Reactions	Fluid and electrolyte retention; increased vascularity of the skin; hypercalcaemia, impaired glucose tolerance; increase bone and skeletal wt; increase LDL cholesterol; increase haematocrit and fibrinolytic activity; headache, depression and GI bleeding. Spermatogenesis suppression, priapism, gynaecomastia, prostatic hyperplasia and accelerated growth of malignant prostate neoplasms (males). Suppression of lactation, ovarian activity and menstruation; virilisation; clitoris hypertrophy; decreased libido; oily skin, acne (females). IM: urticaria, inflammation at Inj site, postinjection induration, furunculosis. Transdermal: local irritation. Potentially Fatal: Peliosis hepatitis; cholestatic jaundice with hepatic necrosis.
Drug Interactions	May enhance activity of ciclosporin, antidiabetics, levothyroxine, anticoagulants. May cause resistance to effects of neuromuscular blockers; increased levels of oxyphenbutazone. Enhanced fluid retention when used with corticosteroids. Potentially Fatal: Possible large increase in INR and prothrombin time with warfarin, dose may need to be reduced.
Lab Interference	May interfere with glucose tolerance and thyroid function tests.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Oral: Store at 20-25°C (68-77°F).

Storage	Oral: Store at 20-25°C (68-77°F).
Mechanism of Action	Oxymetholone has anabolic and androgenic properties. It is used in the treatment of aplastic anaemias to enhance the production and urinary excretion of erythropoietin and can stimulate erythropoiesis in anaemias due to deficient red cell production.
CIMS Class	Anabolic Agents
ATC Classification	A14AA05 - oxymetholone; Belongs to the class of androstan derivative anabolic steroids used as systemic anabolic agents.

oxytetracycline

CIMS Class : (Tetracyclines) , (Eye Anti-infectives & Antiseptics) , (Topical Antibiotics)
oxytetracycline

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ✖ - Lab interference

Food ✖ - Food interaction

related oxytetracycline information

Indication & Dosage

Oral

Susceptible infections

Adult: 250-500 mg 4 times daily. Max 4 g daily.

Child: >8 yr: 25-50 mg/kg daily in 4 divided doses.

Renal impairment: Dosage may need to be reduced.

Oral

Acne

Adult: 250-500 mg bid.

Renal impairment: Dosage may need to be reduced.

Oral

Uncomplicated gonorrhoea

Adult: 1.5 g initially, followed by 0.5 g four times daily up to a total of 9 g per treatment course.

Renal impairment: Dosage may need to be reduced.

Intramuscular

Susceptible infections

Adult: 250 mg once daily or 300 mg daily in 2-3 divided

	Renal impairment: Dosage may need to be reduced. <i>Intramuscular</i> Susceptible infections Adult: 250 mg once daily or 300 mg daily in 2-3 divided doses. Child: >8 yr: 15-25 mg/kg (max 250 mg) daily in 2-3 divided doses. Renal impairment: Dosage may need to be reduced. <i>Ophthalmic</i> Superficial ophthalmic infections Adult: Used in combination with other agents: As ointment: Apply a small amount in the lower conjunctival sac of the infected eye 2-4 times daily. As suspension: Instill 1-2 drops into the affected eye tid. <i>Topical/Cutaneous</i> Infected dermatitis Adult: In combination with a topical steroid: Apply up to 4 times daily.
Administration	Should be taken on an empty stomach. (Take on an empty stomach 1 hr before or 2 hr after meals.)
Contraindications	Hypersensitivity to tetracyclines, children <8 yr, renal damage. Pregnancy, lactation.
Special Precautions	Elderly, renal or hepatic impairment; myasthenia gravis; lupus erythematosus, children <12 yr.
Adverse Drug Reactions	Anorexia, nausea, vomiting, diarrhoea, glossitis, dysphagia, photosensitivity, oesophageal irritation and ulceration, nephrotoxicity, enterocolitis, rash (rare), blood dyscrasias. Headache, visual disturbances; intracranial hypertension; bulging fontanelles (infants). Potentially Fatal: Rare. Fulminant diarrhoea in post operative patients.
Drug Interactions	Antacids, iron, aluminum, calcium, magnesium, zinc salts

Drug Interactions	Antacids, iron, aluminum, calcium, magnesium, zinc salts reduce absorption. Concurrent use may cause increased levels of lithium, digoxin, halofantrine and theophylline; decreased concentrations of atovaquone. Increased risk of ergotism with ergot alkaloids. May cause failure of oral contraception. Potentially Fatal: Interferes with anticoagulant control. Nephrotoxic effects exacerbated by diuretics, methoxyflurane or other nephrotoxic drugs; avoid concurrent use with potentially hepatotoxic drugs. Increased incidence of benign intracranial hypertension with retinoids.
Food Interaction	Absorption reduced by food, milk and milk products. Give 1 hr before or 2 hr after meals.
Lab Interference	Interferes with urinary glucose and catecholamine estimations.
Mechanism of Action	Oxytetracycline binds reversibly to the 30S and possibly 50S ribosomal subunits, thus inhibiting bacterial protein synthesis and arresting cell growth. It is active against a wide range of gram-positive and gram-negative organisms. Distribution: Protein-binding: 20-40% Metabolism: Hepatic (small amounts). Excretion: Urine, faeces; 9 hr (elimination half-life).
CIMS Class	Tetracyclines / Eye Anti-infectives & Antiseptics / Topical Antibiotics
ATC Classification	D06AA03 - oxytetracycline; Belongs to the class of topical tetracycline and derivatives agents used in the treatment of dermatological diseases. G01AA07 - oxytetracycline; Belongs to the class of antibiotics. Used in the treatment of gynecological infections.

dermatological diseases.

G01AA07 - oxytetracycline; Belongs to the class of antibiotics. Used in the treatment of gynecological infections.

J01AA06 - oxytetracycline; Belongs to the class of tetracyclines. Used in the treatment of systemic infections.

S01AA04 - oxytetracycline; Belongs to the class of antibiotics. Used in the treatment of eye infections.

***oxytetracycline information:**

oxytocin

CIMS Class : (Drugs Acting on the Uterus) , (Other Drugs Affecting Hormonal Regulation)
oxytocin

P - Contraindicated in pregnancy

L - Caution when used during lactation

related oxytocin information

Indication & Dosage

Nasal

Facilitate lactation

Adult: 1 spray (4 units) into 1 nostril 5 minutes before suckling.

Intravenous

Adjunct in abortion

Adult: 10-20 milliunits/minute. Max total dose: 30 units in a 12-hr period.

Intravenous

Postpartum haemorrhage

Adult: 10-40 units by infusion in 1000 mL of IV fluid at a rate sufficient to control uterine atony.

Intravenous

Labour induction

Adult: 1-2 milliunits/minute, may increase at intervals of at least 30 minutes until a max of 3-4 contractions occur every 10 minutes. Not to exceed 32 milliunits/minute and no more than a total of 5 units should be given in 1 day. Not to be

least 30 minutes until a max of 3-4 contractions occur every 10 minutes. Not to exceed 32 milliunits/minute and no more than a total of 5 units should be given in 1 day. Not to be given within 6 hr after admin of vaginal prostaglandins.

Monitor uterine contractions and foetal heart rate continuously. Withdraw gradually once labour is progressing.

Intravenous

Oxytocin challenge test for evaluating of foetal distress

Adult: Dilute 5–10 units in 1 L of 5% dextrose inj. Initially, administer the drug in the mother via IV infusion at a rate of 0.5 milliunits/minute. May gradually increase infusion rate at intervals of 15-30 minutes. Max: 20 milliunits/minute. Monitor foetal heart rate and uterine contractions immediately before and during infusion. Discontinue infusion when 3 moderate uterine contractions occur within one 10-minute interval. Compare baseline and oxytocin-induced foetal heart rates. If no change occurs, repeat the test in 1 wk. Termination of pregnancy may be required if a late deceleration in foetal heart rate occurs.

Reconstitution: Postpartum uterine bleeding: oxytocin 10-40 units to running IV infusion, max 40 units/1000 ml.

Incompatibility: When admixed: fibrinolysin (human), norepinephrine, prochlorperazine edisylate, warfarin; variable compatibility with phytonadione.

Overdosage

Tetanic uterine contractions, impaired uterine blood flow, amniotic fluid embolism, uterine rupture, syndrome of inappropriate antidiuretic hormone secretion and seizures. Treatment: Supportive and symptom specific.

Contraindications

Cephalopelvic disproportion; abnormal presentation of the foetus; hydramnios; multiparae; previous caesarian section

	Cephalopelvic disproportion; abnormal presentation of the foetus; hydramnios; multiparae; previous caesarian section or other uterine surgery; hyperactive or hypertonic uterus, uterine rupture; contraindicated vaginal delivery (invasive cervical cancer, active genital herpes, prolapse of the cord, cord presentation, total placenta previa or vasa previa); foetal distress where delivery is not imminent; severe pre-eclamptic toxemia.
Special Precautions	CV disorders; >35 yr; lactation. Monitor foetal and maternal heart rate, maternal BP and uterine motility. Monitor fluid intake and output during treatment. Discontinue immediately if the uterus is hypertonic or hyperactive or if there is foetal distress. Use of nasal spray may produce maternal dependence on its effects. IM admin not regularly used due to unpredictable effects of oxytocin. Not to be used for prolonged periods in resistant uterine inertia, severe pre-eclampsia, or severe CV disorders. Risk of water intoxication when used at high doses for prolonged periods.
Adverse Drug Reactions	Foetus or neonate: Jaundice; arrhythmias, bradycardia; brain, CNS damage; seizure; retinal haemorrhage; low Apgar score. Mother: transient hypotension, reflex tachycardia; nasal irritation, rhinorrhoea, lachrymation (following nasal admin); uterine bleeding, violent contractions, hypertonicity; spasm; nausea, vomiting. Potentially Fatal: Maternal water intoxication (especially with slow infusion over 24 hr); prolonged uterine contractions causing foetal hypoxia and death; rupture of gravid uterus; afibrinogenaemia; subarachnoid haemorrhage
Drug Interactions	Possible severe hypertension if given within 3-4 hr of vasoconstrictor in association with a caudal block anaesthesia. Cyclopropane anaesthesia may increase risk of

	Possible severe hypertension if given within 3-4 hr of vasoconstrictor in association with a caudal block anaesthesia. Cyclopropane anaesthesia may increase risk of hypotension and maternal sinus bradycardia with abnormal AV rhythms. Dinoprostone and misoprostol may increase uterotonic effect of oxytocin, thus oxytocin should not be used within 6 hr after admin of vaginal prostaglandins. Concurrent use may increase the vasopressor effect of sympathomimetics. Potentially Fatal: Concomitant use with prostaglandins increases risk of uterine rupture and cervical lacerations.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Intravenous: Store at 2-8 °C. Nasal: Store at 2-8 °C.
Mechanism of Action	Oxytocin induces rhythmic uterine contraction which increases throughout the pregnancy, reaching the max at term by proliferating oxytocin receptors. It increases the tone and amplitude of the uterine contractions at small doses. Onset: Uterine contractions: IM: 3-5 minutes; IV: approx 1 minute. Duration: IM: 2-3 hr; IV: 1 hr. Absorption: Steady state is reached normally 40 minutes after parenteral admin. Distribution: Distribution throughout extracellular fluid, small amounts reach foetus. Metabolism: Rapidly via the liver and plasma (by oxytocinase); some metabolism via mammary gland. Excretion: Elimination half-life: 1-5 minutes; excreted via urine.

	metabolism. Rapidly via the liver and plasma (by oxytocinase); some metabolism via mammary gland. Excretion: Elimination half-life: 1-5 minutes; excreted via urine.
CIMS Class	Drugs Acting on the Uterus / Other Drugs Affecting Hormonal Regulation
ATC Classification	H01BB02 - oxytocin; Belongs to the class of oxytocin and analogues. Used in posterior pituitary lobe hormone preparations.

paclitaxel

CIMS Class : (Cytotoxic Chemotherapy)
paclitaxel

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food $\square$ - Food interaction

related paclitaxel information

Indication & Dosage

Intravenous

Ovarian carcinoma

Adult: Primary treatment (in combination with cisplatin or carboplatin): 135 mg/m² infused over 24 hr followed by cisplatin and repeated at 3 wk intervals. Secondary treatment (as single agent): 135 or 175 mg/m² infused over 3 hr once every 3 wk.

Hepatic impairment: Do not use in severe impairment, increased risk of hepatotoxicity. For detailed dosing recommendations, consult local protocol.

Intravenous

Breast cancer

Adult: Adjuvant therapy; 2nd line monotherapy or 1st line treatment with trastuzumab: 175 mg/m² infused over 3 hr once every 3 wk for 4 courses; when used with trastuzumab, dose should be given the day after the 1st dose of trastuzumab or immediately after subsequent doses if well-tolerated. 1st line with doxorubicin: 220 mg/m² over 3 hr

dose should be given the day after the 1st dose of trastuzumab or immediately after subsequent doses if well-tolerated. 1st line with doxorubicin: 220 mg/m² over 3 hr every 3 wk, dose to be administered 24 hr after doxorubicin.

Hepatic impairment: Do not use in severe impairment, increased risk of hepatotoxicity. For detailed dosing recommendation, consult local protocol.

Intravenous

Advanced non-small cell lung cancer

Adult: 135 mg/m² over 24 hr or 175 mg/m² over 3 hr, followed by cisplatin and repeated at 3 wk intervals.

Hepatic impairment: Do not use in severe impairment, increased risk of hepatotoxicity. For detailed dosing recommendation, consult local protocol.

Intravenous

AIDS-related Kaposi's sarcoma

Adult: 135 mg/m² over 3 hr every 3 wk. Alternatively, 100 mg/m² over 3 hr every 2 wk especially in patients with poor performance status.

Hepatic impairment: Do not use in severe impairment, increased risk of hepatotoxicity. For detailed dosing recommendation, consult local protocol.

Reconstitution: Paclitaxel must be diluted before infusion. It can be diluted in 0.9% sodium chloride inj, 5% dextrose inj, 5% dextrose and 0.9% sodium chloride inj or 5% dextrose in lactated Ringer's inj to a concentration of 0.3-1.2 mg/ml.

Incompatibility: Do not prepare, store or administer in PVC containing equipment; macrogol glycerol ricinolate (an excipient) can cause [di-(2-ethylhexyl)phthalate] (DEHP) leaching. Y-site incompatibility: Amphotericin B, amphotericin B cholesteryl sulfate complex, chlorpromazine, doxorubicin

	excipient) can cause [di-(2-ethylhexyl)phthalate] (DEHP) leaching. Y-site incompatibility: Amphotericin B, amphotericin B cholesteryl sulfate complex, chlorpromazine, doxorubicin liposome, hydroxyzine, methylprednisolone sodium succinate, mitoxantrone. Variable compatibility when admixed with cisplatin.
Overdosage	Complications: bone marrow suppression, peripheral neurotoxicity and mucositis. There is no known antidote. Treatment is symptom specific and supportive.
Contraindications	History of hypersensitivity (especially macrogol glycerol ricinolate). Patients with baseline neutropenia of <1500 cells/mm³ (<1000 cells/mm³ for kaposi's sarcoma). Pregnancy and lactation. In kaposi's sarcoma, contraindicated in patients with concurrent, serious, uncontrolled infections.
Special Precautions	Bone marrow suppression during therapy. Monitor cardiac function if conduction abnormalities result. Premedication (with corticosteroid, antihistamine and histamine H₂-receptor antagonist) may be required to reduce risk of hypersensitivity reaction. Discontinue, if severe reactions e.g. hypotension, dyspnoea, angioedema or urticaria occur. Caution in patients with moderate hepatic impairment. Monitor for reactions of admin. Safety and efficacy in paediatric patients have not been established. Administer before platinum derivatives (cisplatin, carboplatin) if used in combination. Hazardous agent; use appropriate precautions for handling and disposal.
Adverse Drug Reactions	Neutropenia, leukopenia, thrombocytopenia, anaemia, bleeding; hypersensitivity reactions (dyspnoea, flushing, chest pain, tachycardia, rash, hypotension, hypertension); bradycardia, abnormal ECG; neurotoxicity (mainly peripheral neuropathy), myalgia, arthralgia; nausea, vomiting, diarrhoea; severe mucositis, alopecia; rarely hepatic necrosis and

	bradycardia, abnormal ECG; neurotoxicity (mainly peripheral neuropathy), myalgia, arthralgia; nausea, vomiting, diarrhoea; severe mucositis, alopecia; rarely hepatic necrosis and encephalopathy, inj site reactions e.g. erythema, tenderness, skin discolouration, swelling; interstitial pneumonitis; infections (mainly UTIs and upper respiratory tract); mucosal inflammation, severe elevation in LFTs (aspartate aminotransferase and alkaline phosphatase). Potentially Fatal: Infections and infestations leading to death e.g. pneumonia and peritonitis.
Drug Interactions	Myelosuppression was more profound when given after cisplatin than with the alternate sequence (e.g., paclitaxel before cisplatin). CYP2C8 inducers e.g. carbamazepine, phenobarbital, phenytoin, rifampicin, rifapentine, and secobarbital may reduce levels or effects. CYP2C8 inhibitors e.g. gemfibrozil, ketoconazole, montelukast, and ritonavir may increase levels or effects. CYP3A4 inducers e.g. aminoglutethimide, carbamazepine, nafcillin, nevirapine, phenobarbital, phenytoin, and rifamycins may decrease the levels or effects. CYP3A4 inhibitors e.g. azole antifungals, clarithromycin, diclofenac, doxycycline, erythromycin, imatinib, isoniazid, nefazodone, nifedipine, propofol, protease inhibitors, quinidine, telithromycin, and verapamil may increase levels or effects. May increase anthracycline (eg doxorubicin, epirubicin) levels or toxicity; admin of anthracycline at least 24 hr prior to paclitaxel may reduce interaction. May decrease the absorption of cardiac glycosides (may only affect digoxin tablets); levels should be monitored.
Food Interaction	Avoid black cohosh, dong quai in estrogen-dependent tumours. Valerian and St John's wort may decrease paclitaxel levels. Kava kava and gotu kola may increase CNS

	Avoid black cohosh, dong quai in estrogen-dependent tumours. Valerian and St John's wort may decrease paclitaxel levels. Kava kava and gotu kola may increase CNS depression.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at <25°C and protect from light. Once diluted, chemically and physically stable for 24 hr at 25°C (solutions in glucose 5% in water and normal saline are stable for 3 days at 25°C). Do not refrigerate or freeze diluted solution. Once opened, should be used as soon as possible due to risk of microbial contamination, however can be stored for a max of 28 days at 25°C.
Mechanism of Action	Paclitaxel promotes microtubule formation by enhancing the action of tubulin dimers, stabilising existing microtubules and preventing their disassembly, thereby disrupting normal cell division in the late G₂ mitotic phase of the cell cycle. This results in the inhibition of cell replication. Distribution: Extensive extravascular distribution and/or tissue binding. Volume of distribution affected by dose and duration of infusion. Protein binding: 89-98%. Metabolism: Hepatic via CYP2C8 and 3A4; 6a-hydroxypaclitaxel is the main metabolite. Excretion: For 1-6 hr infusion; mean β half-life: 6.4 hr. For 3 hr infusion: mean terminal half-life: 13.1-20.2 hr. For 24 hr infusion: mean terminal half life:15.7-52.7 hr. 70% excreted via faeces, 14% excreted via urine. Mean total body clearance after 1 hr and 6 hr infusions: 5.8-16.3 l/hr/m²; after 24 hr infusions: 14.2-17.2 l/hr/m².

	via faeces, 14% excreted via urine. Mean total body clearance after 1 hr and 6 hr infusions: 5.8-16.3 l/hr/m ² ; after 24 hr infusions: 14.2-17.2 l/hr/m ² .
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01CD01 - paclitaxel; Belongs to the class of plant alkaloids and other natural products, taxanes. Used in the treatment of cancer.

palonosetron

CIMS Class : (Antiemetics) , (Supportive Care Therapy)
palonosetron

P - Caution when used during pregnancy

L - Caution when used during lactation

related palonosetron information

Indication & Dosage	<i>Intravenous</i> Nausea and vomiting associated with cancer chemotherapy Adult: 250 mcg as a single dose. To be given over 30 sec and 30 minutes before chemotherapy. Do not repeat within 7 days. <i>Intravenous</i> Prophylaxis of postoperative nausea and vomiting Adult: 75 mcg as a single dose immediately before induction of anaesthesia. Reconstitution: Physically and chemically stable at concentrations of 5 and 30 mcg/ml in glucose 5%, sodium chloride 0.9%, glucose 5% in lactated Ringer's for at least 48 hr at room temperature, exposed to light and for 14 days under reffridgeration. Incompatibility: Y-site incompatibility: Methylprednisolone.
Special Precautions	Patients with intestinal obstruction or ileus. Rapid inj may lead to temporary visual changes e.g. blurred vision. Patients who have or may develop prolonged QT intervals. Safety and efficacy not established in children <18 yr. Counsel patients who handle

	Patients with intestinal obstruction or ileus. Rapid inj may lead to temporary visual changes e.g. blurred vision. Patients who have or may develop prolonged QT intervals. Safety and efficacy not established in children <18 yr. Counsel patients who handle skilled tasks e.g. driving may be impaired.
Adverse Drug Reactions	Headache; flushing; fatigue, dizziness, drowsiness; hiccups; chest pain, tachycardia and bradycardia; diarrhoea, constipation, flatulence; dry mouth; urinary retention; dyspepsia, abdominal pain; changes in BP; asthenia; anxiety, euphoria, paraesthesia, peripheral neuropathy; anorexia; motion sickness; influenza-like symptoms; glycosuria, hyperglycaemia; electrolyte disturbance; arthralgia, eye irritation; amblyopia; tinnitus; rash, pruritus.
Drug Interactions	May have additive effect on prolonging QT with drugs e.g. moxifloxacin, erythromycin, antipsychotics and TCAs.
Mechanism of Action	Palonosetron is a selective 5-HT₃ antagonist that is used in the prevention of acute and delayed emesis in emetogenic cancer chemotherapy regimens. Absorption: C_{max} is dose proportional. Distribution: Volume of distribution: 6.9-7.9 l/kg. Protein binding: Approx 62%. Metabolism: 40% metabolised via kidney, 50% metabolised by liver CYP2D6 (mainly), CYP3A4 and CYP1A2 isoenzymes. 50% of drug metabolised, <1 % of metabolites have agonist activity on the 5-HT₃ receptors. Excretion: Average terminal half-life: 40 hr.
CIMS Class	Antiemetics / Supportive Care Therapy
ATC Classification	A04AA05 - palonosetron;

pamidronate

CIMS Class : (Agents Affecting Bone Metabolism)
pamidronate

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related pamidronate information

Indication & Dosage

Intravenous

Paget's disease of bone

Adult: 30 mg daily (over 4 hr) for 3 consecutive days (total dose: 90 mg), may repeat course when clinically indicated. Alternatively, 30 mg wkly for 6 wk (total dose: 180 mg) or 30 mg in the 1st wk, then 60 mg every other wk for 6 wk (total dose: 210 mg); may repeat course 6 mthly until remission of the disease is achieved, or relapse occurs. Max infusion rate: 60 mg/hr. Max total dose: 360 mg/course.

Elderly: Initiate with lower doses.

Renal impairment: Max infusion rate: 20 mg/hr.

CrCl (ml/min)	Dosage Recommendation
<30	Avoid.

Intravenous

Hypercalcaemia of malignancy

Adult: 15-90 mg (based on initial plasma calcium concentration) by slow infusion as a single dose over 2-24

Hypercalcaemia of malignancy

Adult: 15-90 mg (based on initial plasma calcium concentration) by slow infusion as a single dose over 2-24 hr or in divided doses over 2-4 days. Generally, plasma-calcium levels should start declining 24-48 hr after a dose with normalisation within 3-7 days. May repeat treatment if normocalcaemia is not achieved within this time or if hypercalcaemia recurs.

Elderly: Initiate with lower doses.

Renal impairment: Max infusion rate: 20 mg/hr.

CrCl (ml/min)	Dosage Recommendation
<30	Avoid.

Intravenous

Bone metastases

Adult: 90 mg every 3-4 wk. To be given as a 4-hr infusion.

Elderly: Initiate with lower doses.

Renal impairment: If renal function deteriorates: stop treatment until renal function is within 10% of baseline level. If reinstated, infuse over at least 4 hr.

CrCl (ml/min)	Dosage Recommendation	
<30	Avoid, unless case is life threatening tumour induced hypercalcaemia.	
30-60	Max rate: 20 mg/hr	

Reconstitution: Add 5 ml of sterile water for inj to a 15 mg of vial of lyophilised drug or 10 ml to vials containing 30 or 90 mg of lyophilised drug. Resulting solutions will contain 3 or 9 mg/ml of pamidronate disodium. Allow contents to completely dissolve before withdrawing a dose. Further dilution: 250-1000 ml of 0.45% or 0.9% sodium chloride or 5% glucose.

Incompatibility: Incompatible with calcium containing

	250-1000 ml of 0.45% or 0.9% sodium chloride or 5% glucose. Incompatibility: Incompatible with calcium containing solutions such as lactated Ringer's.	
Overdosage	Hypocalcemia, hypotension, ECG changes, seizures, bleeding, paresthesia, carpopedal spasm, and fever. Treatment: IV calcium gluconate and supportive care; fever and hypotension treated with corticosteroids.	
Contraindications	History of allergy to bisphosphonates. Pregnancy.	
Special Precautions	May increase the risk of heart failure in patients with cardiac disease. Lactation. Infuse slowly to reduce risk of adverse effects (e.g. infusion site reactions, renal impairment). Do not give as a bolus inj. Risk of neurotoxicity: Each dose should not >90mg (max concentration: 60 mg/250ml). CBC should be performed (patients with preexisting anemia, leukopenia or thrombocytopenia should be closely monitored within the 1st 2 wk of therapy). Bone, myalgia and/or arthralgia (possibly incapacitating) may develop days, mth, or yr after starting bisphosphonate; pain is distinctly different to the acute bone pain, myalgia or arthralgia which may follow administration and normally improves within several days; symptoms normally stop once therapy is discontinued; do not administer to patients with a history of these reactions associated with bisphosphonate therapy. Monitor creatinine before each dose, especially in those predisposed to renal impairment (withhold dose in patients with bone metastases whose renal function declines).	
Adverse Drug Reactions	Occurrence and severity of reactions depend on dose and duration of infusion. Anorexia, dyspepsia, nausea, abdominal pain, vomiting; metastases; fatigue; arthralgia, myalgia; anxiety, headache, insomnia, fever; flu-like symptoms;	

	duration of infusion. Anorexia, dyspepsia, nausea, abdominal pain, vomiting; metastases; fatigue; arthralgia, myalgia; anxiety, headache, insomnia, fever; flu-like symptoms; transient bone pain, hypocalcaemia; leucopenia; local reactions at infusion site; somnolence, dizziness, hypotension, rash; hypophosphataemia, hypokalaemia, hypomagnesaemia; osteonecrosis of the jaw (especially in cancer patients); vein irritation and thrombophlebitis; candidiasis; UTI; dyspnoea, cough, upper respiratory tract infections, sinusitis, pleural effusion; atrial fibrillation, hypertension, syncope, tachycardia; psychosis; constipation, GI bleed; uremia; rales, rhinitis. Potentially Fatal: Acute renal and heart failure.
Drug Interactions	Additive hypocalcaemic effect with aminoglycosides; decreased absorption with antacids (containing aluminium, calcium or magnesium), administer at a different time of day; decreased absorption with calcium salts; increases risk of GI adverse/toxic effects (especially GI ulcers) with NSAIDs; may increase hypocalcaemic effect of phosphate supplements.
Lab Interference	May interfere with diagnostic imaging agents in bone scans such as technetium-99m-diphosphonate.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Powder for reconstitution: Store <30°C. Solution for inj: Store <25°C. After reconstitution: Stable for up to 24 hr when refrigerated at 2-8°C.
Mechanism of Action	Pamidronate is an aminobisphosphonate that inhibits bone resorption by acting on osteoclasts and osteoclast precursors. It also inhibits tumour induced osteolysis and

	Pamidronate is an aminobisphosphonate that inhibits bone resorption by acting on osteoclasts and osteoclast precursors. It also inhibits tumour induced osteolysis and delays or prevents skeletal related events (e.g. fractures, spinal cord depression) and decreases bone pain in patients with lytic metastases. Onset: 24-48 hr. Duration: Peak effect: max 5-7 days. Absorption: Poor absorption. Excretion: Elimination half-life: 21-35 hr. Excretion: Biphasic; urine (approx 50% as unchanged drug) within 120 hr.
CIMS Class	Agents Affecting Bone Metabolism
ATC Classification	M05BA03 - pamidronic acid; Belongs to the class of bisphosphonates. Used in the treatment of bone diseases.

pancreatin

CIMS Class : (Digestives)
pancreatin

P - Caution when used during pregnancy
L - Caution when used during lactation

related pancreatin information

Indication & Dosage	<i>Oral</i> Pancreatic insufficiency Adult: Dose is adjusted according to dosage form and patient's needs. Usual dose with each meal: 5,000-56,000 units of lipase activity (with varying proportions of protease and amylase activity, depending on the preparation). Child: Dose dependant upon dosage form and patient's needs. Children with cystic fibrosis max dose: 10,000 units lipase/kg/day. Max Dosage:
Overdosage	May lead to laxative effect; treatment: supportive.
Contraindications	Acute pancreatitis or acute exacerbation of chronic pancreatic disease.
Special Precautions	Avoid high doses in patients with cystic fibrosis. Maintain adequate hydration. Some products contain pork protein. Inactivated by heat; do not mix with hot food or liquids. May irritate oral mucosa; should not be held in mouth. Pregnancy and lactation.

	Inactivated by heat; do not mix with hot food or liquids. May irritate oral mucosa; should not be held in mouth. Pregnancy and lactation.
Adverse Drug Reactions	GI effects e.g. abdominal discomfort, nausea and vomiting. Buccal and perianal irritation, particularly in infants. Colonic strictures may occur, mainly in children with cystic fibrosis receiving high doses of pancreatin preparations. Hyperuricaemia and hyperuricosuria may occur.
Drug Interactions	May impair the oral absorption of folic acid when taken together; antagonises hypoglycaemic effect of acarbose.
Storage	Oral: Store at 15-30°C. Protect from humidity.
Mechanism of Action	Pancreatin are pancreatic enzymes which hydrolyse fats to glycerol and fatty acids, break down protein into peptides, proteoses and derived substances, and convert starch into dextrins and sugars.
CIMS Class	Digestives

pancuronium

CIMS Class : (Muscle Relaxants)
pancuronium

P - Caution when used during pregnancy

L - Contraindicated in lactation

related pancuronium information

Indication & Dosage

Intravenous

Facilitate endotracheal intubation

Adult: Initially, 50-100 mcg/kg. Maintenance: 10-20 mcg/kg.

Can be administered undiluted by rapid IV inj.

Child: Neonate:30-40 mcg/kg. Maintenance: 10-20 mcg/kg
4-6 hrly as necessary. 1 mth-18 yr: initially 60-100 mcg/kg,
then 10-20 mcg/kg repeated as required.

CrCl (ml/min)	Dosage Recommendation
10-50	50% normal dose
<10	avoid

Hepatic impairment: Hepatic impairment may results in a slower onset of action, higher initial dosage and longer neuromuscular blockade.

Intravenous

Muscle relaxant in general anaesthesia

Adult: Initially, 50-100 mcg/kg. Maintenance: 10-20 mcg/kg.

Can be administered undiluted by rapid IV inj.

Child: Neonate:30-40 mcg/kg. Maintenance: 10-20 mcg/kg
4-6 hrly as necessary. 1 mth-18 yr: initially 60-100 mcg/kg,

	Can be administered undiluted by rapid IV inj.	
	Child: Neonate:30-40 mcg/kg. Maintenance: 10-20 mcg/kg 4-6 hrly as necessary. 1 mth-18 yr: initially 60-100 mcg/kg, then 10-20 mcg/kg repeated as required.	
	CrCl (ml/min)	Dosage Recommendation
	10-50	50% normal dose
	<10	avoid
	Hepatic impairment: Hepatic impairment may results in a slower onset of action, higher initial dosage and longer neuromuscular blockade.	
	<i>Intravenous</i>	
	Facilitate mechanical ventilation in intensive care	
	Adult: 60 mcg/kg every 60-90 min. May be administered undiluted by rapid IV inj.	
	CrCl (ml/min)	Dosage Recommendation
Overdosage	10-50	50% dose
	<10	avoid
	Hepatic impairment: Hepatic impairment may result in a slower onset of action, higher initial dosage and longer neuromuscular blockade.	
	Reconstitution: Can be diluted in 5% glucose or 0.9% sodium chloride.	
	Incompatibility: At the Y-site: diazepam and thiopental; variable compatibility with propofol. Do not mix other solutions in the same syringe as a change in pH can cause precipitation (normally pH 4).	
	Symptoms: apnoea, respiratory depression and CV collapse. Treatment: pyridostigmine, neostigmine or edrophonium with atropine.	
	Anuria. Relatively contraindicated in conditions of reduced airway control. Lactation.	
	Myasthenia gravis; severe electrolyte disorders; severe CV disease; pregnancy. Hepatic and renal function impairment.	
Contraindications		
Special Precautions		

Special Precautions	Myasthenia gravis; severe electrolyte disorders; severe CV disease; pregnancy. Hepatic and renal function impairment. Hypothermia; jaundice; hypermagnesaemia, hypocalcaemia, hypokalaemia, hypoproteinaemia, acidosis, alkalosis, hypercalcemia. In obese patients, dose should be based on ideal body wt. Elderly; previous anaphylactic reactions to other neuromuscular-blocking agents. Burn patients (>30% of body) may be resistant to action for 5-70 days after injury. Demyelinating lesions, peripheral neuropathies, denervation, infection, muscle trauma, and DM may antagonise the neuromuscular blockade effects of drug. Neuromuscular diseases, acute intermittent porphyria, Eaton-Lambert syndrome. Maintain adequate airway and respiratory support during use.
Adverse Drug Reactions	Tachycardia may occur due to vagal blockade and especially during light anaesthesia. May decrease intra-ocular pressure and induce miosis; excessive salivation; transient rashes and itching; wheezing; elevation in pulse rate, BP, cardiac output; erythema; burning sensation along vein; profound muscle weakness; bronchospasm; hypersensitivity reaction; acute quadriplegic myopathy syndrome, myositis ossificans. Potentially Fatal: Rare anaphylactoid reactions; bradycardia, bronchospasm, hypotension and CV collapse; respiratory depression.
Drug Interactions	Neuroleptanalgesia may decrease neuromuscular activity. Action may be prolonged and/or potentiated by aminoglycoside antibiotics, lithium, diazepam, lidocaine (high dose), quinidine, tetracyclines, propranolol, thiamine (high dose), parenteral magnesium sulphate, MAOIs, quinine, protamine, carbamazepine, donepezil and phenytoin (if pancuronium is given concurrently for <1 wk). Action may be

	dose), quinidine, tetracyclines, propranolol, thiamine (high dose), parenteral magnesium sulphate, MAOIs, quinine, protamine, carbamazepine, donepezil and phenytoin (if pancuronium is given concurrently for <1 wk). Action may be decreased by neostigmine, edrophonium, high-dose or long term corticosteroids, adrenaline (may also potentiate effect), azathioprine, theophylline (high doses), clindamycin, nifedipine, piperacillin, polymixins, verapamil, procainamide. Furosemide may increase or decrease effects. TCAs may increase risk of arrhythmias and hypotension during anaesthesia. Potentially Fatal: Potentiated by volatile anaesthetics (isoflurane and enflurane) and local anaesthetics. Prior admin of suxamethonium can increase the intensity of neuromuscular block. Concomitant use with digoxin may increase risk of serious cardiac arrhythmias.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Normally refrigerated, however stable at room temperature for 6 mth.
Mechanism of Action	Pancuronium bromide is a non-depolarising neuromuscular blocking agent with curarimimetic action through competitive blockade at the myoneural junction by binding with cholinergic receptor sites. Onset: Peak effect after IV administration: 2-3 min. Duration: (dose dependant) 60-100 min. Recovery time is often much slower in renal and hepatic impairment. Distribution: Volume of distribution is increased 50% in hepatic impairment. Protein-binding: 80%.

	often much slower in renal and hepatic impairment. Distribution: Volume of distribution is increased 50% in hepatic impairment. Protein-binding: 80%. Metabolism: Hepatic (30-45%); active metabolite 3-hydroxypancuronium (30-50% activity of drug). Excretion: Half life elimination: 10 min (doubled in hepatic and renal impairment). Excreted via urine (55-70% as unchanged drug). Plasma clearance reduced in hepatic and renal impairment.
CIMS Class	Muscle Relaxants

pantoprazole

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants)
pantoprazole

P - Caution when used during pregnancy

L - Contraindicated in lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related pantoprazole information

Indication & Dosage

Oral

Gastro-oesophageal reflux disease

Adult: 20-40 mg once daily in the morning for 4 wk, increased to 8 wk if necessary. Maintenance: 20-40 mg daily, increased to 40 mg each morning if symptoms return.

Hepatic impairment: Doses >40 mg daily have not been studied in hepatically-impaired patients.

Oral

Peptic ulcer

Adult: 40 mg once daily in the morning for 2-4 wk for duodenal ulceration or 4-8 wk for benign gastric ulceration.

Hepatic impairment: Doses >40 mg daily have not been studied in hepatically-impaired patients.

Oral

***H.pylori* infection**

Adult: Triple therapy: 40 mg bid combined with clarithromycin 500 mg bid and either amoxicillin 1 g bid or

***H.pylori* infection**

Adult: Triple therapy: 40 mg bid combined with clarithromycin 500 mg bid and either amoxicillin 1 g bid or metronidazole 400 mg bid.

Hepatic impairment: Doses >40 mg daily have not been studied in hepatically-impaired patients.

Oral

Prophylaxis of NSAID-induced ulcers

Adult: 20 mg daily.

Hepatic impairment: Doses >40 mg daily have not been studied in hepatically-impaired patients.

Oral

Zollinger-Ellison syndrome

Adult: Initially 80 mg daily, adjusted to individual requirements. Up to 240 mg daily may be used if needed. Daily doses >80 mg should be given in 2 divided doses.

Hepatic impairment: Doses >40 mg daily have not been studied in hepatically-impaired patients.

Intravenous

Zollinger-Ellison syndrome

Adult: As Na salt: 80 mg once or twice daily. Up to 240 mg daily may be given in divided doses. Convert to oral therapy as soon as possible. Dose to be given as slow inj or short-term infusion over 2-15 minutes.

Hepatic impairment: May need to reduce dose.

Intravenous

Gastro-oesophageal reflux disease

Adult: As Na salt: 40 mg daily. Convert to oral therapy as soon as possible. Dose to be given as slow inj or short-term infusion over 2-15 minutes.

Hepatic impairment: May need to reduce doses.

Intravenous

Peptic ulcer

	infusion over 2-15 minutes. Hepatic impairment: May need to reduce doses. <i>Intravenous</i> Peptic ulcer Adult: As Na salt: 40 mg daily. Convert to oral therapy as soon as possible. Dose to be given as slow inj or short-term infusion over 2-15 minutes. Hepatic impairment: May need to reduce doses. Reconstitution: Reconstitute with 10 ml 0.9% sodium chloride (final concentration 4 mg/ml). Reconstituted solution may be given IV (over 2 minutes) or diluted to 100 ml in glucose 5%, 0.9% sodium chloride, or lactated Ringer's and infused over 15 min. Incompatibility: Y site incompatibility: midazolam and zinc.
Administration	Normal release: May be taken with or without food. Controlled-release: Should be taken on an empty stomach. (Take 1 hr before meals. Swallow whole, do not chew/crush.)
Overdosage	Treatment: supportive. Not removed by haemodialysis.
Contraindications	Lactation.
Special Precautions	Long-term therapy may lead to bacterial overgrowth in the GI tract. Hepatic impairment; monitor liver function regularly (if enzymes increase, discontinue); pregnancy; not recommended in children <18 yr; long term use may lead to atrophic gastritis.
Adverse Drug Reactions	Diarrhoea, dizziness, pruritus, skin rashes, GI tract infections, chest pain, headache, nausea, pain, anxiety, hyperglycaemia; malaise or lassitude; myalgia; oedema; insomnia; hyperlipidaemia; flatulence, abdominal pain, constipation, eructation, dyspepsia, rectal disorder; urinary frequency, UTI; abnormalities in liver function; local site reaction; hypertonia, neck pain, weakness; bronchitis, cough,

	constipation, eructation, dyspepsia, rectal disorder; urinary frequency, UTI; abnormalities in liver function; local site reaction; hypertonia, neck pain, weakness; bronchitis, cough, dyspnoea, pharyngitis, rhinitis, sinusitis, upper respiratory tract infection, flu syndrome.
Drug Interactions	Decreased absorption of ketoconazole and itraconazole; may slightly increase digoxin plasma concentration; may reduce plasma concentration of atazanavir, avoid concomitant use; may enhance anticoagulant effect of coumarins; may cause gastric mucosal irritation with alcohol; may increase levels or effects of: bosentan, dapsone, fluoxetine, glimepiride, glipizide, losartan, montelukast, nateglinide, paclitaxel, phenytoin, warfarin, and zafirlukast; may decrease levels or effects of: aminoglutethimide, carbamazepine, phenytoin, and rifampicin.
Food Interaction	Long term use (>3 yr) may lead to vitamin B12 malabsorption. May decrease oral absorption of iron salts.
Lab Interference	May produce false positive urine screening tests for tetrahydrocannabinol.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: IV (before reconstitution): <25 °C. Once reconstituted, store <25 °C and use within 12 hr. Oral: Store tablet at 15-30 °C.
Mechanism of Action	Pantoprazole inhibits H ⁺ /K ⁺ ATPase pump function thereby reducing gastric acid secretion. It also has a role in the eradication of H. pylori.

	Pantoprazole inhibits H⁺/K⁺ ATPase pump function thereby reducing gastric acid secretion. It also has a role in the eradication of H. pylori. Absorption: Well absorbed; peak plasma concentrations: Approx 2-2.5 hr after oral dose. Oral bioavailability: Approx 77% with enteric-coated formulation (does not vary after single or multiple doses). Distribution: Protein-binding: 98%; volume of distribution: 11-24 L. Metabolism: Hepatic; mainly by cytochrome CYP2C19 and slightly by CYP2D6 and CYP2C8. Excretion: Via urine (approx 80%) and bile (approx 20%). Elimination half life: approx 1 hr (prolonged in hepatic impairment; in patients with cirrhosis the elimination half life may be 3-10 hr).
CIMS Class	Antacids, Antireflux Agents & Antiulcerants
ATC Classification	A02BC02 - pantoprazole; Belongs to the class of proton pump inhibitors. Used in the treatment of peptic ulcer and gastro-oesophageal reflux disease (GERD).

pantoprazole + domperidone

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants) , (GIT Regulators, Antiflatulents & Anti-inflammatories)
pantoprazole + domperidone

P - Contraindicated in pregnancy

L - Caution when used during lactation

related pantoprazole + domperidone information

Indication & Dosage	<i>Oral</i> Gastro-oesophageal reflux disease, Dyspepsia Adult: Per tablet/capsule contains pantoprazole 40 mg and domperidone 10 mg: 1 tablet/capsule once daily.
Contraindications	Pantoprazole: Hepatic impairment; hypersensitivity. Domperidone: History of hypersensitivity to dimenhydrinate or related compounds; GI haemorrhage, obstruction and perforation, or after surgery, pregnancy.
Special Precautions	Lactation. Pantoprazole: Not recommended in child <12 yrs. Long-term therapy may lead to bacterial overgrowth in the GIT. Domperidone: Increases serum prolactin levels resulting to galactorrhoea in females and gynaecomastia in males. Hypertensive crisis in patients with pheochromocytoma.
Adverse Drug Reactions	Pantoprazole: Diarrhoea, dizziness, pruritus, skin rashes, GIT infections; anaphylaxis, angioedema, chest pain, dyspnoea, erythema multiforme, gastroenteritis, hyperglycaemia, infection, Inj site reaction, jaundice, optic

	GIT infections; anaphylaxis, angioedema, chest pain, dyspnoea, erythema multiforme, gastroenteritis, hyperglycaemia, infection, Inj site reaction, jaundice, optic neuropathy, anterior ischaemia, pancreatitis, speech disorder. Domperidone: Headache, insomnia, nervousness, dizziness, thirst, lethargy, irritability, GI disturbances, hot flushes, mastalgia, galactorrhoea, gynaecomastia, menstrual irregularities, rash, pruritus, urticaria, stomatitis, conjunctivitis, urinary frequency, dysuria, oedema, palpitations, leg cramps, asthaenia, drug intolerance.
Drug Interactions	Care should be exercised when domperidone is administered in combination with MAO inhibitors.
Mechanism of Action	Pantoprazole acts by selectively inhibiting the H ⁺ /K ⁺ -ATPase enzyme in the secretory canaliculus of the stimulated parietal cell. Domperidone stimulates GI activity by acting as a competitive antagonist at dopamine D ₂ -receptors.
CIMS Class	Antacids, Antireflux Agents & Antiulcerants / GIT Regulators, Antiflatulents & Anti-inflammatories
ATC Classification	A02BC02 - pantoprazole; Belongs to the class of proton pump inhibitors. Used in the treatment of peptic ulcer and gastro-oesophageal reflux disease (GERD). A03FA03 - domperidone; Belongs to the class of propulsives. Used in the treatment of functional gastrointestinal disorders.

paracetamol

CIMS Class : (Analgesics (Non-Opioid) & Antipyretics)
paracetamol

Lab ⚠ - Lab interference
Food ⚠ - Food interaction

related paracetamol information

Indication & Dosage

Oral

Mild to moderate pain and fever

Adult: 0.5-1 g 4-6 hrly as necessary. Max: 4 g daily.

Child: Neonate 28-32 wk post menstrual age: 20 mg/kg as a single dose then 10-15 mg/kg 8-12 hrly (max 30 mg/kg daily in divided doses); neonate >32 wk post menstrual age: 20 mg/kg as a single dose then 10-15 mg/kg 6-8 hrly (max 60 mg/kg daily in divided doses); child 1-3 mth: 30 mg 8 hrly (max 60 mg/kg daily in divided doses); 3 mth-1 yr: 60-120 mg 4-6 hrly (max 4 doses in 24 hr); 1-5 yr: 120-250 mg 4-6 hrly (max 4 doses in 24 hr); 6-12 yr: 250-500 mg 4-6 hrly (max 4 doses in 24 hr).

CrCl (ml/min)	Dosage Recommendation
10-50	6 hrly.
<10	8 hrly.

Oral

Post-immunisation pyrexia

Child: 2-3 mth: Initially, 60 mg repeated 4-6 hrly if necessary.

CrCl (ml/min)	Dosage Recommendation
<10	8 hrly.

Post-immunisation pyrexia

Child: 2-3 mth: Initially, 60 mg repeated 4-6 hrly if necessary.

<10	8 hrly.
-----	---------

10-50	6 hrly.
-------	---------

Intravenous**Mild to moderate pain and fever**

Adult: Admin over 15 minutes. Wt >50 kg: 1 g 4-6 hrly (max 4 g daily); <50 kg: 15 mg/kg 4-6 hrly (max 60 mg/kg daily).

Child: Admin over 15 min. Wt <10 kg: 7.5 mg/kg 4-6 hrly (max 30 mg/kg daily); 10-50 kg: 15 mg/kg 4-6 hrly (max 60 mg/kg daily); >50 kg: 1 g 4-6 hrly (max 4 g daily).

-----	---------

Rectal**Mild to moderate pain and fever**

Adult: 0.5-1 g 4-6 hrly as necessary. Max: 4 g daily.

Child: Neonate 28-32 wk postmenstrual age: 20 mg/kg as a single doses then 15 mg/kg 12 hrly as necessary (max 30 mg/kg daily in divided doses); neonate >32 wk postmenstrual age: 30 mg/kg as a single dose then 20 mg/kg 8 hrly as necessary (max 60 mg/kg daily in divided doses); 1-3 mth: 30-60 mg 8 hrly (max 60 mg/kg daily in divided doses); 3-12 mth: 60-125 mg 4-6 hrly (max 4 doses in 24 hr); 1-5 yr: 125-250 mg 4-6 hrly (max 4 doses in 24 hr); 6-12 yr: 250-500 mg 4-6 hrly (max 4 doses in 24 hr); >12 yr: 500 mg 4-6 hrly (max 4g daily).

CrCl (ml/min)	Dosage Recommendation
---------------	-----------------------

10-50	6 hrly.
-------	---------

<10	8 hrly.
-----	---------

Reconstitution: Can be diluted in 0.9% sodium chloride or 5%

	Reconstitution: Can be diluted in 0.9% sodium chloride or 5% glucose solution up to one $\frac{1}{10}$. Incompatibility: Do not mix with other drugs.	
Administration	May be taken with or without food.	
Overdosage	Overdosage: Consult local protocols. Early symptoms: nausea and vomiting (normally settle within 24 hr of ingestion). After 24 hr symptoms may include right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is greatest 3-4 days after ingestion and may lead to encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema and death. Treatment: based on plasma concentration. Acetylcysteine protects the liver if administered within 24 hr after ingestion (most effective if given within 8 hr). Dose: 140 mg/kg orally (loading) followed by 70 mg/kg every 4 hr for 17 doses. Parenteral acetylcysteine is given to those unable to take oral dosing. Activated charcoal may be given if paracetamol is 150 mg/kg or 12 g (whichever is smaller) if it is thought that the paracetamol has been ingested within the previous hr.	
Special Precautions	Renal or hepatic impairment; alcohol-dependent patients; G6PD deficiency.	
Adverse Drug Reactions	Nausea, allergic reactions, skin rashes, acute renal tubular necrosis. Potentially Fatal: Very rare, blood dyscrasias (e.g. thrombocytopenia, leucopenia, neutropenia, agranulocytosis); liver damage.	
Drug Interactions	Reduced absorption of cholestyramine within 1 hr of admin. Accelerated absorption with metoclopramide. Decreased effect with barbiturates, carbamazepine, hydantoins, rifampicin and sulfinpyrazone. Paracetamol may increase effect of warfarin.	

	Accelerated absorption with metoclopramide. Decreased effect with barbiturates, carbamazepine, hydantoins, rifampicin and sulfinpyrazone. Paracetamol may increase effect of warfarin. Potentially Fatal: Paracetamol increases the risk of liver damage in chronic alcoholics. Increased risk of toxicity with other hepatotoxic drugs or drugs which induce microsomal enzymes e.g. barbiturates, carbamazepine, hydantoins, rifampicin and sulfinpyrazone.
Food Interaction	St John's Wort may decrease effect.
Lab Interference	May produce false-positive test results for 5-hydroxyindoleacetic acid.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Do not store above 30°C; do not freeze or refrigerate; if parenteral solution is diluted: use within an hr (infusion time included). Oral: Do not store above 30°C; do not freeze or refrigerate; if parenteral solution is diluted: use within an hr (infusion time included). Rectal: Do not store above 30°C; do not freeze or refrigerate; if parenteral solution is diluted: use within an hr (infusion time included).
Mechanism of Action	Paracetamol exhibits analgesic action by peripheral blockage of pain impulse generation. It produces antipyresis by inhibiting the hypothalamic heat-regulating centre. Its weak anti-inflammatory activity is related to inhibition of prostaglandin synthesis in the CNS. Onset: <1 hr. Duration: 4-6 hr. Absorption: Incomplete; depends upon dosage form. Time to

	CNS. Onset: <1 hr. Duration: 4-6 hr. Absorption: Incomplete; depends upon dosage form. Time to peak, serum: oral: 10-60 min; may be delayed in acute overdoses. Decreased rate of absorption with food. Distribution: Present in most body tissues; crosses the placenta and enters the breast milk. Protein binding: 8-43% (at toxic doses). Metabolism: Hepatic via glucuronic and sulphuric acid conjugation. At normal therapeutic levels, glucuronide metabolites are metabolised to reactive intermediate (acetylimidoquinone) which is conjugated with glutathione and inactivated; at toxic doses, glutathione conjugation is insufficient leading to increased acetylimidoquinone which may cause hepatic cell necrosis. Excretion: Plasma half-life: 2.7 hr (adults); 1.5-2 hr (infants and children); 3.5 hr (neonates). Neonates, infants and children up to 10 yr excrete less glucuronide than adults. Half-life may be longer after toxic doses. Excreted mainly via urine (2- 5% unchanged; 55% as glucuronide metabolites). Total body clearance: 18 L/hr.
CIMS Class	Analgesics (Non-Opioid) & Antipyretics
ATC Classification	N02BE01 - paracetamol; Belongs to the class of anilide preparations. Used to relieve pain and fever.

paracetamol + codeine

CIMS Class : (Analgesics (Non-Opioid) & Antipyretics)
paracetamol + codeine

P - Caution when used during pregnancy

L - Caution when used during lactation

related paracetamol + codeine information

Indication & Dosage	<i>Oral</i> Mild to moderate pain Adult: Each tablet containing paracetamol 500 mg and codeine phosphate 8 mg: 1-2 tablets every 4-6 hr. Max: 4 doses in 24 hr. Child: 6-12 yr: Each tablet containing paracetamol 500 mg and codeine phosphate 8 mg: ½-1 tablet every 4-6 hr. Max: 4 doses in 24 hr.
Overdosage	Paracetamol: Symptoms: Paleness, nausea, vomiting, anorexia, abdominal pain, metabolic acidosis and glucose metabolism disturbances. Liver damage may surface 12-48 hr after overdose. In severe cases, encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema, acute renal failure and death. Management: Immediate medical treatment even if there are no symptoms. If presented within 1 hr of poisoning, admin activated charcoal. If needed, admin IV N-acetylcysteine or oral methionine. Codeine: Symptoms: Nausea, vomiting, CNS depression. Management: Treatment is symptomatic and supportive with monitoring of vital signs. Admin naloxone if coma or respiratory depression is present. Repeated doses may be

	methionine. Codeine: Symptoms: Nausea, vomiting, CNS depression. Management: Treatment is symptomatic and supportive with monitoring of vital signs. Admin naloxone if coma or respiratory depression is present. Repeated doses may be needed and observe for at least 4 hr after ingestion.
Special Precautions	Liver or kidney impairment. Pregnancy and lactation. Alcohol dependence. Prolonged use may lead to addiction resulting in restlessness and irritability when treatment is stopped.
Adverse Drug Reactions	Nausea, vomiting, constipation, dry mouth, sweating, skin rashes. Potentially Fatal: Blood dyscrasias (rare).
Drug Interactions	Increased paracetamol absorption with metoclopramide and domperidone. Decreased paracetamol absorption with cholestyramine. May increase risk of bleeding with warfarin and coumarins. Codeine may antagonise the GI effects of metoclopramide and domperidone. Increased CNS depression with CNS depressants (e.g. alcohol, anaesthetics, anxiolytics, hypnotics, TCA, and antipsychotics). Potentially Fatal: Increased risk of liver damage with alcohol. Avoid use within 14 days of discontinuing MAOI.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Paracetamol, a para-aminophenol derivative, is a peripherally acting analgesic with antipyretic and weak anti-inflammatory activity. Codeine, a phenanthrene derivative, is an opioid analgesic which acts via the CNS. Absorption: Paracetamol: Readily absorbed from GI tract; time to peak plasma concentrations: 10-60 minutes. Codeine: Absorbed from GI tract; time to peak plasma concentrations: 1

	Absorption: Paracetamol: Readily absorbed from GI tract; time to peak plasma concentrations: 10-60 minutes. Codeine: Absorbed from GI tract; time to peak plasma concentrations: 1 hr; plasma half-life: 3-4 hr (Oral/IM). Distribution: Paracetamol: Distributed into most body tissues including breast milk, crosses the placenta; plasma-protein binding: negligible (but dose dependent); elimination half-life: 1-3 hr. Metabolism: Paracetamol: Undergoes hepatic metabolism. A minor metabolite, produced in minute amounts by cytochrome P450 isoenzymes in the liver and kidney, is usually removed by conjugation with glutathione, but may accumulate and cause tissue damage in paracetamol overdose. Codeine: Undergoes hepatic metabolism to morphine, norcodeine, normorphine, hydrocodone and other metabolites. Excretion: Paracetamol: Excreted in the urine mainly as the glucuronide and sulfate conjugates with <5% excreted unchanged. Codeine: Excreted by kidney, mainly as glucuronate conjugates.
CIMS Class	Analgesics (Non-Opioid) & Antipyretics
ATC Classification	N02BE01 - paracetamol; Belongs to the class of anilide preparations. Used to relieve pain and fever. R05DA04 - codeine; Belongs to the class of cough suppressants, opium alkaloids and derivatives. Used in the treatment of dry cough.

paracetamol + dextropropoxyphene

CIMS Class : (Analgesics (Non-Opioid) & Antipyretics) , (Analgesics (Opioid))
paracetamol + dextropropoxyphene

P - Caution when used during pregnancy

L - Caution when used during lactation

related paracetamol + dextropropoxyphene information

Indication & Dosage

Oral

Chronic pain

Adult: Each tablet/capsule containing dextropropoxyphene 32.5 mg and paracetamol 325 mg: 2 capsules 3-4 times daily. Max: 8 capsules/day.

Elderly: Dose reduction is required.

Renal impairment: Dose reduction is required.

Hepatic impairment: Dose reduction is required.

Overdosage

Overdosage with dextropropoxyphene may cause the patient to be stuporose or comatose and convulsing. Respiratory depression , decreased ventilatory rate and/or tidal volume leading to cyanosis and hypoxia may occur. Subsequently, BP may fall and cardiac performance worsens resulting in pulmonary oedema and circulatory collapse. Paracetamol overdose may result in anorexia, nausea, vomiting, diaphoresis, general malaise and abdominal pain. Evidence of hepatic toxicity may become obvious up to 72 hr after ingestion. Treatment includes establishing a patent airway and restoring ventilation. Naloxone may be used to reduce

	diaphoresis, general malaise and abdominal pain. Evidence of hepatic toxicity may become obvious up to 72 hr after ingestion. Treatment includes establishing a patent airway and restoring ventilation. Naloxone may be used to reduce the degree of respiratory depression; 0.4-2 mg can be administered promptly, preferably via IV route. May repeat naloxone dose at 2-3 min intervals if needed. If no response is observed after 10 mg of naloxone has been administered, the diagnosis of dextropropoxyphene toxicity should be questioned. Obtain a serum paracetamol assay as early as possible, but no earlier than 4 hr after ingestion. N-acetylcysteine, should be administered as early as possible, and within 16 hr of the overdose ingestion for maximal results.
Contraindications	Concurrent admin with alcohol or paracetamol-containing products.
Special Precautions	Hepatic or renal impairment, pregnancy, lactation, children, elderly. Dextropropoxyphene may impair mental alertness and co-ordination. Not recommended for use in patients who are suicidal or prone to drug dependence.
Adverse Drug Reactions	Dizziness, sedation, nausea, vomiting, weakness, constipation, abdominal pain, rash, euphoria, dysphoria, visual disturbances, liver dysfunction, abuse potential. Potentially Fatal: Hepatic necrosis (especially in chronic alcoholics).
Drug Interactions	Dextropropoxyphene may inhibit the hepatic metabolism of antidepressants, anticonvulsants and warfarin-like drugs; paracetamol may enhance anticoagulant activity. Concurrent admin may increase serum levels of carbamazepine and result in neurotoxicity. Ritonavir may increase serum levels of dextropropoxyphene when used together. Potentially Fatal: CNS depressant effect of

	result in neurotoxicity. Ritonavir may increase serum levels of dextropropoxyphene when used together. Potentially Fatal: CNS depressant effect of dextropropoxyphene is additive with other CNS depressants, including alcohol. Concurrent admin with alcohol or paracetamol-containing products.
Mechanism of Action	Dextropropoxyphene is a centrally-acting opioid analgesic. It binds to opioid receptors at several sites within the CNS. Paracetamol is a non-opioid analgesic and antipyretic. In combination, they exert greater analgesic effect than that produced by either drug administered alone. Absorption: Dextropropoxyphene: Readily absorbed from the GI tract; undergoes considerable first pass effect. Paracetamol: Readily and completely absorbed after oral admin. Distribution: Paracetamol: Evenly distributed throughout most body fluids with an apparent volume of distribution of 1-1.2 L/kg. Metabolism: Dextropropoxyphene: Metabolised hepatically. Paracetamol: About 90-95% of a dose is metabolised by the hepatic microsomal system. Excretion: Dextropropoxyphene: Half-life: About 6-12 hr. Paracetamol: Excreted mainly in the urine as the glucuronide and sulfate conjugates. Elimination half-life: 1-4 hr.
CIMS Class	Analgesics (Non-Opioid) & Antipyretics / Analgesics (Opioid)
ATC Classification	N02AC04 - dextropropoxyphene; Belongs to the class of diphenylpropylamine derivative opioids. Used to relieve pain. N02BE01 - paracetamol; Belongs to the class of anilide preparations. Used to relieve pain and fever.

paracetamol + metoclopramide

CIMS Class : (Antimigraine Preparations)
paracetamol + metoclopramide

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food $\square$ - Food interaction

related paracetamol + metoclopramide information

related paracetamol + metoclopramide information	
Indication & Dosage	<i>Oral</i> Migraine Adult: Each tablet containing paracetamol 500 mg and metoclopramide 5 mg: >20 yr: Initially, 2 tablets at first warning of an attack. May repeat doses at 4 hrly intervals. Max: 6 tablets/24 hr. 15-20 yr and $\geq$ 60 kg: Initially, 2 tablets at first warning of an attack. May repeat doses at 4 hrly intervals. Max: 5 tablets/24 hr. 15-20 yr and 30-59 kg or 12-14 yr and $\geq$ 30 kg: Initially, 1 tablet at first warning of an attack. May repeat doses at 4 hrly intervals. Max: 3 tablets/24 hr.
Overdosage	Overdose may cause damage to the liver. May be treated by gastric lavage with supportive measures. IV admin of N-acetylcysteine or oral methionine given within 10 hr of paracetamol overdose may exert a protective effect on the liver.
Contraindications	Lactation. Children <12 yr.

	Lactation. Children <12 yr.
Special Precautions	Porphyria, epilepsy, parkinsonism, history of depression, pregnancy. Renal or hepatic impairment. May impair ability to drive or operate machinery. Risk of acute hypersensitivity reactions in patients with phaeochromocytoma. Exclude the possibility of an underlying disorder if patient has persistent vomiting.
Adverse Drug Reactions	Nausea, allergic reactions, skin rashes, acute renal tubular necrosis. Constipation or diarrhoea; drowsiness, headache, depression, lassitude, extrapyramidal reactions (especially if combined with phenothiazines); galactorrhoea; parkinsonism; neuroleptic malignant syndrome; tardive dyskinesia. Potentially Fatal: Paracetamol: Very rare, blood dyscrasias (e.g. thrombocytopenia, leucopenia, neutropenia, agranulocytosis); liver damage. Metoclopramide: Very rarely, hypertensive crisis in patients with pheochromocytoma. Cardiac conduction disorders (IV admin).
Drug Interactions	Action of metoclopramide may be antagonised by anticholinergics and opioid analgesics. Metoclopramide may affect the absorption of orally administered drugs when given together.
Food Interaction	Decreased rate of absorption with food.
Mechanism of Action	Metoclopramide is a dopamine antagonist, which binds to D₂ receptors in the central and peripheral nervous system. It has anticholinesterase and antiemetic effects. Paracetamol is a centrally and peripherally acting non-opioid analgesic and antipyretic.
CIMS Class	Antimigraine Preparations

	Antimigraine Preparations
ATC Classification	A03FA01 - metoclopramide; Belongs to the class of propulsives. Used in the treatment of functional gastrointestinal disorders. N02BE01 - paracetamol; Belongs to the class of anilide preparations. Used to relieve pain and fever.

paracetamol + pentazocine

CIMS Class : (Analgesics (Opioid)) , (Analgesics (Non-Opioid) & Antipyretics)
paracetamol + pentazocine

P - Caution when used during pregnancy

L - Caution when used during lactation

related paracetamol + pentazocine information

Indication & Dosage	<i>Oral</i> Mild to moderate pain Adult: Each tablet containing paracetamol 650 mg and pentazocine 25 mg: 1 tablet every 4 hr. Max: 6 tablets/day.
Overdosage	Symptoms of overdose would be a combination of those observed with pentazocine overdose and paracetamol overdose. Pentazocine overdose may lead to anxiety, nightmares, strange thoughts and hallucinations. Marked respiratory depression associated with increased BP and tachycardia may also occur. Acute paracetamol overdose may cause nausea, vomiting, anorexia and abdominal pain. Severe overdosage may lead to potentially fatal hepatic necrosis. Treatment involves oxygen, IV fluids, vasopressors and other supportive measures.
Contraindications	Hypersensitivity to either component; raised intracranial pressure or head injury.
Special Precautions	Head injury, other intracranial lesions or preexisting increase in intracranial pressure (impedes pupillary response required

	Head injury, other intracranial lesions or preexisting increase in intracranial pressure (impedes pupillary response required for neurological assessment); patients on opiate analgesics; opioid dependence; acute alcoholism; compromised respiratory, cardiac, renal or hepatic functions; epileptic patients; pregnancy & lactation, children. Caution when used in patients with MI who have accompanying nausea or vomiting. May experience withdrawal symptoms after receiving pentazocine.
Adverse Drug Reactions	Nausea, vomiting, constipation, anorexia, diarrhea, dizziness, sedation, disorientation, euphoria, headache, visual blurring, rarely dysphoria, sweating, flushing, rashes & urticaria; urinary retention, anaphylactoid reaction & drug abuse & dependence. Potentially Fatal: Hepatic necrosis (especially in chronic alcoholics).
Drug Interactions	Paracetamol may also enhance anticoagulant activity. Naloxone reverses effects of pentazocine. Potentially Fatal: Alcohol & other CNS depressants potentiate depressant action of pentazocine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Pentazocine is an opioid analgesic with agonist/antagonist action. Paracetamol is a centrally and peripherally acting analgesic and antipyretic. The combination gives additive analgesic effects. Absorption: Pentazocine: Well absorbed from the GI tract. Paracetamol: Rapidly and almost completely absorbed from

	analgesic and antipyretic. The combination gives additive analgesic effects. Absorption: Pentazocine: Well absorbed from the GI tract. Paracetamol: Rapidly and almost completely absorbed from the GI tract. Distribution: Pentazocine: Passes the placental barrier. Metabolism: Pentazocine: Metabolised mainly by hepatic biotransformation. Paracetamol: Conjugated in the liver with glucuronic acid and to a smaller extent with sulfuric acid. Excretion: Pentazocine: Elimination half-life ranges from 1.5-10 hr. Paracetamol: Elimination half-life ranges from 2-4 hr.
CIMS Class	Analgesics (Opioid) / Analgesics (Non-Opioid) & Antipyretics
ATC Classification	N02AD01 - pentazocine; Belongs to the class of benzomorphan derivative opioids. Used to relieve pain. N02BE01 - paracetamol; Belongs to the class of anilide preparations. Used to relieve pain and fever.

paraffin

CIMS Class : (Laxatives, Purgatives) , (Ophthalmic Lubricants) , (Emollients & Skin Protectives)
paraffin

related paraffin information

Indication & Dosage	<i>Oral</i>
	Constipation
	Adult: Up to 45 ml/day, usually in the evening but should not be taken immediately before going to bed. Max duration of treatment: 1 wk.
	Child: 3-12 yr: 0.5-1 ml/kg (max 30 ml) once daily; 12-18 yr: 10-30 ml once daily, normally after evening meal but not immediately before going to bed. May be mixed with ice cream or yoghurt to increase palatability. Max duration of treatment: 1 wk.
	<i>Ophthalmic</i>
	Dry eye
	Adult: Apply as required, usually at night.
	Child: Apply as required, usually at night.
	<i>Rectal</i>
	Constipation
	Adult: 120 ml (range 60-150 ml) daily as an enema.
	Child: 2-11 yr: 30-60 ml daily as an enema.
	<i>Topical/Cutaneous</i>
	Hydrate and soften skin

	Child: 2-11 yr: 30-60 ml daily as an enema. <i>Topical/Cutaneous</i> Hydrate and soften skin Adult: Apply as required, especially after bath or shower. Child: Apply as required, especially after bath or shower.
Contraindications	Abdominal pain, nausea and vomiting is present; children <3 yr.
Special Precautions	Oral: not recommended for use in patients with difficulty swallowing or impaired neurodevelopment. Avoid prolonged use as a laxative or faecal softener. Contact lens should not be worn at the same time (interval of at least 30 min). Ocular preparations should be applied at least 5 min after any other ocular medication.
Adverse Drug Reactions	Anal irritation (excessive dose) and seepage. Foreign-body granulomatous reactions; vasospasm; lipoid pneumonia; interference with absorption of fat-soluble vitamins. When applied ophthalmically, may cause temporary visual disturbance.
Drug Interactions	May impair absorption of fat-soluble vitamins and possibly other compounds.
Storage	Ophthalmic: Store <25°C. After opening ocular preparation, discard after 28 days. Topical/Cutaneous: For creams and ointments: store <25°C.
Mechanism of Action	When taken orally: penetrates and softens faecal material. When used topically: softens and hydrates skin. When used in the eye: lubricates and protects eye. Onset: When admin orally: produces laxation after 6-8 hr.
CIMS Class	Laxatives, Purgatives / Ophthalmic Lubricants / Emollients & Skin Protectives

parecoxib

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
parecoxib

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related parecoxib information

Indication & Dosage

Parenteral

Postoperative pain

Adult: 40 mg slow IM or IV inj, then 20 or 40 mg every 6-12 hr as required. Max dose: 80 mg/day.

Child: <18 yr: Not recommended.

Elderly: <50 kg: 20 mg slow IV or IM inj, repeat to a max of 40 mg/day.

Hepatic impairment: Mild impairment (Child-Pugh score 5-6): No dosage adjustment. Moderate impairment (Child-Pugh score 7-9): Half the usual dose, repeat to a max of 40 mg/day. Severe impairment (Child-Pugh score >9): Not recommended.

Reconstitution: Reconstitute with sodium chloride 0.9%, glucose 5%, or sodium chloride 0.45% with glucose 5%.

Contraindications

Aspirin or NSAID hypersensitivity; allergy to sulphonamides; inflammatory bowel disease; moderate to severe heart failure; ischaemic heart disease, peripheral arterial disease, or cerebrovascular disease; following CABG; active peptic

	Aspirin or NSAID hypersensitivity; allergy to sulphonamides; inflammatory bowel disease; moderate to severe heart failure; ischaemic heart disease, peripheral arterial disease, or cerebrovascular disease; following CABG; active peptic ulceration; severe hepatic impairment (Child-Pugh score =10); pregnancy (3rd trimester) and lactation.
Special Precautions	Elderly, children ; history of GI ulceration, perforation or bleed; oedema; dehydration; hyperlipidaemia; DM; hypertension; liver or kidney disease; concurrent infection. May impair ability to drive or operate machinery.
Adverse Drug Reactions	Rash, ulcerations or any other signs of an allergic reaction; GI disturbances and bleeding; hypotension; hypertension; back pain; oedema; numbness; agitation or sleeping difficulties; anaemia; sore throat or difficulty breathing; pruritus; decreased urine output; jaundice, abnormal liver function; low platelet count; skin swelling, blistering or peeling; kidney failure; heart failure, heart attack, bradycardia, arrhythmia. Potentially Fatal: Anaphylaxis, Steven-Johnson syndrome, toxic epidermal necrolysis.
Drug Interactions	Enhances effects of oral anticoagulants (azapropazone and phenylbutazone); increases plasma concentrations of lithium, methotrexate, and cardiac glycosides; increased risk of nephrotoxicity with ACE inhibitors, ciclosporin, tacrolimus, or diuretics; reduces antihypertensive effects of some antihypertensives (ACE inhibitors, beta blockers, diuretics); occurrence of convulsions with quinolones; increases effects of phenytoin and sulfonylurea antidiabetics; increased risk of adverse effects with other NSAIDs (including aspirin) and misoprostol; risk of GI bleeding and ulceration increased with corticosteroids, SSRIs, the SNRI venlafaxine, the antiplatelets clopidogrel and ticlopidine, iloprost, erlotinib,

	misoprostol; risk of GI bleeding and ulceration increased with corticosteroids, SSRIs, the SNRI venlafaxine, the antiplatelets clopidogrel and ticlopidine, iloprost, erlotinib, sibutramine, alcohol, bisphosphonates, or pentoxifylline; increased risk of haematotoxicity with zidovudine; increased plasma concentrations with ritonavir; may alter the efficacy of mifepristone; metabolism may be decreased with CYP3A4 (e.g. ketoconazole) and CYP2C9 inhibitors (e.g. fluconazole), or increased with enzyme inducers (e.g. carbamazepine, dexamethasone).
Mechanism of Action	Parecoxib is the prodrug of valdecoxib. It has a very high selectivity for inhibiting cyclo-oxygenase-2 (COX-2) mediated prostaglandin synthesis to reduce mediators of pain and inflammation. The selective inhibition of COX-2 is coupled with reduced GI toxicity, but associated increased risk for thrombotic events and renal impairment have been noted. Distribution: Plasma protein binding: approx 98%. Metabolism: Hydrolysed in the liver to its active metabolite, valdecoxib, and propionic acid; plasma half-life: 22 min. Excretion: Via urine; approx 70% of a dose appearing as inactive metabolites, <5% of a dose appears as unchanged valdecoxib in the urine. Trace amounts of unchanged drug in faeces. Elimination half-life: 8 hr.
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AH04 - parecoxib; Belongs to the class of non-steroidal antiinflammatory and antirheumatic products, coxibs. Used in the treatment of inflammation and rheumatism.

parnaparin

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
parnaparin

P - Caution when used during pregnancy

L - Caution when used during lactation

related parnaparin information

Indication & Dosage	<i>Subcutaneous</i> Prophylaxis of postoperative venous thromboembolism Adult: For general surgical procedures: As sodium: Inj of 3200 units 2 hr before the procedure, followed by 3200 units once daily for 7 days or until the patient is fully ambulant. For higher risk surgery or orthopaedic patients: As sodium: Inj of 4250 units 12 hr before the procedure, followed by 4250 units 12 hr post-op and then once daily for 10 days. <i>Subcutaneous</i> Thromboembolic disorders Adult: As sodium: Inj of 6400 units for 7-10 days.
Overdosage	Haemorrhage; treatment of severe bleeding may be reduced by slow IV admin of protamine sulfate.
Contraindications	Do not give by IM. History of thrombocytopenia with heparin; positive in-vitro platelet aggregation test (cross-reactivity) with parnaparin; bacterial endocarditis; haemorrhagic CVA; conditions or diseases with increased risk of haemorrhage.
Special	Elderly, renal or hepatic impairment, extremes of body

Special Precautions	Elderly, renal or hepatic impairment, extremes of body weight, hypertension, or other patients with increased risk of bleeding; post-operative period following brain or spinal cord surgery; spinal anaesthesia or analgesia. Pregnancy and lactation. Not generally recommended for use in patients with prosthetic heart valves as they may not provide adequate prophylaxis against thromboembolism even at high doses. Monitor platelet counts in long-term treatments. Do not switch from one brand of LMWH to another during treatment.
Adverse Drug Reactions	Hyperkalaemia related to hypoaldosteronism; bleeding; thrombocytopenia; urticarial rash or hypersensitivity skin reactions; skin necrosis reactions (localised to or distant from the inj site); increase in transaminases.
Drug Interactions	Increased risk of haemorrhage with oral anticoagulants or drugs (e.g. aspirin and dipyridamole) that affect platelet function; NSAIDs; dextrans, thrombolytic enzymes such as streptokinase, high doses of penicillins and some cephalosporins, some contrast media, asparaginase, and epoprostenol; alcohol. Hyperkalaemia in patients on ACE inhibitors. Reduced activity if given by IV with IV glyceryl trinitrate. Reduced half-life with tobacco.
Storage	Subcutaneous: Store at =30°C.
Mechanism of Action	Parnaparin is a LMWH with antithrombotic activity. It enhances the action of antithrombin III but, unlike heparin, it is characterised by a higher ratio of anti-factor Xa to anti-factor IIa (antithrombin) activity. It also has less effect on platelet aggregation than heparin; and has no significant effect on blood coagulation tests such as aPTT. Distribution: Mainly in blood. Metabolism: Renal and hepatic. Peak plasma levels of

	platelet aggregation than heparin; and has no significant effect on blood coagulation tests such as aPTT. Distribution: Mainly in blood. Metabolism: Renal and hepatic. Peak plasma levels of anti-Xa activity: 3 hr; Plasma half-life: 6 hr. The anti-Xa activity persists in plasma for 20 hr after single dose. Excretion: Via urine.
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)

paroxetine

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related paroxetine information

Indication & Dosage

Oral

Depression

Adult: 20 mg daily, increase gradually, if necessary, by 10-mg increments wkly; max: 50 mg/day.

Elderly: Initially, 10 mg daily, increase if needed by 10 mg/day at 1 wk intervals; max: 40 mg daily.

Renal impairment: Severe: 10 mg daily, increase to a max of 40 mg daily as necessary.

Hepatic impairment: Severe: 10 mg daily, increase to a max of 40 mg daily as necessary.

Oral

Obsessive compulsive disorder

Adult: Initially, 20 mg daily, increase wkly in 10-mg increments. Maintenance: 40-60 mg daily.

Elderly: Initially, 10 mg daily, increase if needed by 10 mg/day at 1 wk intervals; max: 40 mg daily.

Renal impairment: Severe: 10 mg daily, increase to a max of 40 mg daily as necessary.

mg/day at 1 wk intervals; max: 40 mg daily.

Renal impairment: Severe: 10 mg daily, increase to a max of 40 mg daily as necessary.

Hepatic impairment: Severe: 10 mg daily, increase to a max of 40 mg daily as necessary.

Oral

Panic disorder with or without agoraphobia

Adult: Initially, 10 mg daily, increase wkly in 10-mg increments according to clinical response. Maintenance: 40-60 mg daily.

Elderly: Initially, 10 mg daily, increase if needed by 10 mg/day at 1 wk intervals; max: 40 mg daily.

Renal impairment: Severe: 10 mg daily, increase to a max of 40 mg daily as necessary.

Hepatic impairment: Severe: 10 mg daily, increase to a max of 40 mg daily as necessary.

Oral

Social anxiety disorder

Adult: Initially, 20 mg daily, increase after several wk by 10-mg increments; max dose: 50-60 mg/day.

Elderly: Initially, 10 mg daily, increase if needed by 10 mg/day at 1 wk intervals; max: 40 mg daily.

Renal impairment: Severe: 10 mg daily, increase to a max of 40 mg daily as necessary.

Hepatic impairment: Severe: 10 mg daily, increase to a max of 40 mg daily as necessary.

Oral

Anxiety

Adult: Initially, 20 mg daily, increase in wkly increments of 10 mg; max dose: 50 mg/day.

Elderly: Elderly: Initially, 10 mg daily, increase if needed by 10 mg/day at 1 wk intervals; max: 40 mg daily.

	mg; max dose: 50 mg/day. Elderly: Elderly: Initially, 10 mg daily, increase if needed by 10 mg/day at 1 wk intervals; max: 40 mg daily. Renal impairment: Severe: 10 mg daily, increase to a max of 40 mg daily as necessary. Hepatic impairment: Severe: 10 mg daily, increase to a max of 40 mg daily as necessary. <i>Oral</i> Posttraumatic stress disorder Adult: 20 mg daily, may be increased in 10-mg increments if necessary; max dose: 50 mg/day. Elderly: Initially, 10 mg daily, increase if needed by 10 mg/day at 1 wk intervals; max: 40 mg daily. Renal impairment: Severe: 10 mg daily, increase to a max of 40 mg daily as necessary. Hepatic impairment: Severe: 10 mg daily, increase to a max of 40 mg daily as necessary. <i>Oral</i> Premenstrual dysmorphic disorder Adult: As hydrochloride, modified-release preparation: Initially, 12.5 mg once daily, usually in the morning; may increase up to 25 mg once daily after at least 1 wk, if necessary; given throughout the menstrual cycle or limited to the luteal phase. Elderly: Initially, 10 mg daily, increase if needed by 10 mg/day at 1 wk intervals; max: 40 mg daily. Renal impairment: Severe: 10 mg daily, increase to a max of 40 mg daily as necessary. Hepatic impairment: Hepatic impairment: Severe: 10 mg daily, increase to a max of 40 mg daily as necessary.
Administration	May be taken with or without food. (May be taken w/ meals to minimise GI upset.)

Overdosage	Somnolence, nausea, vomiting, hepatic dysfunction, drowsiness, sinus tachycardia, urinary retention, renal failure (acute), dilated pupils, convulsions, status epilepticus, ventricular arrhythmias (including torsade de pointes), serotonin syndrome and manic reaction. No specific antidotes; treatment is supportive; cardiac monitoring is recommended.
Contraindications	Use with or within 14 days of MAOIs; concurrent use with thioridazine or pimozide.
Special Precautions	Epilepsy, glaucoma, history of mania, cardiac disease, DM, history of bleeding disorders, on drugs with increased risk of bleeding; renal and hepatic impairment; patients receiving electroconvulsive therapy; achlorhydria or high gastric pH (reduced absorption of oral suspension). Pregnancy and lactation. The risk of suicidal behaviour may be higher in young adults, closely monitor. May impair ability to drive or perform tasks. Avoid abrupt withdrawal.
Adverse Drug Reactions	Somnolence, insomnia, headache, dizziness; decreased libido; nausea, xerostomia, constipation, diarrhoea; ejaculatory disturbances; weakness, tremor, diaphoresis; vasodilation, chest pain, palpitation, hypertension, tachycardia, nervousness, anxiety, agitation, abnormal dreams, impaired concentration, yawning, depersonalisation, amnesia, emotional lability, vertigo, confusion, chills; rash, pruritus; orgasmic disturbance, dysmenorrhoea; anorexia, decreased appetite, dyspepsia, flatulence, abdominal pain, appetite increased, vomiting, taste perversion, weight gain; impotence, genital disorder, urinary frequency, UTI; paresthesia, myalgia, back pain, myoclonus, myopathy,

	appetite increased, vomiting, taste perversion, weight gain; impotence, genital disorder, urinary frequency, UTI; paresthesia, myalgia, back pain, myoclonus, myopathy, myasthenia, arthralgia; blurred vision, abnormal vision; tinnitus; respiratory disorder, pharyngitis, sinusitis, rhinitis; infection.
Drug Interactions	Levels/effects inhibited by cyproheptadine, phenytoin. Levels/effects increased by carbamazepine, cimetidine, CYP2D6 inhibitors (e.g. chlorpromazine, delavirdine, fluoxetine, miconazole, pergolide, quinidine, quinine, ritonavir, ropinirole). Increases levels/effects of atomoxetine, carvedilol, clozapine, CYP2B6 substrates (e.g. bupropion, promethazine, propofol, selegiline, sertraline), CYP2D6 substrates (e.g. amphetamines, selected beta-blockers, dextromethorphan, fluoxetine, lidocaine, mirtazapine, nefazodone, risperidone, ritonavir, thioridazine, TCAs, venlafaxine), duloxetine, galantamine, mexilitine, pimozone, procyclidine, propafenone. Decreases levels/effects of CYP2D6 prodrug substrates (e.g. codeine, hydrocodone, oxycodone, tramadol). Inhibits the metabolism of dextromethorphan, haloperidol, thioridazine. Enhances bradycardic effect of beta-blockers. Enhances toxic effects of other CNS depressants. Increased risk of serotonin syndrome with amphetamines, SSRIs, meperidine, nefazodone, trazodone, serotonin agonists, sibutramine, sympathomimetics, tramadol, venlafaxine. Increases risk of bleeding with NSAIDs, aspirin, warfarin, or other drugs affecting coagulation. Increases sensitivity to amphetamines. Neurotoxicity with lithium. Additive hyponatraemia with loop diuretics. Mania or hypertension with selegiline. Potentially Fatal: Fatal reactions with nonselective MAOI.

	Neurotoxicity with lithium. Additive hyponatraemia with loop diuretics. Mania or hypertension with selegiline. Potentially Fatal: Fatal reactions with nonselective MAOI.
Food Interaction	Peak concentration increased; bioavailability not significantly altered. Avoid valerian, St John's wort, SAMe, kava kava. Ethanol may increase CNS depression.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at =25°C for suspensions or 15-30°C for tablets.
Mechanism of Action	Paroxetine selectively inhibits the reuptake of serotonin. It has limited direct action at other neurotransmitter sites including muscarinic receptors. Absorption: Absorbed readily from the GI tract (oral); peak plasma concentrations after 5 hr. Distribution: Enters breast milk. Protein-binding: 95%. Metabolism: Extensive hepatic first-pass metabolism; by oxidation followed by methylation then formation of glucuronide and sulfate conjugates. Excretion: Via urine (64%) and faeces (36%), mainly as metabolites; elimination half-life: 21 hr.
CIMS Class	Antidepressants
ATC Classification	N06AB05 - paroxetine; Belongs to the class of selective serotonin reuptake inhibitors. Used in the management of depression.

pefloxacin

CIMS Class : (Quinolones)
pefloxacin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related pefloxacin information

Indication & Dosage	<i>Oral</i> Susceptible infections Adult: 400 mg bid. Renal impairment: Dose reduction may be necessary. <i>Oral</i> Gonococcal urethritis in men Adult: 800 mg as single dose. Renal impairment: Dose reduction may be necessary. <i>Oral</i> Acute uncomplicated cystitis in women Adult: 800 mg as single dose. Renal impairment: Dose reduction may be necessary.
Administration	Should be taken with food. (Take w/ meals.)
Contraindications	Hypersensitivity to quinolones, children <12 yr, pregnancy, lactation.
Special Precautions	Underlying CNS disease; hepatic disease; renal impairment. Avoid sun exposure, may cause severe sunburn.
Adverse Drug	Nausea, vomiting, gastric pain, dizziness, insomnia, allergic

Adverse Drug Reactions	Nausea, vomiting, gastric pain, dizziness, insomnia, allergic skin reactions, thrombocytopaenia, leukopenia/neutropenia, photosensitisation, arthropathy, muscular pain, headache, delusions, depression, hallucinations, hepatic dysfunction.
Drug Interactions	Reduced absorption with antacids, didanosine (DDI), iron salts, pirenzepine, sucralfate, vincristine, zinc salts; increased levels with cimetidine, probenecid, theophylline; increases the levels of cyclosporine; causes seizures with foscarnet, NSAIDs, piroxicam; hypoglycemia with glimeperide; antagonistic with quercetin.
Storage	Oral: Store at room temperature. Keep away from excess heat and moisture.
Mechanism of Action	Pefloxacin is a fluoroquinolone antibacterial that exhibits its bactericidal action by inhibition of DNA gyrase and topoisomerase IV which are needed for bacterial DNA reproduction. Metabolism: Extensive metabolism; converted to N-desmethylpefloxacin (norfloxacin). Excretion: 8-13 hr (elimination half-life).
CIMS Class	Quinolones
ATC Classification	J01MA03 - pefloxacin; Belongs to the class of quinolones, fluoroquinolone. Used in the treatment of systemic infections.

penfluridol

CIMS Class : (Antipsychotics)
penfluridol

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related penfluridol information

Indication & Dosage	<i>Oral</i> Psychoses Adult: Initially, 20-60 mg wkly, increased up to 250 mg once a wk in severe or resistant conditions.
Overdosage	Symptoms: deep sleep, dystonia, extrapyramidal symptoms. Treatment: supportive and symptom specific.
Contraindications	Preexisting CNS depression or coma.
Special Precautions	Pregnancy and lactation; elderly; epilepsy; preexisting cardiac conduction problems; hypokalaemia, hypomagnesemia; hypothyroidism.
Adverse Drug Reactions	Lower threshold for seizures, blurring of vision, dry mouth, retention of urine, constipation, orthostatic hypotension, weight gain, impaired glucose tolerance, allergic skin rashes, cholestatic jaundice; extrapyramidal effects; delirium; agitation, anxiety, depression, euphoria; anorexia, constipation, diarrhoea; alopecia; amenorrhoea, hypoglycaemia; hyponatraemia; hypersalivation, nausea,

	agitation, anxiety, depression, euphoria; anorexia, constipation, diarrhoea; alopecia; amenorrhoea, hypoglycaemia; hyponatraemia; hypersalivation, nausea, vomiting; bronchospasm; reported increased risk of breast cancer. Potentially Fatal: Blood dyscrasias; neuroleptic malignant syndrome; alteration of heart conduction leading to QT prolongation and life threatening arrhythmias.
Drug Interactions	Orthostatic hypotension with MAOIs; may increase sedation with alcohol, hypnotics, antihistamines, opiates; antacids containing aluminum salts may decrease absorption; additive antimuscarinic effects with TCAs; may reduce bromocriptine's ability to reduce serum prolactin; amphetamines may increase psychosis; may inhibit antiparkinsonian effects of levodopa; may increase risk of extrapyramidal symptoms with metoclopramide; may increase phenytoin levels (phenytoin may reduce penfluridol levels); possible additive effects on QT interval with type 1a antiarrhythmics, TCAs, some quinolone antibiotics (e.g. moxifloxacin), may have additive hypotensive effects with trazodone; may increase levels of valproic acid. Potentially Fatal: May produce neurotoxicity with lithium.
Food Interaction	Avoid valerian, St John's wort, kava kava, gotu kola; increased risk of CNS depression.
Mechanism of Action	Penfluridol blocks the postsynaptic dopamine receptor in the mesolimbic dopaminergic system and inhibits the release of hypothalamic and hypophyseal hormones. Duration: 1 wk. Absorption: Absorbed from the GI tract (oral); peak plasma concentrations after 2 hr. Metabolism: Undergoes enterohepatic recycling. Excretion: Urine and faeces (as N-dealkylated metabolite).

	concentrations after 2 hr. Metabolism: Undergoes enterohepatic recycling. Excretion: Urine and faeces (as N-dealkylated metabolite). Elimination half-life: 36 hr (initial), 120 hr (terminal).
CIMS Class	Antipsychotics
ATC Classification	N05AG03 - penfluridol; Belongs to the class of diphenylbutylpiperidine derivatives antipsychotics. Used in the management of psychosis.

Indication & Dosage

Oral

Wilson's disease

Adult: Initially, 1.5-2 g daily in divided doses. Maintenance dose: 0.75-1 g daily. Doses titrated to maintain urinary copper excretion >2 mg/day. Patients should receive pyridoxine supplementation 25 mg/day. Max: 750 mg/day in older adults.

Child: 1 mth-12 yr: 2.5 mg/kg bid, increased every 1-2 wk to 10 mg/kg bid. 12-18 yr: 0.75-1 g bid, max: 2 g daily for 1 yr; usual maintenance 0.75-1 g daily. Doses titrated to maintain urinary copper excretion >2 mg/day. Patients should receive pyridoxine supplementation 25 mg/day.

Elderly: Doses titrated to maintain urinary copper excretion >2 mg/day. Patients should receive pyridoxine supplementation 25 mg/day. Up to 20 mg/kg/day or 750 mg/day.

>2 mg/day. Patients should receive pyridoxine supplementation 25 mg/day. Up to 20 mg/kg/day or 750 mg/day.

CrCl (ml/min)	Dosage Recommendation
<50	Avoid

Oral

Cystine calculi

Adult: 1-4 g daily in 4 divided doses. Usual dose: 2 g/day. If 4 equal doses are not possible, give largest dose at bedtime. Doses adjusted to limit cystine excretion to 100-200 mg/day (<100 mg/day with history of stone formation). Patients should receive pyridoxine supplementation 25 mg/day.

Child: 1 mth-12 yr: 5-10 mg/kg bid, 12-18 yr: 0.5-1.5 g bid. Doses adjusted to limit cystine excretion to 100-200 mg/day (<100 mg/day with history of stone formation). Patients should receive pyridoxine supplementation 25 mg/day.

CrCl (ml/min)	Dosage Recommendation
<50	Avoid.

Oral

Cystinuria

Adult: 1-4 g daily in 4 divided doses. Usual dose: 2 g/day. If 4 equal doses are not possible, give largest dose at bedtime. Doses adjusted to limit cystine excretion to 100-200 mg/day (<100 mg/day with history of stone formation). Patients should receive pyridoxine supplementation 25 mg/day.

Child: 1 mth-12 yr: 5-10 mg/kg bid, 12-18 yr: 0.5-1.5 g bid. Doses adjusted to limit cystine excretion to 100-200 mg/day (<100 mg/day with history of stone formation). Patients should receive pyridoxine supplementation 25 mg/day.

CrCl (ml/min)	Dosage Recommendation
<50	Avoid.

should receive pyridoxine supplementation 25 mg/day.

Oral

Lead poisoning

Adult: 1-2 g daily in 3 divided doses. Continue treatment until urinary lead is stabilised at <500 mcg/day.

Child: 20 mg/kg/day in 3 divided doses.

Elderly: 20 mg/kg/day in 3 divided doses.

CrCl (ml/min)	Dosage Recommendation
<50	Avoid.

Oral

Severe active rheumatoid arthritis

Adult: As one part of a therapy programme. Initially 125-250 mg daily, increased gradually by the same amount at intervals of 4-12 wk up to 1-1.5 g/day. Discontinue if no response after 3-4 mth treatment with 1-1.5 g daily.

Maintenance: 500-750 mg daily. Doses =500 mg/day: give as a single dose; doses > 500 mg: administer in divided doses.

Max: 750 mg in older adults.

Child: As one part of a therapy programme. Initially, 3 mg/kg/day (=250 mg/day for 3 mth, then 6 mg/kg/day (=500 mg/day) bid for 3 mth. Max: 10 mg/kg/day in 3-4 divided doses (total max 750 mg/day).

Elderly: As one part of a therapy programme. Initially 50-125 mg daily; max: 750 mg/day. Doses =500 mg/day: give as a single dose; doses > 500 mg: administer in divided doses.

Renal impairment: Haemodialysis: decrease to 250 mg/wk after dialysis in patients with rheumatoid arthritis.

CrCl (ml/min)	Dosage Recommendation
<50	Avoid.

Oral

Chronic active hepatitis

Adult: Initially 500 mg daily in divided doses (after liver function tests shows disease controlled by corticosteroids). Dose gradually increased over 3 mth to 1250 mg daily with concurrent reduction in the corticosteroid dose.

Elderly: Not recommended.

CrCl (ml/min)	Dosage Recommendation
<50	Avoid.

Oral

Prophylaxis of cystine calculi

Adult: 0.5-1 g taken at bedtime.

Child: Use minimum dose required to maintain urinary cystine levels <200 mg/l.

Elderly: Use minimum dose required to maintain urinary cystine levels <200 mg/l.

Renal impairment: Reduce dose if impairment present when therapy starts. Use minimum dose required to maintain urinary cystine levels <200 mg/l. Review dose every 4 wk.

Oral

Arsenic poisoning

Adult: 500 mg 4 times daily for 5 days.

Child: 100 mg/kg/day in divided doses 6 hily for 5 days; max: 1g/day.

CrCl (ml/min)	Dosage Recommendation
<50	Avoid.

Administration

Should be taken on an empty stomach. (Take on an empty stomach 1 hr before or 2 hr after meals, & at least 1 hr apart from any other drug, food, milk, antacid, Zn- or Fe-containing

	Should be taken on an empty stomach. (Take on an empty stomach 1 hr before or 2 hr after meals, & at least 1 hr apart from any other drug, food, milk, antacid, Zn- or Fe-containing prep.)
Contraindications	Lupus erythematosus, severe thrombocytopenia, aplastic anaemia, history of D-penicillamine-induced agranulocytosis; pregnancy and lactation.
Special Precautions	Wilson's disease and cystinuria (25 mg/day) continued on a daily basis once instituted; renal impairment; penicillin allergy; monitor urine for proteinuria and haematuria, blood and platelet counts regularly. Consider withdrawal if platelets fall $<120000/\text{mm}^3$ or white blood cells $<2500/\text{mm}^3$ or if 3 successive falls within reference range (restart at reduced dose when levels are within reference range); withdraw permanently if leucopenia or thrombocytopenia reoccur. Regularly monitor renal and hepatic function (every 6 mth). Monitor body temperature twice weekly during 1st month of therapy, then every 2 wk for 5 mth, then monthly. Counsel patient to report sore throat, fever, infection, non-specific illness, unexplained bleeding or bruising, pupura, mouth ulcers or rashes. In cystinuria, maintain adequate fluid intake (1 pint of fluid before bed and 1 pint of fluid during night). Caution in patients who have had previous adverse reactions to gold. Penicillamine serum levels may be decreased if taken with food, take 1 hr before meals and at bedtime. For patients who cannot swallow, dissolve tablet or capsule contents in 15-30 ml of chilled puree or fruit juice; do not administer with milk. Avoid oral iron within 2 hr of dose. In Wilson's disease, decrease copper in diet ($<1\text{-}2\text{ mg/day}$). In lead poisoning, decrease calcium in diet.
Adverse Drug Reactions	Nausea, anorexia, vomiting; oral ulceration and stomatitis; fever and skin reaction; loss of taste, thrombocytopenia,

	Nausea, anorexia, vomiting; oral ulceration and stomatitis; fever and skin reaction; loss of taste, thrombocytopenia, neutropenia, proteinuria, haematuria, haemolytic anaemia, lupus erythematosus-like syndrome, nephrotic syndrome; myasthenia gravis-like syndrome; goodpasture's syndrome; male and female breast enlargement; late rash (also known as pencillamine dermatopathy) may appear several mth or yr after therapy. Potentially Fatal: Agranulocytosis, aplastic anaemia; haematuria; Stevens-Johnson syndrome.
Drug Interactions	Antacids, iron and zinc interfere with the absorption of penicillamine. Concomitant use of NSAIDs may increase risk of renal damage. May increase levodopa levels. May reduce serum digoxin levels. Potentially Fatal: May increase risk of bone marrow suppression with clozapine, co-trimoxazole, nitrofurantoin, olanzapine, thiamazole, gold, chloroquine, hydroxychloroquine or immunosuppressive treatment.
Food Interaction	Penicillamine serum levels may be decreased if taken with food, take 1 hr before meals and at bedtime. For patients who cannot swallow, dissolve tablet or capsule contents in 15-30 ml of chilled puree or fruit juice; do not administer with milk. Avoid oral iron within 2 hr of dose. In Wilson's disease, decrease copper in diet (<1-2 mg/day). In lead poisoning, decrease calcium in diet.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store in tight, well closed containers.

	Oral: Store in tight, well closed containers.
Mechanism of Action	Penicillamine is a chelating agent which aids the removal of heavy-metal ions including copper, lead, arsenic and mercury from the body by forming complexes that are readily excreted by the kidney. It interacts with cystine to form a more soluble compound reducing urinary concentration of cystine and prevents renal calculi development. In rheumatoid arthritis, it depresses circulating IgM rheumatoid factor and T-cell activity (but not B-cell activity). Onset: Rheumatoid arthritis: 2-3 mth; Wilson's disease: 1-3 mth. Absorption: 40-70%; time to peak, serum: 2-3 hr. Distribution: Protein-binding: 80% to albumin. Metabolism: Hepatic (small amounts). Excretion: Elimination half-life: 1.7-3.2 hr; excretion via urine (30-60% as unchanged drug).
CIMS Class	Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence / Cholagogues, Cholelitholytics & Hepatic Protectors / Disease-Modifying Anti-Rheumatic Drugs (DMARDs) / Other Drugs Acting on the Genito-Urinary System
ATC Classification	M01CC01 - penicillamine; Belongs to the class of penicillamine and similar antirheumatic agents. Used in the treatment rheumatism.

pentazocine

CIMS Class : (Analgesics (Opioid))
pentazocine

P - Contraindicated in pregnancy
L - Caution when used during lactation

related pentazocine information

Indication & Dosage

Oral

Moderate to severe pain

Adult: 50-100 mg every 3-4 hrs; max 600 mg daily.

Child: 6-12 yr: As hydrochloride: 25 mg every 3-4 hr.

CrCl (ml/min)	Dosage Recommendation
10-50	75% normal dose.
<10	50% normal dose.

Hepatic impairment: Reduce dose or avoid in liver disease.

Parenteral

Moderate to severe pain

Adult: 30-60 mg SC, IM or IV Inj given every 3-4 hr.

Child: >1 yr: up to 1 mg/kg SC, IM; up to 500 mcg/kg IV every 3-4 hr.

CrCl (ml/min)	Dosage Recommendation
10-50	75% normal dose.
<10	50% normal dose.

Hepatic impairment: Reduce dose or avoid in liver disease.

Rectal

Moderate to severe pain

Adult: 50 mg supp up to 4 times daily.

	<i>Rectal</i>	
	Moderate to severe pain	
	Adult: 50 mg supp up to 4 times daily.	
	Child: Not recommended.	
	CrCl (ml/min)	Dosage Recommendation
	10-50	75% normal dose
	< 10	50% normal dose
	Hepatic impairment: Reduce dose or avoid in liver disease.	
	Incompatibility: At Y site: Nafcillin; when admixed: aminophylline, amobarbital, pentobarbital, phenobarbital, sodium bicarbonate; in syringe: glycopyrrolate, heparin, phenobarbital.	
Administration	Should be taken with food. (Take after meals.)	
Overdosage	Symptoms: respiratory depression, cardiovascular, CNS effects. Treatment: empty stomach by lavage or emesis (lavage in comatose patients or those without gag reflex must have an endotracheal tube). For respiratory depression: parenteral naloxone and supportive treatment such as oxygen, IV fluids and vasopressors.	
Contraindications	Head injury; narcotic dependence; respiratory depression; raised intracranial pressure; MI; heart failure; arterial or pulmonary hypertension; porphyria; pregnancy (prolonged use or high doses at term).	
Special Precautions	May precipitate withdrawal in narcotic addicts. Impaired respiratory, renal and hepatic function; morbidly obese patients; thyroid dysfunction; prostatic hyperplasia or urinary stricture; biliary tract impairment; adrenal insufficiency (including Addison's disease); abdominal conditions. Elderly or debilitated patients; seizure-prone patients; children and infants (safety and efficacy not established in <1 yr); lactation. May impair ability to drive or operate machinery.	

	or debilitated patients; seizure-prone patients; children and infants (safety and efficacy not established in <1 yr); lactation. May impair ability to drive or operate machinery. Administer IM rather than SC (when frequent inj are needed) and inj sites should be varied.
Adverse Drug Reactions	Physical dependence; sedation, dizziness, euphoria, lightheadedness, alterations of mood; respiratory depression; visual hallucinations, disorientation, confusion; hypertension, tachycardia, circulatory depression; shock; hypotension; nausea, vomiting, constipation; seizures, diaphoresis; rash; blood dyscrasias; local tissue damages (SC), muscle fibrosis (IM). Potentially Fatal: Respiratory depression, hypotension, circulatory failure, deepening coma, convulsions.
Drug Interactions	Depressant affects potentiated by alcohol, CNS depressants; concurrent use with fluoxetine may lead to diaphoresis, ataxia flushing and tremor associated with serotonin syndrome.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. if used for prolonged periods or in high doses at term. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).

Mechanism of Action	Pentazocine is a benzomorphan derivative with mixed opioid agonist and antagonist actions. It alters perception of and response to pain and produces generalised CNS depression by binding to opiate receptors in the CNS and acting as a partial agonist/antagonist. Onset: Oral, IM, SC: 15-30 minutes; IV 2-3 minutes. Duration: Oral: 4-5 hr; parenteral: 2-3 hr. Absorption: Absorbed from the GI tract (oral), through the muscles (IM); peak plasma concentrations after 1-3 hr (oral), 15 min-1 hr (IM). Oral bioavailability: approx 20% (60-70% in cirrhosis). Distribution: Crosses the placenta. Protein-binding: 60% Metabolism: Hepatic; via oxidative and glucuronide conjugation pathways; extensive 1st pass. Excretion: Elimination half life: 2-3 hr; prolonged in hepatic impairment; excretion via urine (small amounts as unchanged drug).
CIMS Class	Analgesics (Opioid)
ATC Classification	N02AD01 - pentazocine; Belongs to the class of benzomorphan derivative opioids. Used to relieve pain.

pentoxifylline

CIMS Class : (Haemorrheologicals)
pentoxifylline

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related pentoxifylline information

Indication & Dosage

Oral

Peripheral vascular disease

Adult: As modified-release formulation: 400 mg tid (normally for at least 8 wk), may reduce to 400 mg bid if GI or CNS adverse effects occur.

Renal impairment: Moderate impairment (CrCl about 60 ml/min): 400 mg bid; severe impairment (CrCl about 20 ml/min): 400 mg once daily; may reduce further to 400 mg once every other day if needed.

Hepatic impairment: Dose reduction may be needed in severe impairment.

Administration

Should be taken with food.

Overdosage

Symptoms: Occur 4-5 hr after ingestion; duration approx 12 hr; hypotension, flushing, convulsions, deep sleep, agitation, bradycardia and heart block. Treatment: Supportive and symptom specific.

Contraindications	Previous hypersensitivity reactions to xanthine-related products e.g. caffeine, theophylline and theobromine. Recent cerebral and/or retinal haemorrhage. Porphyrria.
Special Precautions	Avoid use in patients with severe cardiac arrhythmias or acute MI. Caution when used in patients with ischaemic heart disease or hypotension. Impaired renal or hepatic function. Start at lower dose in elderly; safety and efficacy not established in children. Tablets should not be chewed, crushed or broken; swallow whole. Pregnancy, lactation.
Adverse Drug Reactions	Nausea, vomiting, dizziness, headache, flushing; angina, palpitations; occasional cardiac arrhythmias; hepatitis, jaundice; blood dyscrasias reported; agitation; sleep disturbances; hypotension; thrombocytopenia; intrahepatic cholestasis. Potentially Fatal: Fatal haemorrhage (cerebral and GI tract); anaphylactoid reaction.
Drug Interactions	Concurrent use with ciprofloxacin may increase the adverse effect of pentoxifylline. Concurrent use may increase serum levels of theophylline derivatives. Potentially Fatal: May increase risk of adverse effect when used with ketorolac.
Food Interaction	Food: May reduce rate but not extent of absorption; administer with meals to minimise GI effects.
Lab Interference	False-positive theophylline levels.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the

	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30 °C.
Mechanism of Action	Pentoxifylline reduces blood viscosity by increasing deformability of leukocytes and erythrocytes; and decreasing neutrophil adhesion/activation. It also improves microcirculation and peripheral tissue oxygenation through better blood flow. It has also been used in cerebrovascular disorders. Absorption: Well absorbed in the GI tract. Time to peak in serum: 2-4 hr. Distribution: Pentoxifylline and metabolites: Enter breast milk. Metabolism: Hepatic and via erythrocytes; some metabolites are active. Undergoes extensive 1st pass metabolism. Excretion: Mainly via urine; less than 4% recovered in faeces. Apparent half-life of pentoxifylline: 0.4-0.8 hr; for metabolites: 1-1.6 hr.
CIMS Class	Haemorrhheologicals
ATC Classification	C04AD03 - pentoxifylline; Belongs to the class of purine derivative agents used as peripheral vasodilators.

***pentoxifylline information:**

pergolide

CIMS Class : (Antiparkinsonian Drugs)
pergolide

P - Caution when used during pregnancy

L - Caution when used during lactation

related pergolide information

Indication & Dosage

Oral

As monotherapy in Parkinson's disease

Adult: As monotherapy: Initially, 50 mcg on the 1st evening of therapy. Then increase gradually: 50 mcg bid on days 2-4, then increase by 100-250 mcg every 3 or 4 days, in 3 divided doses, up to a daily dose of 1.5 mg at day 28. After day 30, increase dose by a max of 250 mcg twice a wk until optimum response is attained. Maintenance: 2.1-2.5 mg daily. As adjunctive therapy with levodopa: Introduce gradually. During this period, decrease levodopa dose gradually until optimum response is attained. Initial dose of pergolide: 50 mcg daily for the first 2 days; increase gradually by 100 or 150 mcg every 3rd day over the next 12 days. Further increases of 250 mcg may then be made every 3rd day until an optimum response is attained. Maintenance: 3 mg daily. Daily doses for both mono- and combination therapy should not be >5 mg and are usually given in 3 divided doses.

Overdosage

Symptoms: Vomiting, hypotension, agitation, severe hallucinations, severe involuntary movements, tingling in arms

	Symptoms: Vomiting, hypotension, agitation, severe hallucinations, severe involuntary movements, tingling in arms and legs, palpitations, ventricular extrasystoles, convulsions. Treatment: Symptomatic and supportive measures. Repeated doses of charcoal may hasten elimination. Dialysis or haemoperfusion is unlikely to be of benefit.
Special Precautions	Arrhythmias or underlying cardiac disease; history of confusions or hallucinations; pre-existing dyskinesia. Pregnancy and lactation. Withdrawal and dosage increases should be gradual. May impair ability to drive or operate machinery.
Adverse Drug Reactions	Dyskinesia, dizziness, hallucinations, dystonia, confusion, somnolence, insomnia, anxiety, pain (including abdominal), injury (accident), headache, postural hypotension, peripheral oedema, nausea, constipation, diarrhoea, dyspepsia, rhinitis, abnormal vision, sudden sleep episodes.
Drug Interactions	Effects may be reduced by dopamine antagonists e.g. phenothiazines, butyrophenones, thioxanthenes and metoclopramide. Potential pharmacokinetic interaction with protein-bound drugs. Additive sedative effects with CNS depressants e.g. alcohol.
Storage	Oral: Store at 20-25°C (68-77°F).
Mechanism of Action	Pergolide is a centrally-acting dopamine agonist stimulating both D₁ and D₂ receptors in the nigrostriatal system. Absorption: Absorbed from the GI tract. Distribution: Protein-binding: 90%. Metabolism: Extensively metabolised in the liver. Excretion: Via urine (as metabolites).
CIMS Class	Antiparkinsonian Drugs
ATC Classification	N04BC02 - pergolide; Belongs to the class of dopamine agonist.

ATC**Classification**

N04BC02 - pergolide; Belongs to the class of dopamine agonist.

Used in the management of parkinson's disease.

perindopril

CIMS Class : (ACE Inhibitors)
perindopril

P - Contraindicated in pregnancy
L - Caution when used during lactation
Food ⚠ - Food interaction

related perindopril information

Indication & Dosage

Oral

Hypertension

Adult: As erbumine: Initially, 4 mg once daily. 1st dose preferably given at bedtime. Patients with renovascular hypertension, volume depletion, severe hypertension: Initially, 2 mg once daily. Max: 8 mg daily. Patients on diuretics: Withdraw diuretics 2 or 3 days before perindopril therapy. Resume later if required. If diuretic cannot be discontinued, an initial dose of 2 mg once daily may be given.

Elderly: As erbumine: Initially, 2 mg once daily. May be progressively increased to 4 mg after 1 mth then to 8 mg if needed according to renal function.

CrCl (ml/min)	Dosage Recommendation
30-60	2 mg daily.
15-30	2 mg on alternate days.
<15	2 mg on dialysis days.

Oral

	<i>Oral</i>	
	Heart failure	
	Adult: As erbumine: Initially, 2 mg in the morning. Increase by 2-mg increments at no <2 wk intervals to a maintenance dose of 4 mg/day.	
	CrCl (ml/min)	Dosage Recommendation
	30-60	2 mg daily.
	15-30	2 mg on alternate days.
	<15	2 mg on dialysis days.
	<i>Oral</i>	
	Stable ischaemic heart disease	
	Adult: As erbumine: Initially, 4 mg once daily for 2 wk then titrate up to a maintenance dose of 8 or 10 mg once daily if tolerated.	
Administration	Elderly: As erbumine: Initially, 2 mg once daily on the 1st wk, increase as tolerated to 4 mg once daily on the 2nd wk, then increase again as tolerated to a maintenance dose of 8 mg once daily.	
	CrCl (ml/min)	Dosage Recommendation
	30-60	2 mg daily.
	15-30	2 mg on alternate days.
	<15	2 mg on dialysis days.
	Should be taken on an empty stomach. (Take before meals.)	
	Symptom: Mild hypotension, bradycardia, hyperkalaemia (especially in patients with renal insufficiency), circulatory shock, renal failure, hyperventilation, tachycardia, palpitations, dizziness, anxiety, and cough. Treatment: Symptomatic and supportive. Haemodialysis may be beneficial.	
	History of angioedema related to previous ACE inhibitor treatment. Pregnancy (2nd/3rd trimesters).	
Overdosage		
Contraindications		

	History of angioedema related to previous ACE inhibitor treatment. Pregnancy (2nd/3rd trimesters).
Special Precautions	History of airway surgery. Withdraw if there is significant increase in LFTs. Risk factors for hyperkalaemia; monitor potassium closely. Patients dependent on renin-angiotensin-aldosterone system; consider withdrawal in patients with progressive deterioration in renal function. Collagen vascular disease. Hypovolaemia; monitor BP with the 1st dose. Unilateral renal artery stenosis and pre-existing renal insufficiency; valvular aortic stenosis. Before, during, or immediately after anaesthesia. May impair ability to drive or operate machinery. Lactation.
Adverse Drug Reactions	Headache, dizziness, sleep disorders, depression, fever, nervousness, somnolence; cough, upper respiratory tract infection, sinusitis, rhinitis, pharyngitis; oedema, chest pain, abnormal ECG, palpitation; rash; hyperkalaemia, elevated triglycerides, menstrual disorder; nausea, diarrhoea, vomiting, dyspepsia, abdominal pain, flatulence: UTI, sexual dysfunction; increased LFTs; weakness, musculoskeletal pain, upper and lower extremity pain, hypertonia, paraesthesia; proteinuria; tinnitus, ear infection; viral infection, allergy. Potentially Fatal: Anaphylactoid reactions, angioedema.
Drug Interactions	Excessive BP reduction may occur in patients on diuretics. Increased risk of hyperkalaemia with potassium supplements, potassium-sparing diuretics, trimethoprim. May increase lithium levels/toxicity. May increase hypersensitivity reactions to allopurinol. Effects may be reduced by aspirin or other NSAIDs and/or adverse renal effects may be increased. May increase nephrotoxicity of ciclosporin. May

	reactions to allopurinol. Effects may be reduced by aspirin or other NSAIDs and/or adverse renal effects may be increased. May increase nephrotoxicity of ciclosporin. May increase the adverse/toxic effects (nitritoid reaction) of gold sodium thiomalate. Increased risk of hypoglycaemia with insulin. Increased risk of neutropenia with mercaptopurine.
Food Interaction	Conversion to active form reduced with food. Ephedra, yohimbe and ginseng may worsen hypertension. Garlic may increase antihypertensive effect.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 20-25°C (68-77°F). Protect from moisture.
Mechanism of Action	Perindopril is a prodrug of perindoprilat, which is a competitive ACE inhibitor. Perindoprilat prevents conversion of angiotensin I to angiotensin II. It acts as a vasodilator and it reduces peripheral resistance. Onset: Within 1 hr; max effect at about 4-8 hr. Duration: 24 hr. Absorption: Rapidly absorbed from the GI tract. Bioavailability: 65-75%. Peak plasma concentrations of

	Duration: 24 hr. Absorption: Rapidly absorbed from the GI tract. Bioavailability: 65-75%. Peak plasma concentrations of perindoprilat: 3-4 hr after an oral dose of perindopril. Distribution: Protein-binding: Perindopril: 60%. Perindoprilat: 10-20%. Metabolism: Mainly hepatic; extensively metabolised to perindoprilat (active metabolite) and inactive metabolites. Food may reduce the conversion to perindoprilat. Excretion: Mainly via urine (as unchanged drug, as metabolites). Elimination half-life of perindoprilat: 25-30 hr or longer; excretion reduced in renal impairment. Both drug and active metabolite are dialysable.
CIMS Class	ACE Inhibitors
ATC Classification	C09AA04 - perindopril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

***perindopril information:**

perindopril + indapamide

CIMS Class : (ACE Inhibitors) , (Diuretics)
perindopril + indapamide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related perindopril + indapamide information

Indication & Dosage

Oral

Hypertension

Adult: Per tab contains perindopril 4 mg and indapamide

1.25 mg: 1 tab once daily in the morning.

CrCl (ml/min)	Dosage Recommendation
<30	Avoid use.
30-60	Dose adjustment may be needed.

Overdosage

Symptoms include hypotension, nausea, vomiting, cramps, dizziness, sleepiness mental confusion, oliguria which may progress to anuria. Salt and water disturbances (low sodium levels, low potassium levels) may also occur. Gastric lavage or administration of activated charcoal may be used to remove the ingested drug. Monitor and maintain fluid and electrolyte balance.

Contraindications

Hypersensitivity. Severe renal impairment (CrCl <30 ml/min), hypokalaemia, severe hepatic impairment or hepatic encephalopathy, history of angioedema associated with treatment with an ACE inhibitor, children. Dialysis patients or patients with untreated decompensated heart failure.

	encephalopathy, history of angioedema associated with treatment with an ACE inhibitor, children. Dialysis patients or patients with untreated decompensated heart failure. Hereditary/idiopathic angioneurotic oedema. Pregnancy and lactation.
Special Precautions	Impaired renal function, risk of hypotension and electrolyte imbalance. Regular monitoring of renal function and plasma levels of potassium are recommended. Blood glucose levels should be monitored in diabetic patients especially in those with low serum potassium levels. Increased risk of neutropenia/agranulocytosis in immunosuppressed patients. Treatment should be discontinued immediately if there is angioneurotic oedema of the face, extremities, lips, tongue, glottis and/or larynx.
Adverse Drug Reactions	Dry cough, headache, bradycardia, dizziness, asthenia, hypokalaemia and orthostatic hypotension. GI effects such as constipation, dry mouth, nausea, epigastric pain, anorexia, abdominal pain and taste disturbance.
Drug Interactions	Increased risk of lithium toxicity. May cause and potentiate orthostatic hypotension when used with alcohol, barbiturates, neuroleptics, narcotics or other antihypertensives. Increased risk of acute renal insufficiency in dehydrated patients when used with systemic NSAIDs or high dose salicylates. May increase risk of hypoglycaemia in patients on concurrent treatment with hypoglycaemic sulfonamides/insulin. Concurrent use with baclofen may potentiate antihypertensive effect. May reduce antihypertensive effect when used with corticosteroids or tetracosactide. Increased risk of hyperkalaemia when used with potassium-sparing diuretics or potassium supplements. May increase hypotensive effect of certain anaesthetic drugs. Increased risk of leucopenia when used with allopurinol,

	risk of hyperkalaemia when used with potassium sparing diuretics or potassium supplements. May increase hypotensive effect of certain anaesthetic drugs. Increased risk of leucopenia when used with allopurinol, immunosuppressants, procainamide or systemic corticosteroids. Additive hypotensive effect when used with other antihypertensives.
Storage	Oral: Store below 30°C.
Mechanism of Action	Perindopril is an ACE inhibitor, which acts by inhibiting the conversion of angiotensin I to angiotensin II, reducing the activity of the sympathetic nervous system and inhibiting enzyme kininase, which is involved in the conversion of bradykinin and other substances. Indapamide is a sulfonamide derivative with an indole ring. It inhibits the reabsorption of sodium in the cortical dilution segment, thus increasing urinary output, resulting in an antihypertensive effect. Absorption: Perindopril: About 65-70% of an oral dose is absorbed. Indapamide: Rapidly and completely absorbed from the GI tract. Distribution: Plasma protein binding of perindoprilat: <30 %; indapamide: 79%. Metabolism: Perindopril is hydrolysed into perindoprilat which is the active component. Excretion: Elimination half-life of perindoprilat: Approximately 24 hr; indapamide: 14-24 hr (average 18 hr).
CIMS Class	ACE Inhibitors / Diuretics
ATC Classification	C03BA11 - indapamide; Belongs to the class of low-ceiling sulfonamide diuretics. Used to promote excretion of urine. C09AA04 - perindopril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

permethrin

CIMS Class : (Topical Antifungals & Antiparasites)
permethrin

P - Caution when used during pregnancy

L - Caution when used during lactation

related permethrin information

Indication & Dosage

Topical/Cutaneous

Head pediculosis

Adult: Apply 30-60 ml of 1% lotion (cream rinse) to washed and towel-dried hair and allow to remain for 10 min. Rinse with water. Treatment may be repeated after 7-10 days if lice or nits are detected in hair-scalp junctions.

Topical/Cutaneous

Scabies

Adult: Apply a thin layer of 5% cream into all skin surfaces from the neck to toes. Wash off after 8-14 hr. 30 g of cream is usually sufficient for an average adult.

Topical/Cutaneous

Pediculosis pubis

Adult: Apply sufficient amount of 1% lotion (cream rinse) or 5% cream to thoroughly saturate the pubic area. Allow to remain for 10 min and then rinse with water.

Contraindications

Hypersensitivity.

Special Precautions

Avoid contact with eyes and mucous membranes.

Special Precautions	Avoid contact with eyes and mucous membranes. Cross-sensitivity may occur with ragweed or chrysanthemums. History of asthma. Pregnancy and lactation.
Adverse Drug Reactions	Mild and transient burning, stinging, pruritus, erythema, tingling, numbness, rash; difficulty in breathing; phototoxic or photosensitisation reactions.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Topical/Cutaneous: Cream: Store at 15-25°C (59-77°F). Lotion (Cream rinse): Store at 15-25°C (59-77°F) or at 20-25°C (68-77°F).
Mechanism of Action	Permethrin is a pyrethroid pediculocide and scabicide. It causes paralysis and death of the pest by inhibiting sodium ion influx through nerve cell membrane channels delaying repolarisation. Absorption: Small amounts absorbed systemically (topical). Metabolism: Hepatic via ester hydrolysis; converted to inactive metabolites. Excretion: Via urine
CIMS Class	Topical Antifungals & Antiparasites
ATC Classification	P03AC04 - permethrin; Belongs to the class of pyrethrines, including synthetic compounds used as ectoparasitocides.

pethidine

CIMS Class : (Analgesics (Opioid))
pethidine

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related pethidine information

Indication & Dosage

Oral

Moderate to severe acute pain

Adult: As hydrochloride: 50-150 mg every 4 hr if needed.

Child: As hydrochloride: Children 2 mth to 12 yr: 0.5-2 mg/kg;
12-18 yr: 50-100 mg. Repeat dose every 4-6 hr if necessary.

Elderly: As hydrochloride: 50 mg every 4 hr.

Renal impairment: Dose reductions may be necessary.

Hepatic impairment: Dose reductions may be necessary.

Parenteral

Moderate to severe acute pain

Adult: As hydrochloride: 25-100 mg IM/SC inj or 25-50 mg by
slow IV inj repeated after 4 hr. IM/SC doses may be given every
2-3 hr if needed.

Child: As hydrochloride: SC/IM: 2 mth to 12 yr: 0.5-2 mg/kg;
12-18 yr: 20-100 mg. Repeat dose every 4-6 hr if needed. IV inj:
Neonates and children ≤12 yr: 0.5-1 mg/kg IV inj every 10-12 hr
if needed in those up to 2 mth and every 4-6 hr if needed in older
children. 12-18 yr: 25-50 mg every 4-6 hr if needed.

Neonates and children ≤ 12 yr: 0.5-1 mg/kg IV inj every 10-12 hr if needed in those up to 2 mth and every 4-6 hr if needed in older children. 12-18 yr: 25-50 mg every 4-6 hr if needed.

Alternatively, ≥ 1 mth: Loading dose: 1 mg/kg by IV inj followed by 100-400 mcg/kg/hr via continuous IV infusion adjusted according to response.

Elderly: 25 mg every 4 hr.

Renal impairment: Dose reductions may be necessary.

Hepatic impairment: Dose reductions may be necessary.

Parenteral

Obstetric analgesia

Adult: As hydrochloride: 50-100 mg by IM/SC inj as soon as contractions occur at regular intervals; repeat after 1-3 hr if needed. Max: 400 mg in 24 hr.

Renal impairment: Dose reductions may be necessary.

Hepatic impairment: Dose reductions may be necessary.

Intramuscular

Preoperative medication

Adult: As hydrochloride: 25-100 mg IM/SC given 1 hr before surgery.

Child: As hydrochloride: 1-2 mg/kg given 1 hr before surgery.

Renal impairment: Dose reductions may be necessary.

Hepatic impairment: Dose reductions may be necessary.

Parenteral

Postoperative pain

Adult: As hydrochloride: 25-100 mg IM/SC inj every 2-3 hr if necessary.

Renal impairment: Dose reductions may be necessary.

Hepatic impairment: Dose reductions may be necessary.

Intravenous

Adjunct to anaesthesia

Adult: As hydrochloride: 10-25 mg by slow IV inj.

	<i>Intravenous</i> Adjunct to anaesthesia Adult: As hydrochloride: 10-25 mg by slow IV inj. Renal impairment: Dose reductions may be necessary. Hepatic impairment: Dose reductions may be necessary. Reconstitution: IV infusion: Dilute with glucose 5% or sodium chloride 0.9% to required volume. IV inj: Dilute with water for inj to a concentration of 5-10 mg/ml. Incompatibility: Y-site incompatible with idarubicin, imipenem/cilastatin, minocycline, allopurinol, amphotericin B cholesteryl sulfate complex, cefepime, cefoperazone, doxorubicin liposome. Admixture incompatibility: Aminophylline, amobarbital, floxacillin, furosemide, heparin, morphine, phenobarbital, phenytoin, thiopental, pentobarbital. Syringe incompatibility: Pentobarbital, heparin, morphine.
Overdosage	Symptoms: CNS/respiratory depression, mydriasis, bradycardia, pulmonary oedema, chronic tremor, CNS excitability, seizures. Treatment: Symptomatic. Naloxone can be used to reverse opioid effects. Do not use naloxone for pethidine-induced seizures.
Special Precautions	May impair ability to drive or operate machinery. Hypovolaemia, CV disease; adrenal insufficiency; biliary tract disorder; CNS depression or coma; history of drug abuse or acute alcoholism; head injury, intracranial lesions, elevated intracranial pressure; hepatic or renal impairment; morbidly obese; prostatic hyperplasia; toxic psychoses; pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive airway disease; sickle-cell disease; supraventricular tachycardia; thyroid dysfunction. Elderly and debilitated patients. Withdraw gradually. Pregnancy (avoid prolonged use or high doses at term) and lactation.

	tachycardia; thyroid dysfunction. Elderly and debilitated patients. Withdraw gradually. Pregnancy (avoid prolonged use or high doses at term) and lactation.
Adverse Drug Reactions	Hypotension; fatigue, drowsiness, dizziness, nervousness, headache, restlessness, malaise, confusion, depression, hallucinations, tremors, muscle twitches, increased intracranial pressure, seizure, serotonin syndrome; rash, urticaria; nausea, vomiting, constipation, anorexia, stomach cramps, xerostomia, biliary spasm, paralytic ileus, sphincter of Oddi spasm; ureteral spasms, decreased urination; pain at inj site; weakness; dyspnoea; histamine release, physical and psychological dependence.
Drug Interactions	Increased pethidine metabolite levels with aciclovir, cimetidine, ritonavir. Reduced analgesic effects with phenytoin, barbiturates. Additive sedative and/or respiratory depressive effects with alcohol, barbiturates, benzodiazepines, phenothiazines, TCAs, other CNS depressants. Potentially Fatal: Increased risk of serotonin syndrome with MAOIs (not be given concurrently or within 14 days of their discontinuation), serotonin agonists, serotonin reuptake inhibitors, sibutramine, TCAs.
Food Interaction	Increased CNS depression with valerian, St John's wort, kava kava, gotu kola.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters). if used for prolonged periods or in high doses at term.

	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intramuscular: Store at room temperature. Do not freeze and protect from light. Intravenous: Store at room temperature. Do not freeze and protect from light. Oral: Protect from light. Store at room temperature. Parenteral: Store at room temperature. Do not freeze and protect from light.
Mechanism of Action	Pethidine is a phenylpiperidine derivative opioid analgesic. It acts mainly as mu-receptor agonist. Like most, opioid analgesics, it mimics endogenous opioids by activating opioid receptors in the central and peripheral nervous system. It reduces the release of neurotransmitter substances and also reduces the activity of postsynaptic neurons in the spinal cord thus preventing transmission of pain impulse. Absorption: Absorbed from the GI tract; only 50% reaches the circulation due to 1st-pass effect. Peak plasma concentrations after 1-2 hr (oral). Variable absorption (IM). Distribution: Crosses the placenta; enters breast milk; appears in CSF. Protein-binding: 60-80%. Metabolism: Extensively hepatic via hydrolysis to pethidinic acid and norpethidinic acid and via demethylation to norpethidine. Excretion: Via urine (small amounts as unchanged drug); elimination half-life: 3-5 hr (unchanged drug), 20 hr (norpethidine).
CIMS Class	Analgesics (Opioid)

	Analgesics (Opioid)
ATC Classification	N02AB02 - pethidine; Belongs to the class of phenylpiperidine derivative opioids. Used to relieve pain.

phenazopyridine

CIMS Class : (Other Drugs Acting on the Genito-Urinary System)
phenazopyridine

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related phenazopyridine information

Indication & Dosage

Oral

Pain and irritability in cystitis, prostatitis and urethritis

Adult: As hydrochloride: 200 mg tid. When combined with an antibiotic, max duration of treatment is 2 days, although lower doses for at least a wk have been given.

Child: As hydrochloride: 12 mg/kg/day in 3 divided doses for 2 days.

CrCl (ml/min)	Dosage Recommendation
50-80	Give dose every 8-16 hr.
<50	Avoid.

Administration

Should be taken with food. (Take after meals.)

Overdosage

Symptoms: Methaemoglobinaemia, haemolytic anaemia, skin pigmentation, renal and hepatic impairment. Treatment: Use methylene blue for methaemoglobinaemia.

Contraindications

Impaired renal function or severe hepatitis. CrCl <50 ml/min.

Special Precautions

Avoid prolonged use. Pregnancy and lactation. G6PD deficiency. Stop treatment if skin or sclerae discolouration occur. Elderly.

	Avoid prolonged use. Pregnancy and lactation. G6PD deficiency. Stop treatment if skin or sclerae discolouration occur. Elderly.
Adverse Drug Reactions	GI disturbances, headache; rash; hepatotoxicity; haemolytic anaemia, methaemoglobinaemia; discolouration of urine and other body fluids; staining of contact lens; crystal deposits in urinary tract. Potentially Fatal: Acute renal failure.
Lab Interference	May interfere with urine ketone and protein tests. May delay reactions with glucose oxidase reagents. May occasionally cause false-positive tests with Tes-Tape.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Phenazopyridine is an azo dye that exerts an analgesic effect in the urinary tract. Absorption: Absorbed from the GI tract (oral). Excretion: Via urine (65% as unchanged drug; 18% as paracetamol).
CIMS Class	Other Drugs Acting on the Genito-Urinary System
ATC Classification	G04BX06 - phenazopyridine; Belongs to the class of other urologicals. Used in the treatment of urological problems.

phenformin

CIMS Class : (Antidiabetic Agents)
phenformin

P - Caution when used during pregnancy

related phenformin information

Indication & Dosage	<i>Oral</i> Type 2 diabetes mellitus Adult: 200-400 mg bid.
Overdosage	Symptoms: Lactic acidosis. Treatment: Intensive supportive therapy. Glucose or glucagon may be given if hypoglycaemia is present.
Contraindications	Insulin-dependent diabetes, diabetic coma, ketoacidosis, trauma, severe infection, heart failure, recent MI; dehydration. Renal or hepatic impairment.
Special Precautions	Monitor vitamin B ₁₂ concentrations annually during long-term treatment. Pregnancy.
Adverse Drug Reactions	Anorexia, nausea, vomiting, diarrhoea, metallic taste, wt loss, skin reactions, acute pancreatitis. Potentially Fatal: Lactic acidosis, CV adverse effects.
Drug Interactions	May impair vitamin B ₁₂ absorption. Potentially Fatal: Cimetidine may reduce renal clearance of phenformin. Increased risk of lactic acidosis with alcohol, nephrotoxic drugs.

	Potentially Fatal: Cimetidine may reduce renal clearance of phenformin. Increased risk of lactic acidosis with alcohol, nephrotoxic drugs.
Mechanism of Action	Phenformin is a biguanide antidiabetic. It does not stimulate insulin release but requires the presence of insulin to exhibit its hypoglycaemic effect. It delays glucose absorption from the GI tract, increases insulin sensitivity and glucose uptake, and inhibits gluconeogenesis in the liver. Metabolism: Hepatic.
CIMS Class	Antidiabetic Agents

phenindione

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
phenindione

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related phenindione information

Indication & Dosage

Oral

Thromboembolic disorders

Adult: Initially, 200 mg in 2 equal doses on day 1 followed by 100 mg on day 2. Maintenance: 50-150 mg daily depending on coagulation tests.

Overdosage

Symptoms: Early signs include bleeding from the gums or haematuria. Treatment: Withdraw the drug to stop mild bleeding and to normalise prothrombin time. For more severe haemorrhage, administer IV vitamin K₁. Fresh whole blood or frozen plasma transfusion may also be necessary for severe haemorrhage.

Contraindications

Hypersensitivity. Predisposition to severe haemorrhage (e.g. ulceration or bleeding in the GI, genitourinary or respiratory tract, haemorrhagic blood dyscrasias, haemophilia, threatened abortion, presence of extensive surgical wounds).

	ulceration or bleeding in the GI, genitourinary or respiratory tract, haemorrhagic blood dyscrasias, haemophilia, threatened abortion, presence of extensive surgical wounds). Pregnancy.
Special Precautions	Severely impaired renal or hepatic function, severe hypertension, patients who will undergo surgery (including dental extraction), CHF, female patients >60 yr. Monitor prothrombin time regularly. Lactation.
Adverse Drug Reactions	Haemorrhage. Skin rash, pyrexia, diarrhoea, vomiting, sore throat. Rarely, skin necrosis. May colour urine pink or orange. Potentially Fatal: Hypersensitivity reactions e.g. exfoliative dermatitis, liver and kidney damage, myocarditis, agranulocytosis, leucopenia, eosinophilia, leukaemoid syndrome.
Drug Interactions	Reduced effect with haloperidol. Increased effect with clofibrate. Increased prothrombin levels with co-trimoxazole. May increase toxicity of chlorpropamide, phenytoin, sulfonamides and tolbutamide. Potential increase in anticoagulant effects: Alcohol, anaesthetics, antithyroids, aspirin and salicylates, aztreonam, bretylium, cathartics, cimetidine, ciprofloxacin, dextran, disulfiram, ethacrynic acid, fibrinolysin, gemfibrozil, glucagon, guanethidine, heparin, iodine, methaqualone, methotrexate, methyldopa, methylphenidate, nalidixic acid, nicotinic acid, NSAIDs, paracetamol, phenothiazines, phenytoin, probenecid, quinine, quinidine, sulfapyrazone, thyroid

	methyl dopa, methylphenidate, nalidixic acid, nicotinic acid, NSAIDs, paracetamol, phenothiazines, phenytoin, probenecid, quinine, quinidine, sulfapyrazole, thyroid hormones, tolbutamide, vitamin B complex, X-ray contrast media. Potential decrease in anticoagulant effects: Antacids, antihistamines, barbiturates, bioflavonoids, digitalis glycosides, diuretics, ethchlorvynol, fibrinogen, glutethimide, griseofulvin, haloperidol, meprobamate, oral contraceptives, thrombin, trifluoperidol, vitamin K, xanthines.
Lab Interference	May colour urine pink or orange interfering with some urinary tests.
Mechanism of Action	Phenindione is an indanedione anticoagulant. It acts by antagonising the effects of vitamin K. Absorption: Well absorbed from the GI tract (oral). Distribution: Crosses the placenta and enters breast milk. Excretion: Via urine (as metabolites).
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC Classification	B01AA02 - phenindione; Belongs to the class of vitamin K antagonists. Used in the treatment of thrombosis.

pheniramine

CIMS Class : (Antihistamines & Antiallergics) , (Ophthalmic Decongestants, Anesthetics, Anti-inflammatories)
pheniramine

P - Caution when used during pregnancy

L - Caution when used during lactation

related pheniramine information

Indication & Dosage

Oral

Allergic conditions

Adult: As maleate: Syrup: 15-30 mg bid or tid. Tablet: Up to 45 mg tid. Max: 3 mg/kg/day.

Child: As maleate: 5-10 yr: Half a 45-mg tablet up to tid; >10 yr: Syrup: 15-30 mg bid or tid. Tablet: Up to 45 mg tid. Max: 3 mg/kg/day.

Elderly: As maleate: Syrup: 15-30 mg bid or tid. Tablet: Up to 45 mg tid. Max: 3 mg/kg/day.

Oral

Prophylaxis of motion sickness

Adult: As maleate: Syrup: 15-30 mg bid or tid. Tablet: Up to 45 mg tid. Max: 3 mg/kg/day. Take 1st dose at least 30 min before travelling.

Child: As maleate: 5-10 yr: Half a 45-mg tablet up to tid; >10

	45 mg tid. Max: 3 mg/kg/day. Take 1st dose at least 30 min before travelling. Child: As maleate: 5-10 yr: Half a 45-mg tablet up to tid; >10 yr: Syrup: 15-30 mg bid or tid. Tablet: Up to 45 mg tid. Max: 3 mg/kg/day. Take 1st dose at least 30 min before travelling. <i>Ophthalmic</i> Allergic conjunctivitis Adult: Pheniramine maleate 0.3% in combination with naphazoline hydrochloride 0.025%: 1 or 2 drops in the affected eye/s up to 4 times a day. Child: =6 yr: Pheniramine maleate 0.3% in combination with naphazoline hydrochloride 0.025%: 1 or 2 drops in the affected eye/s up to 4 times a day.
Administration	Should be taken with food.
Overdosage	Symptoms: Agitation and convulsions (especially in children), and restlessness, disorientation and hallucinations in adults. Accidental ingestion in small children has resulted in convulsions and in some cases fatal. Treatment: No specific antidote; symptomatic and supportive. Gastric lavage may be useful for some time after ingestion. Do not use stimulants. Diazepam or short-acting barbiturates may be used to control convulsions. Vasopressors may be used for hypotension.
Contraindications	Symptomatic prostatic hypertrophy; neonates and premature infants.
Special Precautions	May impair ability to drive or operate machinery. Has potential for abuse. Narrow angle glaucoma, asthma or

	May impair ability to drive or operate machinery. Has potential for abuse. Narrow angle glaucoma, asthma or severe CV disease. Antiemetic effect may mask signs of other conditions. Pregnancy and lactation. Elderly.
Adverse Drug Reactions	Oral: Sedation. Hypersensitivity reactions. Lassitude, dizziness, tinnitus, inability to concentrate, incoordination, irritability, insomnia and tremors. Nausea, vomiting, diarrhoea, colic, epigastric pain, anorexia, dryness of mouth and constipation. Urinary retention. Palpitations, headache. Blurred vision, increased intraocular pressure. Muscular weakness. Rarely, blood dyscrasias e.g. agranulocytosis, haemolytic anaemia. Ophthalmic: Temporarily enlarged pupils, eye redness (overuse).
Drug Interactions	May mask ototoxicity produced by aminoglycoside antibiotics. Potentially Fatal: Potentiation of CNS depression by alcohol, sedatives, opioids, barbiturates, hypnotics, narcoleptics. May increase antimuscarinic effect of MAOIs, atropine and TCAs.
Storage	Ophthalmic: Store at 20-25°C (68-77°F). Protect from light. Oral: Tablet: Store below 30°C (86°F). Protect from light.
Mechanism of Action	Pheniramine is an alkylamine derivative with histamine H₁-receptor antagonist effects. It also has anticholinergic and moderate sedative effects. Onset: 15-20 min (oral).

	and moderate sedative effects. Onset: 15-20 min (oral). Absorption: Readily absorbed from the GI tract. Peak plasma concentrations in 1-2.5 hr. Metabolism: Metabolised to N-desmethylpheniramine and N-didesmethylpheniramine. Excretion: Via urine (as unchanged drug and metabolites). Terminal half-life: 8-17 hr (IV pheniramine maleate); 16-19 hr (oral).
CIMS Class	Antihistamines & Antiallergics / Ophthalmic Decongestants, Anesthetics, Anti-inflammatories
ATC Classification	R06AB05 - pheniramine; Belongs to the class of substituted alkylamines used as systemic antihistamines.

related phenobarbital information

Indication & Dosage

Oral

Partial seizures

Adult: 60-180 mg daily taken at night. Titrate dose according to patient's needs to achieve adequate control of seizures.

Plasma concentrations of 15-40 mcg/ml (65-170 micromol/l) are usually required.

Child: 1 mth-12 yr: Initially, 1-1.5 mg/kg bid. Increase by 2 mg/kg daily, as required, to a maintenance dose of 2.5-4 mg/kg once or bid. 12-18 yr: Initially, 60-180 mg bid.

Maintenance: 60-180 mg once daily.

CrCl (ml/min)	Dosage Recommendation
<10	Administer every 12-16 hr.

Hepatic impairment: Severe: Monitor plasma levels and adjust dose as necessary.

Oral

Hepatic impairment: Severe: Monitor plasma levels and adjust dose as necessary.

Oral

Generalised tonic-clonic seizures

Adult: 60-180 mg daily taken at night. Titrate dose according to patient's needs to achieve adequate control of seizures. Plasma concentrations of 15-40 mcg/ml (65-170 micromol/l) are usually required.

Child: 1 mth-12 yr: Initially, 1-1.5 mg/kg bid. Increase by 2 mg/kg daily, as required, to a maintenance dose of 2.5-4 mg/kg once or bid. 12-18 yr: Initially, 60-180 mg bid.

Maintenance: 60-180 mg once daily.

CrCl (ml/min)	Dosage Recommendation
<10	Administer every 12-16 hr.

Hepatic impairment: Severe: Monitor plasma levels and adjust dose as necessary.

Oral

Sedation

Adult: 30-120 mg/day in 2-3 divided doses.

Child: 6 mg/kg/day or 180 mg/m²/day divided in 3 equal doses.

CrCl (ml/min)	Dosage Recommendation
<10	Administer every 12-16 hr.

Hepatic impairment: Severe: Monitor plasma levels and adjust dose as necessary.

Oral

Hypnotic

Adult: 100-320 mg at bedtime. Do not admin for >2 wk for the treatment of insomnia.

Hypnotic

Adult: 100-320 mg at bedtime. Do not admin for >2 wk for the treatment of insomnia.

Hepatic impairment: Severe: Monitor plasma levels and adjust dose as necessary.

Oral

Preoperative sedation

Child: 1-3 mg/kg 1-1.5 hr before procedure.

Intramuscular

Emergency management of acute seizures

Adult: As sodium: 200 mg IM repeated after 6 hr if necessary.

Child: As sodium: 15 mg/kg IM as a single dose.

Intravenous

Status epilepticus

Adult: Doses of 10 mg/kg to a max of 1 g.

Child: As sodium: Neonates and children up to 12 yr: Initially, 20 mg/kg by slow IV inj then 2.5-5 mg/kg once or bid.
12-18 yr: Initially 20 mg/kg (max 1 g) by slow IV inj then 300 mg bid.

Intravenous

Generalised tonic-clonic seizures

Child: As sodium: Neonates: Loading dose is 20 mg/kg by slow IV inj followed by 2.5-5 mg/kg once daily either by slow IV inj or orally.

Intravenous

Intravenous

Partial seizures

Child: As sodium: Neonates: Loading dose is 20 mg/kg by slow IV inj followed by 2.5-5 mg/kg once daily either by slow IV inj or orally.

Intramuscular

Sedation

Adult: As sodium: 30-120 mg/day in 2-3 divided doses.

CrCl (ml/min)	Dosage Recommendation
<10	Administer every 12-16 hr.

Hepatic impairment: Severe: Monitor plasma levels and adjust dose as necessary.

Parenteral

Hypnotic

Adult: As sodium: 100-320 mg at bedtime via IM/IV/SC inj.

Child: As sodium: 3-5 mg/kg at bedtime via IM/IV/SC inj.

Hepatic impairment: Severe: Monitor plasma levels and adjust dose accordingly.

Intramuscular

Preoperative sedation

Adult: As sodium: 100-200 mg 1-1.5 hr before procedure.

Child: As sodium: 16-100 mg 1-1.5 hr before procedure.

Intravenous

Preoperative sedation

Child: As sodium: 1-3 mg/kg 1-1.5 hr before procedure.

Reconstitution: Inj should be diluted 1 in 10 although 15 mg/ml may be considered in fluid-restricted children. Give dose over 20 min at a rate no >1 mg/kg/min.

	Reconstitution: Inj should be diluted 1 in 10 although 15 mg/ml may be considered in fluid-restricted children. Give dose over 20 min at a rate no >1 mg/kg/min. Incompatibility: Y-site admin incompatible with amphotericin B cholesteryl sulfate complex, hydromorphone. Do not mix in the same syringe with hydromorphone, pentazocine, ranitidine, sufentanil. Do not admix with chlorpromazine, cimetidine, clindamycin, dimenhydrinate, diphenhydramine, droperidol, ephedrine, hydralazine, hydrocortisone sodium succinate, hydroxyzine, insulin (regular), kanamycin, levorphanol, meperidine, morphine, norepinephrine, pancuronium, penicillin G, pentazocine, phenytoin, procaine, prochlorperazine, promazine, promethazine, streptomycin, succinylcholine, vancomycin.
Overdosage	Symptoms: Unsteady gait, slurred speech, confusion, jaundice, hypothermia, hypotension, respiratory depression, coma. Management: Charcoal haemoperfusion (in severe cases). Treatment is symptomatic and supportive.
Contraindications	Severe renal and hepatic disorders. Severe respiratory depression, dyspnoea or airway obstruction; porphyria. Pregnancy.
Special Precautions	Elderly or debilitated patients, children. Withdraw gradually. Impaired renal, hepatic and respiratory function. Patients with acute pain and depressive disorders. May impair ability to drive or operate machinery. Lactation.
Adverse Drug Reactions	Bradycardia, hypotension, syncope; drowsiness, lethargy, CNS excitation or depression, impaired judgment, hangover

Bradycardia, hypotension, syncope; drowsiness, lethargy, CNS excitation or depression, impaired judgment, hangover effect, confusion, somnolence, agitation, hyperkinesia, ataxia, nervousness, headache, insomnia, nightmares, hallucinations, anxiety, dizziness; rash, exfoliative dermatitis; nausea, vomiting, constipation; agranulocytosis, thrombocytopenia, megaloblastic anaemia; pain at inj site, thrombophlebitis (IV); oliguria: laryngospasm, respiratory depression, apnoea (especially with rapid IV admin), hypoventilation.

Potentially Fatal: Stevens-Johnson syndrome.

Drug Interactions

May enhance the hepatotoxic potential of paracetamol overdoses. May decrease levels/effects of various CYP isoenzyme substrates e.g. teniposide, methotrexate, antipsychotics, β -blockers, calcium-channel blockers, other anticonvulsants, chloramphenicol, cimetidine, corticosteroids, ciclosporin, doxycycline, oestrogens, felbamate, griseofulvin, tacrolimus, furosemide, methadone, oral contraceptives, theophylline, TCAs, warfarin. May reduce effects of guanfacine. Reduced metabolism and or increased toxicity with chloramphenicol, felbamate, MAOIs, valproic acid. May enhance the nephrotoxic effects of methoxyflurane.

Potentially Fatal: Additive sedation and/or respiratory depression with ethanol, sedatives, antidepressants, opioid analgesics, benzodiazepines and other CNS depressants. May decrease levels/effects of antiarrhythmic drugs

	depression with ethanol, sedatives, antidepressants, opioid analgesics, benzodiazepines and other CNS depressants. May decrease levels/effects of antiarrhythmic drugs e.g. disopyramide, propafenone, quinidine.
Food Interaction	Evening primrose may reduce seizure threshold. Increased CNS depression may occur with valerian, St John's wort, kava kava, gotu kola.
Lab Interference	May increase sulfobromophthalein retention and give elevated readings; do not administer within 24 hr preceding the test.
Storage	Intramuscular: Protect from light. Intravenous: Protect from light. Oral: Protect from light. Parenteral: Protect from light.
Mechanism of Action	Phenobarbitone is a short-acting barbiturate. It depresses the sensory cortex, reduces motor activity, changes cerebellar function, and produces drowsiness, sedation and hypnosis. Its anticonvulsant property is exhibited at high doses. Onset: Hypnosis: Oral: 20-60 min; IV: Approx 5 min. Duration: Oral: 6-10 hr; IV: 4-10 hr. Absorption: Readily absorbed from the GI tract (oral); peak plasma concentrations in about 2 hr (oral), and within 4 hr (IM). Distribution: Crosses the placenta; enters breast milk. Protein-binding: 45-60%. Metabolism: Partly hepatic. Excretion: Via urine (as unchanged drug). Plasma half-life: 75-120 hr (adult), greatly prolonged (neonates), 21-75 hr (children).

	Excretion: Via urine (as unchanged drug). Plasma half-life: 75-120 hr (adult), greatly prolonged (neonates), 21-75 hr (children).
CIMS Class	Anticonvulsants / Hypnotics & Sedatives
ATC Classification	N03AA02 - phenobarbital; Belongs to the class of barbiturates and derivatives antiepileptics. Used in the management of epilepsy.

phenobarbital + phenytoin

CIMS Class : (Anticonvulsants)
phenobarbital + phenytoin

P - Caution when used during

L - Caution when used during

Lab - Lab in

Food - Food

related phenobarbital + phenytoin information

Indication & Dosage

Oral

Grand mal seizures, Complex partial seizures

Adult: Each capsule contains phenobarbital 30 mg and phenytoin sodium 100 mg. 1 capsule 3-4 times daily.

Overdosage

Phenobarbital is moderately dialysable (20-50%). Symptoms of phenobarbital overdose: Slowness, ataxia and coma. Toxic phenobarbital levels: >40 mg/ml. Clinical symptoms are used to diagnose phenytoin toxicity as some patients require higher than usual therapeutic levels. Symptoms: Nystagmus, diplopia, slurred speech, ataxia, confusion and hyperglycaemia. Lethal phenytoin level >40 mcg/ml.

Contraindications

Hypersensitivity; acute intermittent porphyria; severe renal and hepatic disease; severe myocardial damage, AV block; respiratory depression.

Special Precautions

Elderly; seriously ill patients; patients doing work requiring mental alertness; unimpaired reflexes; lactation, pregnancy; children; history of alcohol or drug abuse.

	Elderly; seriously ill patients; patients doing work requiring mental alertness; unimpaired reflexes; lactation, pregnancy; children; history of alcohol or drug abuse; hepatic and renal impairment; depression and suicidal tendencies and carers should be counselled how to recognise symptoms of blood or clotting disorders and to seek medical attention. Normal therapeutic levels of phenobarbital are 20-40 mcg/ml. Phenobarbital and phenytoin may increase vitamin D requirements.
Adverse Drug Reactions	Sedation, depression, irritation, aggressiveness, confusion, paradoxical excitation in children, rash, dyskinesia, macrocytic anaemia, thyroiditis, vertigo, nystagmus, ataxia, diplopia and gingival hypertrophy. Potentially Fatal: Agranulocytosis, aplastic anaemia, exfoliative dermatitis (Stevens Johnson syndrome), severe hepatitis and leucopenia.
Drug Interactions	Phenytoin and phenobarbital may alter each other's metabolism. Both reduce levels of abacavir, amprenavir, TCAs, aprepitant, apripiprazole, carbamazepine (phenytoin levels reduced), valproate, clonazepam, lamotrigine, tacrolimus (phenytoin levels may increase) and theophylline. Phenytoin and phenobarbital may decrease effects of some corticosteroids, ciclosporin, coumarins, digitoxin, oestrogens and progestins. Valproate may increase levels of phenobarbitone and phenytoin (levels may conversely increase). Antipsychotics, TCAs, SSRIs and TCA related antidepressants may antagonise effects of phenytoin and phenobarbital. Phenytoin reduces levels and effects of bupropion, busulfan, caspofungin, digoxin, disopyramide, eplerenone, levodopa, mirtazapine and furosemide. Levels of phenytoin may be reduced by antacids (separate doses by a couple of hours), sucralfate, carbamazepine and theophylline. Phenytoin levels may be increased by benzodiazepines and ciprofloxacin. Levels of phenytoin may be increased by

	antacids (separate doses by a couple of hr), sucralfate, carbamazepine and theophylline. Phenytoin levels may be by benzodiazepines and ciprofloxacin. Levels of phenytoin may be increased by cimetidine, clarithromycin, diazepam, fluoxetine, fluconazole, fluvoxamine, ketoconazole, metronidazole, sulphonamide, topiramate (may reduce topiramate levels), trimethoprim (antifolate effect) and amiodarone (interaction continue for wk or mth. Phenytoin effects may be enhanced by influenza vaccine, esomeprazole and NSAIDs. Increased risk of withdrawal symptoms if phenytoin is used with methadone. Pyrimethamine may antagonise phenytoin effects. Phenytoin may increase antifolate effect of methotrexate. Concomitant use of phenobarbital and carbonic anhydrase inhibitors may increase risk of osteomalacia. Chlorpromazine and phenobarbital levels may be reduced if given together. Phenobarbital reduces effects of dihydropyridine calcium channel blockers, diltiazem, felodipine, nelfinavir, verapamil, griseofulvin, doxycycline, pyrazinamide, thyroid hormones, tibolone, haloperidol and mianserin. Phenobarbital reduces levels of chloramphenicol, indinavir, rifampicin, telithromycin (avoid before or after phenobarbital), ethosuximide, itraconazole and voriconazole (avoid concomitant use). Folate may decrease phenobarbital levels. Methylphenidate may increase phenobarbital levels. Potentially Fatal: Lithium toxicity may occur when used with phenytoin (even without increased lithium levels). Concomitant use of phenytoin with chloramphenicol or voriconazole may lead to increased, possibly, toxicity of phenytoin (and reduced voriconazole levels).
Food Interaction	Avoid: Valerian, St John's wort, kava kava, gotu kola (may increase CNS depression) and evening primrose (may reduce seizure threshold).
Lab Interference	Phenobarbital interferes with the assay for lactate dehydrogenase.
Mechanism of Action	Phenytoin and phenobarbital both depress the motor cortex, raise the seizure threshold and reduce spread of seizure. Phenytoin stabilises neuronal membranes.

	Phenytoin and phenobarbital both depress the motor cortex, raise the seizure threshold and reduce spread of seizure. Phenytoin stabilises neuronal membrane by inhibiting movement of sodium and calcium ions during the nerve impulse. Phenobarbital aids gamma-aminobutyric acid (GABA)-mediated inhibition in GABAergic cells. Absorption: Phenytoin: Slowly but almost completely absorbed from GI tract. Distribution: Phenobarbital: 45-60% bound to plasma proteins. Phenytoin: 90% bound to plasma proteins. Metabolism: Phenytoin: Largely metabolised hepatically to inactive metabolites. Excretion: Phenobarbital: About 25% of a dose is excreted in urine unchanged. Phenytoin: About 70% excreted in urine as metabolites. Plasma half-life: About 75-120 hr in adults. Phenytoin: Mean half-life: About 100 hr at steady state.
CIMS Class	Anticonvulsants
ATC Classification	N03AB02 - phenytoin; Belongs to the class of hydantoin derivatives antiepileptics. Used in the management of epilepsy.

phenoxybenzamine

P - Caution when used during pregnancy

L - Caution when used during lactation

related phenoxybenzamine information

Indication & Dosage

Oral

Hypertension in phaeochromocytoma

Adult: As hydrochloride: Initially, 10 mg once or bid.

Gradually increase, as necessary, to 1-2 mg/kg daily in 2 divided doses.

Child: Initially, 0.2 mg/kg (max: 10 mg) once daily. Increase by 0.2 mg/kg increments. Maintenance dose: 0.4-1.2 mg/kg/day every 6-8 hr; higher doses may be required.

Oral

Urinary retention

Adult: As hydrochloride: 10 mg bid.

Intravenous

Operative cover in patients with phaeochromocytoma

Adult: As hydrochloride: 1 mg/kg daily in 200 ml sodium chloride 0.9% infused over at least 2 hr.

	Operative cover in patients with phaeochromocytoma Adult: As hydrochloride: 1 mg/kg daily in 200 ml sodium chloride 0.9% infused over at least 2 hr. <i>Intravenous</i> Severe shock Adult: As hydrochloride: 1 mg/kg daily in 200-500 ml sodium chloride 0.9% infused over at least 2 hr.
Overdosage	Symptoms: Hypotension, tachycardia, lethargy, dizziness, shock. Management: Treat hypotension and shock by postural measures and parenteral fluid volume replacement. Do not use epinephrine.
Contraindications	Conditions in which fall in BP would be dangerous.
Special Precautions	Heart failure, ischaemic heart disease, cerebrovascular disease, renal impairment. Porphyria. Pregnancy and lactation. Discontinue use if angina develops or worsens. Respiratory tract infections. Elderly.
Adverse Drug Reactions	Nasal congestion, slight GI irritation, miosis, postural hypotension with dizziness, fatigue, compensatory tachycardia, inhibition of ejaculation, dry mouth, decreased sweating, confusion, drowsiness, convulsions (rapid IV infusion).
Drug Interactions	May antagonise the effects of α-adrenergic stimulating agents. Increased toxicity with β-blockers. Alcohol ingestion may exaggerate hypotensive effects. Potentially Fatal: Cardiac-accelerating and hypotensive effects may be enhanced by epinephrine and other drugs that stimulate both α- and β-adrenergic receptors. Additive

	Potentially Fatal: Cardiac-accelerating and hypotensive effects may be enhanced by epinephrine and other drugs that stimulate both α- and β-adrenergic receptors. Additive hypotensive effects with sildenafil, tadalafil, vardenafil.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 25°C (77°F).
Mechanism of Action	Phenoxybenzamine produces an irreversible (non-competitive) blockade by binding covalently to α-receptors in the smooth muscle. Onset: Gradual over several hr (oral). Duration: 3-4 days (oral/IV). Absorption: Incompletely and variably absorbed from the GI tract (oral). Metabolism: Hepatic. Excretion: Via urine and bile. Plasma half-life: 24 hr (IV).
CIMS Class	Other Antihypertensives / Other Drugs Acting on the Genito-Urinary System
ATC Classification	C04AX02 - phenoxybenzamine; Belongs to the class of other agents used as peripheral vasodilators.

phenoxymethylpenicillin

CIMS Class : (Penicillins)
phenoxymethylpenicillin

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related phenoxymethylpenicillin information

Indication & Dosage

Oral

Prophylaxis of recurrent rheumatic fever

Adult: 250 mg bid.

Child: <5 yr: 125 mg bid; ≥5 yr: 250 mg bid.

Renal impairment: Dose adjustment may be necessary.

Oral

**Streptococcal infections of the upper respiratory tract,
including scarlet fever and erysipelas**

Adult: 125-250 mg every 6-8 hr for 10 days. For

streptococcal pharyngitis: 500 mg 3-4 times daily for 10
days.

Child: For streptococcal pharyngitis: 250 mg bid-tid for 10
days.

Renal impairment: Dose adjustment may be necessary.

	Child: For streptococcal pharyngitis: 250 mg bid-td for 10 days. Renal impairment: Dose adjustment may be necessary. <i>Oral</i> Pneumococcal infections of the respiratory tract, including otitis media Adult: Mild to moderately severe: 250-500 mg every 6 hr until the patient is afebrile for at least 2 days. Renal impairment: Dose adjustment may be necessary. <i>Oral</i> Fusospirochetosis (Vincent's infection) of the oropharynx Adult: 250-500 mg every 6-8 hr. Renal impairment: Dose adjustment may be necessary. <i>Oral</i> Staphylococcal infections of the skin and soft tissue Adult: 250-500 mg every 6-8 hr. Renal impairment: Dose adjustment may be necessary.
	Administration
	Phenoxymethylpenicillin: Should be taken on an empty stomach. (Take on an empty stomach 1 hr before or 2 hr after meals.)
	Contraindications
	Hypersensitivity to penicillins.
	Special Precautions
	Monitor renal and haematologic systems periodically during prolonged therapy or if high dose is used. Use may result in overgrowth of nonsusceptible organisms. Cross-sensitivity with cephalosporins may occur. History of significant allergies and/or asthma. Pregnancy and lactation.

Adverse Drug Reactions	Nausea, vomiting, epigastric distress, diarrhoea, black hairy tongue; skin eruptions (maculopapular to exfoliative dermatitis), urticaria and other serum-sickness like reactions, laryngeal oedema; fever, eosinophilia. Potentially Fatal: Anaphylaxis.
Drug Interactions	Reduced absorption with neomycin. Levels/effects may be increased with probenecid. May reduce efficacy of estrogen-containing oral contraceptives. Potentially Fatal: Increased risk of anaphylactic reactions with nadolol and propranolol.
Food Interaction	Absorption may be slightly affected by food.
Lab Interference	May interfere with: Diagnostic tests for urinary glucose using copper sulfate; direct Coombs' test; test for urinary or serum proteins; test for uric acid; urinary aminohippurate sodium and phenolsulfonphthalein excretion tests; diagnostic tests that use bacteria.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 20-25°C (68-77°F). Solution must be stored in a refrigerator after reconstitution. Discard any unused solution after 14 days.

	a refrigerator after reconstitution. Discard any unused solution after 14 days.
Mechanism of Action	Phenoxymethylpenicillin inhibits the final cross-linking stage of peptidoglycan production through binding and inactivation of transpeptidases on the inner surface of the bacterial cell membrane, thus inhibiting bacterial cell wall synthesis. It may be less active against some susceptible organisms, particularly gram-negative bacteria. It is suitable for mild to moderate infections, not for chronic, severe or deep-seated infections. Absorption: Rapidly, although variably absorbed from the GI tract; about 60% of an oral dose absorbed. Calcium and potassium salts are better absorbed than the free acid. Peak plasma concentrations in 30-60 min after a 500-mg dose. Distribution: Protein-binding: About 80%. Widely distributed into body tissues; crosses the placenta and distributed in milk. Metabolism: Hepatic. Excretion: Primarily via urine (as unchanged drug and metabolites); via bile (small amounts). Plasma half-life: 30-60 min; may be increased to about 4 hr in severe renal impairment.
CIMS Class	Penicillins
ATC Classification	J01CE02 - phenoxymethylpenicillin; Belongs to the class of beta-lactamase sensitive penicillins. Used in the treatment of systemic infections.

J01CE02 - phenoxymethylpenicillin; Belongs to the class of beta-lactamase sensitive penicillins. Used in the treatment of systemic infections.

phentolamine

CIMS Class : (Other Antihypertensives)
phentolamine

P - Caution when used during pregnancy

L - Caution when used during lactation

related phentolamine information

Indication & Dosage

Intravenous

Hypertension in phaeochromocytoma

Adult: 2-5 mg. Repeat if necessary. Monitor BP.

Child: 1 mg IM/IV 1-2 hr before surgery. During surgery, 1 mg IV as indicated.

Injection

Dermal necrosis associated with norepinephrine IV infusion

Adult: Prevention: 10 mg is added to each liter of solution containing norepinephrine. Treatment of extravasation: Inject 5-10 mg in 10 ml normal saline into the affected area.

Child: Treatment: Infiltrate area with 0.1 to 0.2 mg/kg (max 10 mg).

Parenteral

Diagnosis of pheochromocytoma

Adult: 2.5-5 mg IM/IV.

	<i>Parenteral</i> Diagnosis of pheochromocytoma Adult: 2.5-5 mg IM/IV. Child: 1 mg IV or 3 mg IM.
Overdosage	Hypoglycaemia; severe hypotension, tachycardia, vomiting, dizziness. If fluid replacement is inadequate to treat hypotension, only alpha-adrenergic vasopressors such as norepinephrine should be used. Mixed agents such as epinephrine may cause more hypotension.
Contraindications	Renal impairment, coronary or cerebral arteriosclerosis, concurrent use with phosphodiesterase-5 (PDE-5) inhibitors including sildenafil (>25 mg), tadalafil, or vardenafil.
Special Precautions	Tachycardia or history of cardiac arrhythmias; gastritis or peptic ulcer disease; pregnancy and lactation. Discontinue if symptoms of angina occur or worsen.
Adverse Drug Reactions	Orthostatic hypotension, tachycardia, flushing, sweating, feelings of apprehension, anginal pain, arrhythmias, nausea, vomiting, diarrhoea, weakness, dizziness, nasal congestion. Potentially Fatal: MI, cerebrovascular spasm or occlusion.
Drug Interactions	Epinephrine, ephedrine: effects may be decreased; ethanol: increased toxicity (disulfiram reaction). Potentially Fatal: Additive BP-lowering effects with sildenafil, tadalafil or vardenafil.
Storage	Injection: The reconstituted solution should be used upon preparation and should not be stored. Store unopened vials at controlled room temperature (59-86°F). Intravenous: The

	injection. The reconstituted solution should be used upon preparation and should not be stored. Store unopened vials at controlled room temperature (59-86°F). Intravenous: The reconstituted solution should be used upon preparation and should not be stored. Store unopened vials at controlled room temperature (59-86°F). Parenteral: The reconstituted solution should be used upon preparation and should not be stored. Store unopened vials at controlled room temperature (59-86°F).
Mechanism of Action	Phentolamine is a reversible (competitive) and non-selective alpha-adrenergic receptor blocker, producing brief antagonism of circulating epinephrine and norepinephrine to reduce hypertension caused by alpha effects of these catecholamines. It has direct action on vascular smooth muscle; and has positive inotropic and chronotropic effects on the heart as well. Onset: IM: 15-20 min; IV: immediate. Duration: IM: 30-45 min; IV: 15-30 min. Metabolism: Hepatic. Excretion: Metabolism: Hepatic. Via urine (10% as unchanged drug); half-life elimination: 19 min.
CIMS Class	Other Antihypertensives
ATC Classification	C04AB01 - phentolamine; Belongs to the class of imidazoline derivative agents used as peripheral vasodilators. G04BE05 - phentolamine; Belongs to the class of drugs used in erectile dysfunction.

phenylephrine

CIMS Class : (Vasoconstrictors) , (Nasal Decongestants & Other Nasal Preparations) , (Mydriatic Drugs) , (Ophthalmic Decongestants, Anesthetics, Anti-inflammatories) , (Anorectal Preparations) , (Cough & Cold Preparations)
phenylephrine

P - Caution when used during pregnancy

L - Caution when used during lactation

Food $\square$ - Food interaction

related phenylephrine information

Indication & Dosage

Oral

Nasal congestion

Adult: As hydrochloride: 10 mg every 4 hr, max 60 mg daily; or 12 mg up to 4 times daily.

Child: Child: 2-6 yr: As tannate salt: 1.87-3.75 mg every 12 hr. 6-12 yr: As hydrochloride salt: 10 mg every 4 hr; as tannate salt: 3.75-7.5 mg every 12 hr. >12 yr: As hydrochloride salt: 10-20 mg every 4 hr; as tannate salt: 7.5-15 mg every 12 hr.

Nasal

Nasal congestion

Adult: 0.25 to 1% solution: Instill as nasal drops or a spray into each nostril every 4 hr as needed.

Child: 2-6 yr: 0.125% or 0.16% solution: 2-3 drops into each

Adult: 0.25 to 1% solution: Instill as nasal drops or a spray into each nostril every 4 hr as needed.

Child: 2-6 yr: 0.125% or 0.16% solution: 2-3 drops into each nostril every 4 hr as needed; 6-12 yr: 0.25% solution: 2-3 drops, or 1-2 sprays, into each nostril every 4 hr as needed.

Parenteral

Hypotensive states

Adult: As hydrochloride: Hypotension: Initially, 2-5 mg as a 1% solution via SC/IM admin with further doses of 1-10 mg if necessary; or 100-500 mcg by slow IV inj as a 0.1% solution, repeat as necessary after at least 15 min. Severe hypotension: 10 mg in 500 ml of glucose 5% or sodium chloride 0.9% infused IV at initial rate of up to 180 mcg/min reduce to 30-60 mcg/min according to response.

Child: Acute hypotension: Subcutaneous/IM: 1-12 yr: 100 mcg/kg every 1-2 hr as needed (max: 5 mg); 12-18 yr: 2-5 mg, followed by further doses of 1-10 mg (max initial dose 5 mg) if necessary. IV injection: 1-12 yr: 5 to 20 mcg/kg (max 500 mcg), repeated as needed after at least 15 min; 12-18 yr: 100-500 mcg, repeated as needed after at least 15 min. IV infusion: Solution is diluted with glucose 5% or sodium chloride 0.9% to a concentration of 20 mcg/ml and given via a central venous catheter. 1-16 yr: 100-500 nanograms/kg/min, adjusted according to response; 16-18 yr: initially up to 180 mcg/min, reduced to 30-60 mcg/min according to response.

Injection

Paroxysmal supraventricular tachycardia

according to response.

Injection

Paroxysmal supraventricular tachycardia

Adult: As hydrochloride: Initially, max of 500 mcg as a 0.1% solution, subsequent doses gradually increase by 100-200 mcg, up to 1 mg, if necessary.

Ophthalmic

Mydriasis

Adult: As hydrochloride: Up to 10%. Instill 1 drop, may repeat in 10-60 minutes as needed. May cause intense irritation and a local anaesthetic other than butacaine (incompatible) should be instilled into the eye a few minutes beforehand.

Child: 2.5% solution: <1 yr: Instill 1 drop 15-30 min before procedure. =1 yr: Instill 1 drop, may repeat in 10-60 min as needed.

Ophthalmic

Conjunctival decongestant

Adult: As hydrochloride: Usually 0.12%. Instill 1-2 drops into affected eye, up to 4 times daily; do not use for >72 hr.

Rectal

Haemorrhoids

Adult: Cream/ointment: Apply to clean dry area, up to 4 times daily; may be used externally or inserted rectally using applicator. Suppository: Insert 1 suppository, up to 4 times daily.

Child: =12 yr: Cream/ointment: Apply to clean dry area, up to 4 times daily; may be used externally or inserted rectally

	daily. Child: =12 yr: Cream/ointment: Apply to clean dry area, up to 4 times daily; may be used externally or inserted rectally using applicator. Suppository: Insert 1 suppository, up to 4 times daily.
Administration	Should be taken with food.
Overdosage	Vomiting, hypertension, palpitations, paresthesia, ventricular extrasystoles. Treatment is supportive; in extreme cases, IV phentolamine may be used.
Contraindications	Hypertension, ventricular tachycardia. Oral: use with or within 14 days of MAOI therapy. Ophthalmic: narrow-angle glaucoma.
Special Precautions	Severe hyperthyroidism, severe ischaemic heart disease, DM, prostatic hyperplasia. Rebound congestion in prolonged or excessive use of nasal drops. Use 10% eye drops in extreme caution in infants, elderly, cardiac disease, significant hypertension, advanced arteriosclerosis. Pregnancy and lactation. Over-the-counter cough and cold medications should not be used in infants and children <2 yr.
Adverse Drug Reactions	Anxiety, reflex bradycardia, tachycardia, arrhythmias, headache, cold extremities/gangrene, hypertension, nausea, vomiting, sweating, weakness, fear, restlessness, insomnia, confusion, irritability, psychotic states, dyspnoea, anorexia, palpitations, extravasation causing tissue necrosis and sloughing, mydriasis, difficulty in micturition and urinary retention, piloerection, increased salivation, hyperglycaemia, lactic acidosis. Ophthalmic solutions may liberate pigment

	sloughing, mydriasis, difficulty in micturition and urinary retention, piloerection, increased salivation, hyperglycaemia, lactic acidosis. Ophthalmic solutions may liberate pigment granules from the iris, corneal clouding/damage. Potentially Fatal: Increase in cardiac contractility, which may lead to angina or cardiac arrest; severe hypertension leading to cerebral haemorrhage or pulmonary oedema.
Drug Interactions	May increase hypertensive effect of beta-blockers (nonselective); MAOI potentiate hypertension; methyldopa and TCA can increase the pressor response.
Food Interaction	Ephedra and yohimbe may cause CNS stimulation.
Storage	Injection: Solution for injection: Store vials at 15-30°C. Protect from light. Do not use solution if discolored or contains a precipitate. Ophthalmic: Ophthalmic solution: 0.12%: Store at controlled room temperature. Protect from light and excessive heat. 2.5% and 10%: Refer to product labeling. Some products are stored at room temperature, others under refrigeration at 2-8°C. Do not use solution if discolored or contains a precipitate. Parenteral: Solution for injection: Store vials at 15-30°C. Protect from light. Do not use solution if discoloured or contains a precipitate.
Mechanism of Action	Phenylephrine is a sympathomimetic with mainly direct effects on alpha-adrenergic receptors and weak beta-adrenergic activity. It causes vasoconstriction of the arterioles of the nasal mucosa and conjunctiva; activates the dilator muscle of the pupil to cause contraction; produces vasoconstriction of arterioles in the body and produces

	arterioles of the nasal mucosa and conjunctiva; activates the dilator muscle of the pupil to cause contraction; produces vasoconstriction of arterioles in the body and produces systemic arterial vasoconstriction. Onset: Subcutaneous/IM/Ophthalmic: 10-15 min. IV: immediate. Duration: Subcutaneous: 1 hr; IM: Up to about 2 hr; IV: 15-30 min; Ophthalmic: maximal mydriasis: 1 hr, recover time: 3-6 hr. Absorption: Systemic absorption follows topical application. Metabolism: Via intestinal monoamine oxidase to phenolic conjugates in the liver. Excretion: Via urine (90%).
CIMS Class	Vasoconstrictors / Nasal Decongestants & Other Nasal Preparations / Mydriatic Drugs / Ophthalmic Decongestants, Anesthetics, Anti-inflammatories / Anorectal Preparations / Cough & Cold Preparations
ATC Classification	C01CA06 - phenylephrine; Belongs to the class of adrenergic and dopaminergic cardiac stimulants excluding glycosides. Used in the treatment of heart failure. R01AA04 - phenylephrine; Belongs to the class of topical sympathomimetic agents used as nasal decongestants. R01AB01 - phenylephrine; Belongs to the class of topical sympathomimetic combination preparations, excluding corticosteroids. Used as nasal decongestants. R01BA03 - phenylephrine; Belongs to the class of systemic sympathomimetic preparations used as nasal

sympathomimetic used as nasal decongestants.

R01BA03 - phenylephrine; Belongs to the class of systemic sympathomimetic preparations used as nasal decongestants.

S01FB01 - phenylephrine; Belongs to the class of sympathomimetics used in the treatment of mydriasis and cyclopegia.

S01GA05 - phenylephrine; Belongs to the class of sympathomimetics used as ophthalmologic decongestants.

phenylpropanolamine

CIMS Class : (Cough & Cold Preparations)
phenylpropanolamine

P - Caution when used during pregnancy

L - Caution when used during lactation

related phenylpropanolamine information

Indication & Dosage

Oral

Nasal congestion

Adult: 25 mg every 4 hr. Max: 100 mg daily.

Child: As part of a combination preparation containing phenylpropanolamine 2.5 mg/5 ml: 2-5 yr: 5 ml 3-4 times daily; 6-12 yr: 5-10 ml 3-4 times daily.

Contraindications

Concurrent use or within 14 days after stopping MAOI.

Special Precautions

Hyperthyroidism, DM, ischaemic heart disease, hypertension, renal impairment, or angle-closure glaucoma. Patients who are overweight, or with eating disorders. Pregnancy, lactation, elderly.

Adverse Drug Reactions

Palpitations, hypertension, anxiety, restlessness, insomnia, dizziness, anxiety, agitation, tremors, confusion.
Potentially Fatal: Hypertensive crisis, haemorrhagic stroke.

Drug Interactions

Decreased theophylline clearance with

Drug Interactions	Decreased theophylline clearance with phenylpropanolamine. Potentially Fatal: Increased risk of potentially fatal hypertensive crisis with or within 14 days after stopping MAOI. Increased risk of severe side effects with bromocriptine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Phenylpropanolamine is an indirect acting sympathomimetic, often used orally as the hydrochloride salt for nasal congestion. It has been withdrawn in several countries due to increased risk of haemorrhagic strokes. Onset: 15-30 minutes. Duration: 3 hr (Normal release tab); 12-16 hr (Extended release tab). Absorption: Readily and completely absorbed from GI tract. Peak plasma concentration reached after 1-2 hr. Metabolism: Undergoes some hepatic metabolism. Excretion: Excreted unchanged in urine (80-90%). Half life: 3-5 hr.
CIMS Class	Cough & Cold Preparations
ATC Classification	R01BA01 - phenylpropanolamine; Belongs to the class of systemic sympathomimetic preparations used as nasal

R01BA01 - phenylpropanolamine; Belongs to the class of systemic sympathomimetic preparations used as nasal decongestants.

phenytoin

CIMS Class : (Anticonvulsants)
phenytoin

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related phenytoin information

Indication & Dosage

Oral

Epilepsy

Adult: Initially, 3-4 mg/kg daily as single dose or in divided doses.

Alternatively, 150-300 mg daily increased gradually to 600 mg daily if necessary. Maintenance: 200-500 mg daily.

Child: Initially, 5 mg/kg daily in 2-3 divided doses. Maintenance: 4-8 mg/kg daily in divided doses. Max dose: 300 mg daily.

Intravenous

Tonic-clonic status epilepticus

Adult: Adjunctive therapy with a benzodiazepine (e.g. diazepam): 10-15 mg/kg by slow inj or intermittent infusion at a max rate of 50 mg/min. Maintenance: 100 mg IV (or orally) given every 6-8 hr.

Child: Neonates: 20 mg/kg as a loading dose, then 2.5-5 mg/kg bid; 1 mth-12 yr: 18 mg/kg as a loading dose, then 2.5-5 mg/kg bid; >12

	mg/min. Maintenance: 100 mg IV (or orally) given every 6-8 hr. Child: Neonates: 20 mg/kg as a loading dose, then 2.5-5 mg/kg bid; 1 mth-12 yr: 18 mg/kg as a loading dose, then 2.5-5 mg/kg bid; >12 yr: 18 mg/kg as a loading dose, then up to 100 mg 3-4 times daily.
Administration	Should be taken with food. (When administering to patients on nasogastric or other enteral feeds, be consistent throughout therapy in relation to feed times. Do not switch dosage forms/ brands without prior consideration.)
Overdosage	Unsteady gait, slurred speech, confusion, nausea, hypothermia, fever, hypotension, respiratory depression, coma. Treatment is symptomatic.
Contraindications	Pregnancy. IV admin in sinus bradycardia, heart block, or Stokes-Adams syndrome.
Special Precautions	Cardiovascular disease, e.g. sinus bradycardia, heart blocks; DM; hepatic impairment; hypoalbuminemia; porphyria; seizures (may increase frequency of petit mal seizures); debilitated patients; elderly. Caution in IV admin in hypotension, heart failure or MI, monitor BP and ECG during therapy. IV must be given slowly (too rapid admin may cause hypotension, CNS depression, cardiac arrhythmias and impaired heart conduction). Extravasation and intra-arterial admin must be avoided. Do not discontinue abruptly (may increase seizure frequency), unless safety concerns require a more rapid withdrawal. May impair ability to drive or operate machinery.
Adverse Drug Reactions	Hypersensitivity, lack of appetite, headache, dizziness, tremor, transient nervousness, insomnia, GI disturbances (e.g. nausea, vomiting, constipation), tenderness and hyperplasia of the gums,

	Hypersensitivity, lack of appetite, headache, dizziness, tremor, transient nervousness, insomnia, GI disturbances (e.g. nausea, vomiting, constipation), tenderness and hyperplasia of the gums, acne, hirsutism, coarsening of the facial features, rashes, osteomalacia. Phenytoin toxicity as manifested as a syndrome of cerebellar, vestibular, ocular effects, notably nystagmus, diplopia, slurred speech, and ataxia; also with mental confusion, dyskinesias, exacerbations of seizure frequency, hyperglycaemia. Solutions for inj may cause local irritation or phlebitis. Prolonged use may produce subtle effects on mental function and cognition, especially in children. Potentially Fatal: Toxic epidermal necrolysis, Stevens-Johnson syndrome.
Drug Interactions	Effects with other sedative drugs or ethanol may be potentiated. Enhances toxic effects of paracetamol, lithium. Increased risk of osteomalacia with acetazolamide. Decreased serum levels/effects with acyclovir, antineoplastics, benzodiazepines, ciprofloxacin, CYP2C9 inducers (e.g. carbamazepine), CYP2C19 inducers (e.g. rifampin), folic acid, vigabatrin. Increased serum concentrations with allopurinol, capecitabine, cimetidine, CYP2C9 inhibitors (e.g. fluconazole), CYP2C19 inhibitors (e.g. delavirdine), disulfiram, methylphenidate, metronidazole, omeprazole, SSRI, trazodone, trimethoprim. Increases metabolism of antiarrhythmics, anticonvulsants, antipsychotics, beta-blockers, calcium channel blockers, chloramphenicol, corticosteroids, doxycycline, oestrogens, HMG-CoA reductase inhibitors, methadone, theophylline, TCAs. Decreases levels/effects of clozapine, ciclosporin, tacrolimus, CYP2B6 substrates

	corticosteroids, doxycycline, oestrogens, HMG-CoA reductase inhibitors, methadone, theophylline, TCAs. Decreases levels/effects of clozapine, ciclosporin, tacrolimus, CYP2B6 substrates (e.g. bupropion, selegiline), CYP2C8 substrates (e.g. amiodarone), CYP2C9 substrates (e.g. celecoxib), CYP2C19 substrates (e.g. citalopram), CYP3A4 substrates (e.g. benzodiazepines), digoxin, itraconazole, levodopa, neuromuscular-blocking agents, thyroid hormones, topiramate. Increases levels/effect of dopamine, ticlopidine. Valproic acid may displace phenytoin from binding sites; and affect phenytoin serum concentrations. Transiently increases the hypothermia response to warfarin initially, followed by an inhibition of the response. Potentially Fatal: Enhances the hypotensive properties of dopamine and the cardiac depressant properties of lidocaine.
Food Interaction	Avoid or limit ethanol (interferes with metabolism of phenytoin). Serum concentrations may be altered if taken with food. May decrease calcium, folic acid, and vitamin D levels. Avoid evening primrose (seizure threshold decreased); valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).
Lab Interference	Thyroid function tests; dexamethasone and metyrapone tests.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Solution for inj: Store at room temperature of 15-30°C. Oral: Cap, tab: Store below 30°C. Protect from light and

	Intravenous: Solution for inj: Store at room temperature of 15-30°C. Oral: Cap, tab: Store below 30°C. Protect from light and moisture; Oral suspension: Store at room temperature of 20-25°C, do not freeze, protect from light.
Mechanism of Action	Phenytoin acts as an anticonvulsant by increasing efflux or decreasing influx of sodium ions across cell membranes in the motor cortex during generation of nerve impulses; thus stabilising neuronal membranes and decreasing seizure activity. It acts as an antiarrhythmic by extending the effective refractory period and suppressing ventricular pacemaker automaticity, shortening action potential in the heart. Absorption: Slow but almost complete from the GI tract (oral); much slower absorption (IM). Distribution: Widely distributed. Protein-binding: 90%. Metabolism: Extensively hepatic; converted to inactive metabolites. Excretion: Via urine as hydroxylated metabolite; elimination half life at steady state: 22 hr.
CIMS Class	Anticonvulsants
ATC Classification	N03AB02 - phenytoin; Belongs to the class of hydantoin derivatives antiepileptics. Used in the management of epilepsy.

phytomenadione

CIMS Class : (Haemostatics)
phytomenadione

P - Caution when used during pregnancy

related phytomenadione information

Indication & Dosage

Oral

Vitamin K deficiency due to drugs or malabsorption

Adult: 10-40 mg daily.

Oral

Over-anticoagulation

Adult: Up to 5 mg may be used. Dose depends on INR and degree of haemorrhage.

Intramuscular

Prophylaxis of vitamin K deficiency bleeding in neonates

Child: Neonate: 0.5-1 mg, given as a single dose via IM inj.

Alternatively, 2 mg may be given orally, followed by a 2nd dose of 2 mg after 4-7 days.

Intravenous

Over-anticoagulation

Adult: 0.5-5 mg via slow IV inj. Dose depends on INR and

	<i>intravenous</i> Over-anticoagulation Adult: 0.5-5 mg via slow IV inj. Dose depends on INR and degree of haemorrhage. <i>Parenteral</i> Vitamin K deficiency bleeding in neonates Child: Infant: 1 mg by IV/IM/SC inj, further doses may be given if necessary
Administration	May be taken with or without food.
Contraindications	Hypersensitivity.
Special Precautions	Increased risk of severe haemolytic anaemia in neonates after large doses; severe hepatic impairment; pregnancy. Premature neonates weighing <2.5 kg.
Adverse Drug Reactions	Anaphylaxis, dyspnoea, cyanosis, pain, swelling, phloebitis at the Inj site, diaphoresis, dizziness, hypotension (rare), allergic reactions after SC and IM inj.
Drug Interactions	Decreased effect of oral anticoagulants.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intramuscular: Store at 15-30°C. Intravenous: Store at 15-30°C. Oral: Store at 15-30°C. Parenteral: Store at 15-30°C.
Mechanism of Action	Phytomenadione promotes hepatic synthesis of clotting factors. It is a naturally occurring compound that is used to

	Phytomenadione promotes hepatic synthesis of clotting factors. It is a naturally occurring compound that is used to prevent and treat haemorrhages related to vitamin K deficiency. Absorption: Requires bile for absorption in GI tract. Distribution: Mainly in the liver. Metabolism: Rapidly metabolised to glucuronide and sulfate conjugates. Excretion: In bile and urine as metabolites.
CIMS Class	Haemostatics
ATC Classification	B02BA01 - phytomenadione; Belongs to the class of vitamin K. Used in the treatment of hemorrhage.

pilocarpine

CIMS Class : (Antiglaucoma Preparations)
pilocarpine

P - Contraindicated in pregnancy
L - Caution when used during lactation

related pilocarpine information

Indication & Dosage

Oral

Dry mouth after radiotherapy for malignant neoplasms of the head and neck

Adult: Initial dose: 5 mg tid. If necessary, increase dose gradually after 4 wk until adequate response is achieved.

Max dose: 10 mg tid.

Oral

Sjogren's syndrome

Adult: 5 mg 4 times daily. Max: 30 mg daily. Stop treatment if no improvement after 3 mth.

Hepatic impairment: Reduce dose in moderate to severe cirrhosis. Recommended dose: Child pugh category B: 5 mg bid. Child pugh category C: Avoid usage.

Ophthalmic

Open-angle glaucoma

Adult: As HCl or nitrate: Instill a 0.5-4% soln into the eye 4

	<i>Ophthalmic</i> Open-angle glaucoma Adult: As HCl or nitrate: Instill a 0.5-4% soln into the eye 4 times daily. As modified-release preparation: insert preparation into the conjunctival sac which releases 20-40 mcg/hr for 7 days. As 4% ophth gel: apply once nightly into the affected eye(s). Hepatic impairment: Reduce dose in moderate to severe cirrhosis. Recommended dose: Child pugh category B: 5 mg bid. Child pugh category C: Avoid usage.
Administration	May be taken with or without food.
Overdosage	May lead to "cholinergic crisis".
Contraindications	Angle-closure glaucoma; acute iritis, anterior uveitis; hypersensitivity. Pregnancy.
Special Precautions	Retinal detachment; corneal or conjunctival damage. Patients with cognitive or psychiatric disorders, renal impairment, biliary tract disorders. Prolonged use may lead to lens opacities. May impair ability to drive or operate machines. Lactation.
Adverse Drug Reactions	Ocular: Pain and irritation, blurred vision, lachrymation, browache, conjunctival vascular congestion, superficial keratitis, vitreous haemorrhage, increased pupillary block.
Drug Interactions	Concomitant admin of 2 miotics may increase risk of toxic reactions. Aminoglycosides, clindamycin, colistin, cyclopropane and halogenated inhalational anaesthetics, quinine, procainamide, lithium and β -blockers may reduce

	reactions. Aminoglycosides, clindamycin, ceftriaxone, cyclopropane and halogenated inhalational anaesthetics, quinine, procainamide, lithium and β-blockers may reduce the efficacy of pilocarpine. Concurrent use with β-blockers may lead to bradycardia. May prolong the action of suxamethonium. Potentially Fatal: Miotic and ocular hypotensive effect antagonised by anticholinergics. Conduction disturbances with β-blockers.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Ophthalmic: Store $<8^{\circ}\text{C}$. Do not freeze. Oral: Store at $2\text{-}27^{\circ}\text{C}$.
Mechanism of Action	Pilocarpine is a tertiary parasympathomimetic that directly stimulates cholinergic receptors in the eyes causing pupillary constriction, spasm of accommodation and a transient rise in IOP followed by a fall. Onset: Miosis: 10-30 min, IOP reduction: 75 min (ophthalmic). Duration: Miosis: 4-8 hr, IOP reduction: 4-14 hr (ophthalmic). Metabolism: Inactivated at neuronal synapses and in plasma. Excretion: Urine (as unchanged drug and inactive metabolites). Elimination half-lives: 0.76 (5 mg), 1.35 hr (10

	Excretion: Urine (as unchanged drug and inactive metabolites). Elimination half-lives: 0.76 (5 mg), 1.35 hr (10 mg).
CIMS Class	Antiglaucoma Preparations
ATC Classification	N07AX01 - pilocarpine; Belongs to the class of other agents used as parasympathomimetics. S01EB01 - pilocarpine; Belongs to the class of parasympathomimetics used in the treatment of glaucoma and miosis.

pimozide

CIMS Class : (Antipsychotics)
pimozide

P - Caution when used during pregnancy

L - Caution when used during lactation

Food α - Food interaction

related pimozide information

Indication & Dosage

Oral

Schizophrenia

Adult: Initially, 2 mg daily adjusted according to response by increments of 2-4 mg at intervals of not <1 wk. Max dose: 20 mg/day.

Child: 12-18 yr: Initial dose: 1 mg daily.

Oral

Monosymptomatic hypochondria

Adult: Initially, 4 mg daily adjusted according to response by increments of 2-4 mg at intervals of not <1 wk. Max dose: 16 mg/day.

Elderly: Half the usual initial dose.

Oral

Paranoid states

Adult: Initially, 4 mg daily adjusted according to response

	<i>Oral</i> Paranoid states Adult: Initially, 4 mg daily adjusted according to response by increments of 2-4 mg at intervals of not <1 wk. Max dose: 16 mg/day. Elderly: Half the usual initial dose. <i>Oral</i> Tourette's syndrome Adult: Initially, 1-2 mg or 200 mcg/kg daily. Max dose: 10 mg/day. Child: >12 yr: initial dose: 50 mcg/kg.
Administration	May be taken with or without food.
Contraindications	Prolonged QT interval, family history of congenital QT prolongation, history of cardiac arrhythmias.
Special Precautions	Parkinson's syndrome; epilepsy, pregnancy, lactation; hepatic or renal impairment; monitor ECG before and during treatment; review the need for continuing treatment if repolarisation changes occur. Monitor cardiac function in patients taking >16 mg daily. Electrolytes disturbances such as hypomagnesaemia or hypokalaemia may increase risk of cardiotoxicity.
Adverse Drug Reactions	Extrapyramidal reactions, insomnia, drowsiness, dizziness. ECG changes, dry mouth, constipation, urinary difficulty and blurred vision. Potentially Fatal: Neuroleptic malignant syndrome.
Drug Interactions	Propranolol and cimetidine decrease hepatic metabolism and increase efficacy and toxicity. Concurrent use with

	Propranolol and cimetidine decrease hepatic metabolism and increase efficacy and toxicity. Concurrent use with SSRIs may increase risk of extrapyramidal adverse effects and potentially fatal torsades de pointes arrhythmias. Potentially Fatal: Potentiates other CNS depressants eg, alcohol and benzodiazepines. Increased risk of arrhythmias due to prolonged QT interval with TCAs, terfenadine, astemizole, antimalarial and cisapride. Concurrent use with inhibitors of CYP3A4 or CYP2D6 may lead to increased plasma concentrations leading to cardiac arrhythmias. Imatinib may also raise the plasma concentrations of pimozide. Avoid use with drugs that cause electrolyte disturbances eg, diuretics.
Food Interaction	Concurrent use with grapefruit juice may increase the blood concentrations of pimozide.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Pimozide is a long-acting antipsychotic structurally similar to butyrophenones which blocks dopaminergic receptors in the CNS. It also exhibits some calcium-blocking activity. Absorption: >50% absorbed (oral); peak plasma levels after 4-12 hr. Metabolism: Extensively hepatic via N-dealkylation. Excretion: Urine and faeces (as unchanged drug and

	after 4-12 hr. Metabolism: Extensively hepatic via N-dealkylation. Excretion: Urine and faeces (as unchanged drug and metabolites).
CIMS Class	Antipsychotics
ATC Classification	N05AG02 - pimozide; Belongs to the class of diphenylbutylpiperidine derivatives antipsychotics. Used in the management of psychosis.

CIMS Class : (Beta-Blockers) , (Antiglaucoma Preparations)
pindolol

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related pindolol information

Indication & Dosage

Oral

Angina pectoris

Adult: 2.5-5 mg up to tid. Max dose: 40 mg/day.

Oral

Hypertension

Adult: 5 mg 2-3 times daily or 15 mg once daily, increase according to patient's response. Max dose: 60 mg/day.

Ophthalmic

Glaucoma

Adult: As a 1% eye drops.

Administration

May be taken with or without food. (May be taken w/ meals to reduce GI discomfort.)

Contraindications

2nd and 3rd degree AV block, sinus bradycardia, uncontrolled heart failure, bronchospasm or asthma, metabolic acidosis, severe peripheral arterial disease,

	2nd and 3rd degree AV block, sinus bradycardia, uncontrolled heart failure, bronchospasm or asthma, metabolic acidosis, severe peripheral arterial disease, cardiogenic shock.
Special Precautions	1st degree AV block. May mask symptoms of hyperthyroidism and hypoglycaemia. May unmask myasthenia gravis. May aggravate psoriasis. Abrupt withdrawal has resulted in angina, MI, ventricular arrhythmias and death. Patients on long-term treatment should discontinue medication gradually over a period of 1-2 wk Pregnancy and lactation. Not to be used in patients with pheochromoctoma without concomitant α-adrenoceptor blocking therapy.
Adverse Drug Reactions	Bradycardia; hypotension; heart failure, heart block; bronchospasm; fatigue; coldness of extremities; pneumonitis; pulmonary and retroperitoneal fibrosis; pleurisy; CNS effects; myopathies; GI disturbances; skin rash; pruritus; reversible alopecia; lupus-like syndrome; male impotence; sclerosing peritonitis; paraesthesias; peripheral neuropathy; muscle cramps; haematological reactions.
Drug Interactions	Aldesleukin and general anaesthetics may increase antihypertensive effects of β-blockers. NSAIDs may antagonise the effects of pindolol. Concurrent use with other cardiac depressants such as antiarrhythmics may precipitate bradycardia and heart block. Diabetic patients may have reduced response to insulin and oral hypoglycaemics.

	cardiac depressants such as antiarrhythmics may precipitate bradycardia and heart block. Diabetic patients may have reduced response to insulin and oral hypoglycaemics. Concurrent use with antacids and bile-acid binding resins may reduce absorption. Increased metabolism when used with barbiturates and rifampicin. Reduced metabolism when used with cimetidine, erythromycin, fluvoxamine and hydralazine. Potentially Fatal: Increased risk of rebound hypertension with clonidine. (Withdraw pindolol several days before slowly withdrawing clonidine).
Lab Interference	Changes in blood concentrations of triglycerides, glucose and cholesterol.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Ophthalmic: Store below 30°C. Oral: Store below 30°C.
Mechanism of	Pindolol is a non-cardioselective β -blocker with intrinsic

Mechanism of Action	Pindolol is a non-cardioselective β-blocker with intrinsic sympathomimetic activity but little membrane-stabilizing properties. Absorption: Rapidly absorbed. Peak plasma concentrations within 1 hr of drug admin. Distribution: 40% bound to plasma proteins. Vd in healthy adults: 2 L/kg. Metabolism: Extensively metabolised. Excretion: 35-40% excreted unchanged in urine. 60-65% metabolised to hydroxy-metabolites and excreted as glucuronides and ethereal sulfates.
CIMS Class	Beta-Blockers / Antiglaucoma Preparations
ATC Classification	C07AA03 - pindolol; Belongs to the class of non-selective beta-blocking agents. Used in the treatment of cardiovascular diseases.

pioglitazone

CIMS Class : (Antidiabetic Agents)
pioglitazone

P - Caution when used during pregnancy

L - Contraindicated in lactation

Lab - Lab interference

related pioglitazone information

Indication & Dosage

Oral

Type 2 diabetes mellitus

Adult: 15-30 mg once daily increased in increments if necessary. Max dose: 45 mg/day.

Administration

May be taken with or without food.

Contraindications

Hypersensitivity. Type 1 diabetes mellitus, symptomatic or history of heart failure, diabetic ketoacidosis, childn <18 yr. Lactation.

Special Precautions

Increased risk of hypoglycaemia when used with insulin or oral hypoglycaemics. Oedema, congestive heart failure, hepatic dysfunction, jaundice, anaemia. May cause ovulation in premenopausal, anovulatory women. Monitor liver function before and during treatment. Monitor glycaemic control. Pregnancy. Caution when oral contraceptives or

	in premenopausal, anovulatory women. Monitor liver function before and during treatment. Monitor glycaemic control. Pregnancy. Caution when oral contraceptives or hormonal replacement therapy is used in diabetics due to increased risk of arterial diseases. Stop treatment if ALT increases and remains >3 times above the upper limit of normal or if jaundice develops.
Adverse Drug Reactions	Pharyngitis, oedema, headache, upper resp tract infection, sinusitis, anaemia; GI disturbances, wt gain, visual disturbances, dizziness, arthralgia, haematuria, impotence.
Drug Interactions	Ketoconazole and gemfibrozil may increase the plasma concentrations of pioglitazone while enzyme inducers such as rifampicin may decrease the plasma concentrations. Increased risk of fluid retention when used with NSAIDs.
Lab Interference	Transient elevations in creatine phosphokinase levels were observed.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 25°C.
Mechanism of Action	Pioglitazone is as a potent and highly selective agonist for the peroxisome proliferator activated receptor-gamma (PPAR). Activation of these receptors promotes the production of gene products involved in lipid and glucose metabolism. It also improves insulin response to target cells witho increasing the pancreatic secretion of insulin.

	production of gene products involved in lipid and glucose metabolism. It also improves insulin response to target cells witho increasing the pancreatic secretion of insulin. Onset: Delayed. Absorption: Peak plasma concentrations after 2 hr. Distribution: Protein-binding: >99%. Metabolism: Extensively metabolised by hydroxylation and oxidation. Excretion: Urine (15-30%); faeces (as metabolites); 3-7 hr (elimination half-life, parent drug).
CIMS Class	Antidiabetic Agents
ATC Classification	A10BG03 - pioglitazone; Belongs to the class of thiazolidinediones. Used in the treatment of diabetes.

pioglitazone + metformin

CIMS Class : (Antidiabetic Agents)
pioglitazone + metformin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related pioglitazone + metformin information

Indication & Dosage

Oral

Type 2 diabetes mellitus

Adult: Starting dose should be based on patient's current dosage regimen of pioglitazone and/or metformin. For patients who are inadequately controlled on metformin monotherapy: Usual starting dose: pioglitazone/metformin: 15 mg/500 mg or 15 mg/850 mg 1-2 times daily, adjust dose gradually based on therapeutic response. For patients who are on pioglitazone monotherapy but require additional glycaemic control: Usual starting dose: pioglitazone/metformin: 15 mg/500 mg twice daily or 15 mg/850 mg once daily, adjust dose gradually based on therapeutic response. Daily max: pioglitazone/metformin: 45 mg/2250 mg.

Contraindications

Hypersensitivity; diabetic coma, diabetic ketoacidosis; severe

	Hypersensitivity; diabetic coma, diabetic ketoacidosis; severe renal or hepatic impairment; recent MI, CHF; type 1 DM; severe infection; acute or chronic metabolic acidosis with or without coma; stress, trauma; severe impairment of thyroid function; dehydration, acute or chronic alcoholism; children <18 yr, pregnancy, lactation.
Special Precautions	Elderly. Monitor renal function regularly. Patients receiving pioglitazone in combination with insulin or oral hypoglycaemic agents may be at risk of hypoglycaemia. Oedema, congestive heart failure; hepatic dysfunction; jaundice. Premenopausal, anovulatory women, anaemia. Monitor liver function.
Adverse Drug Reactions	Pioglitazone: Pharyngitis, oedema, headache, upper resp tract infection, sinusitis, anaemia; GI disturbances, wt gain, visual disturbances, dizziness, arthralgia, haematuria, impotence. Metformin: Anorexia, nausea, vomiting, diarrhoea, wt loss, flatulence, occasional metallic taste; weakness; hypoglycaemia; rash, malabsorption of vit B₁₂. Potentially Fatal: Lactic acidosis in presence of renal failure and alcoholism.
Drug Interactions	Pioglitazone: Ketoconazole inhibits the metabolism of pioglitazone (in vitro). Increased hypoglycaemic effect with alcohol. Metformin: Additive effect with sulphonylureas. Antagonistic effects with diuretics, corticosteroids, phenothiazines, thyroid products, oestrogens, oral contraceptives, phenytoin, nicotinic acid, sympathomimetics,

	Antagonistic effects with diuretics, corticosteroids, phenothiazines, thyroid products, oestrogens, oral contraceptives, phenytoin, nicotinic acid, sympathomimetics, Ca channel blockers and isoniazid. Potentially Fatal: Pioglitazone: admin of a thiazolidinedione with OC reduces the plasma concentrations of the hormones which may result in the loss of contraceptive effectivity. Metformin: Lactic acidosis with alcohol and potentiation of hypoglycaemic effect. Cimetidine and furosemide may increase plasma-metformin levels. Drugs eliminated via renal tubular secretion may increase metformin levels.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 25°C.
Mechanism of Action	Pioglitazone is as a potent and highly selective agonist for the peroxisome proliferator activated receptor-gamma. Activation of these receptors promotes the production of gene products involved in lipid and glucose metabolism. It also improves insulin response to target cells with increasing the pancreatic secretion of insulin. Metformin decreases hepatic gluconeogenesis, decreases intestinal absorption of glucose and improves insulin sensitivity (increases peripheral glucose uptake and utilisation).
CIMS Class	Antidiabetic Agents

ATC Classification	A10BA02 - metformin; Belongs to the class of biguanides. Used in the treatment of diabetes. A10BG03 - pioglitazone; Belongs to the class of thiazolidinediones. Used in the treatment of diabetes.

pipecuronium

CIMS Class : (Muscle Relaxants)
pipecuronium

P - Caution when used during pregnancy

L - Caution when used during lactation

related pipecuronium information

Indication & Dosage

Intravenous

Muscle relaxant in general anaesthesia, Facilitate endotracheal intubation

Adult: Initial dose: 80-100 mcg/kg. Subsequent doses: 10-20 mcg/kg. Initial dose following suxamethonium admin or in patients at high risk: 50-60 mcg/kg. Initial dose for caesarean section: 35 mcg/kg.

Overdosage

Prolonged apnoea due to paralysis of the intercostal muscles and diaphragm, with CV collapse and effects of histamine release.

Contraindications

Hypersensitivity.

Special Precautions

Pulmonary disease, respiratory insufficiency, asthma, neuromuscular disease, dehydration, severely ill patients, hepatic or renal impairment. Doses in obese patients should be based on patient's ideal body weight. Pregnancy,

	neuromuscular disease, dehydration, severely ill patients, hepatic or renal impairment. Doses in obese patients should be based on patient's ideal body weight. Pregnancy, lactation.
Adverse Drug Reactions	Transient hypotension, bradycardia, reduced cardiac output. Potentially Fatal: Anaphylactic reactions and malignant hyperthermia.
Drug Interactions	Actions antagonised by cholinesterases and long term carbamazepine, phenytoin or corticosteroids usage. Enhanced block when used with drugs that have neuromuscular blocking activity such as lidocaine, quinidine, verapamil and aminoglycosides. Potentially Fatal: Effects enhanced by volatile inhalational anaesthetics, ketamine (IV), antiarrhythmics, antibacterials, K depleting diuretics, parenteral Mg salts.
Mechanism of Action	Pipecuronium bromide is an aminosteroidal competitive neuromuscular blocker. It does not have significant CV adverse effects or histamine-related effects. Onset: Dose-dependent: 2.5-3 min. Duration: Dose-dependent: 30 min-2 hr. Distribution: Vd: 0.25 L/kg. Metabolism: Converted to 3-desacetyl (less active). Excretion: Via urine (as unchanged); 1.7-2.3 hr (elimination half-life).
CIMS Class	Muscle Relaxants
ATC Classification	M03AC06 - pipecuronium bromide; Belongs to the class of other quaternary ammonium-containing agents used as

M03AC06 - pipecuronium bromide; Belongs to the class of other quaternary ammonium-containing agents used as peripherally-acting muscle relaxants.

piperacillin

CIMS Class : (Penicillins)
piperacillin

P - Caution when used during pregnancy

Lab - Lab interference

related piperacillin information

Indication & Dosage

Intravenous

Severe infections

Adult: As sodium: 200-300 mg/kg daily in divided doses or 3-4 g every 4 or 6 hr. For life-threatening conditions especially those caused by *Pseudomonas* or *Klebsiella* spp: At least 16 mg/day. Usual max dose: 24 g/day.

Child: As sodium: 1 mth-12 yr: 100-300 mg/kg daily in 3-4 divided doses. Neonate: <7 days or <2 kg: 150 mg/kg daily in 3 divided doses; >7 days and >2 kg: 300 mg/kg in 3-4 divided doses. IV route is preferred for infants and children. Single doses >500 mg should not be given via IM inj.

Renal impairment: Moderate-severe: Dose reduction is necessary.

Parenteral

Mild or uncomplicated infections

Adult: As sodium: 100-125 mg/kg daily. Usual dose: if given

Parenteral

Mild or uncomplicated infections

Adult: As sodium: 100-125 mg/kg daily. Usual dose: if given via IV inj/infusion, 2 g every 6 or 8 hr or 4 g every 12 hr; if given via IM inj, 2 g every 8 or 12 hr.

Child: As sodium: 1 mth-12 yr: 100-300 mg/kg daily in 3-4 divided doses. Neonate: <7 days or <2 kg: 150 mg/kg daily in 3 divided doses; >7 days and >2 kg: 300 mg/kg in 3-4 divided doses. IV route is preferred for infants and children. Single doses >500 mg should not be given via IM inj.

Renal impairment: Moderate-severe: Dose reduction is necessary.

Parenteral

Prophylaxis of infection during surgery

Adult: As sodium: 2 g just before the procedure or when the umbilical cord is clamped in caesarean section, followed by at least 2 doses of 2 g at intervals of 4 or 6 hr within 24 hr of procedure.

Renal impairment: Moderate-severe: Dose reduction is necessary.

Intramuscular

Uncomplicated gonorrhoea

Adult: As sodium: 2 g as a single dose in combination with 1 g oral dose of probenecid given 30 min before the inj.

Renal impairment: Moderate-severe: Dose reduction is necessary.

Contraindications

Hypersensitivity.

	Hypersensitivity.
Special Precautions	Renal impairment; heart failure. Pregnancy. Prolonged treatment may increase risk of superinfection, leukopenia, neutropenia and bleeding manifestations. Increased risk of fever and rash in cystic fibrosis patients. Monitor renal, hepatic and haematological functions during prolonged and high-dose therapy.
Adverse Drug Reactions	GI disturbances; hypersensitivity reactions; eosinophilia, hyponatraemia, hypokalaemia. Injection-site related reactions such as pain, erythema and induration. Potentially Fatal: Anaphylactic reactions; prolongation of bleeding time; CNS toxicity.
Drug Interactions	Clearance reduced by probenecid. May prolong bleeding time when used with anticoagulants. Increased risk of aminoglycoside-associated nephrotoxicity when used together. Concurrent use may increase risk of methotrexate toxicity due to reduced clearance. Increased neuromuscular block when used with neuromuscular blockers.
Lab Interference	Interferes with urinary glucose using copper sulfate and false-positive results in urinary or serum protein, uric acid and urinary test.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in

	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intramuscular: Store at 20-25 °C. Intravenous: Store at 20-25 °C. Parenteral: Store at 20-25 °C.
Mechanism of Action	Piperacillin inhibit septum and cell wall synthesis and has an antimicrobial activity against a wide range of gm-ve organisms including K. pneumoniae, P. aeruginosa, Enterobacteriaceae and against Garm-positive organisms eg, E. faecalis and B. fragilis. Absorption: Not absorbed when given orally. IM: well absorbed with peak plasma concentrations after 30-50 min. Distribution: Widely distributed into body tissues and fluids, CSF (small amounts except when the meninges are inflamed), bile (high concentrations); crosses the placenta and enters the breast milk. Protein-binding: 20% Excretion: Via the urine by glomerular filtration and tubular secretion (60-80% unchanged), via the bile (20%); may be removed by dialysis. Elimination half-life: 1 hr; 4-6 hr (end-stage renal failure), 3-fold increase (severe renal insufficiency), prolonged in neonates and in renal and hepatic impairment.
CIMS Class	Penicillins
ATC Classification	J01CA12 - piperacillin; Belongs to the class of penicillins with extended spectrum. Used in the treatment of systemic infections.

piperacillin + tazobactam

CIMS Class : (Penicillins)
piperacillin + tazobactam

P - Caution when used during pregnancy

L - Caution when used during lactation

related piperacillin + tazobactam information

Indication & Dosage

Intravenous

Nosocomial pneumonia

Adult: Initial dose: 4.5 g (piperacillin 4 g and tazobactam 0.5 g) every 6 hr for 7-14 days. When used empirically, combination with an aminoglycoside or antipseudomonal fluoroquinolone is recommended. May be given via infusion over 30 minutes. If *Pseudomonas aeruginosa* is not isolated, may discontinue aminoglycoside.

Child: 2-8 mth: 80 mg of piperacillin/kg every 8 hr; ≥9 mth and ≥40 kg: 100 mg of piperacillin/kg every 8 hr.

Renal impairment: For haemodialysis: admin an additional dose of 0.75 g after each dialysis session on hemodialysis days.

CrCl (ml/min)	Dosage Recommendation
>40	4.5 g every 6 hr
20-40	3.375 g every 6 hr
<20	2.25 g every 6 hr

<20	2.25 g every 6 hr
Haemodialysis	2.25 g every 8 hr
CAPD	2.25 g every 8 hr

Intravenous

Severe infections

Adult: 3.375 g (piperacillin 3 g and tazobactam 0.375 g) every 6 hr for 7-10 days. May be given via infusion over 30 minutes.

Renal impairment: For haemodialysis, admin an additional dose of 0.75 g after each dialysis session on haemodialysis days.

CrCl (ml/min)	Dosage Recommendation
>40	3.375 g every 6 hr
20-40	2.25 g every 6 hr
<20	2.25 g every 8 hr
Haemodialysis	2.25 g every 12 hr
CAPD	2.25 g every 12 hr

Incompatibility: Not compatible with tobramycin for simultaneous admin via Y-site infusion.

Contraindications

Hypersensitivity.

Special Precautions

Pregnancy and lactation, pseudomembranous colitis.

Assess hematopoietic function periodically. Perform periodic electrolyte determinations in patients with low K reserves.

Increased risk of fever and rash in patients with cystic fibrosis. Increased risk of bleeding manifestations.

Prolonged treatment may increase risk of superinfections.

	Increased risk of fever and rash in patients with cystic fibrosis. Increased risk of bleeding manifestations. Prolonged treatment may increase risk of superinfections. Convulsions or neuromuscular excitability may occur when high doses are used, especially in renally impaired patients. Renal impairment.
Adverse Drug Reactions	Diarrhoea, skin rashes, occasionally platelet mediated bleeding, rigors, malaise, ulcerative stomatitis. Inj-site reactions such as pain, erythema, induration and thrombophlebitis. Potentially Fatal: Serious, anaphylactic reactions.
Drug Interactions	Probenecid prolongs half lives of piperacillin and tazobactam. Increased risk of methotrexate toxicity when used together. Potentially Fatal: Interacts with heparin and other oral anticoagulants. Prolongs the neuromuscular blockade of vecuronium and non-depolarizing muscle relaxants.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Inj vials should be stored at 20-25°C prior to reconstitution.
Mechanism of Action	Piperacillin has an antimicrobial activity against a wide range of gm-ve organisms including K. pneumoniae, P. aeruginosa, Enterobacteriaceae and against gm+ve

Piperacillin has an antimicrobial activity against a wide range of gm-ve organisms including K. pneumoniae, P. aeruginosa, Enterobacteriaceae and against gm+ve organisms eg E. faecalis and B. fragilis. Tazobactam is a penicillanic acid sulfone derivative with beta-lactamase inhibitory properties. In combination, tazobactam enhances the activity of piperacillin against beta-lactamase-producing bacteria.

Distribution: Piperacillin and tazobactam: 30% bound to plasma proteins. Widely distributed into body tissues and fluids.

Metabolism: Piperacillin: metabolised to a desethyl metabolite. Tazobactam: metabolised to a single metabolite that lacks pharmacological and antibacterial activities.

Excretion: Half-life of piperacillin and tazobactam ranges from 0.7-1.2 hr. Eliminated via kidney by glomerular filtration and tubular secretion. Piperacillin: 68% excreted unchanged in urine. Tazobactam: 80% excreted unchanged in urine.

CIMS Class	Penicillins
ATC Classification	J01CA12 - piperacillin; Belongs to the class of penicillins with extended spectrum. Used in the treatment of systemic infections. J01CG02 - tazobactam; Belongs to the class of beta-lactamase inhibitors. Used in the treatment of systemic infections.

piperazine

CIMS Class : (Anthelmintics)
piperazine

P - Contraindicated in pregnancy
L - Caution when used during lactation

related piperazine information

Indication & Dosage

Oral

Ascariasis

Adult: As hydrate: 4.5 g as a single dose repeated once after 14 days. Alternatively, may be given as a preparation with senna in a single dose of 4 g of the phosphate, repeat dose mthly for up to 3 mth if needed; same dosage regimen may also be used to prevent ascariasis.

Child: As a single dose, repeated once after 14 days. <1 yr: 120 mg/kg (only upon medical advice), 1-3 yr: 1.5 g, 4-5 yr: 2.25 g, 6-8 yr: 3 g, 9-12 yr: 3.75 g. Alternatively, may be given as a preparation with senna in a single dose of 4 g of the phosphate, repeat dose mthly for up to 3 mth if needed; same dosage regimen may also be used to prevent ascariasis.

Oral

Enterobiasis

ascariasis.

Oral

Enterobiasis

Adult: As hydrate: 2.25 g once daily for 7 days, 2nd course may be repeated after an interval of 7 days. Alternatively, may be given as a preparation with senna in a single dose of 4 g of the phosphate, repeat dose after 14 days.

Child: <1 yr: 45-75 mg/kg (only upon medical advice), 1-3 yr: 750 mg, 4-6 yr: 1.125 g, 7-12 yr: 1.5 g, >12 yr: same as adult dose. To be taken once daily for 7 days, 2nd course may be repeated after an interval of 7 days. Alternatively, for children >6 yr: May be given as a preparation with senna in a single dose of 4 g of the phosphate; repeat dose after 14 days.

Administration

May be taken with or without food.

Contraindications

Severe renal impairment, epilepsy. Pregnancy.

Special Precautions

Hepatic impairment, neurological conditions, mild to moderate renal impairment. Lactation.

Adverse Drug Reactions

Nausea, vomiting, colic, abdominal pain, diarrhoea, urticaria, skin rashes, headache, bronchospasm, dizziness, nystagmus, ataxia, paraesthesia, myoclonic contractions, choreiform movements, muscular incoordination (worm wobble), confusion, EEG abnormalities, blurred vision.

Potentially Fatal: Stevens-Johnson syndrome, bronchospasm and angioedema.

Drug Interactions

Antagonism if pyrantel and piperazine are used together.

Piperazine may potentiate extrapyramidal effects of

	Antagonism if pyrantel and piperazine are used together. Piperazine may potentiate extrapyramidal effects of chlorpromazine and other phenothiazines.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Piperazine is effective against the intestinal nematodes roundworm (<i>Ascaris lumbricoides</i>), pinworm and threadworm (<i>Enterobius vermicularis</i>). It produces a neuromuscular block resulting in muscle paralysis of the worms which are consequently dislodged and expelled in the faeces. Absorption: Readily absorbed from the GIT (oral). Distribution: Distributes into breast milk. Excretion: Via urine (as metabolites).
CIMS Class	Anthelmintics
ATC Classification	P02CB01 - piperazine; Belongs to the class of piperazine and derivatives agents used as antinematodal.

piracetam

CIMS Class : (Nootropics & Neurotonics)
piracetam

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related piracetam information

Indication & Dosage

Oral

Adjunct in cortical myoclonus

Adult: 7.2 g daily in 2-3 divided doses, increased by 4.8

g/day every 3-4 days. Max dose: 20 g daily.

CrCl (ml/min)	Dosage Recommendation
50-79	2/3 usual dose
30-49	1/3 usual dose
20-29	1/6 usual dose
<20	Contra-indicated

Oral

As a cognitive enhancer in cerebrocortical insufficiency

Adult: 2.4 g daily, given as 2-3 divided doses. Up to 4.8 g

daily may be used in severe cases.

CrCl (ml/min)	Dosage Recommendation
50-79	2/3 usual dose
30-49	1/3 usual dose
20-29	1/6 usual dose

	Many may be used in severe cases.	
	20-29	1/6 usual dose
	<20	Contra-indicated
	<i>Parenteral</i> As a cognitive enhancer in cerebrocortical insufficiency Adult: 1-2 g tid via IV/IM admin.	
Administration	Should be taken with food. (Take before meals.)	
Contraindications	Hepatic and severe renal impairment. Cerebral haemorrhage. Pregnancy and lactation.	
Special Precautions	Avoid abrupt withdrawal. Impaired renal function. Cardiac disorders. Haemostatic disorders. Patients who have recently undergone major surgery. Elderly.	
Adverse Drug Reactions	Hyperkinesia, nervousness, depression, diarrhoea, rashes. CNS stimulation, sleep disturbances, dizziness, excitement, insomnia, somnolence, wt gain.	
Drug Interactions	May increase prothrombin time in patients who are on warfarin.	
Mechanism of Action	Piracetam protects the cerebral cortex against hypoxia. It also inhibits platelet aggregation and reduces blood viscosity.	
CIMS Class	Nootropics & Neurotonics	
ATC Classification	N06BX03 - piracetam; Belongs to the class of other agents used as CNS stimulant.

piribedil

CIMS Class : (Antiparkinsonian Drugs)
piribedil

P - Contraindicated in pregnancy
L - Caution when used during lactation

related piribedil information

Indication & Dosage

Oral

As monotherapy in Parkinson's disease

Adult: Monotherapy: 150-250 mg daily in divided doses. In combination with levodopa therapy: 80-140 mg daily.

Oral

Circulatory disorders

Adult: 50 mg daily or 100 mg daily in 2 divided doses for severe cases.

Administration

Should be taken with food. (Take at the end of a main meal.)

Contraindications

Hypersensitivity, CV collapse, acute myocardial infarction, uncontrolled hypertension, pregnancy.

Special Precautions

Raynaud's syndrome, history of psychosis, renal impairment. May cause hypotension in the first few days of treatment. Regular ophthalmological monitoring is

	Raynaud's syndrome, history of psychosis, renal impairment. May cause hypotension in the first few days of treatment. Regular ophthalmological monitoring is recommended. Lactation.
Adverse Drug Reactions	Nausea, vomiting, dizziness, confusion, drowsiness, hypothermia, dyskinesias, occasional changes in liver function. Raynaud's syndrome or digital vasospasm, leg cramps.
Drug Interactions	Clonidine and dopamine antagonists eg, phenothiazines and haloperidol may antagonise effects of piribedil.
Mechanism of Action	Piribedil is a non-ergot dopamine D ₂ agonist that stimulates cerebral and peripheral dopamine receptors and corrects dopamine deficiency. It is used largely, as an adjunct to levodopa therapy in the treatment of Parkinson's disease.
CIMS Class	Antiparkinsonian Drugs
ATC Classification	N04BC08 - piribedil;

piroxicam

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
piroxicam

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab - Lab interference

related piroxicam information

Indication & Dosage

Oral

Rheumatic disorders

Adult: Initially, 20 mg daily as a single dose. Maintenance:
10-30 mg in single or divided doses.

Oral

Acute gout

Adult: 40 mg daily for 5-7 days.

Oral

Acute musculoskeletal disorders

Adult: Initially, 40 mg daily given for 2 days. Maintenance:
20 mg daily for 1-2 wk.

Oral

Postoperative pain

Adult: Initially, 40 mg daily given for 2 days. Maintenance:
20 mg daily for 1-2 wk.

	Postoperative pain Adult: Initially, 40 mg daily given for 2 days. Maintenance: 20 mg daily for 1-2 wk. <i>Oral</i> Juvenile idiopathic arthritis Child: =6 yr: <15 kg: 5 mg, 16-25 kg: 10 mg, 26-45 kg: 15 mg, ≥46 kg: 20 mg. Doses to be taken once daily. <i>Topical/Cutaneous</i> Local pain relief Adult: Apply a 0.5% gel 3-4 times daily over the affected area. Treatment should be reviewed after 4 wk.
Administration	Should be taken with food.
Overdosage	Symptoms are usually mild and include nausea and vomiting, headache, drowsiness, blurred vision and dizziness.
Contraindications	Hypersensitivity, active peptic ulceration, porphyria, pregnancy (3 rd trimester) and lactation.
Special Precautions	Elderly, childn <12 yr. Patients with infections, asthma, allergic disorders, haemorrhagic disorders or hypertension. Impaired renal, hepatic or cardiac function. Monitor for signs of liver, kidney, blood or eye disorders.
Adverse Drug Reactions	GI disturbances, peptic ulcer, GI bleeding, headache, dizziness, blurred vision, tinnitus, skin rashes and pruritus. Haematological changes and photosensitivity. Potentially Fatal: Thrombocytopaenia and acute nephropathy. Toxic epidermal necrolysis and Stevens-Johnson syndrome.

	Potentially Fatal: Thrombocytopaenia and acute nephropathy. Toxic epidermal necrolysis and Stevens-Johnson syndrome.
Drug Interactions	Increased risk of hyperkalaemia when used with ACE inhibitors and potassium-sparing diuretics. Convulsions may occur when used with quinolones. Effects of phenytoin and sulfonylureas may be enhanced. Antihypertensive effects of ACE inhibitors, β-blockers and diuretics may be reduced. Increased risk of GI bleeding and ulceration when used with corticosteroids, SSRIs or antiplatelet agents. Increased risk of haematotoxicity when used with zidovudine. ACE inhibitors, ciclosporin, tacrolimus or diuretics may increase nephrotoxicity. Potentially Fatal: May potentiate anticoagulants. Increased levels of lithium, methotrexate and cardiac glycosides.
Lab Interference	May interfere with thyroid function tests.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 3rd trimester or near delivery. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).

	be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at <30°C. Topical/Cutaneous: Store at <30°C.
Mechanism of Action	Piroxicam is a NSAID, belonging to the oxicam group. It inhibits prostaglandin synthesis, reduces fever by acting on the heat-regulating center of the hypothalamus, inhibits platelet-aggregating substance thromboxane A₂ and reduces pain receptor sensitivity. It also exerts anti-inflammatory effect by lysosomal stabilisation, kinin and leukotriene production, alteration of chemotactic factors and neutrophil activation inhibition. Absorption: Well absorbed from the GIT (oral); peak plasma concentrations 3-5 hr after an oral dose. Distribution: Detected in breast milk. Protein-binding: 99% Metabolism: Hepatic via hydroxylation and conjugation; undergoes enterohepatic recycling. Excretion: Mainly in urine (as metabolites and unchanged drug), faeces; elimination half-life: 50 hr.
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AC01 - piroxicam; Belongs to the class of non-steroidal antiinflammatory and antirheumatic products, oxicams. Used in the treatment of inflammation and rheumatism. M02AA07 - piroxicam; Belongs to the class of non-steroidal antiinflammatory preparations for topical use. Used in the treatment of joint and muscular pains. S01BC06 - piroxicam; Belongs to the class of non-steroidal

antiinflammatory preparations for topical use. Used in the treatment of joint and muscular pains.

S01BC06 - piroxicam; Belongs to the class of non-steroidal antiinflammatory agents. Used in the treatment of inflammation of the eye.

piroxicam beta-cyclodextrin

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
piroxicam beta-cyclodextrin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab - Lab interference

related piroxicam beta-cyclodextrin information

Indication & Dosage	<i>Oral</i> Rheumatic disorders, Acute musculoskeletal disorders Adult: As piroxicam: 20 mg daily as a single dose. Elderly: 10 mg daily.
Overdosage	Symptoms are usually mild and include nausea and vomiting, headache, drowsiness, blurred vision and dizziness.
Contraindications	Hypersensitivity, active peptic ulceration, porphyria, pregnancy (3 rd trimester), lactation.
Special Precautions	Elderly, childn <12 yr. Patients with infections, asthma, allergic disorders, haemorrhagic disorders or hypertension. Impaired renal, hepatic or cardiac function. Monitor for signs of liver, kidney, blood or eye disorders.
Adverse Drug Reactions	GI disturbances, peptic ulcer, GI bleeding, headache,

Adverse Drug Reactions	GI disturbances, peptic ulcer, GI bleeding, headache, dizziness, blurred vision, tinnitus, skin rashes and pruritus. Haematological changes and photosensitivity. Potentially Fatal: Thrombocytopaenia and acute nephropathy. Toxic epidermal necrolysis and Stevens-Johnson syndrome.
Drug Interactions	Increased risk of hyperkalaemia when used with ACE inhibitors and potassium-sparing diuretics. Convulsions may occur when used with quinolones. Effects of phenytoin and sulfonylureas may be enhanced. Antihypertensive effects of ACE inhibitors, β-blockers and diuretics may be reduced. Increased risk of GI bleeding and ulceration when used with corticosteroids, SSRIs or antiplatelet agents. Increased risk of haematotoxicity when used with zidovudine. ACE inhibitors, ciclosporin, tacrolimus or diuretics may increase nephrotoxicity. Potentially Fatal: May potentiate anticoagulants. Increased levels of lithium, methotrexate and cardiac glycosides.
Lab Interference	May interfere with thyroid function tests.
Storage	Oral: Store $<30^{\circ}\text{C}$.
Mechanism of Action	Piroxicam β-cyclodextrin is a complex of NSAID-piroxicam, and cyclic oligosaccharide β-cyclodextrin. Such complexing of piroxicam increases its solubility and in turn its rate of absorption resulting in faster onset of anti-inflammatory and analgesic action.

	of piroxicam increases its solubility and in turn its rate of absorption resulting in faster onset of anti-inflammatory and analgesic action. Absorption: Dissociates in GI tract to piroxicam and β-cyclodextrin. Faster absorbed than unmodified piroxicam. Peak concentration reached 30-60 min after an oral dose. Metabolism: Converted to various sugars in the colon.
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)

polymyxin b

CIMS Class : (Other Antibiotics) , (Eye Anti-infectives & Antiseptics) , (Ear Anti-infectives & Antiseptics) , (Topical Antibiotics)
polymyxin b

P - Caution when used during pregnancy

L - Caution when used during lactation

related polymyxin b information

Indication & Dosage

Parenteral

Susceptible infections

Adult: IV admin: 15,000-25,000 u (1.5-2.5 mg)/kg/day in divided doses 12 hrly by IV infusion. IM admin: 25,000-30,000 u/kg/day in divided doses 4-6 hrly. Total dose should not exceed 2,000,000 u/day.

Renal impairment: Reduce dose. Max: 15,000 units/kg daily.

Ophthalmic

Ocular infections

Adult: As a 0.1% eye solution/ointment with neomycin and dexamethasone. Eye drops: instill 1-2 drops 4-6 times daily into the affected eye(s) in mild disease, may be used hrly in severe disease. Eye ointment: apply a small amount into the conjunctival sac(s) of the affected eye(s) up to 3-4 times

	into the affected eye(s) in mild disease, may be used hrly in severe disease. Eye ointment: apply a small amount into the conjunctival sac(s) of the affected eye(s) up to 3-4 times daily. <i>Otic/Aural</i> Otic infections Adult: As an otic suspension containing 3.5 mg neomycin base, polymyxin B equivalent to 10,000 polymyxin B units and hydrocortisone 10 mg/ml of the suspension: instill 4 drops into the affected ear canal 3-4 times daily for up to 10 days. Child: As an otic suspension containing 3.5 mg neomycin base, polymyxin B equivalent to 10,000 polymyxin B units and hydrocortisone 10 mg/ml of the suspension: instill 3 drops into the affected ear canal 3-4 times daily for up to 10 days. <i>Topical/Cutaneous</i> Skin infections Adult: Apply a 0.1% soln or oint onto affected area in combination with other drugs.
Contraindications	Hypersensitivity, perforated ear drums.
Special Precautions	Application to large areas of broken skin. Renal impairment; monitor renal function. Pregnancy, lactation. Monitor serum concentrations of polymyxins in patients receiving parenteral therapy.
Adverse Drug Reactions	Dizziness, paraesthesia, muscle weakness, ataxia, confusion, drowsiness, psychoses, convulsions, coma.

	Dizziness, paraesthesia, muscle weakness, ataxia, confusion, drowsiness, psychoses, convulsions, coma. Neuromuscular blockade characterized by respiratory paralysis and apnoea. Acute interstitial nephritis; nausea, vomiting, electrolyte imbalance. Topical: Hypersensitivity eg, macular rashes, risk of systemic toxicity if applied to large areas of broken skin. Otic: Ototoxicity, stinging and burning sensation. Ophthalmic: Hypersensitivity, itching, redness and oedema of conjunctiva and eye lid. Intrathecal: Meningeal irritation. Potentially Fatal: Nephrotoxicity (higher doses and preexisting failure), neurotoxicity; resp failure; anaphylaxis.
Drug Interactions	May enhance action of neuromuscular blockers. Increased risk of ototoxicity and nephrotoxicity when used with vancomycin. Potentially Fatal: Potentiates nephrotoxicity produced by cefalotin and aminoglycosides.
Storage	Ophthalmic: Store at 2-25°C. Otic/Aural: Store at 15-25°C. Topical/Cutaneous: Store at 15-30°C.
Mechanism of Action	Polymyxin B disrupts the bacterial cytoplasmic membrane of mostly gm-ve organisms allowing leakage of intracellular constituents by binding to membrane phospholipids. Absorption: Minimal from GIT except in neonates. Peak plasma concentrations after 2 hr (IM). Distribution: Widely distributed; extensively bound to cell membranes in the tissues. Excretion: Excreted mainly by kidneys. Urine (>60% as

	Distribution: Widely distributed; extensively bound to cell membranes in the tissues. Excretion: Excreted mainly by kidneys. Urine (>60% as unchanged drug); 6 hr (elimination half-life).
CIMS Class	Other Antibiotics / Eye Anti-infectives & Antiseptics / Ear Anti-infectives & Antiseptics / Topical Antibiotics
ATC Classification	A07AA05 - polymyxin B; Belongs to the class of antibiotics. Used for the treatment of intestinal infections. J01XB02 - polymyxin B; Belongs to the class of polymyxins used in the treatment of systemic infections. S01AA18 - polymyxin B; Belongs to the class of antibiotics. Used in the treatment of eye infections. S02AA11 - polymyxin B; Belongs to the class of anti-infectives used in the treatment of ear infections. S03AA03 - polymyxin B; Belongs to the class of anti-infectives used in ophthalmologic and otologic preparations.

polyvinyl alcohol

related polyvinyl alcohol information

Indication & Dosage	<i>Ophthalmic</i> Dry eye Adult: As a 0.5-1.4% solution with or without povidone: 1-2 drops into the affected eye(s), up to 3-4 times daily when necessary.
Special Precautions	Not to be used with soft contact lens.
Adverse Drug Reactions	Mild stinging/burning/irritation in the eye; temporary blurred vision.
Mechanism of Action	Polyvinyl alcohol, a nonionic surfactant, is used as a stabilising agent, lubricant and as an agent to increase viscosity in pharmaceutical manufacturing. In eye preparations, polyvinyl alcohol is used to increase the viscosity and thereby prolonging contact time of the active ingredient with the eye. It is often found in artificial tears preparations for dry eye and in contact lens solutions.
CIMS Class	Ophthalmic Lubricants

povidone iodine

CIMS Class : (Preparations for Vaginal Conditions) , (Mouth/Throat Preparations) , (Skin Antiseptics & Disinfectants)
povidone iodine

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related povidone iodine information

Indication & Dosage

Mouth/Throat

Oral hygiene

Adult: Rinse mouth with 10 mL of a 0.1% undiluted or diluted solution with an equal amount of warm water solution for 30 sec qid continued for 14 days.

Child: >6 yr: Same as adult dose.

Mouth/Throat

Oral candidiasis

Adult: Rinse mouth with 1% mouthwash solution.

Topical/Cutaneous

Treatment and prophylaxis of wound infection

Adult: Apply 0.5-5% topical powders on affected area.

Vaginal

Vaginal candidiasis

	<i>Vaginal</i> Vaginal candidiasis Adult: 200 mg given as pessaries.
Contraindications	Hypersensitivity; prolonged use in patients with thyroid disorders or on lithium therapy. Premature neonates or neonates weighing <1.5 kg.
Special Precautions	Avoid contact with eyes; should not be used under occlusive dressing. Pregnancy, lactation; neonates.
Adverse Drug Reactions	Local irritation and sensitivity (rare). Application to large areas of denuded skin may produce systemic effects due to iodine absorption.
Lab Interference	May interfere with thyroid function test results and interpretation, when applied over large surface areas.
Mechanism of Action	Povidone-iodine is an iodophore with a powerful broad-spectrum germicidal activity against a wide range of bacteria, viruses, fungi, protozoa and spores. Absorption: Minimal systemic absorption (topical). Rapid, serum concentrations of total iodine and inorganic iodide are increased significantly (vaginal).
CIMS Class	Preparations for Vaginal Conditions / Mouth/Throat Preparations / Skin Antiseptics & Disinfectants
ATC Classification	D08AG02 - povidone-iodine; Belongs to the class of iodine product antiseptics. Used in the treatment of dermatological diseases. D09AA09 - povidone-iodine; Belongs to the class of ointment dressings with antiinfectives. Used in treatment of

diseases.

D09AA09 - povidone-iodine; Belongs to the class of ointment dressings with antiinfectives. Used in treatment of wounds.

D11AC06 - povidone-iodine; Belongs to the class of medicated shampoos. Used in the treatment of dermatological diseases.

G01AX11 - povidone-iodine; Belongs to the class of other antiinfectives and antiseptics. Used in the treatment of gynecological infections.

R02AA15 - povidone-iodine; Belongs to the class of antiseptics used in throat preparations.

S01AX18 - povidone-iodine; Belongs to the class of other antiinfectives. Used in the treatment of eye infections.

pralidoxime

CIMS Class : (Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence)
pralidoxime

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related pralidoxime information

Indication & Dosage

Parenteral

Organophosphorus poisoning

Adult: Used in combination with atropine. Admin atropine via IM/IV inj and repeat as needed until patient shows signs of atropine toxicity. Maintain atropinisation for at least 48 hr. As soon as the effects of atropine are observed, 1-2 g of pralidoxime (chloride, iodide or mesilate) may be given via IM/IV inj. Repeat dose after 1 hr, then every 8-12 hr, if necessary. In severe poisoning, continuous infusion of 200-500 mg/hr may be given, titrated according to response. Alternatively, pralidoxime chloride may be given at an initial dose of 30 mg/kg via IV infusion over 20 minutes or IV inj over 5 minutes, followed by IV infusion at 8 mg/kg/hr. Max: 12 g/24 hr.

	2000 or 30 mg/kg via IV infusion over 20 minutes or IV inj. over 5 minutes, followed by IV infusion at 8 mg/kg/hr. Max: 12 g/24 hr. Child: As mesilate: 20-60 mg/kg. Renal impairment: Dose adjustment may be required.
Contraindications	Carbamate pesticide poisoning, hypersensitivity.
Special Precautions	Renal dysfunction, myasthenia gravis. Atropinisation may occur faster when atropine and pralidoxime are used together. Pregnancy, lactation.
Adverse Drug Reactions	Drowsiness, dizziness, visual disturbances, nausea, tachycardia, headache, hyperventilation and muscle weakness. Potentially Fatal: Rapid admin causes tachycardia, laryngospasm and rigidity. Large doses cause neuromuscular blockade.
Lab Interference	May interfere with estimation of acetylcholinesterase activity using acetylcholine reagent.
Storage	Parenteral: Store at 20-25°C.
Mechanism of Action	Pralidoxime reactivates cholinesterase outside the CNS which has been inactivated by phosphorylation due to organophosphate pesticide exposure-resulting. This leads to the destruction of acetylcholine at the neuromuscular junction thus relieving muscle paralysis. It also removes the phosphyl group from the active site of inactivated enzyme which is dependent on the nature of the phosphyl group. Distribution: Not bound and does not readily penetrate the CNS.

	which is dependent on the nature of the phosphyl group. Distribution: Not bound and does not readily penetrate the CNS. Excretion: Via urine (rapid; as unchanged and partly as metabolites); 1-3 hr (elimination half-life).
CIMS Class	Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence
ATC Classification	V03AB04 - pralidoxime; Belongs to the class of antidotes. Used in organo-phosphate poisoning.

pravastatin

CIMS Class : (Dyslipidaemic Agents)
pravastatin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related pravastatin information

Indication & Dosage

Oral

Hyperlipidaemias

Adult: As sodium: 10-40 mg daily at night, adjusted according to response at 4-wk intervals. Max dose: 40 mg daily.

Child: (With familial hypercholestrolaemia) 8-13 yr: 10-20 mg, 14-18 yr: 10-40 mg, dose to be taken once daily.

Renal impairment: Moderate to severe: initial dose should not exceed 10 mg daily.

Hepatic impairment: Significant impairment: initial dose should not exceed 10 mg daily.

Special Populations: Patients on ciclosporin treatment may start with 20 mg once daily.

Administration

May be taken with or without food.

	May be taken with or without food.
Contraindications	Hypersensitivity; active liver disease; children <8 yr. Pregnancy, lactation.
Special Precautions	Severe intercurrent illness increases risk of myopathy, rhabdomyolysis and renal failure; stop pravastatin during illness. Severe renal impairment, monitor regularly renal function and creatine kinase. Women of childbearing potential, use adequate contraception. Preexisting abnormal liver function, monitor serum transaminase. Children. May increase creatine phosphokinase and transaminases levels.
Adverse Drug Reactions	GI symptoms, headache, insomnia, chest pain, rash, fatigue, dizziness, myalgia, hypersensitivity, anaphylaxis, angioedema, rhabdomyolysis, renal failure, hepatitis, alopecia, paraesthesia, impotence, gynaecomastia.
Drug Interactions	Fenofibrate, clofibrate, nicotinic acid and gemfibrozil increase risk of myopathy or rhabdomyolysis, use lowest effective dose. Cyclosporin, clarithromycin, itraconazole, ketoconazole and erythromycin increase pravastatin concentrations. Increased risk of bleeding when used with coumarins and fluindione. Decreased serum concentrations when used with efavirenz and rifampicin.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly

	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Oral: Store at 25°C.
Mechanism of Action	Pravastatin inhibits HMG-CoA reductase, the enzyme which catalyses the rate-limiting step in cholesterol biosynthesis. It reduces conc of total cholesterol and LDL (LDL) cholesterol and triglyceride. It produces an increase in high-density lipoprotein (HDL) cholesterol and it increases hepatic cholesterol uptake from blood. Absorption: Rapidly but incompletely absorbed from the GIT (oral). Absolute bioavailability is about 17%. Distribution: Protein-binding: 50% Metabolism: Extensively hepatic. Excretion: Faeces (70%); urine (20%); 1.5-2 hr (elimination half-life).
CIMS Class	Dyslipidaemic Agents
ATC Classification	C10AA03 - pravastatin; Belongs to the class of HMG CoA reductase inhibitors. Used in the treatment of hyperlipidemia.

praziquantel

CIMS Class : (Anthelmintics)
praziquantel

P - Contraindicated in pregnancy
L - Contraindicated in lactation

related praziquantel information

Indication & Dosage	<i>Oral</i>
	Schistosomiasis
	Adult: 3 doses of 20 mg/kg every 4-6 hr or 40-60 mg/kg as a single dose.
	Child: >4 yr: Same as adult dose.
	<i>Oral</i>
	Clonorchiasis
	Adult: 25 mg/kg tid for 1-2 days or 40 mg/kg as a single daily dose.
	Child: >4 yr: Same as adult dose.
	<i>Oral</i>
	Opisthorchiasis
	Adult: 25 mg/kg tid for 1-2 days or 40 mg/kg as a single daily dose.
	Child: >4 yr: Same as adult dose.
	<i>Oral</i>
	Intestinal fluke infections
	Adult: 25 mg/kg tid for 1-2 days or 40 mg/kg as a single daily dose.

	<i>Oral</i> Intestinal fluke infections Adult: 25 mg/kg tid for 1-2 days or 40 mg/kg as a single daily dose. Child: >4 yr: Same as adult dose. <i>Oral</i> Lung fluke infections Adult: 25 mg/kg tid for 1-2 days or 40 mg/kg as a single daily dose. Child: >4 yr: Same as adult dose. <i>Oral</i> Tapeworm infections Adult: 5-25 mg/kg as a single dose. Child: >4 yr: Same as adult dose. <i>Oral</i> Neurocysticercosis Adult: 50 mg/kg/day, given in 3 divided doses for 14 days. Alternatively, 3 doses of 25 mg/kg every 2 hr.
	Administration Should be taken with food. (Swallow whole, do not chew/crush)
	Contraindications Hypersensitivity, ocular cysticercosis.
	Special Precautions Driving or operating machinery during or for 24 hr after treatment. Severe hepatic disease. Do not breastfeed during or for 72 hr after treatment.
	Adverse Drug Reactions Headache, drowsiness, dizziness, malaise, abdominal discomfort, nausea, vomiting, diarrhoea, urticaria, rashes, pruritus, fever, eosinophilia.
	Drug Interactions Reduced plasma concentrations when used with dexamethasone. Carbamazepine, phenytoin and chloroquine may reduce the bioavailability of praziquantel while cimetidine may

	Reduced plasma concentrations when used with dexamethasone. Carbamazepine, phenytoin and chloroquine may reduce the bioavailability of praziquantel while cimetidine may increase the bioavailability of praziquantel.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Praziquantel is an anthelmintic with a broad spectrum of activity against trematodes (flukes) and cestodes (tapeworms). It increases the cell permeability to Ca in schistosomes, causing strong contractions and paralysis of worm musculature leading to detachment of suckers from the blood vessel walls and to dislodgement. Absorption: 80% of dose is rapidly absorbed from the GIT (oral); peak plasma concentrations after 1-3 hr. Distribution: CSF, enters breast milk. Metabolism: Rapid and extensive hepatic first-pass metabolism by hydroxylation. Excretion: Via urine (as metabolites); elimination half-life: 1-1.5 hr (parent drug), 4 hr (metabolites).
CIMS Class	Anthelmintics
ATC Classification	P02BA01 - praziquantel; Belongs to the class of quinoline derivatives and related substances used as antirematodals.

prazosin

CIMS Class : (Other Antihypertensives)
prazosin

P - Contraindicated in pregnancy
L - Caution when used during lactation
Lab α - Lab interference

related prazosin information

Indication & Dosage

Oral

Hypertension

Adult: As hydrochloride: Initially, 500 mcg bid-tid for 3-7 days, increased to 1 mg bid-tid for the next 3-7 days if tolerated, and gradually increased thereafter according to patient's response. Max dose: 20 mg daily.

Oral

Heart failure

Adult: As hydrochloride: Initially, 500 mcg bid-qid, gradually increased according to response. Maintenance: 4-20 mg daily.

Oral

Raynaud's syndrome

Adult: Initially, 500 mcg bid, increased to a maintenance dose of =2 mg bid.

	Raynaud's syndrome Adult: Initially, 500 mcg bid, increased to a maintenance dose of =2 mg bid. <i>Oral</i> Benign prostatic hyperplasia Adult: Initially, 500 mcg bid, increased to a maintenance dose of =2 mg bid.
Administration	May be taken with or without food. (Starting dose is best taken w/ dinner, at least 2-3 hr before retiring. Maintenance doses may be taken w/ or without meals.)
Overdosage	Severe hypotension may occur. May be treated with activated charcoal if patient presents within 1 hr of ingestion.
Contraindications	Congestive heart failure due to mechanical obstruction. Hypersensitivity. Pregnancy.
Special Precautions	Angina pectoris. Ability to drive or operate machinery may be impaired. Phaeochromocytoma, abrupt withdrawal, impaired renal and liver function. child <12 yr. Lactation. May develop tolerance in prolonged treatment. Initiate treatment with low doses.
Adverse Drug Reactions	Postural hypotension, syncope, palpitations, lack of energy, nausea, oedema, chest pain, dyspnoea, constipation, diarrhoea, vomiting, depression, nervousness, sleep disturbances, headache, lassitude, drowsiness, loss of consciousness, dizziness, vertigo, hallucinations, paraesthesia, nasal congestion, epistaxis, dry mouth, urinary frequency and incontinence, pruritus, rash.

	consciousness, dizziness, vertigo, hallucinations, paraesthesia, nasal congestion, epistaxis, dry mouth, urinary frequency and incontinence, pruritus, rash. Potentially Fatal: Rarely, hypotension may be life-threatening.
Drug Interactions	May increase plasma concentrations of digoxin. Antihypertensive effect enhanced by other antihypertensive drugs. Diuretics and alcohol. Risk of 1st dose hypotension is increased in patients receiving β-blockers or calcium-channel blockers.
Lab Interference	May give false-positive results in screening tests for pheochromocytoma.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Prazosin competitively blocks postsynaptic α_1-adrenoceptors of veins and arterioles causing vasodilation and reduction in blood pressure. The effect is seen in resistant vessels. There is no reflex tachycardia. Diastolic pressure reduced to a greater extent. Absorption: Readily absorbed from the GIT; peak plasma concentrations after 1-3 hr (oral). Distribution: Small amounts enter the breast milk. Protein-binding: High. Metabolism: Extensively hepatic. Excretion: Faeces (5-11% as unchanged drug; metabolites); urine (<10%); 2-4 hr (elimination half-life).

	Metabolism: Extensively hepatic. Excretion: Faeces (5-11% as unchanged drug; metabolites); urine (<10%); 2-4 hr (elimination half-life).
CIMS Class	Other Antihypertensives
ATC Classification	C02CA01 - prazosin; Belongs to the class of alpha-adrenoreceptor antagonists, peripherally-acting antiadrenergic agents. Used in the treatment of hypertension.

prednicarbate

CIMS Class : (Topical Corticosteroids)
prednicarbate

P - Caution when used during pregnancy

L - Caution when used during lactation

related prednicarbate information

Indication & Dosage

Topical/Cutaneous

Corticosteroid-responsive dermatoses

Adult: Apply a thin film of 0.1-0.25% cream or ointment to affected area. Discontinue therapy when control is achieved.

Contraindications

Hypersensitivity. Primary infective skin conditions; rosacea; perioral dermatitis.

Special Precautions

Periodic HPA axis evaluation if used in large amounts over prolonged periods; secondary dermatological infections; pregnancy; lactation; infants; avoid contact with eyes and their immediate vicinity. Paraffin in prednicarbate cream prep can cause breaking or leaking of latex condoms. Avoid application to large areas, especially when the skin is broken or under occlusive dressings.

Adverse Drug Reactions

Burning sensation; in rare instances, rash, itching, paraesthesia, folliculitis or allergic features like reddening or

	Burning sensation; in rare instances, rash, itching, paraesthesia, folliculitis or allergic features like reddening or weeping skin lesions may occur.
Mechanism of Action	Prednicarbate is a corticosteroid that possesses anti-inflammatory, antipruritic, vasoconstrictive and antiproliferative properties.
CIMS Class	Topical Corticosteroids
ATC Classification	D07AC18 - prednicarbate; Belongs to the class of potent (group III) corticosteroids. Used in the treatment of dermatological diseases.

Food ⚠ - Food interaction

related prednisolone information

Indication & Dosage

Oral

Allergic and inflammatory disorders

Adult: 5-60 mg daily, usually given in 2-4 divided doses.

Usual maintenance dose range: 2.5-15 mg daily. Withdrawal should be gradual after long-term therapy.

Child: 1 mth-18 yr: For autoimmune inflammatory disorders:

Initially, 1-2 mg/kg once daily, may reduce dose gradually after a few days if needed. Max: 60 mg daily. For autoimmune hepatitis: Initially, 2 mg/kg once daily, then reduce to minimum effective dose. Max: 40 mg daily.

Oral

Poorly controlled, moderate to severe asthma

Adult: For patients with at least 2 exacerbations/yr requiring oral corticosteroids: 40-60 mg daily in 1-2 divided doses;

Poorly controlled, moderate to severe asthma

Adult: For patients with at least 2 exacerbations/yr requiring oral corticosteroids: 40-60 mg daily in 1-2 divided doses; usually given as a short course treatment over 3-10 days until symptom resolution and patient achieves a peak expiratory flow (PEF) of at least 80% of his or her personal best. May be used with maintenance dosages of inhaled corticosteroid and a long-acting inhaled β_2 -agonist bronchodilator.

Child: For patients with >3 exacerbations/yr in children ≥ 4 yr or at least 2 exacerbations/yr in children 5-11 yr: 1-2 mg/kg daily for 3-5 days may be used with existing asthma treatment, dose may be given in 1-2 divided doses. Max: 60 mg daily.

Oral

Nephrotic syndrome

Child: 1 mth-18 yr: Initially, 60 mg/m² (max: 80 mg) once daily for 4 wk until urine is protein-free followed by 40 mg/m² every other day for 4 wk then withdraw dose gradually. For prevention of relapse: 0.5-1 mg/kg once daily every other day for 3-6 mth.

Oral

Rheumatoid arthritis

Adult: Initially, 5-7.5 mg daily adjusted as necessary.

Elderly: 5 mg daily.

Oral

Multiple sclerosis

Adult: 200 mg daily for 1 wk followed by 80 mg every other

Oral

Multiple sclerosis

Adult: 200 mg daily for 1 wk followed by 80 mg every other day for 1 mth.

Oral

Infantile spasms

Child: 1 mth–2 yr: Initially, 10 mg 4 times daily for 14 days; increase to 20 mg 3 times daily for 7 days if seizures are not controlled after 7 days; reduce dose slowly over 15 days until therapy is stopped. For patients taking 40 mg daily, reduce dose in steps of 10 mg every 5 days, then stop; patients taking 60 mg daily, reduce dose to 40 mg daily for 5 days, then 20 mg daily for 5 days, then 10 mg daily for 5 days, then stop.

Oral

Idiopathic thrombocytopenic purpura

Child: 1-10 yr: 1-2 mg/kg daily (max: 14 days) or 4 mg/kg daily (max: 4 days).

Parenteral

Allergic and inflammatory disorders

Adult: Given as sodium phosphate ester: 5-60 mg prednisolone base daily IV inj/infusion or IM. Dose to be individualised based on the severity of the condition and patient's response.

Intra-articular

Joint inflammations

Adult: 5-25 mg (as acetate) or 2-30 mg (as phosphate) or 4-40 mg (as terbutate). The phosphate and tebutate may

Joint inflammations

Adult: 5-25 mg (as acetate) or 2-30 mg (as phosphate) or 4-40 mg (as terbutate). The phosphate and tebutate may also be given intralesional or injected into soft tissue.

Ophthalmic

Conjunctivitis

Adult: As 1% acetate suspension or 0.12% acetate suspension: Instill 1-2 drops into the affected eye(s) 2-4 times daily. Higher frequency may be used during the initial 24-48 hr, if needed. Re-evaluate if there is no improvement after 2 days of treatment.

Otic/Aural

Allergic and inflammatory conditions of the ear

Adult: As acetate or phosphate: 0.5 or 1% drops.

Special Populations: May need to increase dose in patients with hyperthyroidism to achieve therapeutic effects.

Administration

Should be taken with food.

Overdosage

Treatment of acute overdose includes immediate gastric lavage or emesis followed by supportive and symptomatic therapy. For chronic overdose, the dosage of prednisolone may be reduced temporarily, or introduce alternate day treatment.

Contraindications

Hypersensitivity; live vaccines; herpes simplex keratitis, systemic infections.

Special Precautions

Patients with hypothyroidism, cirrhosis, ulcerative colitis, CHF, convulsive disorders, thrombophlebitis, peptic ulcer,

	Patients with hypothyroidism, cirrhosis, ulcerative colitis, CHF, convulsive disorders, thrombophlebitis, peptic ulcer, elderly. DM, hypertension, psychological disturbances, osteoporosis; pregnancy, lactation. Adrenal suppression and infection. May cause irreversible growth retardation, glaucoma, corneal perforation.
Adverse Drug Reactions	Cushing's syndrome and growth retardation in children; osteoporosis, fractures. Peptic ulceration; glaucoma, cataracts; hyperglycaemia, pancreatitis; increased appetite, obesity. Topical: Thinning and atrophy, systemic absorption with prolonged use over large surface, broken skin or under occlusive dressing. Intradermal/Intralesional: Local hypopigmentation of hyperpigmented lesions. Ophthalmic: Raised IOP and reduced visual function. Potentially Fatal: Acute adrenal insufficiency precipitated by infection, trauma or surgery in patients on long-term therapy or following cessation of such therapy. CV collapse following rapid IV injection.
Drug Interactions	Increased requirement of insulin and oral hypoglycaemics. Actions blunted by barbiturates, phenytoin, rifampicin. Increased bioavailability with oestrogens and oral contraceptives. Increases plasma salicylate levels. Increased risk of convulsions when used with ciclosporin, increased clearance by carbimazole or carbamazepine. Increased risk of GI bleeding and ulceration when used with NSAIDs. May decrease methotrexate clearance.

	increased clearance by carbimazole or carbamazepine. Increased risk of GI bleeding and ulceration when used with NSAIDs. May decrease methotrexate clearance.
Food Interaction	Limit caffeine.
Lab Interference	May interfere with response to skin test.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 1st trimester. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intra-articular: Store at 20-25°C. Ophthalmic: Store at 20-25°C. Oral: Store at 20-25°C. Otic/Aural: Store at 20-25°C. Parenteral: Store at 20-25°C.
Mechanism of Action	Prednisolone decreases inflammation by inhibition of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability. It suppresses the immune system by reducing the activity and production of the lymphocytes and eosinophils. Absorption: Readily absorbed from the GI tract with peak plasma concentrations after 1-2 hr (oral); initial absorption is affected by food.

	Absorption: Readily absorbed from the GI tract with peak plasma concentrations after 1-2 hr (oral); initial absorption is affected by food. Distribution: Inactivated as it crosses the placenta; enters the breast milk. Protein-binding: Extensive. Excretion: Via urine (as free and conjugated metabolites); 1-2 hr (elimination half-life).
CIMS Class	Corticosteroid Hormones / Eye Corticosteroids / Ear Corticosteroids
ATC Classification	A07EA01 - prednisolone; Belongs to the class of corticosteroids acting locally. Used in the treatment of intestinal inflammation. C05AA04 - prednisolone; Belongs to the class of products containing corticosteroids for topical use. Used in the treatment of hemorrhoids. D07AA03 - prednisolone; Belongs to the class of weak (group I) corticosteroids. Used in the treatment of dermatological diseases. D07XA02 - prednisolone; Belongs to the class of weak (group I) corticosteroids in other combinations. Used in the treatment of dermatological diseases. H02AB06 - prednisolone; Belongs to the class of glucocorticoids. Used in systemic corticosteroid preparations. R01AD02 - prednisolone; Belongs to the class of topical corticosteroids used as nasal decongestants. S01BA04 - prednisolone; Belongs to the class of

R01AD02 - prednisolone; Belongs to the class of topical corticosteroids used as nasal decongestants.

S01BA04 - prednisolone; Belongs to the class of corticosteroids. Used in the treatment of inflammation of the eye.

S01CB02 - prednisolone; Belongs to the class of corticosteroids/antiinfectives/mydriatics combinations. Used in the treatment of eye diseases.

S02BA03 - prednisolone; Belongs to the class of corticosteroids used in the treatment of inflammation of the ear.

S03BA02 - prednisolone; Belongs to the class of corticosteroids used in ophthalmologic and otologic preparations.

pregabalin

CIMS Class : (Anticonvulsants) , (Drugs For Neuropathic Pain) , (Anxiolytics)
pregabalin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related pregabalin information

Indication & Dosage

Oral

Postherpetic neuralgia

Adult: 75-150 mg bid. May increase up to 600 mg/day in patients with ongoing pain and can tolerate 300 mg/day.

Renal impairment: Dosage adjustment is required. Patients undergoing haemodialysis should receive a supplementary dose of 25-100 mg immediately after each 4-hr haemodialysis session.

CrCl (ml/min)	Dosage Recommendation
30-60	Initiate at 75 mg, max dose: 300 mg/day.
15-30	Initiate at 25-50 mg, max dose: 150 mg/day.
<15	Initiate at 25 mg, max dose: 75 mg/day.

Oral

Adjunct in partial seizures

Adult: 150-600 mg/day. Should be given in 2-3 divided doses. Max dose: 600 mg/day,

Adjunct in partial seizures

Adult: 150-600 mg/day. Should be given in 2-3 divided doses. Max dose: 600 mg/day,

Renal impairment: Dosage adjustment is required. Patients undergoing haemodialysis should receive a supplementary dose of 25-100 mg immediately after each 4-hr haemodialysis session.

CrCl (ml/min)	Dosage Recommendation
30-60	Initiate at 75 mg, max dose: 300 mg/day.
15-30	Initiate at 25-50 mg, max dose: 150 mg/day.
<15	Initiate at 25 mg, max dose: 75 mg/day.

Oral

Fibromyalgia

Adult: Initiate at 75 mg bid. May increase to 225 mg bid for patients who do not experience sufficient benefit with 300 mg/day.

Renal impairment: Dosage adjustment is required. Patients undergoing haemodialysis should receive a supplementary dose of 25-100 mg immediately after each 4-hr haemodialysis session.

CrCl (ml/min)	Dosage Recommendation
30-60	Initiate at 75 mg, max dose: 300 mg/day.
15-30	Initiate at 25-50 mg, max dose: 150 mg/day.
<15	Initiate at 25 mg, max dose: 75 mg/day.

Oral

Anxiety

Adult: Initiate at 150 mg daily. May increase at wkly intervals in steps of 150 mg. Max dose: 600 mg daily.

Renal impairment: Dosage adjustment is required. Patients

	Adult: Initiate at 150 mg daily. May increase at wkly intervals in steps of 150 mg. Max dose: 600 mg daily.	
	Renal impairment: Dosage adjustment is required. Patients undergoing haemodialysis should receive a supplementary dose of 25-100 mg immediately after each 4-hr haemodialysis session.	
	CrCl (ml/min)	Dosage Recommendation
	30-60	Initiate at 75 mg, max dose: 300 mg/day.
	15-30	Initiate at 25-50 mg, max dose: 150 mg/day.
	<15	Initiate at 25 mg, max dose: 75 mg/day.
Administration	May be taken with or without food.	
Contraindications	Hypersensitivity. Pregnancy, lactation. Driving or working with machines, or do other dangerous activities.	
Special Precautions	Discontinue treatment if patients develop severe angioedema. Withdraw treatment gradually over at least 1 wk. May cause peripheral oedema. Regular vision check is recommended. May decrease platelet count and prolong PR interval.	
Adverse Drug Reactions	Dizziness, drowsiness, visual disturbance (including blurred vision, diplopia), ataxia, dysarthria, tremor, lethargy, memory impairment, euphoria, wt gain, constipation, dry mouth, peripheral edema, depression, confusion, agitation, hallucinations, myoclonus, hypoaesthesia, hyperaesthesia, tachycardia, excessive salivation, sweating, flushing, rash, muscle cramp, myalgia, arthralgia, urinary incontinence, dysuria, thrombocytopenia, neutropenia, 1st ° heart block, hypotension, hypertension, pancreatitis, dysphagia, oliguria, rhabdomyolysis.	

	hypotension, hypertension, pancreatitis, dysphagia, oliguria, rhabdomyolysis.
Drug Interactions	Concurrent use with oxycodone, lorazepam and ethanol may increase the CNS effects.
Storage	Oral: Store at 25°C.
Mechanism of Action	Pregabalin is an analog of the neurotransmitter GABA. It binds potently to the α_2-delta subunit resulting in modulation of Ca channels and reduction in the release of several neurotransmitters, including glutamate, norepinephrine, serotonin, dopamine, and substance P. Absorption: Rapidly absorbed after oral doses. Peak plasma concentrations are achieved within 1.5 hr. Distribution: Not bound to plasma proteins. Metabolism: Negligible metabolism. Excretion: About 98% excreted unchanged in urine. Elimination half life: about 6.3 hr.
CIMS Class	Anticonvulsants / Drugs For Neuropathic Pain / Anxiolytics

primaquine

CIMS Class : (Antimalarials)
primaquine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related primaquine information

Indication & Dosage

Oral

Radical treatment of vivax or ovale malaria

Adult: A course of treatment with a blood schizontocide should be given first to kill any erythrocytic parasites. 15 mg daily for 14 days, increased to higher doses or longer course if resistance in *P.vivax* occurs.

Child: 250 mcg/kg daily for 14 days.

Oral

Prophylaxis of chloroquine-resistant malaria

Adult: 30 mg once daily; to be started 1-2 days before travel and continue for 7 days after departure from the malaria-endemic area.

Child: 0.5 mg/kg once daily for 14 days. Max: 30 mg/day.

Alternatively, for patients with mild G6PD deficiency: 45 mg once wkly for 8 wk.

	Alternatively, for patients with mild G6PD deficiency: 45 mg once wkly for 8 wk. Special Populations: For patients with G6PD deficiency: Adult: 30-45 mg/dose and children: 500-750 mcg/kg/dose. Dose to be taken once every 7 days for 8 wk.
Administration	Should be taken with food. (Take w/ meals to avoid GI discomfort.)
Contraindications	Hypersensitivity. Childn <1 yr. Acute flare-ups of systemic diseases (RA, SLE) having tendency for agranulocytopaenia, Pregnancy and lactation.
Special Precautions	G6PD deficiency; pregnancy; NADH methaemoglobin reductase deficient patients. Monitor Hb levels and blood counts routinely. Patients with systemic diseases that have an increased risk of granulocytopenia. Withdraw treatment if signs of haemolysis or methaemogloinaemia occur.
Adverse Drug Reactions	Nausea, vomiting, epigastric distress, abdominal cramps, leukopaenia, leucocytosis, agranulocytosis, methaemoglobinemia in NADH methaemoglobin reductase-deficient individuals. Potentially Fatal: Haemolytic anaemia (G6PD deficient), thrombocytopaenia, leucopaenia, AV block.
Drug Interactions	Primaquine may inhibit metabolism of chloroquine. Avoid ethanol. Potentially Fatal: Mepacrine may potentiate toxicity of primaquine. Potentially haemolytic drugs eg, sulphonamides, nitrofurans and bone marrow suppressants

	Potentially Fatal: Mepacrine may potentiate toxicity of primaquine. Potentially haemolytic drugs eg, sulphonamides, nitrofurans and bone marrow suppressants eg, methotrexate, phenylbutazone, chloramphenicol should not be co-admin with primaquine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 25°C.
Mechanism of Action	Primaquine is an 8-aminoquinoline antimalarial which eliminates the exoerythrocytic forms of malarial parasite <i>P. vivax</i>, <i>P. falciparum</i> by disrupting mitochondria and binding to DNA. By this action primaquine achieves radical cure of vivax malaria. It is also active against gametocytes of <i>P. falciparum</i>. Absorption: Readily absorbed from the GIT; peak plasma concentrations after 1-2 hr (oral). Distribution: Widely distributed throughout body tissues. Protein-binding: 98% Metabolism: Hepatic; converted to carboxyprimaquine (major metabolite). Excretion: Urine (as unchanged drug); 3-6 hr (elimination half-life).
CIMS Class	Antimalarials
ATC Classification	P01BA03 - primaquine; Belongs to the class of

P01BA03 - primaquine; Belongs to the class of aminoquinoline antimalarials. Used in the management of malarial infections.

primidone

CIMS Class : (Anticonvulsants)
primidone

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related primidone information

Indication & Dosage

Oral

Generalised tonic-clonic seizures

Adult: Initially, 125 mg daily at bedtime, increased by 125 mg every 3 days if necessary up to 500 mg daily, given in 2 divided doses, may further increase by 250 mg every 3 days if needed. Maintenance: 0.75-1.5 g daily.

Child: Initial dose: 125 mg daily, may increase by 125 mg every 3 days if needed. Maintenance: >9 yr: Same as adult dose; 6-9 yr: 0.75-1 g daily; 2-5 yr: 500-750 mg daily; <2 yr: 250-500 mg daily.

Oral

Partial seizures

Adult: Initially, 125 mg daily at bedtime, increased by 125 mg every 3 days if necessary up to 500 mg daily, given in 2 divided doses, may further increase by 250 mg every 3 days if needed. Maintenance: 0.75-1.5 g daily.

	mg every 3 days if necessary up to 500 mg daily, given in 2 divided doses, may further increase by 250 mg every 3 days if needed. Maintenance: 0.75-1.5 g daily. Child: Initial dose: 125 mg daily, may increase by 125 mg every 3 days if needed. Maintenance: >9 yr: Same as adult dose; 6-9 yr: 0.75-1 g daily; 2-5 yr: 500-750 mg daily; <2 yr: 250-500 mg daily. <i>Oral</i> Essential tremor Adult: Initially, 50 mg daily gradually increased over 2-3 wk if necessary. Max dose: 750 mg daily.
Administration	May be taken with or without food. (May be taken w/ food or milk to avoid stomach upset.)
Contraindications	Hypersensitivity. Porphyria, severe respiratory depression, pregnancy and lactation.
Special Precautions	Impaired hepatic, renal, resp function; abrupt withdrawal; elderly, debilitated and paed patients. May impair ability to drive or operate machinery. Monitor CBC regularly every 6 mth.
Adverse Drug Reactions	Drowsiness, ataxia; nausea, vomiting, visual disturbances, rashes, nystagmus, vertigo. Hypersensitivity.
Drug Interactions	Induces hepatic metabolism of many drugs; reduces efficacy of β -blockers, chloramphenicol, cimetidine, corticosteroids, furosemide, oral contraceptives, TCAs, warfarin. Increased plasma concentrations when used with valproate or phenytoin. Increased risk of osteomalacia when used with acetazolamide. May

	TCAs, warfarin. Increased plasma concentrations when used with valproate or phenytoin. Increased risk of osteomalacia when used with acetazolamide. May decrease serum levels of quinidine. Potentially Fatal: May potentiate CNS depressant effect of alcohol.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Primidone raises seizure thresholds and decreases excitability of neurons. It is partly metabolised to phenobarb which also exerts anticonvulsant activity. Absorption: Readily absorbed from the GIT (oral). Distribution: Widely distributed. Crosses the placenta; enters breast milk. Protein-binding: 20% Metabolism: Hepatic; converted to phenylethylmalonamide and phenobarbital. Excretion: Urine (as unchanged drug and metabolites); 10-15 hr (elimination half-life).
CIMS Class	Anticonvulsants
ATC Classification	N03AA03 - primidone; Belongs to the class of barbiturates and derivatives antiepileptics. Used in the management of epilepsy.

probenecid

CIMS Class : (Hyperuricemia & Gout Preparations)
probenecid

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab - Lab interference

related probenecid information

Indication & Dosage

Oral

Hyperuricaemia with gout

Adult: 250 mg bid for 1 wk increased to 500 mg bid. Dose may be increased up to 2 g daily by increments of 500 mg every 4 wk if needed.

Oral

Adjunct to antibacterial therapy

Adult: 500 mg 4 times daily. As a single dose treatment of gonorrhoea: 1 g as a single dose is given together with an oral antibacterial, or 30 min before an injected antibacterial.

Child: >2 yr weighing <50 kg: Initially, 25 mg/kg (700 mg/m²) followed by 10 mg/kg (300 mg/m²) every 6 hr.

Administration

Should be taken with food. (Take w/ meals or antacids.

Ensure adequate fluid intake.)

Contraindications

Hypersensitivity, acute gout attack, history of uric acid

Contraindications	Hypersensitivity, acute gout attack, history of uric acid nephrolithiasis, blood dyscrasias, childn <2 yr, as an antibacterial adjunct in patients with known renal impairment.
Special Precautions	Pregnancy and lactation; renal impairment, history of peptic ulcer, G6PD deficient individuals. Adequate fluid intake is recommended especially during the first few mth of treatment.
Adverse Drug Reactions	Seizures (overdosage), headache, anorexia; nausea, vomiting, urinary frequency, sore gums, dizziness, dermatitis, uric acid nephrolithiasis and pruritus. Potentially Fatal: Hepatic necrosis, aplastic anaemia, anaphylaxis.
Drug Interactions	Pyrazinamide and salicylates antagonize uricosuric effects of probenecid. May reduce clearance of methotrexate, ganciclovir and aciclovir. Probenecid may increase the plasma concentrations of penicillins or β -lactams. Potentially Fatal: Reduced renal clearance of sulphonylurea antidiabetic and ketorolac.
Lab Interference	Interferes with the determination of urinary 17-ketosteroids and may give false-positive with both Benedict test and Clinitest for urine-sugar.
Pregnancy Category (US)	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Probenecid increases excretion of uric acid by competitively blocking its reabsorption at the proximal convoluted tubule thus lowering serum uric acid levels and eventually reducing urate deposits in the tissues. It also causes plasma levels of weak organic acids (eg, penicillins and most cephalosporins) to increase by competitively inhibiting their renal tubular secretion.
CIMS Class	Hyperuricemia & Gout Preparations
ATC Classification	M04AB01 - probenecid; Belongs to the class of preparations increasing uric acid excretion. Used in the treatment of gout.

Child: Loading dose of 10-12 mg/kg, followed by continuous infusion of 20-75 mcg/kg/min. Elderly: Dosage reduction or increase in dosing intervals is recommended. Max Dosage: Adult: 1 g. Renal impairment: Dosage reduction or increase in dosing intervals is recommended. Hepatic impairment: Dosage reduction is recommended.
Administration	Should be taken on an empty stomach. (Best taken on an empty stomach 1 hr before or 2 hr after meals. May also be taken w/ food or milk to avoid stomach upset.)
Contraindications	Heart block, SLE, heart failure, hypotension, myasthenia gravis, digoxin toxicity, lactation.
Special Precautions	Myocardial damage or severe organic heart disease, asthma. Perform regular blood tests. Screen for lupus erythematosus. Serum antinuclear factor should be carried out before and regularly during therapy. Pregnancy, elderly, hepatic and renal impairment. May worsen torsade de pointes. Pre-treatment with digoxin may be necessary if procainamide is used in the treatment of atrial tachycardia. IV admin may cause severe hypotension, thus slow inj and

	pointes. Pre-treatment with digoxin may be necessary if procainamide is used in the treatment of atrial tachycardia. IV admin may cause severe hypotension, thus slow inj and monitoring of ECG and BP are recommended.
Adverse Drug Reactions	Severe hypotension, ventricular fibrillation and asystole with rapid IV admin. Drug-induced SLE syndrome; blood disorders; fever myocardial depression, heart failure, agranulocytosis after prolonged treatment, psychosis, angioedema, hepatomegaly; skin irritation; hypergammaglobulinaemia; GI disorders; CNS effects.
Drug Interactions	May enhance effects of antihypertensives, other antiarrhythmics, antimuscarinics and neuromuscular-blocking drugs and diminish those of parasympathomimetics. Increased clearance when used with alcohol. Increased plasma concentrations and toxicity of procainamide when used with trimethoprim. Potentially Fatal: Increased risk of arrhythmias with terfenadine and antipsychotics that prolong QT interval.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Procainamide directly interferes with depolarization of the cell membrane by blocking the fast inward current of Na into cardiac cells. It slows the rate of change of the depolarization phase of the action potential, moderately prolong the PR, QRS and QT intervals on ECG monitoring.

cardiac cells. It slows the rate of change of the depolarization phase of the action potential, moderately prolong the PR, QRS and QT intervals on ECG monitoring. It also has local anesthetic properties.

Absorption: Readily and almost completely absorbed.

Distribution: Widely distributed and only about 15-20% bound to plasma proteins. Crosses the placenta and passes into the breast milk.

Metabolism: Hydrolysis and acetylation in the liver,

Excretion: Excreted in the urine via active renal secretion. About 30-70% as unchanged drug. Elimination half-life of procainamide is about 2.5-5 hr.

CIMS Class	Cardiac Drugs
ATC Classification	C01BA02 - procainamide; Belongs to class Ia antiarrhythmics used in the treatment of arrhythmia.

prochlorperazine

CIMS Class : (Antipsychotics) , (Antivertigo Drugs)
prochlorperazine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food α - Food interaction

related prochlorperazine information

Indication & Dosage

Oral

Prophylaxis of nausea and vomiting

Adult: As maleate or mesilate: 5-10 mg bid/tid. May also be given rectally.

Oral

Nausea and vomiting

Adult: As maleate or mesilate: 20 mg, further doses are given if needed. Recommended buccal dose: As maleate: 3-6 mg bid.

Oral

Psychoses

Adult: As maleate or mesilate: 12.5 mg bid for 7 days, adjusted gradually to 75-100 mg daily according to response. Usual maintenance dose: 25-50 mg daily.

Child: 1-5 yr: 1.25-2.5 mg; 5-12 yr: 2.5-5 mg. May be given

adjusted gradually to 75-100 mg daily according to response. Usual maintenance dose: 25-50 mg daily.

Child: 1-5 yr: 1.25-2.5 mg; 5-12 yr: 2.5-5 mg. May be given up to tid, if necessary.

Oral

Adjunct in severe anxiety disorders

Adult: As maleate or mesilate: 5-10 mg, up to 3-4 times daily.

Oral

Vertigo

Adult: As maleate or mesilate: 15-30 mg daily, given in divided doses. May reduce gradually to 5-10 mg daily.

Recommended buccal dose: 3-6 mg bid.

Intramuscular

Nausea and vomiting

Adult: As mesilate: 12.5 mg by deep IM. If required, may give further doses via oral admin.

Intramuscular

Psychoses

Adult: As mesilate: 12.5-25 mg by deep IM Inj bid/tid.

Intravenous

Severe nausea and vomiting

Adult: As edisilate: 2.5-10 mg via slow IV inj or infusion at a rate not exceeding 5 mg/minute. Not to exceed 40 mg daily.

Rectal

Nausea and vomiting

Adult: As base: 25 mg bid.

Rectal

	Nausea and vomiting Adult: As base: 25 mg bid. <i>Rectal</i> Psychoses Adult: As maleate: 25 mg bid/tid.
Administration	May be taken with or without food.
Contraindications	CNS depression, comatose patients. Bone marrow depression, phaeochromocytoma, prolactin-dependent tumours, hypersensitivity. Childn <2 yr. Pregnancy and lactation.
Special Precautions	Extrapyramidal syndrome, hypotension, epilepsy, impaired hepatic, renal, CV, cerebrovascular or respiratory function, glaucoma. May impair ability to drive or perform tasks requiring mental alertness or physical coordination. Parenteral use in children is not recommended. History of jaundice, parkinsonism, diabetes mellitus, hypothyroidism, myasthenia gravis, paralytic ileus, prostatic hyperplasia or urinary retention. Regular eye examinations are recommended in patients on long-term treatment.
Adverse Drug Reactions	Cholestatic jaundice, cardiac arrhythmias, orthostatic hypotension, leucopaenia, thrombocytopaenia, dry mouth, blurring of vision, glaucoma, urinary retention, constipation, galactorrhoea, gynaecomastia, amenorrhoea and impotence. Buccal: Transient numbness of gum and tongue. Potentially Fatal: Bone-marrow suppression. Cardiac arrhythmias or aspiration.
Drug Interactions	Additive anticholinergic effects with antihistamines, tricyclic

Drug Interactions	Additive anticholinergic effects with antihistamines, tricyclic antidepressants and drugs used in parkinsonism. May reduce the antihypertensive effect of guanethidine and other adrenergic neurone blockers. May also increase risk of arrhythmias when used with drugs that prolong QT interval. Potentially Fatal: Potentiation of other CNS depressants including alcohol, sedatives, hypnotics, barbiturates, opioids, antihistamines and general anaesthetics.
Food Interaction	None reported.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intramuscular: Store below 30°C. Rectal: Store at 15-30°C.
Mechanism of Action	Prochlorperazine blocks both postsynaptic dopamine receptors as well as the medullary chemo receptor trigger zone. It depresses hypothalamic and hypophyseal hormone release and possesses α-adrenergic and anticholinergic inhibitory activity.
CIMS Class	Antipsychotics / Antivertigo Drugs
ATC Classification	N05AB04 - prochlorperazine; Belongs to the class of phenothiazine antipsychotics with piperazine structure. Used in the management of psychosis.

N05AB04 - prochlorperazine, belongs to the class of
phenothiazine antipsychotics with piperazine structure.
Used in the management of psychosis.

procyclidine

CIMS Class : (Antiparkinsonian Drugs)
procyclidine

P - Caution when used during pregnancy
L - Caution when used during lactation

related procyclidine information

Indication & Dosage

Oral

Parkinsonism and drug-induced extrapyramidal syndrome

Adult: As hydrochloride: Initially, 2.5 mg tid, increased gradually by 2.5-5 mg every 2-3 days if required.

Maintenance: 10-30 mg/day in 3-4 divided doses. Up to 60 mg daily may be required in some cases.

Elderly: Lower doses are required.

Oral

Dystonia in children

Child: 7-12 yr: 1.25 mg tid; 12-18 yr: 2.5 mg tid. For emergency cases, a single dose may be given via IM or IV inj: <2 yr: 0.5-2 mg; 2-10 yr: 2-5 mg and 10-18 yr: 5-10 mg.

Parenteral

Parkinsonism and drug-induced extrapyramidal syndrome

	<i>Parenteral</i> Parkinsonism and drug-induced extrapyramidal syndrome Adult: Emergency cases: IV admin: 5-10 mg, higher doses may be needed; IM admin: 5-10 mg as a single dose, may repeat after 20 minutes if needed, to a max of 20 mg daily. Elderly: Lower doses are required.
Contraindications	Urinary outflow obstruction, prostatic hyperthrophy, narrow-angle glaucoma, paralytic ileus and pyloric stenosis.
Special Precautions	Patients with diarrhoea. May impair a patient's ability to perform skilled tasks e.g. driving. May precipitate psychotic episodes in patients with mental disorders. Thyrotoxicosis, heart failure, acute myocardial infarction, hypertension. Childn, elderly. Pregnancy and lactation. Avoid abrupt withdrawal.
Adverse Drug Reactions	Excitability, dizziness, hallucinations (seen on abuse), dry mouth, blurred vision, constipation, urinary retention, agitation, restlessness, confusion and convulsions.
Drug Interactions	Increased plasma concentrations when used with paroxetine. May counteract the GI effects of cisapride, domperidone and metoclopramide. May also reduce gastric motility, thus affecting the absorption of other drugs. Potentially Fatal: Additive anticholinergic effects with antihistamines, opiate antagonists, phenothiazine, tricyclic antidepressants, quinidine.
Storage	Oral: Store at 15-25°C. Parenteral: Store at 15-25°C.

Mechanism of Action	Procyclidine is a tertiary amine antimuscarinic which acts by blocking excess acetylcholine at cerebral synapses. It also exhibits direct antispasmodic effect on smooth muscle. Absorption: Bioavailability is about 75% after an oral dose. Distribution: About one-fifth is metabolised in the liver, mainly by P450 isoenzymes. Excretion: Mean elimination half-life: about 12 hr (oral and IV admin). A small amount of the drug is excreted unchanged in the urine.
CIMS Class	Antiparkinsonian Drugs
ATC Classification	N04AA04 - procyclidine; Belongs to the class of tertiary amines anticholinergic agents. Used in the management of parkinson's disease.

progesterone

CIMS Class : (Oestrogens & Progesterones & Related Synthetic Drugs)
progesterone

P - Contraindicated in
L - Caution when used during
Lab - Lab in

related progesterone information

related progesterone information	
Indication & Dosage	<i>Oral</i> Progestogen component of menopausal hormonal replacement therapy Adult: 200 mg daily as a single daily dose at night for 12-14 days of each month. <i>Oral</i> Dysfunctional uterine bleeding Adult: 400 mg daily for 10 days. <i>Oral</i> Amenorrhoea Adult: 400 mg daily for 10 days. <i>Intramuscular</i> Dysfunctional uterine bleeding Adult: 5-10 mg daily for 5-10 days until 2 days prior to expected onset of menstruation. <i>Intramuscular</i> Amenorrhoea

	of menstruation. <i>Intramuscular</i> Amenorrhoea Adult: 5-10 mg daily for 5-10 days until 2 days prior to expected onset of menstruation. <i>Intramuscular</i> Recurrent miscarriage with progesterone deficiency Adult: 25-100 mg twice wkly from the 15th day of pregnancy until 8-16 wk increase to daily inj, if necessary. <i>Intrauterine</i> Contraception Adult: Insert the device (containing 38 mg of progesterone) into the uterus. efficacy can last up till 1 yr. <i>Vaginal</i> Dysfunctional uterine bleeding Adult: 45 mg every other day from the 15th-25th day of the cycle. May increase dose to 90 mg in non-responders. <i>Vaginal</i> Amenorrhoea Adult: 45 mg every other day from the 15th-25th day of the cycle. May increase dose to 90 mg in non-responders. <i>Vaginal</i> Premenstrual syndrome Adult: 200 mg daily, may increase to 400 mg bid. Treatment is usually started 7-10 days before the onset of menstruation and continues until onset of menstruation. Same may also be given rectally.
Contraindications	Hypersensitivity; thrombophlebitis; cerebral apoplexy; severe hepatic impairment; undiagnosed vaginal bleeding, incomplete abortion, hormone-dependent cancer.

	Hypersensitivity; thrombophlebitis; cerebral apoplexy; severe hepatic impairment; undiagnosed vaginal bleeding, incomplete abortion, hormone-dependent conditions; use as a diagnostic test for pregnancy; pregnancy. History or current high risk of arterial disease.
Special Precautions	Discontinue medications if there is sudden partial or complete loss of vision; proptosis or diplopia; migraine and embolic disorders; epilepsy, migraine, cardiac or renal dysfunction. History of depression, glucose intolerance and diabetes in patients. May impair ability to drive or operate machinery. Avoid sudden withdrawal of progesterone; lactation.
Adverse Drug Reactions	GI disturbances, appetite/weight change, fluid retention, oedema, acne, skin rash, urticaria, depression, headache, fever, fatigue, breast changes, hirsutism, weight gain, decrease in libido, altered menstrual cycles or irregular menstrual bleeding (rare).
Drug Interactions	Enhanced clearance with enzyme-inducing drugs such as carbamazepine, griseofulvin, phenobarbital, phenytoin and rifampicin. Fluconazole may increase serum levels of progesterone. May inhibit cyclosporin metabolism.
Lab Interference	May alter serum lipid profile and rarely, LFTs.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which drugs cannot be used or are ineffective).
Mechanism of Action	Progesterone is the main hormone secreted by corpus luteum. It induces changes in the endometrium, promotes mammary gland development, relaxes the uterus, blocks follicular maturation and ovulation, and maintains pregnancy. Absorption: Oral bioavailability is low. Distribution: Highly bound to plasma proteins. Distributes into breast milk.

	uterus, blocks follicular maturation and ovulation, and maintains pregnancy. Absorption: Oral bioavailability is low. Distribution: Highly bound to plasma proteins. Distributes into breast milk. Metabolism: Hepatic; extensive 1st-pass effect. Excretion: Via the urine (as sulfate and glucuronide conjugates).
CIMS Class	Oestrogens & Progesterones & Related Synthetic Drugs
ATC Classification	G03DA04 - progesterone; Belongs to the class of pregnen (4) derivative progestogens used in progestogenic hormone preparations.

proguanil

CIMS Class : (Antimalarials)
proguanil

L - Caution when used during lactation

related proguanil information

Indication & Dosage

Oral

Prophylaxis of malaria

Adult: 200 mg daily when used with chloroquine or 100 mg daily when used with 250 mg atovaquone.

Recommendation: Start prophylaxis 1 wk before exposure to malaria, or 1-2 days prior to travel. Continue admin throughout exposure and for at least 4 wk (or 1 wk if given with atovaquone) after leaving a malaria-infested area.

Child: Co-admin with chloroquine: =45 kg (=13 yr): Same as adult dose, 25-44.9 kg (8-12 yr): $\frac{3}{4}$ of adult dose, 16-24.9 kg (4-7 yr): $\frac{1}{2}$ of adult dose, 10-15.9 kg (1-3 yr): $\frac{3}{8}$ of adult dose, 6-9.9 kg (3-11 mth): $\frac{1}{4}$ of adult dose, <6 kg (0-12 wk): $\frac{1}{8}$ of adult dose. Co-admin with atovaquone: =40 kg: Same as adult dose, 31-40 kg: $\frac{3}{4}$ of adult dose, 21-30 kg: $\frac{1}{2}$ of adult dose, 11-20 kg: $\frac{1}{4}$ of adult dose.

CrCl (ml/min)	Dosage Recommendation
<10	50 mg once wkly.

Same as adult dose, 31-40 kg: $\frac{3}{4}$ of adult dose, 21-30 kg: $\frac{1}{2}$

of adult dose, 11-20 kg: $\frac{1}{4}$ of adult dose.

<10	50 mg once wkly.
10-19	50 mg every other day.
20-59	100 mg daily.

Oral

Uncomplicated falciparum malaria

Adult: 400 mg when used with 1 g of atovaquone as a single daily dose for 3 consecutive days.

Child: >40 kg: Same as adult dose, 31-40 kg: $\frac{3}{4}$ of adult dose, 21-30 kg: $\frac{1}{2}$ of adult dose, 11-20 kg: $\frac{1}{4}$ of adult dose, 9-10 kg: $\frac{3}{16}$ of adult dose, 5-8 kg: $\frac{1}{8}$ of adult dose.

CrCl (ml/min)	Dosage Recommendation
<10	50 mg once wkly.
10-19	50 mg every other day.
20-59	100 mg daily.

Administration

Should be taken with food. (Take after meals. Tab may be crushed & mixed w/ milk, honey or jam just before swallowing.)

Contraindications

Hypersensitivity. Severe renal failure; known resistance of *Plasmodium spp.*

Special Precautions

Renal impairment. Lactation.

Adverse Drug Reactions

GI disturbances, headache, vertigo, rash, haematological abnormality in persons with renal impairment, dermatological reactions.

Drug Interactions

May reduce bioavailability of cloxacillin. Absorption is reduced when used with magnesium trisilicate. Increased risk of mouth ulcers when used

	May reduce bioavailability of cloxacillin. Absorption is reduced when used with magnesium trisilicate. Increased risk of mouth ulcers when used with chloroquine. Fluvoxamine may reduce the metabolism of proguanil to its active metabolite, cycloguanil,
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Proguanil is a biguanide derivative which has to be metabolised in the body to the active metabolite, cycloguanil. It acts by inhibiting plasmodial dihydrofolate reductase and preventing nucleic acid synthesis. It is active against pre-erythrocytic forms and is a slow blood schizontocide. Absorption: Readily absorbed after oral admin. Distribution: Distributes into breast milk. Metabolism: In the liver to active metabolite, cycloguanil. Excretion: About 40-60% excreted in urine, of which 60% unchanged and 30% cycloguanil.
CIMS Class	Antimalarials
ATC Classification	P01BB01 - proguanil; Belongs to the class of biguanide antimalarials. Used in the management of malarial infections.

Lab - Lab interference

related promethazine information

Indication & Dosage

Oral

Allergic conditions

Adult: As hydrochloride: 25 mg at night increased to 25 mg bid, if needed; alternatively, 10-20 mg bid or tid.

Child: As hydrochloride: 5-10 yr: 10-25 mg daily; 2-5 yr: 5-15 mg daily. Doses are given in 1 or 2 divided doses.

Renal impairment: Dose reduction may be required.

Oral

Nausea and vomiting

Adult: As teoclate: 25 mg at night, may be increased to 50 or 75 mg at night or to 25 mg bid/tid, if needed. Max: 100 mg daily.

Child: As teoclate: 5-10 yr: 12.5-37.5 mg daily.

Renal impairment: Dose reduction may be required.

Oral

Child: As teoclate: 5-10 yr: 12.5-37.5 mg daily.

Renal impairment: Dose reduction may be required.

Oral

Prophylaxis of motion sickness

Adult: As hydrochloride: 20 or 25 mg the night before travelling followed by a similar dose in the morning if needed. As teoclate: 25 mg at night or 25 mg 1-2 hr before travelling. Same doses (for HCl) may also be given via rectal route as suppositories.

Child: As hydrochloride: 5-10 yr: 10 mg; 2-5 yr: 5 mg; doses are given at night before travelling, repeated the following morning if needed. As teoclate: 5-10 yr: 12.5 mg daily starting either on the night before long journeys or 1-2 hr before short journeys. Same doses (for HCl) may also be given via rectal route as suppositories.

Renal impairment: Dose reduction may be required.

Oral

Short-term management of insomnia

Adult: As hydrochloride: 20-50 mg at night.

Child: As hydrochloride: 5-10 yr: 20-25 mg; 2-5 yr: 15-20 mg. Doses are taken at night. May also be given as suppository.

Renal impairment: Dose reduction may be required.

Parenteral

Allergic conditions

Adult: As hydrochloride: 25-50 mg, given via IM or slow IV inj or injected into the tubing of a freely running infusion at a concentration of not >25 mg/ml and infused at a rate of not

	Adult: As hydrochloride: 25-50 mg, given via IM or slow IV inj or injected into the tubing of a freely running infusion at a concentration of not >25 mg/ml and infused at a rate of not >25 mg/min. Max dose: 100 mg. Child: As hydrochloride: 5-10 yr: 6.25-12.5 mg by deep IM inj. Renal impairment: Dose reduction may be required. <i>Parenteral</i> Nausea and vomiting Adult: As hydrochloride: 12.5-25 mg repeated at intervals of not <4 hr. May be given via deep IM or slow IV inj. Max: 100 mg/24 hr. Child: As hydrochloride: 5-10 yr: 6.25-12.5 mg by deep IM inj. Renal impairment: Dose reduction may be required.
Administration	May be taken with or without food.
Overdosage	May lead to antimuscarinic, extrapyramidal and CNS effects.
Contraindications	Hypersensitivity, coma, porphyria, cardiac disease, hypokalaemia, intra-arterial or SC inj, neonates and young children, pregnancy, lactation.
Special Precautions	Elderly, glaucoma, epilepsy, CVS disease, impaired liver function, asthma, urinary retention, prostatic hyperplasia, pyloroduodenal obstruction. May cause drowsiness. For parenteral admin: Drug must be administered carefully and slowly; incorrect admin can lead to severe tissue injury.
Adverse Drug	CNS depression, paradoxical excitation in childn, dryness of

Adverse Drug Reactions	CNS depression, paradoxical excitation in childn, dryness of mouth, blurring of vision, retention of urine, constipation, glaucoma, tachycardia, headache, hypotension, tinnitus.
Drug Interactions	Masks ototoxicity of aminoglycoside antibiotics. May enhance the sedative effects of CNS depressants like alcohol, hypnotics, barbiturates and opioids. Potentially Fatal: Ventricular arrhythmias when used with drugs that prolong QT interval.
Lab Interference	May interfere with immunological urinary pregnancy tests giving false positive results. Alters intradermal allergen tests flare reponse. Increases serum glucose in glucose tolerance tests.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Promethazine, a phenothiazine derivative, blocks postsynaptic dopaminergic receptors in the brain and has a strong α-adrenergic blocking effect. It competitively binds to H_1-receptors. Absorption: Well absorbed (Oral, IM); peak plasma concentrations after 2-3 hr. Distribution: Widely distributed: Brain, crosses the placenta, enters breast milk. Protein-binding: 76-93%. Metabolism: Extensive hepatic 1st-pass metabolism;

	Distribution: Widely distributed: Brain, crosses the placenta, enters breast milk. Protein-binding: 76-93%. Metabolism: Extensive hepatic 1st-pass metabolism; converted to promethazine sulfoxide, N-desmethyldipromethazine. Excretion: Via urine and bile (as metabolites); 5-14 hr (elimination half-life).
CIMS Class	Antivertigo Drugs / Antihistamines & Antiallergics
ATC Classification	D04AA10 - promethazine; Belongs to the class of topical antihistamines used in the treatment of pruritus. R06AD02 - promethazine; Belongs to the class of phenothiazine derivatives used as systemic antihistamines.

propafenone

CIMS Class : (Cardiac Drugs)
propafenone

P - Caution when used during pregnancy

L - Caution when used during lactation

related propafenone information

Indication & Dosage

Oral

Supraventricular and ventricular arrhythmias

Adult: Doses should be started under close monitoring of ECG and BP. For immediate-release tablet: Usual initial doses: 150 mg tid, may increase at intervals of 3-4 days up to 300 mg tid. Dose reduction is recommended in patients weighing <70 kg. For extended-release capsule: Initial doses: 225 mg every 12 hr; may increase dose at intervals of at least 5 days, up to 325-425 mg every 12 hr

Elderly: Dose reduction is recommended.

Hepatic impairment: Dose reduction is recommended.

Administration

Should be taken with food. (Take after meals. Swallow whole, do not chew/crush.)

Contraindications

Uncontrolled heart failure, marked hypotension, severe bradycardia and heart block, conduction abnormalities,

	Uncontrolled heart failure, marked hypotension, severe bradycardia and heart block, conduction abnormalities, cardiogenic shock, myasthenia gravis.
Special Precautions	Severe pulmonary obstructive diseases, CHF, cardiac pacemaker, impaired renal/hepatic function, pregnancy, lactation, elderly. Correct electrolyte disturbances before starting treatment. May worsen heart failure in patients with preexisting organic heart disease. May worsen or cause new severe ventricular arrhythmias e.g. ventricular tachycardia or fibrillation. May aggravate electrically induced ventricular tachycardia in some patients.
Adverse Drug Reactions	Dizziness, headache, visual disturbances, vertigo, dry mouth, GI disturbances, alteration in taste, allergic skin rashes, leucopenia, bradycardia and bitter or metallic taste. Potentially Fatal: SA/AV or intraventricular blocks. Severe hypotension, especially in elderly.
Drug Interactions	Reduced plasma levels when used with enzyme inducers e.g. rifampicin. Increased plasma levels when used with enzyme inhibitors e.g. cimetidine, fluoxetine, quinidine and HIV protease inhibitors. Absorption is reduced by orlistat. Increased risk of arrhythmias when used with antiarrhythmics/arrhythmogenic drugs. Increased serum levels of theophylline, metoprolol and propranolol when used concurrently. Increased risk of bradycardia and heart block when used with β -blockers. Potentially Fatal: Increased digoxin plasma levels. Potentiates anticoagulant effects of warfarin.

	when used with β-blockers. Potentially Fatal: Increased digoxin plasma levels. Potentiates anticoagulant effects of warfarin.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 25°C.
Mechanism of Action	Propafenone is a class 1C antiarrhythmic drug with local anaesthetic effects, and a direct stabilising action on myocardial membranes. The electrophysiological effect manifests itself in a reduction of upstroke velocity (Phase 0) of the monophasic action potential. In Purkinje fibers, and to a lesser extent myocardial fibers, propafenone reduces the fast inward current carried by sodium ions. Diastolic excitability threshold is increased and effective refractory period prolonged. Propafenone reduces spontaneous automaticity and depresses triggered activity. Absorption: Readily and well-absorbed from the GI tract (oral). Distribution: Crosses the placenta and appears in breast milk. Protein-binding: 95%. Metabolism: Hepatic; by the cytochrome P450 isoenzyme CYP2D6, glucuronidation. Excretion: Urine and faeces (as metabolites); Elimination half-life: 2-10 hr (fast metabolisers); 10-32 hr (slow metabolisers).

	Excretion: Urine and faeces (as metabolites); Elimination half-life: 2-10 hr (fast metabolisers); 10-32 hr (slow metabolisers).
CIMS Class	Cardiac Drugs
ATC Classification	C01BC03 - propafenone; Belongs to class Ic antiarrhythmics used in the treatment of arrhythmia.

propantheline

CIMS Class : (Antispasmodics) , (Other Drugs Acting on the Genito-Urinary System)
propantheline

P - Caution when used during pregnancy

L - Caution when used during lactation

related propantheline information

Indication & Dosage

Oral

Gastrointestinal tract spasm

Adult: 15 mg tid and 30 mg at bedtime. Doses up to 120 mg daily may be needed.

Child: For relief of GI spasm: 1 mth - 12 yr: 300 mcg/kg (max 15 mg), given 3-4 times daily.

Elderly: 7.5 mg tid. May increase to a max of 30 mg tid.

Oral

Adjunct in peptic ulcer

Adult: 15 mg tid and 30 mg at bedtime. Doses up to 120 mg daily may be needed.

Child: For relief of GI spasm: 1 mth - 12 yr: 300 mcg/kg (max 15 mg), given 3-4 times daily.

Elderly: 7.5 mg tid. May increase to a max of 30 mg tid.

Oral

	(max 15 mg), given 3-4 times daily. Elderly: 7.5 mg tid. May increase to a max of 30 mg tid. <i>Oral</i> Adult enuresis Adult: 15-30 mg bid/tid. <i>Oral</i> Hyperhidrosis Adult: 15-30 mg bid/tid. <i>Oral</i> Urinary incontinence Adult: 15-30 mg bid/tid.
Administration	Should be taken on an empty stomach. (Take ½ hr before meals.)
Overdosage	Severe intoxication may result in convulsion, circulatory failure, coma, delirium, resp depression, restlessness and hallucinations. Treatment: Empty the stomach and administer activated charcoal. Supportive treatment (e.g. oxygen, admin of fluids and assisted ventilation) is recommended. In severe cases, the use of IV physostigmine may be considered.
Contraindications	Glaucoma, obstructive diseases of GI or urinary tract, severe ulcerative colitis or toxic megacolon, intestinal atony, hiatus hernia associated with reflux oesophagitis, unstable cardiovascular adjustment in acute bleeding, prostatic enlargement, myasthenia gravis, paralytic ileus, pyloric stenosis, angle-closure glaucoma.
Special Precautions	Hyperthyroidism, congestive heart failure, coronary heart

Special Precautions	Hyperthyroidism, congestive heart failure, coronary heart disease, cardiac arrhythmias, acute MI, cardiac insufficiency, hypertension. Pregnancy and lactation; elderly. Patients with fever, diarrhoea, GI reflux disease or ulcerative colitis. Hepatic or renal impairment. Increased risk of fever or heat stroke in patients exposed to high environmental temperature. Caution when used in patients with Down's syndrome.
Adverse Drug Reactions	Dry mouth, thirst, difficulty in swallowing, skin dryness, flushing, reduced sweating, heat stroke, constipation, nausea and vomiting. Pupil dilatation with loss of accommodation and increased sensitivity to light; increased intra-ocular pressure. Bradycardia followed by tachycardia, arrhythmias and palpitations. Glaucoma, urinary hesitancy and retention, orthostatic hypotension especially in elderly. Potentially Fatal: Toxic megacolon due to preexisting ulcerative colitis.
Drug Interactions	Additive anticholinergic effect with MAOIs, TCAs, phenothiazines, antihistamines and disopyramide. Delayed gastric emptying causes delayed absorption of other drugs. May antagonise the GI effects of domperidone, cisapride and metoclopramide. May reduce absorption of ketoconazole and levodopa. May increase absorption of nitrofurantoin. May increase serum levels of digoxin. May reduce effects of haloperidol and sublingual tablets of nitrates. May antagonise effects of parasympathomimetics.

	nitrofurantoin. May increase serum levels of digoxin. May reduce effects of haloperidol and sublingual tablets of nitrates. May antagonise effects of parasympathomimetics.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Propantheline bromide is a quaternary ammonium antimuscarinic with antisecretory and antispasmodic effects. Duration: About 6 hr. Absorption: Incompletely absorbed. Metabolism: Extensive metabolism in small intestines. Excretion: Mainly in urine as metabolites and <10% excreted as unchanged drug.
CIMS Class	Antispasmodics / Other Drugs Acting on the Genito-Urinary System

propofol

CIMS Class : (Anaesthetics - Local & General)
propofol

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related propofol information

Indication & Dosage

Intravenous

Induction and maintenance of general anaesthesia

Adult: Induction: 40 mg by inj or infusion every 10 sec.

Usual dose: 1.5-2.5 mg/kg. Maintenance: 4-12 mg/kg/hr or intermittent bolus inj of 20-50 mg.

Child: >8 yr: Induction dose of 2.5 mg/kg. Maintenance dose: 9-15 mg/kg/hr by IV infusion or intermittent bolus inj.

Elderly: Including neurosurgical and debilitated patients: Infuse at a rate of 20 mg every 10 sec. Maintenance: 3-6 mg/kg/hr. Usual dose needed: 1-1.5 mg/kg.

Intravenous

Sedation

Adult: In diagnostic and surgical procedures: Initially, 6-9 mg/kg/hr by infusion given for 3-5 minutes or an alternative dose of 0.5-1 mg/kg by slow inj over 1-5 minutes.

Maintenance: 1.5-4.5 mg/kg/hr infusion. Reduce

	mg/kg/hr by infusion given for 3-5 minutes or an alternative dose of 0.5-1 mg/kg by slow inj over 1-5 minutes. Maintenance: 1.5-4.5 mg/kg/hr infusion. Reduce maintenance dose by 20% for high-risk patients needing sedation. For ventilated patients: 0.3-4 mg/kg/hr by infusion. Monitor lipid concentrations if duration of sedation lasts >3 days.
Contraindications	Electroconvulsive therapy, obstetrics. Sedation in children $\leq$16 yr. Pregnancy, lactation.
Special Precautions	Paediatrics, elderly, hypovolaemia, epilepsy, lipid disorders, patients with increased intracranial pressure. Avoid rapid bolus doses in high risk patients. Emulsion formulation of propofol 2% should only be used in children >3 yr.
Adverse Drug Reactions	Involuntary muscle movements; nausea, vomiting, headache, fever; pain, burning or stinging at inj site. Potentially Fatal: Apnoea, bradycardia, hypotension, convulsions; anaphylaxis.
Drug Interactions	Reduce dose if given with nitrous oxide or halogenated anaesthetics. Increased sedative, anaesthetic and cardiorespiratory effects when used with other CNS depressants.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
	Propofol is a short-acting anaesthetic given for induction

Mechanism of Action	Propofol is a short-acting anaesthetic given for induction and maintenance of general anaesthesia. Onset: 30 sec. Duration: 3-10 min. Distribution: Extensively redistributed from brain to other tissues; crosses the placenta and enters breast milk. Protein-binding: 95% Metabolism: Extensively hepatic; converted to water-soluble sulfate and glucuronide conjugates. Excretion: Urine (as metabolites); faeces. Elimination half-life: 40 min (initial); 4-7 hr (terminal).
CIMS Class	Anaesthetics - Local & General
ATC Classification	N01AX10 - propofol; Belongs to the class of other agents used as general anesthetics.

propranolol

CIMS Class : (Beta-Blockers) , (Antimigraine Preparations)
propranolol

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab - Lab interference

related propranolol information

Indication & Dosage

Oral

Hypertension

Adult: As conventional tablet or oral solution: Initially, 40-80 mg bid. Usual range: 160-320 mg daily. As extended release tablet: Initially, 80 mg once daily. Usual range: 120-160 mg once daily. Max: 640 mg daily.

Child: Initially, 1 mg/kg daily in divided doses, may increase to 2-4 mg/kg daily in 2 divided doses.

Oral

Phaeochromocytoma

Adult: 60 mg daily given on the 3 days before the operation with α -blockade. Prolonged treatment of 30 mg daily may be given if tumour is inoperable.

Child: 250-500 mcg/kg 3-4 times daily.

Oral

given if tumour is inoperable.

Child: 250-500 mcg/kg 3-4 times daily.

Oral

Myocardial infarction

Adult: 40 mg 4 times daily for 2-3 days followed by 80 mg bid. Alternatively, 180-240 mg daily in divided doses. Doses to be given within 5-21 days of MI.

Oral

Cardiac arrhythmias

Adult: 30-160 mg daily in divided doses.

Child: 250-500 mcg/kg 3-4 times daily.

Oral

Prophylaxis of migraine

Adult: Initially, 40 mg bid-tid increased to 160 mg daily. Up to 240 mg daily may be necessary. Discontinue therapy if satisfactory response not obtained within 4-6 wk after reaching max dose.

Child: <12 yr: 20 mg bid-tid.

Oral

Portal hypertension

Adult: Initially, 40 mg bid increased up to 160 mg bid.

Oral

Angina pectoris

Adult: As conventional tablet or oral solution: 40 mg bid-tid, may increase to 120-240 mg daily, up to 320 mg daily may be required in some patients. As extended release tablet: 80 mg once daily, increased as needed every 3-7 days, average dose 160 mg once daily, max: 320 mg daily.

be required in some patients. As extended release tablet: 80 mg once daily, increased as needed every 3-7 days, average dose 160 mg once daily, max: 320 mg daily.

Oral

Hypertrophic cardiomyopathy

Adult: 10-40 mg, given 3-4 times daily.

Oral

Hyperthyroidism

Adult: 10-40 mg, given 3-4 times daily.

Oral

Anxiety

Adult: 40 mg once daily, may increase to bid-tid.

Oral

Essential tremor

Adult: 40 mg bid-tid. May increase at wkly intervals to 160 mg daily. Up to 320 mg daily may be necessary.

Intravenous

Emergency treatment of cardiac arrhythmias

Adult: 1 mg injected over a period of 1 minute, repeated every 2 minutes, if needed. Max: 10 mg in conscious patients and 5 mg in patients under anaesthesia.

Child: 25-50 mcg/kg via slow inj, may be repeated 3-4 times daily.

Intravenous

Hyperthyroidism

Adult: 1 mg, given over 1 minute, may repeat at 2-minute intervals until response is observed or a max of 10 mg is used in conscious patients or 5 mg in patients who are

	Adult: 1 mg, given over 1 minute, may repeat at 2-minute intervals until response is observed or a max of 10 mg is used in conscious patients or 5 mg in patients who are under anaesthesia.
Administration	Cap: May be taken with or without food. (Take consistently either always w/ or always without meals.) Tab: Should be taken on an empty stomach. (Take before meals.)
Overdosage	Severe and occasionally fatal CV depression.
Contraindications	Sinus bradycardia, cardiogenic shock, pulmonary oedema, severe hyperactive airway disease, compensated cardiac failure, Raynaud's disease, hypoglycaemia, severe haemorrhage, metabolic acidosis, severe peripheral arterial disease, 2nd or 3rd degree heart block. Pregnancy (2nd and 3rd trimesters).
Special Precautions	Compensated heart failure, peripheral vascular disease, diabetes. Switching from conventional to sustained-release preparations, elderly. Ischaemic heart disease, congestive cardiac failure, renal or hepatic dysfunction. Increased risk of bradycardia and hypotension in patients with underlying cardiac disorders. 1st degree heart block. May mask symptoms of hyperthyroidism and hypoglycaemia. May unmask myasthenia gravis. Abrupt withdrawal may lead to angina, MI, ventricular arrhythmias and death. Lactation.
Adverse Drug Reactions	Cold extremities, insomnia, fatigue, dizziness, vivid dreams, lassitude, nausea, constipation or diarrhoea, vomiting, anorexia, stomach discomfort, impotence. Weakness,

	Cold extremities, insomnia, fatigue, dizziness, vivid dreams, lassitude, nausea, constipation or diarrhoea, vomiting, anorexia, stomach discomfort, impotence. Weakness, paraesthesia, wheezing, pharyngitis, bronchospasm. CNS disturbances at higher doses and mood alterations. Thrombocytopenic purpura, agranulocytosis, nonthrombocytopenic purpura, thrombocytopenia. Depression, confusion, cognitive dysfunction, emotional lability, fatigue, hallucinations. Potentially Fatal: Heart failure, heart block and bronchospasm.
Drug Interactions	Decreased effect with aluminum and calcium salts, NSAIDs, ampicillin, rifampicin. Concurrent use with chlorpromazine results in raised blood levels of both drugs and additive hypotensive effect. Hypotensive effect reduced by indometacin. Additive effect with other antihypertensives and diuretics. May reduce the clearance of bupivacaine. Plasma levels may be increased by hydralazine and propafenone. Increased serum levels of thioridazine when used with propranolol. Potentially Fatal: Marked hypertension and bradycardia with adrenaline. Rebound hypertension due to abrupt withdrawal of clonidine is potentiated. Severe bradycardia may occur with digitalis.
Lab Interference	Metabolite may interfere with bilirubin and metanephrine measurements.
Pregnancy Category (US)	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 20-25°C. Oral: Store at 20-25°C.
Mechanism of Action	Propranolol competitively blocks β_1- and β_2-receptors resulting to decreased heart rate myocardial contractility, BP and myocardial oxygen demand. It only possesses membrane-stabilising properties. Absorption: Almost completely absorbed from the GI tract (oral); peak plasma concentrations after 1 hr. Distribution: Crosses the blood-brain barrier and placenta, enters breast milk. Protein-binding: 90%. Metabolism: Hepatic; yields 4-hydroxypropranolol (biologically active). Excretion: Via urine (as metabolites and small amounts of unchanged drug); 3-6 hr (elimination half-life). May be removed by dialysis.

	Excretion: Via urine (as metabolites and small amounts of unchanged drug); 3-6 hr (elimination half-life). May be removed by dialysis.
CIMS Class	Beta-Blockers / Antimigraine Preparations
ATC Classification	C07AA05 - propranolol; Belongs to the class of non-selective beta-blocking agents. Used in the treatment of cardiovascular diseases.

propranolol + hydrochlorothiazide

CIMS Class : (Beta-Blockers) , (Diuretics)
propranolol + hydrochlorothiazide

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related propranolol + hydrochlorothiazide information

Indication & Dosage	<i>Oral</i> Hypertension Adult: Propranolol HCl 40mg + Hydrochlorothiazide 25mg (tablets). Start with ½ to 1 tab bid. Increase gradually as required up to max of 4 tabs daily.
Contraindications	Cardiogenic shock, sinus bradycardia & > first-degree block, bronchial asthma, CHF (unless the failure is secondary to tachyarrhythmias treatable with propranolol), anuria patients, hypersensitivity to either component & sulfonamide allergy.
Special Precautions	Avoid abrupt discontinuation of therapy; diabetes mellitus, thyrotoxicosis; renal/hepatic impairment; beta-blockade may interfere with glaucoma screening test. Monitor serum electrolytes periodically; pregnancy & lactation.

	thyrotoxicosis; renal/hepatic impairment; beta-blockade may interfere with glaucoma screening test. Monitor serum electrolytes periodically; pregnancy & lactation.
Adverse Drug Reactions	Hypotension, intensification of A-V block, bradycardia, paraesthesia, depression, vivid dreams, visual disturbances, fatigue, lethargy, nausea, epigastric distress, constipation, diarrhoea, airway resistance, impotence, alopecia, agranulocytosis, purpura, fever, photosensitivity, masking of hypoglycaemic symptoms; hyperglycaemia, hyperuricaemia, pancreatitis may occur. Potentially Fatal: CHF, severe hypotension.
Drug Interactions	Alum hydroxide gel, ethanol reduce propranolol absorption, cimetidine inhibits propranolol hepatic clearance. Propranolol reduces theophylline clearance. Concurrent steroid use may cause hypokalemia. Potentially Fatal: Exaggerated hypotension with catecholamine depletors & other antihypertensives. NSAIDs blunt antihypertensive effect. Insulin requirements in diabetics may be altered.
Food Interaction	Food may delay absorption of propranolol while it may increase absorption of thiazides; overall, bioavailability is increased.
Lab Interference	A propranolol metabolite may interfere with bilirubin measurements (diazotization method) & with determination of metanephrine by p-isotope method. Prolonged thiazides may interfere with parathyroid function tests interpretation.
Pregnancy	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Propranolol is a non-selective β-blocker which reduces heart rate, cardiac output and blood pressure. Hydrochlorothiazide increases renal excretion of sodium, chloride and water. There is a secondary loss of K and bicarbonate.
CIMS Class	Beta-Blockers / Diuretics
ATC Classification	C03AA03 - hydrochlorothiazide; Belongs to the class of low-ceiling thiazide diuretics. Used to promote excretion of urine. C07AA05 - propranolol; Belongs to the class of non-selective beta-blocking agents. Used in the treatment of cardiovascular diseases.

propylthiouracil

CIMS Class : (Antithyroid Agents)
propylthiouracil

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related propylthiouracil information

Indication & Dosage

Oral

Hyperthyroidism

Adult: 150-450 mg daily in divided doses. For severe cases, initial doses of 600-1200 mg daily have been used.

Maintenance dose for euthyroid patients: 50-150 mg daily.

Treatment is usually continued for 1-2 yr.

Child: Neonates: 2.5-5 mg/kg bid; 1 mth-1 yr: 2.5 mg/kg tid;

1-5 yr: 25 mg tid; 5-12 yr: 50 mg tid; 12-18 yr: 100 mg tid.

CrCl (ml/min)	Dosage Recommendation
<10	Reduce dose by 50%.
10-50	Reduce dose by 25%.

Hepatic impairment: Dose reduction is recommended.

Administration

Should be taken with food.

Overdosage

Symptoms include nausea, vomiting, epigastric distress, headache, fever, arthralgia, pruritus, oedema and pancytopenia. Agranulocytosis is the most serious effect.

	Symptoms include nausea, vomiting, epigastric distress, headache, fever, arthralgia, pruritus, oedema and pancytopenia. Agranulocytosis is the most serious effect. Rarely, exfoliative dermatitis, hepatitis, neuropathies or CNS stimulation or depression may occur.
Contraindications	Hypersensitivity, pregnancy, lactation.
Special Precautions	Reserve use for patients unable to tolerate any other treatments e.g. methimazole, radioactive iodine or surgery. Inform patient of liver failure risk and to report any signs of liver dysfunction (e.g. loss of appetite, nausea, vomiting, pruritus, dark coloured urine, light coloured stools, jaundice, right upper-quadrant pain) or agranulocytosis (e.g. fever, sore throat) immediately. Stop treatment upon signs of agranulocytosis, aplastic anaemia, fever, liver injury, elevated LFT above 3 times the upper limit of normal, or exfoliative dermatitis. Regular monitoring of thyroid function and CBC is advisable. Monitor prothrombin time regularly during treatment, especially before surgical procedures.
Adverse Drug Reactions	Mild leukopenia, lupus-like syndrome, cutaneous vasculitis, thrombocytopenia. Skin rash, urticaria, arthralgia and fever. GI discomfort, vomiting, headache. Potentially Fatal: Agranulocytosis, aplastic anaemia, liver injury and liver failure.
Drug Interactions	May potentiate activity of anticoagulants. Doses of β-blockers, digitalis glycosides and theophylline may need to be reduced when patient becomes euthyroid.
Pregnancy Category (US)	

Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Propylthiouracil inhibits the production of thyroid hormones by preventing iodine from being oxidised in the thyroid gland. It also blocks the peripheral deiodination of thyroxine to tri-iodothyronine. Absorption: Rapidly absorbed. Bioavailability: about 50-75%. Distribution: 80% bound to plasma proteins. Crosses the placenta and distributes into the breast milk. Excretion: Elimination half-life: about 1-2 hr. Excreted in the urine as glucuronide conjugates.
CIMS Class	Antithyroid Agents
ATC Classification	H03BA02 - propylthiouracil; Belongs to the class of thiouracils. Used in the management of thyroid diseases.

***propylthiouracil information:**

protionamide

CIMS Class : (Anti-TB Agents)
protionamide

P - Caution when used during pregnancy

L - Caution when used during lactation

related protionamide information

Indication & Dosage

Oral

Tuberculosis

Adult: As 2nd line drug: 15-20 mg/kg daily as a single dose.

Max: 1 g daily.

Child: As 2nd line drug: 10-20 mg/kg daily as a single dose.

Max dose: 750 mg daily.

Contraindications

Hypersensitivity. Severe hepatic disease, porphyria.

Special Precautions

Difficulty in managing DM. Monitor blood glucose, thyroid and visual function. Perform LFT before and during treatment with protionamide. Caution in patients with psychiatric illness or depression. Pregnancy and lactation.

Adverse Drug Reactions

Anorexia, excessive salivation, metallic taste, nausea, vomiting, abdominal pain, diarrhoea. Peripheral and/or optic neuritis, psychiatric disturbances e.g. depression, anxiety, psychosis, postural hypotension. Jaundice, hepatitis.

	vomiting, abdominal pain, diarrhoea. Peripheral and/or optic neuritis, psychiatric disturbances e.g. depression, anxiety, psychosis, postural hypotension. Jaundice, hepatitis. Thrombocytopenia, skin rashes, stomatitis, gynaecomastia.
Drug Interactions	Increased neurotoxic effects with cycloserine. Potentially Fatal: Increased incidence of hepatotoxicity with rifampicin.
Mechanism of Action	Protonamide inhibits peptide synthesis. It is active against mycobacteria species. Bacteriostatic against M. tuberculosis. Also active against atypical mycobacteria e.g. M. kansasii and some strains of M. aviumcomplex, and M. leprae. Onset: 30-60 min. Duration: 12-16 hr. Absorption: Readily absorbed from the GI tract (oral); peak plasma concentrations after 2 hr. Distribution: Widely distributed into body fluids and CSF. Metabolism: Converted to sulfoxide (active) and other metabolites. Excretion: Via urine (<1% as unchanged).
CIMS Class	Anti-TB Agents
ATC Classification	J04AD01 - protonamide; Belongs to the class of thiocarbamide derivative antimycobacterials. Used in the treatment of tuberculosis.

***protonamide information:**

Note that there are some more drugs interacting with protonamide

protonamide

pseudoephedrine

CIMS Class : (Cough & Cold Preparations)
pseudoephedrine

P - Caution when used during pregnancy

L - Caution when used during lactation

related pseudoephedrine information

Indication & Dosage

Oral

Nasal congestion

Adult: As hydrochloride or sulfate: 60 mg every 4-6 hr. Max: 4 doses in 24 hr. As modified-release preparation: 120 mg every 12 hr or 240 mg every 24 hr.

Child: As hydrochloride or sulfate: 2-6 yr: 15 mg 3-4 times daily; 6-12 yr: 30 mg 3-4 times daily.

Administration

May be taken with or without food.

Contraindications

Severe hypertension, phaeochromocytoma.

Special Precautions

Hyperthyroidism; ischaemic heart disease, arrhythmia or tachycardia; occlusive vascular disorders e.g. arteriosclerosis, hypertension or aneurysms; DM and closed-angle glaucoma; renal impairment, prostatic enlargement. Pregnancy; lactation.

Adverse Drug

Anginal pain; rebound congestion and rhinorrhoea; fear,

Adverse Drug Reactions	Anginal pain; rebound congestion and rhinorrhoea; fear, anxiety, restlessness, tremor, insomnia, confusion, irritability and psychotic states; reduced appetite, nausea, vomiting; gangrene; cerebral haemorrhage and pulmonary oedema; reflex bradycardia, tachycardia and cardiac arrhythmias, palpitations and cardiac arrest, hypotension and dizziness, fainting and flushing. Tissue necrosis and sloughing; myocardial and arterial necrosis.
Drug Interactions	Increased risk of hypertension and arrhythmias if given with cardiac glycosides, quinidine or TCAs. Increased risk of vasoconstrictor effects if given with ergot alkaloids or oxytocin. Co-admin with MAOIs may cause hypertensive crisis. Anaesthetics e.g. cyclopropane, halothane and other halogenated anaesthetics; antihypertensive agents.
Mechanism of Action	Pseudoephedrine is both an α- and β-adrenergic receptor agonist. It causes vasoconstriction via direct stimulation of α-adrenergic receptors of the respiratory mucosa. It also directly stimulates β-adrenergic receptors causing bronchial relaxation, increased heart rate and contractility. Onset: Oral: 15-30 minutes. Duration: As immediate-release tablet: 4-6 hr. As sustained-release preparation: 12 hr. Absorption: Rapidly absorbed from the GI tract. Distribution: Small amounts are distributed into breast milk. Metabolism: Hepatic.

	Absorption: Rapidly absorbed from the GI tract. Distribution: Small amounts are distributed into breast milk. Metabolism: Hepatic. Excretion: Via the urine largely as unchanged drug with some of its hepatic metabolites. Half-life: about 5-8 hr.
CIMS Class	Cough & Cold Preparations
ATC Classification	R01BA02 - pseudoephedrine; Belongs to the class of systemic sympathomimetic preparations used as nasal decongestants.

***pseudoephedrine information:**

Note that there are some more drugs interacting with pseudoephedrine

pyrantel

CIMS Class : (Anthelmintics)
pyrantel

related pyrantel information

Indication & Dosage

Oral

Single or mixed infections due to susceptible worms

Adult: 10 mg/kg as a single dose.

Child: 10 mg/kg as a single dose.

Oral

Ascariasis

Adult: 5 mg/kg as a single dose. Max: 1 g/dose. For mass treatment programmes: 2.5 mg/kg as a single dose given 3-4 times a yr.

Oral

Necatoriasis

Adult: 10 mg/kg daily for 3-4 days or 20 mg/kg daily for 2 days.

Oral

Enterobiasis

Adult: 10 mg/kg repeated once after 2-4 wk. Max dose: 1 g/dose.

	Enterobiasis Adult: 10 mg/kg repeated once after 2-4 wk. Max dose: 1 g/dose. <i>Oral</i> Trichinosis Adult: 10 mg/kg daily for 5 days.
Administration	May be taken with or without food.
Special Precautions	Liver dysfunction, anaemia or severe malnutrition. Treat members in close contact with the patient.
Adverse Drug Reactions	Anorexia, nausea, vomiting, abdominal cramps, drowsiness, insomnia, diarrhoea, tenesmus, SGOT elevations, headache, dizziness, rash.
Mechanism of Action	Pyrantel is effective against roundworms (<i>Ascaris</i>), threadworms (<i>Enterobius</i>), hookworms and <i>Trichostrongylus</i>. Not effective against whipworm. Acts by paralysing the worms which get detached and are excreted by intestinal peristalsis. Absorption: Minimally absorbed from the GI tract (oral). Excretion: Via urine (7% as unchanged drug and metabolites), via faeces (>50% as unchanged).
CIMS Class	Anthelmintics
ATC Classification	P02CC01 - pyrantel; Belongs to the class of tetrahydropyrimidine derivative agents used as antinematodal.

***pyrantel information:**

pyrazinamide

CIMS Class : (Anti-TB Agents)
pyrazinamide

P - Contraindicated in pregnancy

related pyrazinamide information

Indication & Dosage	<i>Oral</i> Tuberculosis Adult: As part of a mulitdrug regimen, 20-25 mg/kg (max: 2 g) daily or 1.5-3 g 3 times wkly. Child: As part of a mulitdrug regimen, 35 mg/kg daily or 50 mg/kg 3 times wkly or 75 mg/kg twice wkly. Max dose: 3 g daily. Renal impairment: May need dose reduction.
Administration	Should be taken with food.
Contraindications	Hypersensitivity; existing liver disease; acute gout or hyperuricaemia. Porphyria. Pregnancy and lactation.
Special Precautions	Diabetes, renal failure, history of gout, children. Monitor liver function and serum uric acid regularly.
Adverse Drug Reactions	Hepatotoxicity (hepatomegaly, splenomegaly and jaundice may develop and in rare case fulminating acute yellow atrophy and death). Anorexia, nausea, vomiting, arthralgia,

	Hepatotoxicity (hepatomegaly, splenomegaly and jaundice may develop and in rare case fulminating acute yellow atrophy and death). Anorexia, nausea, vomiting, arthralgia, malaise, fever, hyperuricaemia, abnormal LFT, skin rashes. Potentially Fatal: Severe liver damage, fulminant hepatitis.
Drug Interactions	Excretion may be blocked by probenecid.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Pyrazinamide has bactericidal action against M. tuberculosis in acid environment present in macrophages and inflamed tissue. Together with rifampicin provides greatest sterilising action with reduction in relapse rate. Reduces tubular secretion of uric acid. Absorption: Readily absorbed from the GI tract (oral); peak plasma concentrations after 2 hr. Distribution: Body fluids and tissues (wide), CSF, enters breast milk. Metabolism: Hepatic; hydrolysed to pyrazinoic acid (active) then hydroxylated to 5-hydroxypyrazinoic acid (major excretory product). Excretion: Via urine by glomerular filtration (70% as metabolites, 4-14% as unchanged); 9-10 hr (elimination half-life), removed by dialysis.

	metabolites, 4-14% as unchanged); 9-10 hr (elimination half-life), removed by dialysis.
CIMS Class	Anti-TB Agents
ATC Classification	J04AK01 - pyrazinamide; Belongs to the class of other drugs used in the treatment of tuberculosis.

pyridostigmine bromide

CIMS Class : (Neuromuscular Disorder Drugs) , (Other Drugs Acting on the Genito-Urinary System)
pyridostigmine bromide

P - Caution when used during pregnancy

L - Caution when used during lactation

related pyridostigmine bromide information

related pyridostigmine bromide information	
Indication & Dosage	<i>Oral</i> Myasthenia gravis Adult: 0.3-1.2 g daily in divided doses. Child: <6 yr: Initially, 30 mg, 6-12 yr: Initially, 60 mg. Dose may be gradually increased by 15-30 mg on a daily basis until a satisfactory response is observed. Renal impairment: Dose reduction may be required. <i>Oral</i> Neonatal myasthenia gravis Child: 5-10 mg given every 4-6 hr. <i>Oral</i> Paralytic ileus and postoperative urinary retention Adult: Doses of 60-240 mg. <i>Intramuscular</i> Neonatal myasthenia gravis

	Adult: Doses of 60-240 mg. <i>Intramuscular</i> Neonatal myasthenia gravis Child: 50-150 mcg/kg, given every 4-6 hr. <i>Intravenous</i> Reversal of neuromuscular blockade Adult: 10-20 mg with or preceded by 0.6-1.2 mg atropine sulfate to counteract any muscarinic effects.
Administration	Should be taken with food.
Overdosage	May cause a cholinergic crisis resulting in excessive sweating, lachrymation, increased peristalsis, involuntary defaecation and urination. Death may result from respiratory failure.
Contraindications	GI or urinary obstruction.
Special Precautions	Renal impairment, pregnancy and lactation, epilepsy, bronchial asthma, bradycardia, cardiac arrhythmias, recent coronary occlusion, vagotonia, hyperthyroidism, peptic ulcer, recent bladder/intestinal surgery. Care should be taken in the use of atropine for counteracting side effects.
Adverse Drug Reactions	Muscarinic side effects e.g. nausea, vomiting, diarrhoea, abdominal cramps, increased peristalsis, increased salivation, increased bronchial secretions, miosis and diaphoresis. Nicotinic side effects include muscle cramps, fasciculation and weakness.
Drug Interactions	Quaternary ammonium ions are poorly absorbed and their absorption may be completely inhibited by bulk laxatives eg, methylcellulose. Quinidine, procainamide, propranolol block

	Quaternary ammonium ions are poorly absorbed and their absorption may be completely inhibited by bulk laxatives eg, methylcellulose. Quinidine, procainamide, propranolol block acetylcholine receptor and may aggravate myasthenia gravis. Antagonistic effects with atropine. Increased risk of bradycardia and hypotension when used with β-blockers. Drugs with neuromuscular blocking activity e.g. aminoglycosides may reduce the efficacy of pyridostigmine. Potentially Fatal: May inhibit the metabolism of suxamethonium, thus concurrent use is not recommended.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Pyridostigmine bromide is a potent reversible inhibitor of acetylcholinesterase, the enzyme responsible for destroying acetylcholine. Inhibiting the enzyme allows free transmission of nerve impulses across the neuromuscular junction. Pyridostigmine bromide has a carbonyl ester linkage that is hydrolysed by acetylcholinesterase but much more slowly than is acetylcholine itself. Absorption: Poorly absorbed from the GI tract (oral). Distribution: CNS (poor penetration); crosses the placenta and enters breast milk (small amounts). Metabolism: Hepatic: Hydrolysed by cholinesterases. Excretion: Excreted in the urine (as unchanged drug and metabolites).

	Metabolism: Hepatic: Hydrolysed by cholinesterases. Excretion: Excreted in the urine (as unchanged drug and metabolites).
CIMS Class	Neuromuscular Disorder Drugs / Other Drugs Acting on the Genito-Urinary System

pyridoxine

CIMS Class : (Vitamin B-Complex / with C)
pyridoxine

Lab ▯ - Lab interference

related pyridoxine information

Indication & Dosage	<i>Oral</i> Treatment and prophylaxis of vitamin B₆ deficiency states Adult: Up to 150 mg daily. May also be given via SC, IM or IV routes. <i>Oral</i> Sideroblastic anaemia Adult: Up to 400 mg daily. May also be given via SC, IM or IV routes.
Administration	Should be taken with food. (Preferably taken w/ meals.)
Adverse Drug Reactions	Severe peripheral neuropathies (with long-term admin of large doses).
Drug Interactions	Isoniazid, penicillamine and oral contraceptives may result in greater requirement in pyridoxine dose. Reduces the effects of levodopa, phenobarbitone, altretamine and phenytoin.
Lab Interference	May result in false-positive results for urobilinogen in the spot test using Ehrlich's reagent.

	May result in false-positive results for urobilinogen in the spot test using Ehrlich's reagent.
Pregnancy Category (US FDA)	Category A: Controlled studies in women fail to demonstrate a risk to the foetus in the 1 st trimester (and there is no evidence of a risk in later trimesters), and the possibility of foetal harm remains remote.
Mechanism of Action	Pyridoxine is a water-soluble vitamin which functions in the metabolism of carbohydrates, proteins and fats. It is essential in Hb formation and GABA synthesis within the CNS. It also aids in the release of glycogen stored in the liver and muscles. Absorption: Well-absorbed from the GI tract following oral admin. Distribution: Crosses the placenta and enters breast milk. Metabolism: Converted to pyridoxal phosphate and pyridoxamine phosphate, which are stored and metabolised mainly in the liver. Excretion: 4-pyridoxic acid and other active metabolites are excreted via the urine.
CIMS Class	Vitamin B-Complex / with C

pyritinol

CIMS Class : (Nootropics & Neurotonics)
pyritinol

related pyritinol information

Indication & Dosage	<i>Oral</i> Cerebrovascular and mental function disorders Adult: 600 mg daily, given in 3 divided doses.
Administration	Should be taken with food. (Take w/ a large glass of water. Swallow whole, do not chew/ crush.)
Special Precautions	Rheumatoid arthritis.
Adverse Drug Reactions	Epigastric distress; anorexia; nausea; vomiting; headache; insomnia; pruritus and rash; restlessness. Potentially Fatal: Acute pancreatitis, severe cholestatic hepatitis.
Drug Interactions	Concomitant therapy with gold, levamisole or D-penicillamine.
Mechanism of Action	Pyritinol improves cerebral function in patients with cerebral dysfunction. Memory and coordination improved. Promotes glucose reuptake by the brain and has been used in various cerebrovascular disorders.
CIMS Class	Nootropics & Neurotonics

CIMS Class	Nootropics & Neurotonics
ATC Classification	N06BX02 - pyritinol; Belongs to the class of other agents used as CNS stimulant.

quetiapine

CIMS Class : (Antipsychotics)
quetiapine

P - Caution when used during pregnancy

L - Caution when used during lactation

related quetiapine information

Indication & Dosage

Oral

Schizophrenia

Adult: Initially, 25 mg bid on day 1, increased to 50 mg bid on day 2, 100 mg bid on day 3 and 150 mg bid on day 4.

Usual dose range: 300-450 mg daily. Max: 750 mg/day.

Elderly: Initially, 25 mg daily, increased in steps of 25-50 mg daily according to response.

Renal impairment: Initially, 25 mg daily, may increase in steps of 25-50 mg daily according to response.

Hepatic impairment: Dose adjustment may be required.

Oral

Bipolar disorder

Adult: Manic phase: 50 mg bid on day 1, 100 mg bid on day 2, 150 mg bid on day 3 and 200 mg bid on day 4. Usual range: 400-800 mg/day; adjust dose according to response.

Dosage increments should be =200 mg/day. Depressive

phase: Initially, 50 mg at bedtime on day 1; 100 mg on day 2, 200 mg on day 3, and 300 mg on day 4. May increase to 400 mg on day 5 and 600 mg on day 8, if needed.

	Dosage increments should be ~200 mg/day. Depressive phase: Initially, 50 mg at bedtime on day 1; 100 mg on day 2, 200 mg on day 3, and 300 mg on day 4. May increase to 400 mg on day 5 and 600 mg on day 8, if needed. Elderly: Initially, 25 mg daily, increased in steps of 25-50 mg daily according to response. Renal impairment: Initially, 25 mg daily, may increase in steps of 25-50 mg daily according to response. Hepatic impairment: Dose adjustment may be required.
Administration	May be taken with or without food.
Overdosage	Symptoms include drowsiness and sedation, tachycardia and hypotension.
Contraindications	Severe CNS depression, bone marrow suppression, coma.
Special Precautions	CV disease, cerebrovascular disease or conditions that predispose to hypotension. History of seizures; neuroleptic malignant syndrome; tardive dyskinesia. Monitor glycaemic control, especially in diabetics. Hepatic or renal impairment. Gradual withdrawal is recommended. Monitor for signs of clinical worsening, suicidality or unusual changes in behaviour. Pregnancy and lactation.
Adverse Drug Reactions	Headache, asthenia, abdominal pain, back pain, fever, chest pain, postural and orthostatic hypotension, hypertension, constipation, dry mouth, dyspepsia, diarrhoea, leucopenia, elevations in serum transaminase level, weight gain, myalgia, somnolence, dizziness, anxiety, rhinitis, rash, dry skin, ear pain, UTI, syncope, neuroleptic malignant syndrome, variations in WBC count, neutropenia, eosinophilia, elevations in nonfasting serum triglyceride level and total cholesterol, decrease in thyroid hormone levels, prolongation of the QTc interval.
Drug Interactions	Increased risk of drowsiness and postural hypotension when used with alcohol. CYP3A4 inducers

	Increased risk of drowsiness and postural hypotension when used with alcohol. CYP3A4 inducers eg. phenytoin and carbamazepine may decrease plasma levels of quetiapine while CYP3A4 inhibitors eg. ketoconazole and erythromycin may increase its plasma levels.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 25°C.
Mechanism of Action	Quetiapine is an antagonist at multiple neurotransmitter receptors in the brain: Serotonin 5-HT_{1A} and 5-HT₂, dopamine D₁ and D₂, histamine H₁ and adrenergic α₁ and α₂ receptors. It is used in the treatment of schizophrenia and bipolar disorder. Absorption: Well absorbed after oral doses. Distribution: Widely distributed throughout the body. 83% bound to plasma proteins. Metabolism: Extensively metabolised in the liver by sulfoxidation and oxidation. Excretion: Excreted mainly as inactive metabolites. Elimination half-life: about 6-7 hr.
CIMS Class	Antipsychotics
ATC Classification	N05AH04 - quetiapine; Belongs to the class of diazepines, oxazepines and thiazepines antipsychotics. Used in the management of psychosis.

quinidine

CIMS Class : (Cardiac Drugs) , (Antimalarials)
quinidine

P - Caution when used during pregnancy

L - Caution when used during lactation

related quinidine information

Indication & Dosage

Oral

Atrial and ventricular premature contractions

Adult: As sulfate: 200-300 mg 3-4 times daily.

CrCl (ml/min)	Dosage Recommendation
<10	Use 75% of normal dose.

Hepatic impairment: Dose reduction may be needed.

Oral

Uncomplicated falciparum malaria

Adult: As sulfate: 300-600 mg or 10 mg/kg every 8 hr for 5-7 days.

Child: As sulfate: 300-600 mg or 10 mg/kg every 8 hr for 5-7 days.

CrCl (ml/min)	Dosage Recommendation
<10	Use 75% of normal dose.

Hepatic impairment: Dose reduction may be needed.

Oral

Paroxysmal supraventricular tachycardia

Adult: 400-600 mg every 2-3 hr until paroxysm is terminated.

CrCl (ml/min)	Dosage Recommendation
<10	Use 75% of normal dose.

Paroxysmal supraventricular tachycardia

Adult: 400-600 mg every 2-3 hr until paroxysm is terminated.

<10	Use 75% of normal dose.
-----	-------------------------

Hepatic impairment: Dose reduction may be needed.

Oral

Conversion of atrial fibrillation

Adult: 200 mg every 2-3 hr for 5-8 doses. Subsequent doses may be increased on a daily basis until normal sinus rhythm is achieved or toxicity occurs. Max: 3-4 g/day. Maintenance: 200-300 mg 3-4 times daily.

CrCl (ml/min)	Dosage Recommendation
---------------	-----------------------

<10	Use 75% of normal dose.
-----	-------------------------

Hepatic impairment: Dose reduction may be needed.

Intravenous

Cardiac arrhythmias

Adult: As gluconate: IV admin: 800 mg diluted in 40 ml of 5% dextrose inj and infused at a rate of 0.25 mg/kg/min. Monitor ECG and BP continuously during infusion. To discontinue treatment if conversion to sinus rhythm has not occurred after reaching the max dose. Max dose: total IV dosage: 10 mg/kg.

CrCl (ml/min)	Dosage Recommendation
---------------	-----------------------

<10	Use 75% of normal dose.
-----	-------------------------

Hepatic impairment: Dose reduction may be needed.

Intravenous

Malaria

Adult: Loading dose: Infuse 15 mg/kg (diluted in 250 mL normal saline) over 4 hr. Maintenance: To start 24 hr after the start of loading dose, infuse 7.5 mg/kg over 4 hr, every 8 hr for 7 days or until oral therapy can be used. Alternatively, infuse 10 mg/kg (diluted in 250 mL normal saline) over 1-2 hr. Maintenance: Infuse 0.02 mg/kg/min for up to 72 hr or until parasitemia is reduced to <1% or oral therapy can be used.

Child: Can be given via continuous infusion or intermittent

	Maintenance: Infuse 0.02 mg/kg/min for up to 72 hr or until parasitemia is reduced to <1% or oral therapy can be used.	
	Child: Can be given via continuous infusion or intermittent inj. Continuous infusion: initial loading dose of 6.25 mg/kg of quinidine base, diluted in 5 ml/kg of normal saline, given by IV infusion over 1–2 hr, followed by a continuous maintenance infusion of 12.5 mcg/kg of base per min, given for at least 24 hr and until parasitemia is reduced to <1% and oral quinine sulfate can be substituted. Intermittent inj: initial loading dose of 15 mg/kg of quinidine base, diluted in 250 ml of normal saline and infused over 4 hr, followed 4 hr later by maintenance doses of 7.5 mg/kg of base, given by IV infusion over 4 hr at 8-hr intervals until 3 maintenance doses have been admin and parasitemia is reduced to <1% and oral quinine sulfate can be substituted.	
	CrCl (ml/min)	Dosage Recommendation
	<10	Use 75% of normal dose.
	Hepatic impairment: Dose reduction may be needed.	
Administration	Should be taken with food. (Best taken at meal times.)	
Overdosage	May result in ventricular arrhythmias and hypotension. Other symptoms include nausea, vomiting, tinnitus, blurred vision, confusion and delirium.	
Contraindications	Hypersensitivity, complete heart block, history of thrombocytopenia during treatment with quinine or quinidine, digitalis intoxication.	
Special Precautions	Test dose is recommended. Atrial flutter; widening QRS complex; incomplete AV block; uncompensated heart failure, myasthenia gravis, acute infections, fever, digitalised patients; hypokalaemia; acute MI; obstructive GI tract changes; renal or hepatic impairment; elderly. Prolonged QT interval, history of torsade de pointes, myocarditis, severe myocardial damage. Rapid infusion may result in hypotension	

	changes; renal or hepatic impairment; elderly. Prolonged QT interval, history of torsade de pointes, myocarditis, severe myocardial damage. Rapid infusion may result in hypotension and vascular collapse. Pregnancy and lactation.
Adverse Drug Reactions	Muscle weakness, nausea, vomiting, diarrhoea; cinchonism symptoms including impaired hearing, headache, blurred vision, dizziness and vomiting; urticaria and skin reactions. Potentially Fatal: Asystole, syncope, ventricular fibrillation. Thrombocytopenia, exfoliative dermatitis, granulomatous hepatitis (hypersensitivity); CHF; heart block, ventricular arrhythmias, tachycardia, seizure, coma.
Drug Interactions	May enhance effects of antihypertensives, vasodilators, myocardial depressants, oral anticoagulants and non-depolarizing muscle relaxants. Reduced clearance when used with drugs that alkalinise the urine eg. thiazides. Increased plasma levels when used with cimetidine or amiodarone. Increased metabolism when used with enzyme inducers eg. phenobarbital, phenytoin and rifampicin. Decreased metabolism when used with verapamil. Increased serum levels of procainamide and haloperidol. Potentially Fatal: Increases plasma digitalis concentration.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 20-25°C. Oral: Store at 20-25°C.
Mechanism of Action	Quinidine is a class Ia antiarrhythmic. Its actions include depression of phase 0 action potential, decrease of myocardial excitability, conduction, velocity, sodium influx during depolarisation and potassium efflux in repolarisation.

	Quinidine is a class Ia antiarrhythmic. Its actions include depression of phase 0 action potential, decrease of myocardial excitability, conduction, velocity, sodium influx during depolarisation and potassium efflux in repolarisation. Quinidine prevents calcium from diffusing across cell membrane. It reduces rate of depolarisation phase of cardiac action potential, slows depolarisation and prolongs refractory period. Exerts vagal blockade, controls atrial fibrillation, ventricular and supraventricular tachycardias. Absorption: Rapidly absorbed from the GI tract. Distribution: Crosses the placenta and enters breast milk. Protein-binding: 80-90%. Metabolism: Hepatic: mainly by cytochrome CYP450 isoenzymes. Excretion: Plasma half-life: 6-8 hr.
CIMS Class	Cardiac Drugs / Antimalarials
ATC Classification	C01BA01 - quinidine; Belongs to class Ia antiarrhythmics used in the treatment of arrhythmia.

quinine

CIMS Class : (Antimalarials) , (Muscle Relaxants)
quinine

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related quinine information

Indication & Dosage

Oral

Malaria

Adult: As sulfate: 648 mg given every 8 hr for 7 days.

Child: 10 mg/kg given every 8 hr for 7 days.

Renal impairment: Severe chronic renal failure (as sulfate): 648 mg followed 12 hr later by maintenance doses of 324 mg every 12 hr.

Oral

Nocturnal leg cramps

Adult: 200-300 mg once at night.

Oral

Babesiosis

Adult: As sulfate: 650 mg every 6-8 hr. To be taken with clindamycin for 7-10 days.

Child: 8 mg/kg (up to 650 mg) every 8 hr. To be taken with clindamycin for 7-10 days.

Intravenous

Malaria

	clindamycin for 7-10 days. <i>Intravenous</i> Malaria Adult: As dihydrochloride: Initially, 20 mg/kg (max: 1.4 g) given over 4 hr. Start maintenance doses 8 hr after the start of the initial infusion. Maintenance: 10 mg/kg (up to 700 mg) given over 4 hr every 8 hr. Loading dose should not be given if patient has received quinine, quinidine, mefloquine or halofantrine during the previous 24 hr. If parenteral treatment is required for >48 hr, maintenance dose should be reduced to 5-7 mg/kg.
Administration	Should be taken with food.
Overdosage	Symptoms include GI effects, oculotoxicity, CNS disturbances and cardiotoxicity.
Contraindications	Hypersensitivity to quinine or quinidine. Myasthaenia gravis; haemolytic anaemia; quinine-resistant falciparum; patients with tinnitus or optic neuritis; patients who have suffered an attack of blackwater fever. Prolonged QT interval. Pregnancy.
Special Precautions	Lactation. CV diseases; G6PD deficient individuals.
Adverse Drug Reactions	Cinchonism characterised by tinnitus, impaired hearing, headache, nausea, vomiting, disturbed vision, vertigo, abdominal pain and diarrhoea; urticaria, pruritus, fever, angioedema, asthma, dyspnoea, haemoglobinuria, thrombocytopenic purpura, hypoglycaemia, renal failure, hypoprothrombinaemia, agranulocytosis, Inj site irritation, pain and necrosis. Potentially Fatal: Sinus arrest, AV block, ventricular fibrillation and sudden death especially with IV use.
Drug Interactions	Rifampicin accelerates quinine clearance; cimetidine inhibits quinine metabolism; quinine may enhance hypoglycaemic

	Rifampicin accelerates quinine clearance; cimetidine inhibits quinine metabolism; quinine may enhance hypoglycaemic effects of oral antidiabetics. Concurrent admin with aluminium and/or magnesium containing antacids may decrease the absorption of quinine. Potentially Fatal: Increases digitalis toxicity; hypoprothrombinaemic effect of warfarin enhanced by quinine. Increased risk of convulsions with mefloquine. Increased risk of ventricular arrhythmias with halofantrine or other arrhythmogenic drugs e.g., amiodarone, astemizole, terfenadine, cisapride and pimozide.
Lab Interference	Quinine may interfere with some methods of measuring 17-hydroxycorticosteroids, 17-ketogenic steroids and urinary catecholamines.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Oral: Store at 25-30°C.
Mechanism of Action	Quinine is a cinchona alkaloid and a 4-methanol quinoline. It rapidly acts on blood schizonticide by interfering with lysosomal function or nucleic acid synthesis in the Plasmodia spp. It has no activity against exoerythrocytic forms. In the skeletal muscle, quinine increases the refractory period and excitability of the myoneural junction. Absorption: Rapid and almost complete from the GIT; peak plasma concentrations after 1-3 hr (oral). Distribution: Widely distributed; crosses the placenta; enters breast milk. Protein-binding: 70%.

	Absorption: Rapid and almost complete from the GI, peak plasma concentrations after 1-3 hr (oral). Distribution: Widely distributed; crosses the placenta; enters breast milk. Protein-binding: 70%. Metabolism: Extensively hepatic. Excretion: Urine; 11 hr (elimination half-life).
CIMS Class	Antimalarials / Muscle Relaxants
ATC Classification	P01BC01 - quinine; Belongs to the class of methanolquinoline antimalarials. Used in the management of malarial infections.

rabeprazole

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants)
rabeprazole

P - Caution when used during pregnancy

Food $\square$ - Food interaction

related rabeprazole information

Indication & Dosage	<i>Oral</i>
	Gastro-oesophageal reflux disease
	Adult: For erosive oesophagitis: 20 mg once daily in the morning for 4-8 wk. Maintenance: 10-20 mg once daily according to response. For non-erosive oesophagitis: 10 mg once daily for 4 wk, upon symptom resolution, may continue with 10 mg once daily when necessary.
	<i>Oral</i>
	Hypersecretory conditions
	Adult: Initially, 60 mg daily adjusted according to response. Max dose: 120 mg daily.
	<i>Oral</i>
	Active peptic ulcer disease
	Adult: 20 mg daily given for 4-8 wk for duodenal ulcer and 6-12 wk for gastric ulcer.
	<i>Oral</i>
	<i>H.pylori</i> infection
	Adult: As a combination with two antibacterials: 20 mg bid combined with clarithromycin 500 mg bid and either

	<i>H.pylori</i> infection Adult: As a combination with two antibacterials: 20 mg bid combined with clarithromycin 500 mg bid and either amoxicillin 1 g bid or metronidazole 400 mg bid. To be taken for a wk.
Administration	Delayed-release: May be taken with or without food.
Overdosage	May result in drowsiness, headache and tachycardia.
Contraindications	Hypersensitivity.
Special Precautions	Severe hepatic impairment, gastric malignancy. May increase the risk of GI infections due to acid suppressive effects. Pregnancy.
Adverse Drug Reactions	Headache, diarrhoea, rash, infection and flu-like syndrome. Dizziness, fatigue, constipation, nausea and vomiting. Potentially Fatal: Anaphylaxis, agranulocytosis.
Drug Interactions	May reduce absorption of ketoconazole and itraconazole. May prolong the elimination of diazepam, phenytoin and warfarin.
Food Interaction	Delayed absorption with high-fat meals.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Rabeprazole is a PPI that suppresses gastric acid secretion by inhibiting the gastric H ⁺ /K ⁺ ATPase at the secretory surface of the gastric parietal cell. Onset: 1 hr. Duration: 24 hr.

	surface of the gastric parietal cell. Onset: 1 hr. Duration: 24 hr. Absorption: Oral bioavailability: about 52% and peak plasma concentrations are reached about 3.5 hr after oral admin. Distribution: Protein-binding: 97%. Metabolism: Extensively metabolised in the liver by cytochrome P450 isoenzymes. Excretion: Metabolites are mainly excreted in the urine (90%). Half-life: about 1 hr.
CIMS Class	Antacids, Antireflux Agents & Antiulcerants
ATC Classification	A02BC04 - rabeprazole; Belongs to the class of proton pump inhibitors. Used in the treatment of peptic ulcer and gastro-oesophageal reflux disease (GERD).

rabeprazole + itopride

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants)
rabeprazole + itopride

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food $\square$ - Food interaction

related rabeprazole + itopride information

Indication & Dosage	<i>Oral</i> Gastro-oesophageal reflux disease Adult: Per capsule contains rabeprazole 20 mg and itopride 150 mg: 1 capsule once daily.
Contraindications	Hypersensitivity; lactation.
Special Precautions	Itopride should be used with caution because it enhances the action of acetylcholine Rabeprazole should be used with caution in patients with severe hepatic impairment. Pregnancy.
Adverse Drug Reactions	Headache, diarrhoea, dizziness, rash. Potentially Fatal: Anaphylaxis, agranulocytosis.
Drug Interactions	Rabeprazole increase elimination T _{1/2} of digoxin, decreases effects with aminoglutethimide, carbamazepine, phenytoin and rifampin and reduces absorption of ketoconazole and itraconazole. Anticholinergic agents reduces the action of itopride.
Food Interaction	Avoid alcohol (may irritate gastric mucosa). Rabeprazole has

Food Interaction	Avoid alcohol (may irritate gastric mucosa). Rabeprazole has delayed absorption but unaltered C _{max} and AUC with high-fat meals.
Mechanism of Action	Rabeprazole is a PPI that suppresses gastric acid secretion by inhibiting the gastric H ⁺ /K ⁺ ATPase at the secretory surface of the gastric parietal cell. Itopride increases acetylcholine (ACh) concentrations by inhibiting dopamine D ₂ receptors and acetylcholinesterase. Higher ACh increases GI peristalsis, increases the lower oesophageal sphincter pressure, stimulates gastric motility, accelerates gastric emptying, and improves gastro-duodenal coordination.
CIMS Class	Antacids, Antireflux Agents & Antiulcerants
ATC Classification	A02BC04 - rabeprazole; Belongs to the class of proton pump inhibitors. Used in the treatment of peptic ulcer and gastro-oesophageal reflux disease (GERD).

racecadotril

CIMS Class : (Antidiarrheals)
racecadotril

P - Caution when used during pregnancy
L - Caution when used during lactation

related racecadotril information

Indication & Dosage	<i>Oral</i> Acute diarrhoea Adult: 100 mg tid, up to 7 days.
Administration	May be taken with or without food.
Special Precautions	Renal insufficiency, pregnancy, lactation.
Adverse Drug Reactions	Vomiting, nausea, constipation, abdominal pain, thirst, vertigo and headache.
Mechanism of Action	Racecadotril increases the availability of endogenous opioids (enkephalins) by inhibiting the membrane-bound enkephalinase. These enkephalins activate d-opioid receptors in the GI tract. This leads to a reduction in cAMP mucosal levels, resulting in a reduced secretion of water and electrolytes in the intestinal lumen. Onset: Within 30 min.
CIMS Class	Antidiarrheals
ATC Classification	A07XA04 - racecadotril; Belongs to the class of other preparations used in the treatment of diarrhea.

raloxifene

CIMS Class : (Agents Affecting Bone Metabolism)
raloxifene

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related raloxifene information

Indication & Dosage	<i>Oral</i> Prophylaxis of postmenopausal osteoporosis Adult: 60 mg daily.
Administration	May be taken with or without food.
Overdosage	May cause leg cramps and dizziness.
Contraindications	Hypersensitivity; active or past history of venous thromboembolic events including DVT, pulmonary embolism and retinal vein thrombosis; hepatic and severe renal impairment. Pregnancy, lactation.
Special Precautions	CHF or active malignancy; history of oestrogen-induced hypertriglyceridaemia; renal insufficiency.
Adverse Drug Reactions	Hot flushes, leg cramps, sweating, sleep disorders, peripheral oedema, vag bleeding; flu-like symptoms, rashes, GI disturbances, hypertension, headache, sinusitis, arthralgia. Potentially Fatal: Endometrial carcinoma and thromboembolic events.

Drug Interactions	Cholestyramine reduces the absorption of raloxifene. Raloxifene with warfarin may reduce the prothrombin response and time. Caution when used in highly protein-bound drugs such as diazepam, lidocaine and diazoxide.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Raloxifene is a selective oestrogen receptor modulator that has both selective agonist or antagonist activities on oestrogen receptors. It acts as an agonist on bone by preventing bone loss and partially on cholesterol metabolism by decreasing total and LDL cholesterol levels but antagonises oestrogen effects leading to development of breast and uterine cancer. Absorption: Well absorbed from the GI tract (oral). Distribution: Protein-binding: Extensive to albumin and α_1-acid glycoprotein. Metabolism: Extensively hepatic; converted to glucuronide conjugates; undergoes enterohepatic recycling. Excretion: Faeces; 27 hr (elimination half-life).
CIMS Class	Agents Affecting Bone Metabolism
ATC Classification	G03XC01 - raloxifene; Belongs to the class of selective estrogen receptor modulators. Used as other hormone preparations.

ramipril

CIMS Class : (ACE Inhibitors)
ramipril

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related ramipril information

Indication & Dosage

Oral

Hypertension

Adult: Initially, 1.25 mg once daily given at bedtime.

Maintenance: 2.5-5 mg daily as a single dose, up to 10 mg daily as needed.

CrCl (ml/min)	Dosage Recommendation
10-30	Initiate with 1.25 mg once daily. Max dose: 5 mg daily.
<10	Initiate with 1.25 mg once daily. Max dose: 2.5 mg daily.

Hepatic impairment: Initiate with 1.25 mg once daily.

Oral

Heart failure

Adult: Initially, 1.25 mg once daily. Max dose: 10 mg daily.

Doses =2.5 mg may be given in 2 divided doses.

Max Dosage: 10 mg daily in 1-2 divided doses.

CrCl (ml/min)	Dosage Recommendation
10-30	Initiate with 1.25 mg once daily. Max dose: 5 mg daily.
<10	Initiate with 1.25 mg once daily. Max dose: 2.5

	<10	Initiate with 1.25 mg once daily. Max dose: 2.5 mg daily.
	Hepatic impairment: Initiate with 1.25 mg once daily. Oral Post myocardial infarction Adult: Initially, 2.5 mg bid increased after 2 days to 5 mg bid. Start treatment 3-10 days after infarction. Usual dose: 2.5-5 mg bid.	
	CrCl (ml/min)	Dosage Recommendation
	10-30	Initiate with 1.25 mg once daily. Max dose: 5 mg daily.
	<10	Initiate with 1.25 mg once daily. Max dose: 2.5 mg daily.
	Hepatic impairment: Initiate with 1.25 mg once daily. Oral Prophylaxis of cardiovascular events in high-risk patients Adult: Initially, 2.5 mg once daily increased to 5 mg once daily after 1 wk if tolerated. Maintenance: 10 mg once daily after a further 3 wk.	
	CrCl (ml/min)	Dosage Recommendation
	10-30	Initiate with 1.25 mg once daily. Max dose: 5 mg daily.
	<10	Initate with 1.25 mg once daily. Max dose: 2.5 mg daily.
	Hepatic impairment: Initiate with 1.25 mg once daily.	
Administration	May be taken with or without food.	
Overdosage	May lead to severe hypotension. Normal saline infusion may be used for treatment.	
Contraindications	Hypersensitivity, bilateral renal artery stenosis, or a single kidney with unilateral renal artery stenosis. Aortic stenosis or outflow tract obstruction. Pregnancy and lactation.	

	Hypersensitivity, bilateral renal artery stenosis, or a single kidney with unilateral renal artery stenosis. Aortic stenosis or outflow tract obstruction. Pregnancy and lactation.
Special Precautions	Renal impairment, hypovolaemia, hyperkalaemia, valvular stenosis; before, during or immediately after anaesthesia. Severe resistant hypertension, elderly, peripheral vascular disease or generalised atherosclerosis. Monitor renal function before and during treatment. Use with caution in patients with history of idiopathic or hereditary angioedema. Regular monitoring of WBC in patients with vascular collagen disorders is recommended.
Adverse Drug Reactions	Nausea, vomiting, diarrhoea, dizziness, fatigue, headache, abdominal pain, cough. Rarely symptomatic hypotension. Angioneurotic oedema of face, lips, tongue, glottis and larynx, syncope, renal impairment, hypersensitivity reactions. Potentially Fatal: Severe hypotension and renal failure, angioedema.
Drug Interactions	NSAIDs may increase risk of deterioration of renal function. Potentially Fatal: Concomitant admin of diuretics may lead to serious hypotension. Severe hyperkalaemia may result when used with potassium-sparing diuretics, potassium supplements and drugs that cause hyperkalaemia. May increase serum lithium concentration.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal

	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Ramipril is an ACE inhibitor which is metabolised into the active metabolite ramiprilat. It competitively inhibits angiotensin-converting enzyme (ACE) from converting angiotensin I to angiotensin II resulting in increased plasma renin activity and reduced aldosterone secretion. It also increases bradykinin levels. By these mechanisms, ramipril produces a hypotensive effect and a beneficial effect in CHF. Absorption: 50-60% is absorbed from the GI tract (oral); peak plasma concentrations after 2-4 hr (ramiprilat). Distribution: Protein-binding: 56%. Metabolism: Hepatic: Converted to ramiprilat. Excretion: Via urine (60% of the dose), via faeces (remaining dose); 13-17 hr (elimination half-life), may be prolonged in renal impairment.
CIMS Class	ACE Inhibitors
ATC Classification	C09AA05 - ramipril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

ramipril + hydrochlorothiazide

CIMS Class : (ACE Inhibitors) , (Diuretics)
ramipril + hydrochlorothiazide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related ramipril + hydrochlorothiazide information

Indication & Dosage	<i>Oral</i> Essential hypertension Adult: Per tablet contains ramipril 2.5 mg and hydrochlorthiazide 12.5 mg: 1 tablet daily up to a max of 4 tablets daily.
Contraindications	Anuria, hypersensitivity, history of angioedema, bilateral renal artery stenosis, unilateral renal artery stenosis
Special Precautions	Severe renal disease, impaired hepatic, allergy or bronchial asthma, systemic lupus erythematosus, acute gout, diabetes mellitus, elderly, collagen vascular diseases, should be discontinued before carrying out tests for parathyroid function. Pregnancy and lactation.
Adverse Drug Reactions	Pancreatitis, jaundice, diarrhoea, nausea, vomiting, cramps, constipation, gastric irritation, anorexia, aplastic anaemia, agranulocytosis, leukopaenia, haemolytic anaemia, thrombocytopaenia, vasculitis, resp distress, including pneumonitis and pulmonary oedema, photosensitivity, fever,

	agranulocytosis, leukopaenia, haemolytic anaemia, thrombocytopaenia, vasculitis, resp distress, including pneumonitis and pulmonary oedema, photosensitivity, fever, urticaria, rash, hyperglycaemia, glycosuria, hyperuricaemia, muscle spasm, vertigo, paraesthesias, dizziness, headache, restlessness, renal failure, renal dysfunction, interstitial nephritis, erythema multiforme including Stevens-Johnson syndrome, exfoliative dermatitis including toxic epidermal necrolysis, alopecia, transient blurred vision, xanthopsia, impotence, dizziness, fatigue, headache, abdominal pain, cough, rarely symptomatic hypotension, angioneurotic oedema of face, lips, tongue, glottis and larynx, syncope, renal impairment, hypersensitivity reactions. Potentially Fatal: Anaphylactic reactions, electrolyte imbalance, hypotension.
Drug Interactions	Hydrochlorthiazide in combination with alcohol, barbiturates, or narcotics potentiates orthostatic hypotension. When coadministered with other antihypertensive gives additive effect. Absorption is reduced withcholestyramine and colestipol resins. Hypokalemia is observed with corticosteroids, tubocurarine responsiveness to the muscle relaxant is increased. It decreases the renal clearance of lithium and increases the risk of lithium toxicity. Non-steroidal anti-inflammatory agents can reduce the diuretic and natriuretic effect of hydrochlorthiazide. Ramipril with potassium-sparing diuretics results in severe hyperkalemia. May increase serum lithium concentration, NSAIDs may reduce the effect of the drug and cause deterioration of renal function.
Food Interaction	Absorption delayed. Not significant.
Mechanism of Action	Ramipril is a long-acting ACE inhibitor which is metabolised into the active metabolite ramiprilat. Supine and standing

	Ramipril is a long-acting ACE inhibitor which is metabolised into the active metabolite ramiprilat. Supine and standing blood pressures (BP) are reduced with reflex tachycardia. Ventricular hypertrophy is reversed and renal blood flow increased. In CHF (CHF), pulmonary artery pressure and pulmonary capillary wedge pressure are reduced. Cardiac function is improved. Hydrochlorothiazide is a thiazide diuretic. It increases excretion of Na and chloride in approx equiv amounts. Natriuresis may be accompanied by some loss of K and bicarbonate. The rationale behind this combination is that these have a synergistic effect in lowering BP and offer an advantage of once-daily dosing convenience.
CIMS Class	ACE Inhibitors / Diuretics
ATC Classification	C03AA03 - hydrochlorothiazide; Belongs to the class of low-ceiling thiazide diuretics. Used to promote excretion of urine. C09AA05 - ramipril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

ranitidine

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants)
ranitidine

P - Caution when used during pregnancy

L - Caution when used during lactation

related ranitidine information

Indication & Dosage

Oral

Benign gastric and duodenal ulceration

Adult: Initially, 300 mg as a single daily dose at bedtime or 150 mg bid; 300 mg bid for 4 wk may be used in duodenal ulcer to improve healing). Treatment duration: 4-8 wk for benign gastric and duodenal ulceration; up to 8 wk in NSAID-associated ulceration. For prevention of NSAID-associated ulceration: 150 mg bid.

Child: 3-12 yr: 2-4 mg/kg (max: 150 mg) bid for 4-8 wk.

Renal impairment: Dosage reduction is required in severe renal impairment.

CrCl (ml/min)	Dosage Recommendation
≤20	Dosage should be halved.

Oral

***H.pylori* infection**

Adult: 300 mg once daily or 150 mg bid in combination with amoxicillin 750 mg tid and metronidazole 500 mg tid given for 2 wk. Treatment with ranitidine may be continued for a

Adult: 300 mg once daily or 150 mg bid in combination with amoxicillin 750 mg tid and metronidazole 500 mg tid given for 2 wk. Treatment with ranitidine may be continued for a further 2 wk.

Renal impairment: Dosage reduction is required in severe renal impairment.

CrCl (ml/min)	Dosage Recommendation
≤20	Dosage should be halved.

Oral

Gastro-oesophageal reflux disease

Adult: 150 mg bid or 300 mg at bedtime for up to 8 wk, may increase to 150 mg four times daily for 12 wk in severe cases.

Child: 5-10 mg/kg daily, given in 2 divided doses.

Renal impairment: Dosage reduction is required in severe renal impairment.

CrCl (ml/min)	Dosage Recommendation
≤20	Dosage should be halved.

Oral

Hypersecretory conditions

Adult: Initially, 150 mg bid/tid increased to 6 g daily if necessary.

Renal impairment: Dosage reduction is required in severe renal impairment.

CrCl (ml/min)	Dosage Recommendation
≤20	Dosage should be halved.

Oral

Acid aspiration during general anaesthesia

Adult: 150 mg given 2 hr before induction of anaesthesia and preferably, an additional dose on the previous evening.

Adult: 150 mg given 2 hr before induction of anaesthesia and preferably, an additional dose on the previous evening.

Renal impairment: Dosage reduction is required in severe renal impairment.

CrCl (ml/min)	Dosage Recommendation
≤20	Dosage should be halved.

Oral

Dyspepsia

Adult: 75 mg repeated if necessary up to 4 doses daily.

Max: 2 wk of continuous use at each time. For chronic episodic dyspepsia: 150 mg bid for up to 6 wk.

Renal impairment: Dosage reduction is required in severe renal impairment.

CrCl (ml/min)	Dosage Recommendation
≤20	Dosage should be halved.

Parenteral

Prophylaxis of acid aspiration during general anaesthesia

Adult: 50 mg IV/IM given 45-60 minutes before the induction of anaesthesia.

Renal impairment: Dosage reduction is required in severe renal impairment.

CrCl (ml/min)	Dosage Recommendation
≤20	Doses should be halved.

Intravenous

Hypersecretory conditions

Adult: Initially, 1 mg/kg/hr IV infusion, may increase by increments of 0.5 mg/kg/hr starting after 4 hr if necessary.

Renal impairment: Dosage reduction is required in severe renal impairment.

	increments of 0.5 mg/kg/hr starting after 4 hr if necessary.	
	Renal impairment: Dosage reduction is required in severe renal impairment.	
	CrCl (ml/min)	Dosage Recommendation
	≤20	Dosage should be halved.
	Intravenous Stress ulceration of upper gastrointestinal tract Adult: 50 mg by slow IV Inj as priming dose followed by 125-250 mcg/kg/hr as continuous IV infusion then transfer to oral dose of 150 mg bid once oral feeding is resumed. Renal impairment: Dosage reduction is required in severe renal impairment.	
Administration	CrCl (ml/min)	Dosage Recommendation
	≤20	Dosage should be halved.
	May be taken with or without food.	
	May lead to muscular tremors, vomiting and rapid respiration.	
	Contraindications	
Overdosage	Porphyria.	
	Special Precautions	
	Exclude malignancy before treating gastric ulcer. Renal and hepatic impairment. Infants, pregnancy and lactation.	
	Adverse Drug Reactions	
	Headache, dizziness. Rarely hepatitis, thrombocytopaenia, leucopaenia, hypersensitivity, confusion, gynaecomastia, impotence, somnolence, vertigo, hallucinations. Potentially Fatal: Anaphylaxis, hypersensitivity reactions.	
Drug Interactions	Antacids may interfere with absorption. May decrease the GI absorption of ketoconazole. Smoking may decrease the plasma levels of ranitidine. May cause an increase in the bioavailability of furosemide.	
	Pregnancy Category (US FDA)	
	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled	

	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Ranitidine blocks histamine H₂-receptors in the stomach and prevents histamine-mediated gastric acid secretion. It does not affect pepsin secretion, pentagastrin-stimulated factor secretion or serum gastrin. Absorption: 50% with peak plasma concentrations after 2-3 hr (oral); rapid with peak plasma concentrations after 15 min (IM). Distribution: Widely distributed. Crosses the placental barrier and enters breast milk. Protein-binding: 20% Metabolism: Hepatic; converted to N-oxide, S-oxide and desmethylranitidine. Excretion: Urine (as unchanged drug) within 24 hr; faeces; 2-3 hr (elimination half-life).
CIMS Class	Antacids, Antireflux Agents & Antiulcerants
ATC Classification	A02BA02 - ranitidine; Belongs to the class of H ₂ -receptor antagonists. Used in the treatment of peptic ulcer and gastro-oesophageal reflux disease (GERD).

reboxetine

CIMS Class : (Antidepressants)
reboxetine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related reboxetine information

Indication & Dosage	<i>Oral</i> Depression Adult: 4 mg bid, may increase to 10 mg daily after 3-4 wk if necessary. Max: 12 mg daily. Elderly: 2 mg bid, may increase dose to 6 mg/day after 3 ww if required. Renal impairment: Initiate with lower doses: 2 mg bid; may increase gradually according to tolerance. Hepatic impairment: Initiate with lower doses: 2 mg bid; may increase gradually according to tolerance.
Administration	May be taken with or without food.
Special Precautions	Renal and hepatic impairment, benign prostatic hyperplasia, cardiac disorders, epilepsy, bipolar disorders, urinary retention, glaucoma. May impair ability to perform tasks requiring mental alertness, driving or operating machinery. Monitor for signs of clinical worsening eg. suicidal tendency especially during the initial phase of the treatment.
Adverse Drug	Insomnia, dizziness, increased sweating, impotence, dry mouth,

Adverse Drug Reactions	Insomnia, dizziness, increased sweating, impotence, dry mouth, constipation, urinary hesitancy, dry mouth, postural hypotension, dysuria, paraesthesia, hyponatraemia, tachycardia. Potentially Fatal: Tachycardia.
Drug Interactions	Avoid concomitant admin with antiarrhythmics, antipsychotics, ciclosporin, imidazole and triazole antifungals, TCAs. Concurrent use with CYP3A4 inhibitors may increase plasma levels of reboxetine. Concurrent use with ergot derivatives may increase BP. Potentially Fatal: Risk of hypertensive crisis when used with MAOIs.
Mechanism of Action	Reboxetine selectively and potently inhibits norepinephrine reuptake. It also has a weak effect on serotonin reuptake. Absorption: Well absorbed; peak plasma concentrations about 2 hr after oral dose. Distribution: Protein-binding: 97%. Metabolism: Metabolised by CYP3A4. Dealkylation, hydroxylation, oxidation followed by glucuronide and sulfate conjugations. Excretion: Mainly via urine (78%) with 10% as unchanged drug; 13 hr (elimination half-life).
CIMS Class	Antidepressants
ATC Classification	N06AX18 - reboxetine; Belongs to the class of other agents used in the management of depression.

repaglinide

CIMS Class : (Antidiabetic Agents)
repaglinide

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food α - Food interaction

related repaglinide information

Indication & Dosage

Oral

Type 2 diabetes mellitus

Adult: Usual initial dose: 0.5 mg, taken within 30 minutes of main meals. Initial doses of 1 or 2 mg may be used in patients who have had previous hypoglycaemic treatment. May adjust dose at intervals of 1-2 wk, up to 4 mg before meals. Max dose: 16 mg daily.

Hepatic impairment: May require longer intervals between dosage adjustments.

Administration

Should be taken with food. (Usually taken within 15 mins of the meal but time may vary from immediately before to 30 mins before the meal.)

Overdosage

Severe hypoglycaemic reactions with coma, seizure and other neurological impairment may occur.

Contraindications

Diabetic ketoacidosis; severe hepatic impairment, type 1 diabetes; hypersensitivity. Lactation.

Special

Myocardial infarction, coma, trauma during surgery, elderly,

Special Precautions	Myocardial infarction, coma, trauma during surgery, elderly, malnourished and debilitated patients. Hepatic or severe renal impairment. Pregnancy.
Adverse Drug Reactions	Hypoglycaemia, nausea, diarrhoea, constipation, vomiting, dyspepsia, arthralgia, sinusitis, rhinitis, back pain; rash, pruritus, urticaria; visual disturbances.
Drug Interactions	Cytochrome P450 3A4 inducers eg. rifampicin, barbiturates and carbamazepine may increase repaglinide metabolism. NSAIDs and other highly protein bound drugs eg, salicylates, sulphonamides, phenylbutazone, oral anticoagulants and hydantoins may potentiate action of repaglinide. Ketoconazole, fluconazole, itraconazole and erythromycin may increase plasma conc of repaglinide. Antagonistic effect with drugs causing hyperglycaemia. Concurrent use with gemfibrozil may lead to enhanced and prolonged blood glucose lowering effect. Potentially Fatal: Increased risk of myocardial infarction when used with isophane insulin.
Food Interaction	Absorption may be affected when given with food.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store below 25°C. Protect from moisture.
Mechanism of Action	Repaglinide stimulates release of insulin from pancreatic β -cells by inhibiting K efflux via closure of ATP regulated K channels. This results in depolarization of the cell and opening of voltage-dependent Ca channels, which increases

	β-cells by inhibiting K efflux via closure of ATP regulated K channels. This results in depolarization of the cell and opening of voltage-dependent Ca channels, which increases influx of Ca into the beta cells and causes release of insulin. Absorption: Rapid and complete; peak plasma concentrations after 1 hr (oral). Distribution: Protein-binding: >98%. Metabolism: Completely metabolised by oxidative biotransformation and direct conjugation with glucuronic acid. Excretion: Urine (about 8%); faeces (90%).
CIMS Class	Antidiabetic Agents
ATC Classification	A10BX02 - repaglinide; Belongs to the class of other oral blood glucose lowering drugs. Used in the treatment of diabetes.

***repaglinide information:**

Note that there are some more drugs interacting with repaglinide

reserpine

CIMS Class : (Other Antihypertensives)
reserpine

Lab α - Lab interference

related reserpine information

Indication & Dosage	<i>Oral</i> Hypertension Adult: Up to 500 mcg daily for about 2 wk, subsequently reduced to lowest dose necessary to maintain response. Maintenance: 100-250 mcg daily. Max dose: 500 mcg daily. <i>Oral</i> Psychoses Adult: Up to 1 mg daily.
Administration	Should be taken with food.
Overdosage	Signs include CNS depression ranging from drowsiness to coma.
Contraindications	Active peptic ulcer or ulcerative colitis; depression; Parkinson's disease; pheochromocytoma; electroconvulsive therapy (ECT).
Special Precautions	Elderly or debilitated patients; epilepsy; renal insufficiency; gallstones; allergic conditions; cardiac arrhythmias; MI. Maintain an interval of at least 7-14 days between the last dose of reserpine and start of ECT.

Adverse Drug Reactions	Nasal congestion; headache; CNS disorders; GI disturbances; breast engorgement, galactorrhoea; gynaecomastia, decreased libido, impotence, Na retention, oedema, decreased or increased appetite; weight gain, miosis, dry mouth, sialorrhoea, dysuria, rashes, pruritus, thrombocytopaenic purpura.
Drug Interactions	Hypotensive effects enhanced by thiazide diuretics and other antihypertensives. May cause excitation and hypertension with MAOIs. May cause cardiac arrhythmias with digitalis or quinidine. Effects of CNS depressants may be enhanced. May decrease patient's response to levodopa.
Lab Interference	May cause a slight increase in urinary 5-hydroxyindoleacetic acid excretion. May also interfere with colorimetric assay procedures for the determination of urinary 17-hydroxycorticosteroids by the Glenn-Nelson technique and 17-ketosteroids by the Holtorff Koch modification of the Zimmerman reaction.
Storage	Oral: Store at 20-25°C.
Mechanism of Action	Reserpine is an antihypertensive drug that causes depletion of noradrenaline, catecholamine and serotonin stores resulting in a reduction in BP, bradycardia and CNS depression. Decrease in cardiac output and peripheral resistance result in hypotensive effect. Absorption: Readily absorbed from the GI tract, bioavailability: about 50%. Distribution: Crosses the blood brain barrier and appears in breast milk. 95% bound to plasma proteins. Metabolism: Extensive metabolism. Excretion: About 8% is excreted in urine as metabolites and

	breast milk. 95% bound to plasma proteins. Metabolism: Extensive metabolism. Excretion: About 8% is excreted in urine as metabolites and about 60% is excreted in faeces, mainly unchanged.
CIMS Class	Other Antihypertensives
ATC Classification	C02AA02 - reserpine; Belongs to the class of rauwolfia alkaloids, centrally-acting antiadrenergic agents. Used in the treatment of hypertension.

retinol

CIMS Class : (Vitamins A, D & E) , (Acne Treatment Preparations) , (Psoriasis, Seborrhea & Ichthyosis Preparations)
retinol

P - Contraindicated in pregnancy

related retinol information

Indication & Dosage

Oral

Vitamin A deficiency

Adult: For severe deficiency with corneal changes: 500,000 units daily for 3 days, followed by 50,000 units daily for 2 wk and then 10,000-20,000 units daily for 2 mth as follow-up therapy. For cases with corneal changes: 10,000-25,000 units daily until clinical improvement occurs (usually 1–2 wk).

Child: In children with xerophthalmia: 5000 units/kg daily for 5 days or until recovery occurs.

Intramuscular

Patients with biliary cirrhosis or chronic cholestatic liver disease

Adult: 100,000 units every 2-4 mth.

Topical/Cutaneous

Acne

Adult: Apply as cream or ointment on affected areas.

Topical/Cutaneous

Psoriasis

	Adult: Apply as cream or ointment on affected areas. <i>Topical/Cutaneous</i> Psoriasis Adult: Apply as cream or ointment on affected areas.
Contraindications	Hypervitaminosis A; pregnancy (dose exceeding RDA).
Special Precautions	Cholestatic jaundice; fat-malabsorption conditions. Monitor patients closely for toxicity. Liver impairment and children.
Adverse Drug Reactions	Hypervitaminosis A characterised by fatigue, irritability, anorexia, weight loss, vomiting and other GI disturbances, low-grade fever, hepatosplenomegaly, skin changes, alopecia, dry hair, cracking and bleeding lips, SC swelling, nocturia, pains in bones and joints.
Drug Interactions	Decreased absorption with neomycin. Increased risk of hypervitaminosis A with synthetic retinoids eg, acitretin, isotretinoin and tretinoin. Increased risk of toxicity when used with alcohol.
Mechanism of Action	Retinol (vitamin A) is an essential cofactor in many biological processes for growth, development and maintenance of epithelial tissues and visual adaptation to darkness Absorption: Well-absorbed from GI tract (except in the presence of fat malabsorption, low-protein intake, impaired hepatic or pancreatic function) after oral administration. Distribution: Concentrated in the liver. Enters breastmilk. Metabolism: Hydrolysed to retinol by pancreatic enzymes. Excretion: Urine and faeces.
CIMS Class	Vitamins A, D & E / Acne Treatment Preparations / Psoriasis, Seborrhea & Ichthyosis Preparations
ATC Classification	D10AD02 - retinol; Belongs to the class of topical retinoid preparations used in the treatment of acne. R01AX02 - retinol; Belongs to the class of other topical

D10AD02 - retinol; Belongs to the class of topical retinoid preparations used in the treatment of acne.

R01AX02 - retinol; Belongs to the class of other topical preparations used as nasal decongestants.

S01XA02 - retinol; Belongs to the class of other agents used as ophthalmologicals.

reviparin sodium

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
reviparin sodium

L - Caution when used during lactation

related reviparin sodium information

Indication & Dosage	<i>Subcutaneous</i> Prophylaxis of venous thromboembolism during moderate-risk surgical procedures Adult: 1750 anti-Xa IU, given 2 hr prior to surgery. Continue once daily dosing until patient is fully mobile. <i>Subcutaneous</i> Prophylaxis of venous thromboembolism during high-risk surgical procedures Adult: 4200 anti-Xa IU, given 12 hr before surgery. Continue once daily dosing until patient is fully mobile and for at least 14 days. <i>Subcutaneous</i> Thromboembolic disorders Adult: Initiate treatment upon confirmation of diagnosis. 35-45 kg: 3500 anti-Xa IU; 46-60 kg: 4200 anti-Xa IU and >60 kg: 6300 anti-Xa IU. Doses to be given bid with an oral anticoagulant. Usual treatment duration with reviparin: 5-7 days.
Overdosage	Overdosage may lead to haemorrhage. Severe bleeding

	Overdosage may lead to haemorrhage. Severe bleeding may be decreased by slow IV admin of protamine sulfate.
Contraindications	Patients at serious risk of haemorrhage including blood disorders, thrombocytopaenia, peptic ulcer disease, cerebrovascular disorders, bacterial endocarditis, severe hypertension, oesophageal varices, patients who have recently undergone surgery, severe renal or hepatic impairment. IM admin. Patients who have developed thrombocytopenia with heparin. Patients with prosthetic heart valves.
Special Precautions	Elderly (women in particular); lactation; children; renal failure; diabetes mellitus. Platelet count done before and during reviparin therapy. Monitor anti-factor-Xa activity in patients with increased risk of bleeding such as elderly, renally impaired patients and patients with active bleeding.
Adverse Drug Reactions	Vomiting, constipation, epistaxis, conjunctivitis, asthma, rhinitis. Bleeding from skin, mucosa, GI tract, wounds and genital tract; thrombosis; thromboembolism; consumption coagulopathy; Inj site necrosis; melena; petechiae; purpura; allergic features like pruritus, urticaria; nausea, headache, fever, body pain, dyspnoea and hypotension; transient alopecia, hyperkalaemia, hypoaldosteronism; metabolic acidosis; priapism. Potentially Fatal: Severe thrombocytopaenia with severe thromboembolic disorders and haemorrhage.
Drug Interactions	Nitroglycerin infusion may diminish reviparin effect. May displace propranolol from protein-binding sites. Increased risk of haemorrhage when used with aspirin. Increased risk of hyperkalaemia when used with ACE inhibitors or angiotensin II receptor antagonists.

	risk of haemorrhage when used with aspirin. Increased risk of hyperkalaemia when used with ACE inhibitors or angiotensin II receptor antagonists. Potentially Fatal: Serious GI bleeding may occur when used with ketorolac.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Reviparin sodium, like heparin, inhibits blood clotting in vitro and in vivo by enhancing the action of antithrombin III. Antithrombin III inhibits the activity of activated clotting factors including thrombin (factor IIa) and activated factor X (factor Xa). Absorption: Absorbed from systemic circulation (SC); peak plasma concentrations after 3 hr. Bioavailability: about 95%. Excretion: Excreted mainly in the urine. Elimination half-life: about 3 hr.
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)

ribavirin

CIMS Class : (Antivirals)
ribavirin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related ribavirin information

Indication & Dosage

Oral

Chronic hepatitis C

Adult: Dosing regimens depend on the product used and patient's body wt. *Rebetol (Schering-Plough):* when used with peginterferon alfa-2b, recommended dose is 800 mg daily; when used with interferon alfa-2b, recommended dose is 1 g daily (for patients =75 kg) or 1.2 g daily (for patients >75 kg). To be given in 2 divided doses. Usual treatment duration: 48 wk (treatment-naïve patients) or 24 wk (patients who have failed interferon alfa-2b monotherapy). *Copegus (Roche):* Use in combination with peginterferon alfa-2a. Dosing regimens depend on hepatitis C viral genotype. For genotype 1 or 4: 1 g daily (patients <75 kg) or 1.2 g daily (patients =75 kg); for genotype 2 or 3: 800 mg daily. For coinfection with HIV, 800 mg daily (regardless of hepatitis C viral genotype). To be given in 2 divided doses. Usual treatment duration: 48 wk (genotype 1 or 4 or HIV coinfection) or 24 wk (genotype 2 or 3).

Child: =3 yr: recommended dosing regimen (*Rebetol*

viral genotype). To be given in 2 divided doses. Usual

treatment duration: 48 wk (genotype 1 or 4 or HIV coinfection) or 24 wk (genotype 2 or 3).

Child: =3 yr: recommended dosing regimen (*Rebetol* (Schering Plough)): 15 mg/kg daily, given in 2 divided doses. Used in combination with interferon alfa-2b. For patients =25 kg or unable to swallow capsules, oral solution should be used. Capsules should not be used in patients <5 yr. Usual treatment duration: 48 wk (treatment-naïve patients) or 24 wk (patients who have failed interferon alfa-2b monotherapy).

CrCl (ml/min)	Dosage Recommendation
<50	Avoid usage.

Hepatic impairment: Avoid in severe impairment.

Inhalation

Respiratory syncytial viral infections

Child: Usual dose: Mist containing 190 mcg/L delivered to the patient via the SPAG-2 aerosol generator and an oxygen hood, face mask, or oxygen tent at a rate of about 12.5 L of mist per minute continuously for 12–18 hr daily for 3–7 days.

CrCl (ml/min)	Dosage Recommendation
<50	Avoid usage.

Hepatic impairment: Avoid in severe impairment.

Special Populations: Reduce dose in patients with low Hb concentrations.

Reconstitution: Reconstitute by using at least 75 ml of sterile water for inj or inhalation into a vial containing 6 g of ribavirin. The final concentration should be 20 mg/ml.

Administration

Tab: Should be taken with food.

Cap: May be taken with or without food. (Take consistently w/ respect to meals, either always with or always without meals.)

Contraindications

Hypersensitivity. Pregnancy and lactation. Unstable cardiac

Contraindications	Hypersensitivity. Pregnancy and lactation. Unstable cardiac disease, haemoglobinopathies or CrCl <50 ml/min. Severe hepatic impairment or decompensated liver cirrhosis. Men whose female partners are pregnant. Children and adolescents with a history of, or existing psychiatric disorders.
Special Precautions	Patients with extensive hepatic fibrosis; renal impairment; anaemias. Monitor CBC at the start of, and regularly during treatment. Ensure contraception during treatment and for at least 6 mth after treatment cessation in women and female partners of male patients. Increased risk of fatal and nonfatal MI in patients with anaemia.
Adverse Drug Reactions	Oral: Increased serum bilirubin and uric acid, haemolytic anaemia, reticulocytosis, anorexia, dyspepsia, nausea, irritability, dyspnoea, pharyngitis, skin rashes, pruritus and headache, abdominal cramps, fatigue, metallic taste, increased thirst, GI complaints, mood changes, insomnia. High dose may cause reduction in haemoglobin, haematocrit and RBC count. Aerosol: Deterioration in pulmonary function, bacterial pneumonia and pneumothorax, BP fall, cardiac arrest, anaemia, reticulocytosis, conjunctivitis, skin rash. Eye irritation due to deposited drug (infrequent).
Drug Interactions	May worsen neutropenia induced by interferon alfa. May increase risk of adverse effects when used with nucleoside reverse transcriptase inhibitors. Potentially Fatal: Risk of fatal hepatic failure, peripheral neuropathy and pancreatitis when used with didanosine. Increased risk of severe neutropenia and anaemia when used with zidovudine.

	neuropathy and pancreatitis when used with didanosine. Increased risk of severe neutropenia and anaemia when used with zidovudine.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Inhalation: Lyophilised drug powder may be stored at 25°C. Reconstituted solution may be stored at 20-30°C for 24 hr. Oral: Capsule/tablet: Store at 15-30°C. Oral solution: Store at room temperature or refrigerate at 2-8°C.
Mechanism of Action	Ribavirin is a synthetic nucleoside which has inhibitory action against respiratory syncytial virus, influenza virus and herpes simplex virus. The mechanism of action is not clear. It may act at several sites including cellular enzymes to interfere with viral nucleic acid synthesis. The mono- and triphosphate derivatives are known to be responsible for the antiviral action of the compound. Absorption: Rapidly absorbed from the GI tract; peak plasma concentrations after 1-2 hr (oral). Oral bioavailability: about 45-65%. Absorbed from the resp tract (inhalation). Distribution: Crosses the blood-brain barrier; present in sperm and RBC (high concentrations). Metabolism: Extensively hepatic via phosphorylation; converted to the mono-, di- and triphosphate derivatives. Excretion: Mainly in the urine (as unchanged drug and metabolites). Elimination half-life: 2 hr (β phase), 20-50 hr (terminal phase).
CIMS Class	Antivirals
ATC Classification	J05AB04 - ribavirin; Belongs to the class of nucleosides and nucleotides excluding reverse transcriptase inhibitors. Used

ATC
Classification

J05AB04 - ribavirin; Belongs to the class of nucleosides and nucleotides excluding reverse transcriptase inhibitors. Used in the systemic treatment of viral infections.

Prophylaxis against meningococcal meningitis

Adult: 600 mg bid for 2 days.

Child: 1-12 yr: 10 mg/kg; <12 mth: 5 mg/kg, doses to be given bid for 2 days.

Hepatic impairment: Dosage reduction may be necessary.

Oral

Prophylaxis against meningitis due to *Haemophilus influenzae*

	Hepatic impairment: Dosage reduction may be necessary. <i>Oral</i> Prophylaxis against meningitis due to <i>Haemophilus influenzae</i> Adult: 600 mg daily for 4 days. Child: 1-3 mth: 10 mg/kg/day; >3 mth: 20 mg/kg/day. Doses to be taken once daily for 4 days. Max: 600 mg/day. Hepatic impairment: Dosage reduction may be necessary. <i>Oral</i> Staphylococcal infections Adult: 600-1200 mg daily, in divided doses. May also be given via IV infusion. Child: =1 yr: 5-10 mg/kg bid; 1-18 yr: 10 mg/kg (max: 600 mg) bid. May be given via mouth or IV infusion. Hepatic impairment: Dosage reduction may be necessary. <i>Oral</i> Legionnaire's disease Adult: 600-1200 mg daily, in divided doses. May also be given via IV infusion. Child: =1 yr: 5-10 mg/kg bid; 1-18 yr: 10 mg/kg (max: 600 mg) bid. May be given via mouth or IV infusion. Hepatic impairment: Dosage reduction may be necessary. <i>Oral</i> Brucellosis Adult: 600-1200 mg daily, in divided doses. May also be given via IV infusion. Child: =1 yr: 5-10 mg/kg bid; 1-18 yr: 10 mg/kg (max: 600 mg) bid. May be given via mouth or IV infusion. Hepatic impairment: Dosage reduction may be necessary.
Administration	Should be taken on an empty stomach. (Best taken on an empty stomach 1 hr before or 2 hr after meals.)
Overdosage	May lead to nausea, vomiting, abdominal pain, pruritus, headache and lethargy. Hypotension, ventricular arrhythmias, seizures and

	May lead to nausea, vomiting, abdominal pain, pruritus, headache and lethargy. Hypotension, ventricular arrhythmias, seizures and cardiac arrest may occur in fatal cases.
Contraindications	Hypersensitivity, jaundice, severe hepatic disease. IM/SC admin. Porphyrria. Not to be used for treatment of meningococcal disease.
Special Precautions	Impaired hepatic or renal function. Elderly, malnourished or very young patients. Alcoholic patients. Monitor blood counts and liver function regularly. Body fluids may colour orange-red. Discontinue use if thrombocytopenia or purpura occurs. Pregnancy and lactation. Care should be taken during IV admin to prevent extravasation.
Adverse Drug Reactions	GI disturbances, pseudomembranous colitis (rare), abnormalities of liver function, fatalities in those with liver disorders, influenza-like symptoms, skin reactions, eosinophilia, transient leucopenia, thrombocytopenia, purpura, shock, drowsiness, headache, ataxia, visual disturbances, menstrual irregularities. Reddish coloured urine and tears. IV: Thrombophlebitis; extravasation following local irritation and inflammation. Potentially Fatal: Hepatitis or shock-like syndrome with hepatic involvement.
Drug Interactions	Increased metabolism of chloramphenicol, clofibrate, dapsone, digoxin, hexobarbitone, ketoconazole and quinidine. Absorption may be decreased when taken with antacids, anticholinergics, opioids and ketoconazole. Increased metabolism of losartan and its active metabolite, diazepam and nitrazepam. Reduces serum levels of aprepitant, atovaquone, bisoprolol, carvedilol, metoprolol, propranolol, buspirone, bunazosin, diltiazem, nifedipine and verapamil. Increased risk of transplant rejection when used with ciclosporin. Decreases effects of tolbutamide, clofibrate, coumarin anticoagulants, diazepam and oral contraceptives.

	Increased risk of transplant rejection when used with ciclosporin. Decreases effects of tolbutamide, clofibrate, coumarin anticoagulants, diazepam and oral contraceptives. Potentially Fatal: May reduce efficacy of corticosteroids in Addison's disease and induce an Addisonian crisis.
Lab Interference	Interferes with colorimetric tests, including bromsulphothalein tests of liver function and bilirubin assays. Erroneous low readings of vitamin B ₁₂ and folates may occur.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Avoid excessive heat and protect from light.
Mechanism of Action	Rifampicin has a broad-spectrum bactericidal action which inhibits bacterial RNA synthesis by binding to the β subunit of DNA-dependent RNA polymerase, thus blocking RNA transcription. It is commonly used in the treatment of tuberculosis, leprosy and opportunistic atypical mycobacterial infections. Absorption: Readily absorbed from the GI tract (oral); peak plasma concentrations after 2-4 hr. May be reduced and delayed in the presence of food. Distribution: Body tissues and fluids, CSF (increased during meningitis), crosses the placenta and enters into breast milk. Protein-binding: 84-91% Metabolism: Hepatic; converted to 25-O-desacetyl-rifampicin. Excretion: Via faeces (60% of the dose).
CIMS Class	Anti-TB Agents / Antileprotics / Other Antibiotics
ATC Classification	J04AB02 - rifampicin; Belongs to the class of antibiotics. Used in the treatment of tuberculosis.

risedronic acid

CIMS Class : (Agents Affecting Bone Metabolism)
risedronic acid

P - Contraindicated in pregnancy

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related risedronic acid information

Indication & Dosage

Oral

Paget's disease of bone

Adult: 30 mg once daily for 2 mth, repeat if necessary after 2 mth interval.

CrCl (ml/min)	Dosage Recommendation
<30	Avoid use.

Oral

Treatment and prophylaxis of postmenopausal or corticosteroid-induced osteoporosis

Adult: 5 mg daily. To minimize GI effects, take with at least 200 ml of water in an upright position on an empty stomach, at least 30 min before breakfast and any other oral medication. Remain upright after taking the tab for at least 30 min. Do not take at bedtime or before rising. Alternatively, for postmenopausal osteoporosis, 35 mg once wkly or 75 mg on 2 consecutive days of each mth or 150 mg once a mth may be given.

	for postmenopausal osteoporosis, 35 mg once wkly or 75 mg on 2 consecutive days of each mth or 150 mg once a mth may be given.	
	CrCl (ml/min)	Dosage Recommendation
	<30	Avoid use.
	<i>Oral</i> Increase bone mass in men with osteoporosis Adult: 35 mg once wkly.	
	CrCl (ml/min)	Dosage Recommendation
	<30	Avoid use.
Overdosage	May decrease serum calcium and phosphorus levels. Antacids or milk containing calcium may be given to decrease the absorption of the drug.	
Contraindications	Acute upper GI inflammation, pregnancy, hypocalcaemia and CrCl <30 ml/min.	
Special Precautions	Correct hypocalcaemia prior to therapy. Monitor hepatic and renal function and WBC. Renal impairment; inability to remain in an upright position for at least 30 min after oral intake.	
Adverse Drug Reactions	Electrolyte disturbances; GI disturbances; musculoskeletal pain; headache; hypersensitivity reactions; blood disorders; liver enzyme disturbances. Bone, joint and/or muscle pain.	
Drug Interactions	Co-admin with calcium, antacids or oral medications containing divalent cations may affect the absorption of risedronate. May have additive calcium lowering effects when used with aminoglycosides.	
Food Interaction	Impaired absorption.	
Lab Interference	May interfere with the use of bone-imaging agents.	
Storage	Oral: Store at 20-25°C.	
Mechanism of Action	Risedronic acid inhibits bone resorption by inhibiting osteoclasts. It also prevents formation and dissolution of	

Mechanism of Action	Risedronic acid inhibits bone resorption by inhibiting osteoclasts. It also prevents formation and dissolution of hydroxyapatite crystals, and therefore may interfere with bone mineralisation. Absorption: Poor absorption after oral admin. Distribution: Protein binding: about 24%. Metabolism: Not metabolised. Excretion: About half of the absorbed portion is excreted in the urine within 24 hr. Unabsorbed drug is eliminated in the faeces.
CIMS Class	Agents Affecting Bone Metabolism
ATC Classification	M05BA07 - risedronic acid; Belongs to the class of bisphosphonates. Used in the treatment of bone diseases.

risperidone

CIMS Class : (Antipsychotics)
risperidone

P - Caution when used during pregnancy

related risperidone information

Indication & Dosage

Oral

Schizophrenia

Adult: Initially, 2 mg daily, may increase to 4 mg daily on the 2nd day, adjusted further in increments or decrements of 1-2 mg daily at wkly intervals. Doses may be given in 1-2 divided doses. Maintenance: 4-6 mg daily. Max: 16 mg/day.

Elderly: Initially, 0.5 mg bid gradually increased in increments of 0.5 mg bid. Maintenance: 1-2 mg bid.

Renal impairment: Initially, 0.5 mg bid, may increase in steps of 0.5 mg bid, up to 1-2 mg bid. Dose increments above 1.5 mg bid should be made at intervals of at least 1 wk.

Hepatic impairment: Initially, 0.5 mg bid, may increase in steps of 0.5 mg bid, up to 1-2 mg bid. Dose increments above 1.5 mg bid should be made at intervals of at least 1 wk.

Oral

Acute manic episodes of bipolar disorder

Adult: Initially, 2-3 mg once daily. May increase by 1 mg daily at intervals of at least 24 hr. Max: 6 mg daily.

Elderly: Initiate with lower doses.

Renal impairment: Initially, 0.5 mg bid, may increase in steps

	Adult: Initially, 2-3 mg once daily. May increase by 1 mg daily at intervals of at least 24 hr. Max: 6 mg daily. Elderly: Initiate with lower doses. Renal impairment: Initially, 0.5 mg bid, may increase in steps of 0.5 mg bid, up to 1-2 mg bid. Dose increments above 1.5 mg bid should be made at intervals of at least 1 wk. Hepatic impairment: Initially, 0.5 mg bid, may increase in steps of 0.5 mg bid, up to 1-2 mg bid. Dose increments above 1.5 mg bid should be made at intervals of at least 1 wk. <i>Intramuscular</i> Schizophrenia Adult: Give oral risperidone for a few days to assess tolerability prior to initiating inj. For patients not stabilised on oral risperidone: 25 mg every 2 wk. Patients stabilised on oral risperidone for at least 2 wk in doses $\leq$ 4 mg daily: 25 mg every 2 wk. Patients stabilised on oral risperidone for at least 2 wk in doses $>$ 4 mg daily: 37.5 mg every 2 wk. Continue oral risperidone for the 1st 3 wk after the 1st inj. Elderly: Max dose: 25 mg every 2 wk.
Administration	May be taken with or without food.
Overdosage	May lead to tachycardia, hypotension and extrapyramidal symptoms. In cases of acute overdosage, maintain airway and ensure sufficient oxygenation and ventilation. Gastric lavage and admin of activated charcoal with a laxative may be considered. Monitor ECG and CV status.
Special Precautions	Preexisting CV diseases; discontinue use if signs and symptoms of tardive dyskinesia occur; renal and hepatic impairment, elderly, epilepsy; parkinsonism; pregnancy. May cause drowsiness and orthostatic hypotension. Gradual withdrawal is recommended. Monitor blood glucose in diabetics and patients at risk of developing diabetes.
Adverse Drug	Agitation, anxiety, dizziness, headache, somnolence;

Adverse Drug Reactions	Agitation, anxiety, dizziness, headache, somnolence; orthostatic hypotension; constipation, dyspepsia, nausea, vomiting, abdominal pain, blurred vision, erectile dysfunction, priapism, rhinitis, rash and allergy, galactorrhoea, gynaecomastia, menstrual disorders, extrapyramidal symptoms (rarely). weight gain, oedema, tardive dyskinesia. Potentially Fatal: Neuroleptic malignant syndrome may occur rarely; seizures. May cause increased mortality in elderly with dementia-related psychosis.
Drug Interactions	May antagonise the effects of levodopa and dopamine agonists. May increase serum levels of clozapine when used together. Increased serum levels of carbamazepine when used concurrently. Carbamazepine may also decrease the serum levels of risperidone. Increased risk of neuroleptic malignant syndrome when used with indinavir and ritonavir. Potentially Fatal: Risperidone may enhance the hypotensive effect of certain antihypertensives.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-25°C.
Mechanism of Action	Risperidone is an atypical antipsychotic. Its activity is mediated through a combination of dopamine (D₂) and serotonin (5-HT₂) receptor antagonism. It also exhibits affinity to adrenergic (α₁ and α₂) and histamine (H₁) receptors. It is less likely to cause extrapyramidal effects than conventional antipsychotics. Absorption: Readily absorbed from the GI tract (oral); peak plasma concentrations after 1-2 hr.

	(α_1 and α_2) and histamine (H_1) receptors. It is less likely to cause extrapyramidal effects than conventional antipsychotics. Absorption: Readily absorbed from the GI tract (oral); peak plasma concentrations after 1-2 hr. Distribution: Protein-binding: 90% (risperidone), 70% (9-hydroxyrisperidone). Metabolism: Extensively hepatic by hydroxylation. Excretion: Mainly in the urine and, to a lesser extent in the faeces.
CIMS Class	Antipsychotics
ATC Classification	N05AX08 - risperidone; Belongs to the class of other antipsychotics. Used in the management of psychosis.

ritodrine

CIMS Class : (Drugs Acting on the Uterus)
ritodrine

P - Contraindicated in pregnancy
L - Caution when used during lactation

related ritodrine information

Indication & Dosage	<i>Oral</i> Uncomplicated premature labour Adult: Start oral therapy 30-60 mins before termination of IV infusion at 10 mg every 2 hr for 24 hr. Subsequently, 10-20 mg every 4-6 hr according to patient's response. Max oral dose 120 mg daily. <i>Parenteral</i> Uncomplicated premature labour Adult: Given as IV infusion, initially 0.05 mg/min. Increase by 0.05 mg/min every 10 min until patient responds. Usual rate: 0.15-0.35 mg/min. As IM inj: 10 mg every 3-8 hr. Maintain for 12-48 hr after the contractions have stopped.
Overdosage	May lead to tachycardia, CNS stimulation, hypokalaemia and hyperglycaemia.
Contraindications	Antepartum haemorrhage, eclampsia and severe preeclampsia, intrauterine foetal death, cardiac disease. Threatened miscarriage, placenta praevia and cord compression.

	preeclampsia, intrauterine foetal death, cardiac disease. Threatened miscarriage, placenta praevia and cord compression.
Special Precautions	CV risk factors, concurrent steroids, hyperthyroidism, myocardial insufficiency, arrhythmias, hypertension, DM, bronchial asthma treated with beta-agonists, lactation. Monitor plasma glucose and potassium. Monitor maternal pulse throughout infusion; adjust rate to avoid maternal heart beat exceeding 140 beats/min. Monitor patient's hydration status to reduce risk of pulmonary oedema. Discontinue treatment if there are signs of pulmonary oedema.
Adverse Drug Reactions	Tachycardia, palpitation, headache, nervousness, anxiety, nausea, vomiting. Potentially Fatal: Rarely, anaphylaxis, arrhythmia, pulmonary oedema, hypokalaemia.
Drug Interactions	May enhance neuromuscular blockade produced by pancuronium and vecuronium. Potentially Fatal: Potassium-depleting drugs may increase risk of hypokalaemia.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	A selective β_2-adrenoceptor agonist with its main action on the uterus, causing relaxation. It reduces the intensity and frequency of contractions. Heart rate is also increased while diastolic pressure is reduced. May cause bronchial relaxation but this is not clinically significant in its usage. Absorption: Rapid absorption from the GI tract (oral).

	frequency of contractions. Heart rate is also increased while diastolic pressure is reduced. May cause bronchial relaxation but this is not clinically significant in its usage. Absorption: Rapid absorption from the GI tract (oral). Bioavailability: about 30% of an oral dose. Distribution: Crosses the placenta. Metabolism: Hepatic: By conjugation with glucuronic acid or sulfate. Excretion: 70-90% of a dose is excreted in the urine within 10-12 hr.
CIMS Class	Note that there are some more drugs Acting on the Uterus
ATC Classification	G02CA01 - ritodrine; Belongs to the class of sympathomimetics. Used as labour repressants.

ritonavir

CIMS Class : (Antivirals)
ritonavir

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food α - Food interaction

related ritonavir information

Indication & Dosage

Oral

HIV infection

Adult: Combined with other antiretrovirals: Initially, 300 mg bid for 1 day. May increase dose gradually by 100 mg bid over a period of up to 14 days: 600 mg bid.

Child: Combined with other antiretrovirals: >2 yr: 250 mg/m² bid. Increase dose by 50 mg/m² bid at 2-3 day intervals up to 400 mg/m² bid. Max: 600 mg bid.

Hepatic impairment: Dosage reduction may be required.

Oral

As a pharmacokinetic enhancer

Adult: To enhance the efficacy of other protease inhibitors: 100-200 mg once or twice daily.

Administration

Should be taken with food.

Overdosage

Treatment includes general supportive measures such as vital sign monitoring and observation of clinical status of the patient.

Contraindications

Hypersensitivity; lactation; severe hepatic impairment.

	Hypersensitivity; lactation; severe hepatic impairment.
Special Precautions	Pregnancy; child; hepatic impairment; DM; haemophilia; pancreatitis. Monitor glucose, lipid, uric acid and blood counts. Ensure adequate hydration to reduce risk of nephrolithiasis. Discontinue treatment if patient develops haemolytic anaemia.
Adverse Drug Reactions	Syncope, orthostatic hypotension; dry mouth, mouth ulcers, throat irritation; cough; dyspepsia, nausea, vomiting, diarrhoea, taste disturbance, seizure; anxiety, sweating, fever, asthenia, fatigue, headache, dizziness, paraesthesia, myalgia, skin rashes, pruritus, renal insufficiency, anaemia, raised WBC, raised prothrombin time, lipodystrophy, pancreatitis, electrolyte imbalance. Potentially Fatal: Hypersensitivity, anaphylaxis and Stevens-Johnson syndrome.
Drug Interactions	Decreased plasma concentration with phenobarbital, carbamazepine, dexamethasone, phenytoin, rifabutin, rifampicin. Increased plasma concentration of certain drugs highly metabolized by CYP3A. May increase serum levels of sildenafil. Potentially Fatal: Avoid concurrent administration of oral solution (contains alcohol) with disulfiram or metronidazole. Increased risk of myopathy when used with simvastatin or lovastatin. Concurrent use with alfuzosin may lead to serious hypotension. Increased risk of cardiac arrhythmias when used with amiodarone, cisapride, propafenone, quinidine, flecainide and pimozide. Risk of acute ergot toxicity when used with ergot derivatives. Increased risk of serious adverse reactions when used with midazolam or triazolam.
Food Interaction	Co-administration with St. John's wort may lead to a substantial decrease in the plasma levels of ritonavir.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a

	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Ritonavir, a selectively competitive reversible inhibitor of HIV protease, interferes with the formation of essential proteins and enzymes. After which the formation of immature and non-infectious viruses follows. It also interferes with the production of infectious HIV and limits further infectious spread of the virus. Absorption: Peak plasma concentrations occur about 2-4 hr after oral admin. Distribution: Protein binding: about 98%. Metabolism: Extensively metabolised in the liver by CYP450 isoenzymes Excretion: Mainly excreted in the faeces. Half-life: 3-5 hr.
CIMS Class	Antivirals
ATC Classification	J05AE03 - ritonavir; Belongs to the class of protease inhibitors. Used in the systemic treatment of viral infections.

rivastigmine

CIMS Class : (Neurodegenerative Disease Drugs)
rivastigmine

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related rivastigmine information

Indication & Dosage

Oral

Mild to moderately severe dementia in Alzheimer's disease

Adult: Initially, 1.5 mg bid, increased according to response by 1.5 mg bid at intervals of at least 2 wk. If treatment is interrupted for >a few days, restart at 1.5 mg bid and increase dose accordingly, if required. Max: 6 mg bid.

Administration

Should be taken with food.

Overdosage

May result in cholinergic crisis. General supportive measures should be used.

Contraindications

Hypersensitivity to other carbamate derivatives. Severe hepatic impairment.

Special Precautions

Patients with sick sinus syndrome or conduction defects, resp diseases. Cholinergic stimulation may increase gastric acid secretion. May exacerbate urinary obstruction and seizures. Pregnancy. Renal impairment, mild to moderate hepatic impairment. Monitor body wt. Asthma or obstructive

	acid secretion. May exacerbate urinary obstruction and seizures. Pregnancy. Renal impairment, mild to moderate hepatic impairment. Monitor body wt. Asthma or obstructive pulmonary disease. May worsen extrapyramidal symptoms. Lactation.
Adverse Drug Reactions	Accidental trauma, fatigue, asthenia, dizziness, headache, somnolence, agitation, insomnia, confusion, depression, nausea, vomiting, diarrhoea, abdominal pain, loss of appetite, dyspepsia, upper respiratory tract infection, urinary tract infection. Rarely, angina pectoris, gastric and duodenal ulcers, GI haemorrhage; bradycardia, seizures, rashes and syncope. Potentially Fatal: Serious GI reactions such as anorexia, vomiting and weight loss.
Drug Interactions	Not to be used with other cholinomimetic drugs that might interfere with the activity of anticholinergic medications. May exaggerate the effects of succinylcholine-type muscle relaxants during anaesthesia. Tobacco smoking may increase its clearance.
Food Interaction	Food delays absorption.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store below 25°C.
Mechanism of Action	Rivastigmine reversibly inhibits hydrolysis of acetylcholine by cholinesterases thus increasing acetylcholine present in the CNS. It is selective for the CNS and is used for the symptomatic treatment of dementia in Alzheimer's disease

	cholinesterases thus increasing acetylcholine present in the CNS. It is selective for the CNS and is used for the symptomatic treatment of dementia in Alzheimer's disease and idiopathic Parkinson's disease. Absorption: Readily absorbed from the GI tract (oral); peak plasma concentrations after 1 hr. Distribution: Crosses the blood-brain barrier. Protein-binding: 40%. Metabolism: Rapid and extensive; hydrolysis by cholinesterase. Excretion: Via urine (90%), via faeces (<1%); 1 hr (elimination half-life).
CIMS Class	Neurodegenerative Disease Drugs
ATC Classification	N06DA03 - rivastigmine; Belongs to the class of anticholinesterases. Used in the management of dementia.

CIMS Class : (Antimigraine Preparations)
rizatriptan

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related rizatriptan information

Indication & Dosage

Oral

Acute migraine attacks

Adult: Initially, 10 mg. If ineffective, 2nd dose should not be taken for the same attack. If symptoms recur after initial response, a further dose of 10 mg may be given. Doses should be separated by at least 2 hr. Max: 20 mg/24 hr. If patient is also taking propranolol, initiate with 5 mg. Max: 10 mg/24 hr. Ensure that the 2 drugs are separated by at least 2 hr.

Renal impairment: For mild-moderate impairment, initiate with 5 mg. Further dose of 5 mg may be taken after an interval of at least 2 hr. Max: 10 mg/24 hr. Avoid in severe impairment.

Hepatic impairment: For mild-moderate impairment, initiate with 5 mg. Further dose of 5 mg may be taken after an interval of at least 2 hr. Max: 10 mg/24 hr. Avoid in severe impairment.

Administration

May be taken with or without food.

Administration	May be taken with or without food. Orally disintegrating tab: May be taken with or without food. (Place on the tongue & allow to dissolve; it can then be swallowed w/ the saliva.)
Overdosage	May cause hypertension and CV symptoms. Gastric lavage using activated charcoal may be considered. Monitor ECG and clinical status of the patient.
Contraindications	History of MI, peripheral vascular disease, transient ischaemic attack, ischaemic heart disease or Prinzmetal's angina; uncontrolled hypertension; basilar or hemiplegic migraine; severe hepatic or renal impairment. Adolescent <18 yr.
Special Precautions	Elderly; mild to moderate hepatic or renal impairment; coronary artery disease; pregnancy, lactation. May cause drowsiness. History of seizures. Ensure an interval of at least 24 hr after stopping an ergotamine compound and starting a serotonin (5-HT₁) agonist.
Adverse Drug Reactions	Increased BP, chest pain, palpitation; skin flushing; dyspnoea; nausea, abdominal pain, dry mouth; dizziness, drowsiness, fatigue. Potentially Fatal: Toxic epidermal necrolysis.
Drug Interactions	Increased serum concentrations with propranolol. Increased risk of vasospastic reactions when used with ergotamine and methysergide. Concurrent use with SSRIs may increase risk of serotonin syndrome. Potentially Fatal: Concurrent use with or within 2 wk of stopping MAOI treatment.
Food Interaction	Absorption delayed. Concurrent use with St John's wort may increase risk of adverse reactions.
Storage	Oral: Store at 15-30°C.

Storage	Oral: Store at 15-30°C.
Mechanism of Action	Rizatriptan is a selective serotonin (5-HT₁) agonist in cranial arteries responsible for vasoconstriction and reduction of inflammation associated with antidromic neuronal transmission. Absorption: Bioavailability: about 40-45%. Distribution: Protein binding: 14%. Metabolism: Primarily by monoamine oxidase type A. Excretion: About 14% of an oral dose is excreted unchanged in the urine. Plasma half-life: about 2-3 hr.
CIMS Class	Antimigraine Preparations
ATC Classification	N02CC04 - rizatriptan; Belongs to the class of selective serotonin (5HT1) agonists preparations. Used to relieve migraine.

ropinirole

CIMS Class : (Antiparkinsonian Drugs)
ropinirole

P - Caution when used during pregnancy
L - Contraindicated in lactation

related ropinirole information

Indication & Dosage

Oral

As monotherapy in Parkinson's disease

Adult: Initially, 250 mcg tid, may increase by 750 mcg at wkly intervals for the first 4 wk. Subsequent increments can be made in steps of 1.5 mg at wkly intervals up to 9 mg/day, then in steps of 3 mg at wkly intervals. Usual dose ranges from 3-9 mg daily. Max: 24 mg/day. Higher dose may be necessary if used in conjunction with levodopa. Gradual withdrawal is recommended.

Hepatic impairment: Dosing adjustments may be necessary.

Oral

Restless leg syndrome

Adult: Initially, 250 mcg daily for 2 days, taken 1-3 hr before bedtime. May increase to 500 mcg daily for the next few days. Subsequent increments may be made in steps of 500 mcg at wkly intervals until 3 mg daily is reached. Max: 4 mg daily.

Hepatic impairment: Dosing adjustments may be required.

	days. Subsequent increments may be made in steps of 500 mcg at wkly intervals until 3 mg daily is reached. Max: 4 mg daily. Hepatic impairment: Dosing adjustments may be required.
Administration	Should be taken with food. (Swallow whole, do not chew/crush.)
Overdosage	Symptoms include nausea, vomiting, visual hallucinations, hyperhidrosis, asthenia and nightmares. General supportive measures and monitoring of vital signs are recommended. May consider gastric lavage.
Contraindications	Lactation.
Special Precautions	Pregnancy. May impair ability to drive or operate machinery. Withdrawal should be gradual. Hepatic or renal impairment. May cause daytime sleepiness or episodes of falling asleep during activities. May cause or worsen pre-existing dyskinesia.
Adverse Drug Reactions	Sudden onset of sleep with or without any prior feeling of drowsiness. Nausea, abdominal pain; dizziness, somnolence, headache, hallucinations; dyskinesias.
Drug Interactions	Inhibitors of CYP1A2 e.g. cimetidine, ciprofloxacin, erythromycin, fluvoxamine, isoniazid, ritonavir and zileuton may increase serum concentrations of ropinirole. Oestrogens and tobacco smoking may decrease clearance of ropinirole. Efficacy may be reduced by dopamine antagonists such as phenothiazines and metoclopramide.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.

Storage	Oral: Store at 20-25°C.
Mechanism of Action	Ropinirole is a non-ergot dopamine D₂-agonist with similar actions to those of bromocriptine. It is used in the management of Parkinson's disease, either alone or as an adjunct to levodopa. Absorption: Rapidly absorbed from the GI tract after oral admin. Bioavailability: about 50%. Distribution: Widely distributed. Plasma protein binding: 10-40%. Metabolism: Extensively metabolised in the liver by CYP1A2. Excretion: Excreted in the urine as inactive metabolites; <10% of the oral dose is excreted unchanged. Elimination half-life: about 6 hr.
CIMS Class	Antiparkinsonian Drugs
ATC Classification	N04BC04 - ropinirole; Belongs to the class of dopamine agonist. Used in the management of parkinson's disease.

rosiglitazone

CIMS Class : (Antidiabetic Agents)
rosiglitazone

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related rosiglitazone information

Indication & Dosage	<i>Oral</i> Type 2 diabetes mellitus Adult: 4 mg daily, may increase after 8-12 wk of therapy according to response. Max: 8 mg daily.
Administration	May be taken with or without food.
Overdosage	Supportive treatment is recommended.
Contraindications	Hypersensitivity, symptomatic heart failure. Not to be used in patients with established NYHA (New York Heart Association) class III or IV heart failure. Pregnancy, lactation.
Special Precautions	CV disease; renal or hepatic impairment. Monitor liver function regularly. Patients with oedema.
Adverse Drug Reactions	Upper respiratory tract infections, headache, back pain, hyperglycaemia, fatigue, sinusitis, diarrhoea, hypoglycaemia, oedema, anaemia, weight gain. Potentially Fatal: May cause or exacerbate congestive heart failure.

	hyperglycaemia, fatigue, emaciation, diarrhoea, hypoglycaemia, oedema, anaemia, weight gain. Potentially Fatal: May cause or exacerbate congestive heart failure.
Drug Interactions	Increased effect with NSAIDs, pioglitazone, gemfibrozil, fluconazole, sulfonamides. Decreased effect with carbamazepine, phenytoin, secobarbital, phenobarbital and rifampicin. Increased risk of fluid retention when used with NSAIDs. Increased risk of hypoglycaemia when used with quinolones. Increased risk of fluid retention and hypoglycaemia when used with insulin.
Food Interaction	Decreased serum levels when used with St John's wort.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 25°C.
Mechanism of Action	Rosiglitazone is a thiazolidinedione antidiabetic agent which improves insulin sensitivity by lowering blood glucose level without increasing pancreatic insulin secretion. It is dependent on the presence of insulin. Rosiglitazone is a potent agonist for the peroxisome proliferator-activated receptor-gamma, which in turn regulates the transcription of insulin-responsive genes involved in the control of glucose production, transport and utilisation. Onset: Delayed. Duration: 12 wk. Absorption: Well absorbed from the GI tract after oral admin. Peak plasma concentrations after 1 hr. Distribution: Protein-binding: 99.8%. Metabolism: Extensively metabolised by CYP2C8.

	admin. Peak plasma concentrations after 1 hr. Distribution: Protein-binding: 99.8%. Metabolism: Extensively metabolised by CYP2C8. Excretion: Urine (64%); faeces (23%); 3-4 hr (elimination half-life).
CIMS Class	Antidiabetic Agents
ATC Classification	A10BG02 - rosiglitazone; Belongs to the class of thiazolidinediones. Used in the treatment of diabetes.

rosiglitazone + metformin

CIMS Class : (Antidiabetic Agents)
rosiglitazone + metformin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food α - Food interaction

related rosiglitazone + metformin information

related rosiglitazone + metformin information	
Indication & Dosage	<i>Oral</i> Type 2 diabetes mellitus Adult: Doses are expressed in terms of rosiglitazone/metformin. For drug-naïve patients: Recommended starting dose: 2 mg/500 mg 1-2 times daily, may increase in steps of 2 mg/500 mg per day to a max of 8 mg/2000 mg per day in patients who are not adequately controlled after 4 wk. For patients who are inadequately controlled on rosiglitazone monotherapy: Usual starting dose: 1000 mg of metformin per day plus the dose of rosiglitazone patient is already taking. For patients who are inadequately controlled on metformin monotherapy: Usual starting dose: 4 mg of rosiglitazone per day plus the dose of metformin patient is already taking. If control is inadequate, increments may be made in steps of 4 mg of rosiglitazone and/or 500 mg of metformin. Daily max: 8 mg/2000 mg.
Contraindications	Hypersensitivity; hepatic impairment; history of heart failure; concurrent admin with insulin; diabetic coma, diabetic

	Hypersensitivity; hepatic impairment; history of heart failure; concurrent admin with insulin; diabetic coma, diabetic ketoacidosis; severe renal impairment; recent MI, CHF; type 1 diabetes mellitus; severe infection; acute or chronic metabolic acidosis with or without coma; stress, trauma; severe impairment of thyroid function; dehydration, acute or chronic alcoholism. Pregnancy, lactation.
Special Precautions	Cardiovascular disease; monitor renal and liver function.
Adverse Drug Reactions	Rosiglitazone: Upper resp tract infections, headache, back pain, hyperglycaemia, fatigue, sinusitis, diarrhoea, hypoglycaemia, oedema, anaemia, wt gain. Metformin: Anorexia, nausea, vomiting, diarrhoea, wt loss, flatulence, occasional metallic taste; weakness; hypoglycaemia; rash, malabsorption of vit B12<>. Potentially Fatal: Lactic acidosis in presence of renal failure and alcoholism.
Drug Interactions	Rosiglitazone: Increased effect with NSAIDs, pioglitazone, gemfibrozil, fluconazole, sulfonamides. Decreased effect with carbamazepine, phenytoin, secobarbital, phenobarbital and rifampin. Metformin: Additive effect with sulphonylureas. Antagonistic effects with diuretics, corticosteroids, phenothiazines, thyroid products, oestrogens, oral contraceptives, phenytoin, nicotinic acid, sympathomimetics, Ca channel blockers and isoniazid. Potentially Fatal: Lactic acidosis with alcohol and potentiation of hypoglycaemic effect. Cimetidine and furosemide may increase plasma-metformin levels. Drugs eliminated via renal tubular secretion may increase metformin levels.
Food Interaction	Absorption delayed.

Food Interaction	Absorption delayed.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 25°C.
Mechanism of Action	Rosiglitazone is a thiazolidinedione antidiabetic agent which targets insulin resistance by lowering blood-glucose level witho increasing pancreatic insulin secretion. Its action is dependent on the presence of insulin. Metformin improves glucose tolerance in patients with type 2 diabetes, lowering both basal and post-prandial blood glucose. It decreases hepatic gluconeogenesis, decreases intestinal absorption of glucose, and improves insulin sensitivity by increasing peripheral glucose uptake and utilisation.
CIMS Class	Antidiabetic Agents
ATC Classification	A10BA02 - metformin; Belongs to the class of biguanides. Used in the treatment of diabetes. A10BG02 - rosiglitazone; Belongs to the class of thiazolidinediones. Used in the treatment of diabetes.

rosuvastatin

CIMS Class : (Dyslipidaemic Agents)
rosuvastatin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related rosuvastatin information

Indication & Dosage

Oral

Hyperlipidaemias

Adult: Initially, 5-10 mg daily, may increase dose at 4-wkly intervals to 20 mg daily if necessary. Max: 40 mg daily. In patients receiving gemfibrozil, max: 10 mg once daily. For those receiving ciclosporin, max: 5 mg once daily.

CrCl (ml/min)	Dosage Recommendation
<60	Initially, 5 mg/day. Max: 20 mg/day.
<30	Avoid use.

Administration

May be taken with or without food.

Overdosage

Symptomatic and supportive treatment should be instituted as required.

Contraindications

Severe renal impairment, active liver disease, unexplained persistent elevations of serum transaminases; hypersensitivity. Pregnancy, lactation.

Special Precautions

Not to be used in patient with acute, serious condition suggestive of myopathy or predisposing to the development of renal failure secondary to rhabdomyolysis e.g. sepsis, hypotension, major surgery, trauma, severe metabolic,

	Not to be used in patient with acute, serious condition suggestive of myopathy or predisposing to the development of renal failure secondary to rhabdomyolysis e.g. sepsis, hypotension, major surgery, trauma, severe metabolic, endocrine and electrolyte disorders or uncontrolled seizures. History of liver disease and alcoholism. Discontinue treatment if there is marked or persistent increase in serum aminotransferase concentrations, significant increase in creatinine phosphokinase or evidence of myopathy.
Adverse Drug Reactions	Headache, dizziness, constipation, nausea, vomiting, abdominal pain, myalgia, chest pain, peripheral oedema, depression, insomnia, rash, paraesthesia, proteinuria and asthenia. Potentially Fatal: Rhabdomyolysis with acute renal failure.
Drug Interactions	Increased risk of myopathy when used with gemfibrozil. May increase serum levels of warfarin and oral contraceptives. Concurrent admin with aluminium/magnesium hydroxide may lead to decreased bioavailability of rosuvastatin. Serum levels may be increased by fluconazole. Potentially Fatal: Increased risk of serious myopathy and renal failure when used with ciclosporin.
Storage	Oral: Store at 20-25°C.
Mechanism of Action	Rosuvastatin is a selective and competitive inhibitor of HMG-CoA reductase, the rate-limiting enzyme in cholesterol synthesis. It increases the number of hepatic LDL receptors on the cell surface, enhancing uptake and catabolism of LDL. It also decreases apolipoprotein B, triglycerides and increases HDL. Onset: 1 wk. Absorption: Incompletely absorbed in the GI tract. Bioavailability: about 20%. Plasma concentrations peak 5 hr after oral admin.

	Absorption: Incompletely absorbed in the GI tract. Bioavailability: about 20%. Plasma concentrations peak 5 hr after oral admin. Distribution: Protein-binding: 90%. Extensively taken up by the liver. Metabolism: Limited metabolism by CYP2C9. Excretion: Faeces (90% of an oral dose); 19 hr (elimination half-life).
CIMS Class	Dyslipidaemic Agents
ATC Classification	C10AA07 - rosuvastatin; Belongs to the class of HMG CoA reductase inhibitors. Used in the treatment of hyperlipidemia.

roxatidine

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants)
roxatidine

P - Caution when used during pregnancy

L - Contraindicated in lactation

related roxatidine information

Indication & Dosage

Oral

Peptic ulcer

Adult: 150 mg at bedtime or 75 mg bid daily for 4-6 wk.

Maintenance: 75 mg at bedtime.

CrCl (ml/min)	Dosage Recommendation
20-50	75 mg at bedtime.
<20	75 mg every 2 days.

Oral

Gastro-oesophageal reflux disease

Adult: 75 mg bid or 150 mg at bedtime for 6-8 wk.

CrCl (ml/min)	Dosage Recommendation
20-50	75 mg at bedtime.
<20	75 mg every 2 days.

Oral

Gastritis

Adult: 75 mg once daily in the evening.

CrCl (ml/min)	Dosage Recommendation
20-50	75 mg at bedtime.
<20	75 mg every 2 days.

	Adult: 75 mg once daily in the evening.	
	<20	75 mg every 2 days.
	<i>Oral</i> Zollinger-Ellison syndrome Adult: 75 mg bid.	
	CrCl (ml/min)	Dosage Recommendation
	20-50	75 mg at bedtime.
	<20	75 mg every 2 days.
	<i>Oral</i> Premedication before anaesthesia Adult: 75 mg in the evening on the day before surgery and repeated 2 hr before induction of anaesthesia. Alternatively, 150 mg once on the night before surgery. <i>Intravenous</i> Upper gastrointestinal haemorrhage Adult: 75 mg bid via slow inj or infusion.	
Contraindications	Lactation. Porphyria.	
Special Precautions	Renal and hepatic impairment, pregnancy.	May mask the symptoms of gastric malignancy.
Adverse Drug Reactions	Occasional headache, GI disturbances, gynaecomastia, alopecia, blood dyscrasias, pancreatitis, sleep disturbances, restlessness, rarely dizziness. Hypersensitivity reactions e.g. rash and itching reported occasionally. Changes in pulse rate and transient impairment of sexual drive. Possible increase in liver enzyme activity. May reduce leucocytes and/or thrombocytes.	
Drug Interactions	May affect serum levels of protease inhibitors.	
Mechanism of Action	Roxatidine is a potent and selective inhibitor of basal and stimulated gastric acid secretion through competitive	

	Roxatidine is a potent and selective inhibitor of basal and stimulated gastric acid secretion through competitive blockade of H₂-receptors. Total pepsin secretion is reduced in a dose-dependent manner. There is an independent mucosal protection action. Absorption: Absorbed rapidly and almost completely from the GI tract (oral); peak plasma concentrations after 1-3 hr. Distribution: Enters breast milk (small amounts). Metabolism: Liver, small intestines and serum; hydrolysed to the desacetyl metabolite. Excretion: Via urine (90% as roxatidine and metabolites); 6 hr (elimination half-life).
CIMS Class	Antacids, Antireflux Agents & Antiulcerants
ATC Classification	A02BA06 - roxatidine; Belongs to the class of H ₂ -receptor antagonists. Used in the treatment of peptic ulcer and gastro-oesophageal reflux disease (GERD).

***roxatidine information:**

Note that there are some more drugs interacting with roxatidine

roxithromycin

CIMS Class : (Macrolides)
roxithromycin

related roxithromycin information

Indication & Dosage	<i>Oral</i> Susceptible infections Adult: 150 mg bid or 300 mg once daily for 5-10 days in susceptible infections. Child: 6-40 kg: 5-8 mg/kg daily. Renal impairment: Dosage adjustment may be required. Hepatic impairment: Usual daily doses should be halved in hepatic impairment.
Administration	Should be taken on an empty stomach. (Take before meals.)
Contraindications	Hypersensitivity. Porphyria.
Special Precautions	Hepatic impairment. Monitor liver function. Prolonged treatment increases risk of hepatotoxicity. History of arrhythmias.
Adverse Drug Reactions	Nausea, vomiting, abdominal pain, diarrhoea, weakness, malaise, anorexia, constipation, dyspepsia, flatulence; hepatitis; rashes, headache, dizziness, weakness, changes in blood counts; increased liver enzyme values; eosinophilia; rarely, acute pancreatitis.
Drug Interactions	May raise serum levels of ciclosporin and digoxin. Increased

	May raise serum levels of ciclosporin and digoxin. Increased risk of rhabdomyolysis when used with simvastatin.
Mechanism of Action	Roxithromycin inhibits protein synthesis by irreversibly binding to the 50s ribosomal subunits thus blocking the transpeptidation or translocation reactions of susceptible organisms resulting in stunted cell growth. Absorption: Plasma concentrations peak after 2 hr (oral); reduced if taken after food. Bioavailability: about 50%. Distribution: Widely distributed into body tissues and fluids. Protein-binding: 96% at trough concentrations. Metabolism: Small amounts are metabolised in the liver. Excretion: Mainly via the faeces as unchanged drug and metabolites, via the urine (7-12%) and the lungs (15%). Elimination half-life: 8-13 hr. May be prolonged in renal and hepatic impairment, children.
CIMS Class	Macrolides
ATC Classification	J01FA06 - roxithromycin; Belongs to the class of macrolides. Used in the treatment of systemic infections.

rupatadine

CIMS Class : (Antihistamines & Antiallergics)
rupatadine

P - Caution when used during pregnancy

L - Caution when used during lactation

related rupertadine information

Indication & Dosage	<i>Oral</i> Allergic rhinitis, Chronic idiopathic urticaria Adult: 10 mg once daily.
Contraindications	Hypersensitivity. Avoid alcohol.
Special Precautions	Renal or hepatic insufficiency. May impair ability to drive or operate machinery. Pregnancy, lactation. Elderly, children <12 yr.
Adverse Drug Reactions	Headache, somnolence, fatigue/asthenia.
Drug Interactions	Increased CNS depressant effects when used with CNS depressants or alcohol.
Mechanism of Action	Rupatadine acts as a long-acting, non-sedative antagonist at histaminergic H ₁ -receptors. Rupatadine also antagonises the platelet-activating factor (PAF). Both histamine and PAF cause bronchoconstriction and lead to an increase in the vascular permeability, acting as mediators in the inflammatory process. Metabolism: Liver - mainly by CYP450.

	vascular permeability, acting as mediators in the inflammatory process. Metabolism: Liver - mainly by CYP450.
CIMS Class	Antihistamines & Antiallergics
ATC Classification	R06AX28 - rupatadine; Belongs to the class of other agents used as systemic antihistamines.

salbutamol

CIMS Class : (Antiasthmatic & COPD Preparations) , (Drugs Acting on the Uterus)
salbutamol

P - Caution when used during pregnancy

related salbutamol information

Indication & Dosage

Oral

Acute bronchospasm

Adult: 2-4 mg (up to 8 mg) 3-4 times daily. As modified-release tablet: 8 mg bid.

Child: 1 mth-2 yr: 100 mcg/kg (max: 2 mg), 2-6 yr: 1-2 mg, >6 yr: 2 mg. Doses to be taken 3-4 times daily.

Elderly: Initially, 2 mg 3-4 times daily.

Inhalation

Acute bronchospasm

Adult: As aerosol: 100 or 200 mcg (1-2 puffs) 3-4 times daily. 2 puffs may be given prior to exertion to prevent exercise-induced bronchospasm.

Inhalation

Acute severe asthma

Adult: As MDI: 4-6 inhalations may be given every 10-20 min via a large volume spacer.

Parenteral

Severe bronchospasm

Adult: 250 mcg (as a solution of 50 mcg/ml) via IV inj, or via

Parenteral

Severe bronchospasm

Adult: 250 mcg (as a solution of 50 mcg/ml) via IV inj, or via IV infusion of a solution containing 5 mg in 500 ml at a rate of 3-20 mcg/min adjusted according to patient's need. Higher dosages may be used in respiratory failure. IM/SC: 500 mcg, repeated every 4 hr if necessary.

Intravenous

Uncomplicated premature labour

Adult: For arrest of preterm labor between 24 and 33 wk of gestation: Initially, 10 mcg/min using a dilute solution of 20 mcg/ml in glucose 5% (200 mcg/ml of salbutamol if using a syringe pump), increase rate gradually at 10-min intervals until there is response; then increase slowly until contractions cease. Maintain rate for 1 hr after contractions have stopped, then gradually reduce rate by 50% at intervals of 6 hr. Usual dose: 10-45 mcg/min. Avoid prolonged therapy.

Inhalation

Severe bronchospasm

Adult: Via nebuliser: 2.5-5 mg, may repeat up to 4 times daily. Alternatively, may be given continuously at a rate of 1-2 mg/hr. Patients with asthma may require supplemental oxygen.

Child: >18 mth: Via nebuliser: 2.5-5 mg, may repeat up to 4 times daily. Alternatively, may be given continuously at a rate of 1-2 mg/hr. Patients with asthma may require supplemental oxygen.

Administration

Should be taken on an empty stomach. (Take 1 hr before or 2 hr after meals.)

Overdosage

May lead to tachycardia, tremor, CNS stimulation, hypokalaemia and hyperglycaemia. Symptomatic treatment

	May lead to tachycardia, tremor, CNS stimulation, hypokalaemia and hyperglycaemia. Symptomatic treatment is recommended.
Contraindications	Eclampsia and severe pre-eclampsia; intra-uterine infection, intra-uterine foetal death, antepartum haemorrhage, placenta praevia and cord compression, threatened miscarriage, cardiac disease.
Special Precautions	Pregnancy; mild to moderate pre-eclampsia. Arrhythmias, hyperthyroidism, hypertension, DM, myocardial insufficiency, susceptibility to QT-interval prolongation. Monitor serum potassium levels. In women treated for premature labour, monitor hydration status, cardiac and respiratory function. Minimise volume of infusion fluid. Discontinue treatment if patient develops signs of pulmonary oedema.
Adverse Drug Reactions	Fine skeletal muscle tremor especially hands, tachycardia, palpitations, muscle cramps, headache, paradoxical bronchospasm, angioedema, urticaria, hypotension and collapse. Potentially Fatal: Potentially serious hypokalaemia after large doses.
Drug Interactions	Diuretics, corticosteroids and xanthines may augment hypokalaemia. CV effects potentiated by MAOIs, TCAs, sympathomimetics. Increases absorption of sulfamethoxazole when used together. May markedly increase heart rate and BP when used with atomoxetine. Reduces serum levels of digoxin. Hypokalaemia induced by salbutamol increases the risk of digitalis toxicity. BP should be closely monitored if linezolid is used concurrently with salbutamol.
Pregnancy Category (US)	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Inhalation: Store between 2-25°C (36-77°F). Intravenous: Store below 30°C. Protect from light. Oral: Store at 20-25°C (68-77°F). Parenteral: Store below 30°C. Protect from light.
Mechanism of Action	Salbutamol is a direct-acting sympathomimetic with β-adrenergic activity and selective action on β_2 receptors, producing bronchodilating effects. It also decreases uterine contractility. Onset: Inhalation: 5-15 min; oral: 30 min. Duration: Inhalation: 3-6 hr; oral: 8 hr; modified-release preparation: 12 hr. Absorption: Readily absorbed from the GI tract. Metabolism: Hepatic and in the gut wall. Excretion: Via the urine as metabolites and unchanged drug. Some excretion in the faeces.
CIMS Class	Antiasthmatic & COPD Preparations / Drugs Acting on the Uterus
ATC Classification	R03AC02 - salbutamol; Belongs to the class of adrenergic inhalants, selective beta-2-adrenoreceptor agonists. Used in the treatment of obstructive airway diseases. R03CC02 - salbutamol; Belongs to the class of adrenergics for systemic use, selective beta-2-adrenoreceptor agonists. Used in the treatment of obstructive airway diseases.

salbutamol + theophylline

CIMS Class : (Antiasthmatic & COPD Preparations)
salbutamol + theophylline

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related salbutamol + theophylline information

Indication & Dosage	<i>Oral</i> Emphysema, Chronic bronchitis, Asthma Adult: Per tab contains salbutamol 2 mg and theophylline 100 mg: 1 or 2 tab 3-4 times daily. Child: Child (under 6 yrs) salbutamol (0.5-1mg) + theophylline (25-50mg) t.i.d/q.i.d. SR (S 4mg+T 300mg) 1 tab b.i.d.
Contraindications	Hypersensitivity, thyrotoxicosis.
Special Precautions	Hepatic impairment, cardiac failure, hypertension, arrhythmias, pulmonary oedema, hyperthyroidism, diabetes mellitus, history of peptic ulcer and convulsive disorders, patients on MAOIs or tricyclic antidepressants, high fever, neonates and infants, pregnancy, lactation.
Adverse Drug Reactions	Seizures, tremor, muscle cramps, palpitation, hypokalaemia, headache, anorexia, nausea, anxiety, irritability, insomnia, rarely rash and angioedema.

	Seizures, tremor, muscle cramps, palpitation, hypokalaemia, headache, anorexia, nausea, anxiety, irritability, insomnia, rarely rash and angioedema. Potentially Fatal: Arrhythmias including premature ventricular contractions.
Drug Interactions	Increased theophylline toxicity with propranolol, cimetidine, erythromycin (7-5 days), quinolone antibiotics. Reduced efficacy with rifampicin, phenobarbitone, phenytoin, carbamazepine, sulfinpyrazone and smoking. Increased risk of hypokalaemia with diuretics. Potentially Fatal: With anaesthetics, pancuronium bromide and sympathomimetics (increased risk of arrhythmias).
Food Interaction	Absorption of theophylline reduced variably by different types of food.
Lab Interference	Theophylline may cause spurious elevations of serum uric acid and increase in urinary catecholamines.
Mechanism of Action	Salbutamol is a selective β_2-agonist. It causes bronchial smooth muscle relaxation via the cyclic adenylyl cyclase (cAMP) system. Theophylline is a phosphodiesterase inhibitor. It enhances intracellular cAMP conc thereby contributing to bronchial smooth muscle relaxation. It also suppresses airway hyper-response to stimuli. Advantage of this combination is the additive effect allowing reduction of individual doses.
CIMS Class	Antiasthmatic & COPD Preparations
ATC Classification	R03AC02 - salbutamol; Belongs to the class of adrenergic inhalants, selective beta-2-adrenoreceptor agonists. Used in the treatment of obstructive airway diseases. R03CC02 - salbutamol; Belongs to the class of adrenergics for systemic use, selective beta-2-adrenoreceptor agonists.

inhalants, selective beta-2-adrenoreceptor agonists. Used in the treatment of obstructive airway diseases.

R03CC02 - salbutamol; Belongs to the class of adrenergics for systemic use, selective beta-2-adrenoreceptor agonists. Used in the treatment of obstructive airway diseases.

R03DA04 - theophylline; Belongs to the class of other systemic drugs used in the treatment of obstructive airway diseases, xanthines.

salicylic acid

CIMS Class : (Acne Treatment Preparations) , (Keratolytics)
salicylic acid

related salicylic acid information

Indication & Dosage	<i>Topical/Cutaneous</i> Hyperkeratotic and scaling skin conditions Adult: As 2-6% preparation; may be applied up to tid. <i>Topical/Cutaneous</i> Acne Adult: As 2-6% preparation; may be applied up to tid. <i>Topical/Cutaneous</i> Warts and calluses Adult: Apply 60% salicylic acid preparation.
Special Precautions	Not for prolonged use in high concentrations and on large areas of the body. Impaired peripheral circulation or diabetes. Avoid broken skin, mouth, eyes, mucous membranes and anogenital region.
Adverse Drug Reactions	Irritation, sensitivity, excessive drying; systemic effects on prolonged use.
Mechanism of Action	Salicylic acid has a potent keratolytic action and a slight antiseptic action when applied topically. It softens and destroys the stratum corneum by increasing endogenous hydration which causes the horny layer of the skin to swell, soften, and then desquamate. At high concentrations, salicylic acid has a caustic

	antiseptic action when applied topically. It softens and destroys the stratum corneum by increasing endogenous hydration which causes the horny layer of the skin to swell, soften, and then desquamate. At high concentrations, salicylic acid has a caustic effect. It also possesses weak antifungal and antibacterial activity.
CIMS Class	Acne Treatment Preparations / Keratolytics
ATC Classification	D01AE12 - salicylic acid; Belongs to the class of other antifungals for topical use. Used in the treatment of fungal infection. S01BC08 - salicylic acid; Belongs to the class of non-steroidal antiinflammatory agents. Used in the treatment of inflammation of the eye.

salmeterol

CIMS Class : (Antiasthmatic & COPD Preparations)
salmeterol

P - Caution when used during pregnancy

related salmeterol information

Indication & Dosage	<i>Inhalation</i> Chronic obstructive pulmonary disease, Chronic asthma Adult: As metered-dose aerosol: 2 inhalations of 25 mcg bid up to 100 mcg bid. As dry powder inhalation: 50 mcg bid or 100 mcg bid if necessary. Child: As metered-dose aerosol: ≥4 yr: 50 mcg bid.
Overdosage	May result in exaggeration of adverse effects e.g. tachycardia and arrhythmia.
Special Precautions	Pregnancy. Arrhythmias, hyperthyroidism, hypertension, DM, myocardial insufficiency, susceptibility to QT-interval prolongation. May cause paradoxical bronchospasm. Not to be used for treatment of acute bronchospasm or patients with deteriorating asthma. Monitor serum potassium concentrations in severe asthma.
Adverse Drug Reactions	Fine skeletal muscle tremor especially hands, tachycardia, palpitations, muscle cramps, headache, paradoxical bronchospasm, angioedema, urticaria, hypotension and collapse.
Drug	Diuretics, corticosteroids and xanthines may augment

Drug Interactions	Diuretics, corticosteroids and xanthines may augment hypokalaemia. Risk of severe hypertension when used with MAOIs, TCAs and other sympathomimetics. Increased susceptibility to cardiac arrhythmias caused by digoxin and other cardiac glycosides.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Inhalation: Store at 20-25°C.
Mechanism of Action	Salmeterol is a direct-acting sympathomimetic which relaxes bronchial smooth muscle by its selective action on β_2 receptors with little effect on heart rate. Onset: Oral inhalation: 10-20 min. Duration: 12 hr. Absorption: Plasma concentrations are negligible after inhalation. Distribution: About 96% bound to plasma proteins. Metabolism: Hepatically hydroxylated. Excretion: About 25% and 60% of the dose was eliminated in the urine and faeces respectively, over a period of 7 days.
CIMS Class	Antiasthmatic & COPD Preparations
ATC Classification	R03AC12 - salmeterol; Belongs to the class of adrenergic inhalants, selective beta-2-adrenoreceptor agonists. Used in the treatment of obstructive airway diseases.

salmeterol + fluticasone

CIMS Class : (Antiasthmatic & COPD Preparations)
salmeterol + fluticasone

P - Caution when used during pregnancy

L - Caution when used during lactation

related salmeterol + fluticasone information

Indication & Dosage	<i>Inhalation</i> Asthma Adult: As combination containing salmeterol 50 mcg and fluticasone propionate 100/250/500 mcg/dose of inhalation powder: 1 inhalation bid. As combination containing salmeterol 25 mcg and fluticasone propionate 50/125/250 mcg/dose of pressurised inhalation: 2 inhalation bid. Child: 4-12 yr: As combination containing salmeterol 50 mcg and fluticasone propionate 100 mcg/ dose of inhalation powder: 1 inhalation bid; as combination containing salmeterol 25 mcg and fluticasone propionate 50 mcg/dose of pressurised inhalation: 2 inhalation bid. ≥12 yr: As combination containing salmeterol 50 mcg and fluticasone propionate 100/250/500 mcg/dose of inhalation powder: 1 inhalation bid; as combination containing salmeterol 50/125/250 mcg and fluticasone propionate 50 mcg/dose of pressurised inhalation: 2 inhalation bid. <i>Inhalation</i> Chronic obstructive pulmonary disease

	50/125/250 mcg and fluticasone propionate 50 mcg/dose of pressurised inhalation: 2 inhalation bid. <i>Inhalation</i> Chronic obstructive pulmonary disease Adult: As combination containing salmeterol 50 mcg and fluticasone propionate 500 mcg/dose of inhalation powder: 1 inhalation bid.
Contraindications	Not for primary treatment of status asthmaticus or other acute attacks of asthma.
Special Precautions	Pulmonary TB, severe cardiovascular disorders, heart rhythm abnormalities, DM, thyrotoxicosis, hypokalaemia. Patients at risk of decreased bone mineral content (e.g. smoking, old age, sedentary lifestyle, poor nutrition, family history of osteoporosis or long term use of drugs that may decrease bone mass (e.g. anticonvulsants and corticosteroids). Do not stop therapy abruptly; therapy should be down titrated. Advise patient to rinse mouth after inhalation. Monitor height of children on prolonged therapy. Pregnancy, lactation.
Adverse Drug Reactions	Mouth and throat candidiasis, throat irritation, hoarseness/dysphonia, nasopharyngitis, lower respiratory tract infections (e.g. pneumonia and bronchitis), hypokalaemia, headache, tremors, palpitation, muscle cramps. Prolonged high dose use may cause Cushing's syndrome, Cushingoid features, adrenal suppression, retardation of growth in children and adolescents, bone mineral density decrease, cataract and glaucoma. Potentially Fatal: Paradoxical bronchospasm.
Drug Interactions	Increased fluticasone levels with CYP 3A4 inhibitors e.g. ritonavir, ketoconazole, itraconazole. Additive effects with other β-agonist.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Inhalation: Do not store >30 °C.
Mechanism of Action	Salmeterol, a long acting β_2-agonist which acts locally in the lung to mediate bronchodilation. Fluticasone, a corticosteroid with mainly glucocorticoid activity, reduce symptoms and exacerbations of asthma. Onset: Bronchodilation: 10-20 minutes. Duration: Bronchodilation: 12 hr Absorption: Salmeterol: Negligible absorption after inhalation. Fluticasone: Poorly absorbed from the GI tract; oral bioavailability <1%; absolute bioavailability of inhaled fluticasone: 5-11% (depending on device used). Distribution: Salmeterol: Protein binding: 96%. Fluticasone: Protein binding: 91%. Metabolism: Salmeterol: Extensive hepatic metabolism by hydroxylation; terminal elimination half-lives: 5.5 hr. Fluticasone: Extensive first-pass metabolism by cytochrome CYP3A4. Excretion: Salmeterol: Eliminated mainly in faeces; negligible amounts of unchanged salmeterol are detectable in urine or faeces. Fluticasone: Mainly excreted in faeces as metabolites and unchanged drug; <5% excreted in urine.
CIMS Class	Antiasthmatic & COPD Preparations

s-amlodipine

CIMS Class : (Calcium Antagonists)
s-amlodipine

P - Contraindicated in pregnancy
L - Caution when used during lactation

related s-amlodipine information

Indication & Dosage	<i>Oral</i> Hypertension Adult: 2.5 mg once daily. Hepatic impairment: Dosage reduction may be required.
Overdosage	May lead to excessive peripheral vasodilation resulting in marked hypotension and reflex tachycardia.
Contraindications	Liver insufficiency. Pregnancy.
Special Precautions	Lactation. May increase frequency and/or severity of angina during treatment initiation or dosage increments. Heart failure or hepatic impairment.
Adverse Drug Reactions	Headache, fatigue, insomnia, nausea, abdominal pain, flushing, dizziness, pruritus, skin rash, dyspnoea, weakness, muscular spasm, dyspepsia, oedema.
Mechanism of Action	(S)-amlodipine is the active enantiomer of amlodipine. It blocks the passage of calcium ions into the vascular smooth muscle cells and myocardial cells during depolarisation resulting in relaxation of coronary vascular smooth muscle and coronary vasodilatation. It also helps to increase the

	blocks the passage of calcium ions into the vascular smooth muscle cells and myocardial cells during depolarisation resulting in relaxation of coronary vascular smooth muscle and coronary vasodilatation. It also helps to increase the delivery of oxygen to the myocardial tissues in patients with vasospastic angina.
CIMS Class	Calcium Antagonists

s-amlodipine + nebivolol

CIMS Class : (Calcium Antagonists) , (Beta-Blockers)
s-amlodipine + nebivolol

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related s-amlodipine + nebivolol information

Indication & Dosage	<i>Oral</i> Hypertension Adult: 1 cap [S-Amlodipine 2.5mg + Nebivolol 5mg] once daily.
Contraindications	Allergic to dihydropyridine Ca antagonist, hypersensitivity to the active substance or to any of the excipients, liver insufficiency or liver function impairment. Pregnancy, lactation.
Special Precautions	History of allergies, psoriasis, hyperthyroidism, peripheral arterial disease, diabetes, elderly.
Adverse Drug Reactions	Headache, fatigue, parasthesias and dizziness, insomnia, nausea, abdominal pain, flushing, pruritus, skin rash, dyspnea, weakness, muscular spasm, and dyspepsia.
Mechanism of Action	S-amlodipine is an enantiomer of amlodipine, which blocks Ca ion outside the cardiac muscle cells and vascular smooth muscle cells via the Ca channel of cytomembrane. It directly dilates vascular smooth muscle, resisting hypertension. The mechanism of remitting angina pectoris is not yet determined

	muscle cells via the Ca channel of cytomembrane. It directly dilates vascular smooth muscle, resisting hypertension. The mechanism of remitting angina pectoris is not yet determined completely. It can decrease myocardial ischemia through dilatation of the peripheral small artery, decreasing peripheral resistance, causing the reduction of energy consumption, and O2 requirement of cardiac muscle and dilating the coronary artery and coronary small artery at normal and ischemic areas, increasing the O2 supply of the cardiac muscle of the coronary spasm patients. Nebivolol exerts its actions by exhibiting a high selectivity for beta-1 adrenergic receptors and also by reducing the peripheral vascular resistance by modulating NO release.
CIMS Class	Calcium Antagonists / Beta-Blockers
ATC Classification	C07AB12 - nebivolol; Belongs to the class of selective beta-blocking agents. Used in the treatment of cardiovascular diseases.

***s-amlodipine + nebivolol information:**

Note that there are some more drugs interacting with s-amlodipine + nebivolol

s-atenolol

CIMS Class : (Beta-Blockers)
s-atenolol

P - Caution when used during pregnancy

L - Caution when used during lactation

related s-atenolol information

Indication & Dosage

Oral

Hypertension

Adult: 50-100 mg once daily.

Renal impairment: Dosage adjustments may be required.

Oral

Angina pectoris

Adult: 50-100 mg once daily.

Renal impairment: Dosage adjustments may be required.

Oral

Prophylaxis of migraine

Adult: 50-100 mg daily.

Renal impairment: Dosage adjustments may be required.

Overdosage

May cause severe and fatal CV depression. Activated charcoal or gastric lavage may be considered if patient presents within 1 hr of ingestion.

Contraindications

Hypersensitivity, 2nd and 3rd degree heart block, cardiogenic shock, bronchospasm, history of obstructive airway disease, metabolic acidosis, hypotension, severe

	Hypersensitivity, 2nd and 3rd degree heart block, cardiogenic shock, bronchospasm, history of obstructive airway disease, metabolic acidosis, hypotension, severe peripheral arterial disease, sinus bradycardia.
Special Precautions	Renal failure, DM, children, pregnancy and lactation. May mask symptoms of hyperthyroidism and hypoglycaemia. Avoid abrupt withdrawal.
Adverse Drug Reactions	Fatigue, cold extremities, bradycardia, heart failure, headache, dizziness, hallucinations, confusion and sleep disturbances.
Drug Interactions	Disopyramide when given in combination with atenolol depresses myocardial contractility and may precipitate cardiac failure. Efficacy may be antagonised by NSAIDs. Potentially Fatal: Concurrent use with verapamil may precipitate heart failure in patients with impaired left ventricular function. Simultaneous withdrawal of atenolol and clonidine may result in severe rebound hypertension.
Mechanism of Action	S-Atenolol selectively blocks the β_1 receptors, and it significantly reduces both maximal and submaximal exercise heart rates in a dose-related manner. Endocrine and metabolic actions of S-atenolol include lowering of plasma renin activity and free fatty acids.
CIMS Class	Beta-Blockers
ATC Classification	C07AB11 - s-atenolol; Belongs to the class of selective beta-blocking agents. Used in the treatment of cardiovascular diseases.

secnidazole

CIMS Class : (Antiamoebics)
secnidazole

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related secnidazole information

Indication & Dosage	<i>Oral</i> Severe invasive amoebiasis Adult: 1.5 g daily as single or in divided doses for 5 days. Child: 30 mg/kg daily for 5 days. <i>Oral</i> Trichomoniasis Adult: 2 g as a single dose. Child: 30 mg/kg as a single dose. <i>Oral</i> Amoebiasis Adult: 2 g as a single dose. Child: 30 mg/kg as a single dose. <i>Oral</i> Giardiasis Adult: 2 g as a single dose. Child: 30 mg/kg as a single dose.
Contraindications	Hypersensitivity; pregnancy (1st trimester) and lactation.
Special Precautions	Avoid alcohol and disulfiram. Avoid in patients with history of

Special Precautions	Avoid alcohol and disulfiram. Avoid in patients with history of blood disorders.
Adverse Drug Reactions	Nausea, gastralgia, change of taste, metallic taste, stomatitis, urticaria, rashes, leucopenia. Rarely vertigo, moderate neurological, digestive disturbances.
Drug Interactions	Concurrent disulfiram admin may cause psychotic reactions. Disulfiram-like reactions with alcohol. Cimetidine may prolong half-life. Potentially Fatal: May potentiate anticoagulant effect of warfarin and increase risk of haemorrhage.
Mechanism of Action	Secnidazole is active against <i>E histolytica</i> , <i>G lamblia</i> , <i>T vaginalis</i> , <i>Clostridium</i> spp, <i>B fragilis</i> , <i>Gardnerella</i> spp. The drug enters the microorganisms by diffusion and is reduced intracellularly by low oxidation-reduction potential ferredoxin which then result in DNA damage.
CIMS Class	Antiamoebics
ATC Classification	P01AB07 - secnidazole; Belongs to the class of nitroimidazole derivatives antiprotozoals. Used in the treatment amoebiasis and other protozoal diseases.

selegiline

CIMS Class : (Antiparkinsonian Drugs) , (Antidepressants)
selegiline

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related selegiline information

Indication & Dosage

Oral

Early parkinsonism

Adult: As conventional preparations: 10 mg daily either as a single dose in the morning or in 2 divided doses of 5 mg at breakfast and lunchtime. As oral lyophilisate tablets: Initially, 1.25 mg daily, may increase to 2.5 mg once daily after at least 6 wk if needed.

Elderly: Initially, 2.5 mg daily.

Transdermal

Depression

Adult: Initially, 6 mg/24 hr, dose may be increased in steps of 3 mg/24 hr at intervals of not <2 wk. Patients on doses =9 mg/24 hr should restrict intake of tyramine-rich foods during and for 2 wk after discontinuing the treatment. Patches should be changed every 24 hr and the new patch is applied to a different site. Max: 12 mg/24 hr.

Administration

Should be taken with food.

Overdosage

Symptoms may include dizziness, irritability, hyperactivity,

	Symptoms may include dizziness, irritability, hyperactivity, agitation, hallucinations, convulsions and coma. Immediate hospitalisation, with continuous observation and monitoring is strongly recommended.
Contraindications	Active ulceration. Pregnancy and lactation.
Special Precautions	History of peptic ulcer, uncontrolled hypertension, arrhythmias, angina, psychosis. Severe liver or kidney dysfunction.
Adverse Drug Reactions	Hallucinations, dizziness, confusion, anxiety, dreams, palpitations, syncope, irritability, restlessness, nausea, dry mouth, sexual dysfunction, hypotension, arrhythmia, angina, tachycardia. Orthostatic hypotension, chest pain, insomnia, abnormal dreams. Transient elevations in liver enzymes.
Drug Interactions	Amantadine may increase BP when used together. Risk of hypertensive effect when used with dopamine. Concurrent use with dextromethorphan increases the risk of adverse effects. Potentially Fatal: Risk of muscular rigidity, severe agitation and elevated temperature when used with meperidine. Increased risk of toxicity when used with TCAs or SSRIs. Risk of orthostatic hypotension when used with bupropion.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C. Transdermal: Store at 15-30°C.
Mechanism of Action	Selegiline increases dopaminergic activity by intervening with the re-uptake of dopamine at the synapse. It also

	Selegiline increases dopaminergic activity by intervening with the re-uptake of dopamine at the synapse. It also irreversibly inhibits the MAO-B which is involved in the metabolism of dopamine. Absorption: Readily absorbed from the GI tract (oral). Bioavailability is about 10%. Distribution: Rapidly distributed throughout the body and crosses the blood-brain barrier. Metabolism: Extensive hepatic first-pass effect; converted to L-(-)-desmethylselegiline, L-(-)-N-methylamfetamine and L-(-)-amfetamine. Excretion: Mainly as metabolites in the urine; about 15% is excreted via faeces. Elimination half-life: about 10 hr.
CIMS Class	Antiparkinsonian Drugs / Antidepressants
ATC Classification	N04BD01 - selegiline; Belongs to the class of dopaminergic agents, monoamine oxidase B inhibitors. Used in the management of parkinson's disease.

Oral

Social anxiety disorder

Adult: Initially, 25 mg daily, increased after 1 wk to 50 mg daily. May increase in steps of 50 mg at wkly intervals. Max: 200 mg daily.

Hepatic impairment: Dosage reduction may be required.

Oral

Premenstrual dysmorphic disorder

Adult: Initially, 50 mg daily. May be given throughout the menstrual cycle or only during the luteal phase. May increase by 50 mg each cycle if needed. Max: 150 mg daily for continuous dosing or 100 mg daily for luteal phase-only dosing. Patients who require 100 mg daily for luteal phase-only dosing should always start with 50 mg daily for the 1st 3 days of each luteal phase dosing period.

Hepatic impairment: Dosage reduction may be required.

Administration

May be taken with or without food.

	May be taken with or without food.
Overdosage	Symptoms include nausea, vomiting and CNS excitation. May lead to death.
Contraindications	Children <18 yr. Poorly controlled epilepsy.
Special Precautions	History of hypomania and seizure disorders, hepatic and renal impairment, cardiac disease, recent MI, history of bleeding disorders, DM and angle-closure glaucoma. Discontinue treatment if seizures develop or if there is an increase in seizure frequency. Withdrawal should be gradual. Monitor for signs of clinical worsening, suicidality and unusual changes in behaviour especially during the initial treatment period or when there are dosage adjustments. Pregnancy and lactation.
Adverse Drug Reactions	Nausea, anorexia, dyspepsia, constipation, diarrhoea, dry mouth, flatulence, vomiting, ejaculation failure, increased sweating, somnolence, agitation, insomnia, headache, dizziness, fatigue, anxiety, nervousness, tremor, paraesthesia, decreased libido, rash, hot flushes, blurred vision.
Drug Interactions	May increase risk of delirium when used with antimuscarinics. Increased risk of extrapyramidal symptoms and neuroleptic malignant syndrome when used with aripiprazole. Serum levels may be reduced by carbamazepine. Concurrent use with dihydroergotamine or linezolid may lead to serotonin syndrome. May increase serum levels of lamotrigine and risk of toxicity. May increase serum levels of olanzapine, pimozide, risperidone, methadone, clozapine and amiodarone. Plasma levels may be increased by cimetidine and ritonavir. May increase the anticoagulant

	olanzapine, pimozide, risperidone, methadone, clozapine and amiodarone. Plasma levels may be increased by cimetidine and ritonavir. May increase the anticoagulant activity of warfarin and acenocoumarol. Potentially Fatal: Concomitant admin with MAOIs can result in serious serotonin syndrome.
Food Interaction	Co-admin with food increases peak plasma concentration of sertraline. Plasma levels are increased by grapefruit juice.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Sertraline has a potent and selective inhibitory action on CNS neuronal reuptake of 5-HT resulting in increased 5-HT concentrations at the synaptic clefts, leading to sustained activity at the postsynaptic receptor sites and improvement of depression. Reduction of serotonin turnover (in brain) also contributes to its action. Its long half-life allows once daily admin. Absorption: Absorbed slowly from the GI tract (oral); plasma concentrations peak 4.5-8.5 hr after oral admin. Distribution: Body tissues (wide), enters breast milk. Protein-binding: 98%. Metabolism: Extensive hepatic first-pass metabolism; demethylation to N-desmethylsertraline (inactive) then to glucuronide conjugates. Excretion: Via urine and faeces (as metabolites); elimination half-life: about 26 hr.
CIMS Class	Antidepressants

CIMS Class	Antidepressants
ATC Classification	N06AB06 - sertraline; Belongs to the class of selective serotonin reuptake inhibitors. Used in the management of depression.

sevelamer hydrochloride

CIMS Class : (Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence)
sevelamer hydrochloride

P - Caution when used during pregnancy
L - Caution when used during lactation

related sevelamer hydrochloride information

Indication & Dosage

Oral

Hyperphosphataemia

Adult: Initially, 800-1600 mg tid, taken with each meal and based on serum phosphorus level: 5.5 to <7.5 mg/dL: 800 mg tid; 7.5 to <9 mg/dL: 1.2-1.6 g tid; ≥9 mg/dL: 1.6 g tid. Usual maintenance: 0.8-4 g with each meal. Patients switching from calcium acetate based on current dosage: 667 mg calcium acetate is equivalent to 800 mg sevelamer (carbonate/HCl).

Overdosage

Risk of systemic toxicity is low as it is not absorbed from the gut.

Contraindications

Hypophosphatemia or bowel obstruction.

Special Precautions

Dysphagia, swallowing disorders, severe GI motility disorders, or major GI tract surgery. Pregnancy and lactation. Monitor serum levels of calcium, bicarbonate and chloride. To be taken with meals and tablets should be swallowed intact.

	lactation. Monitor serum levels of calcium, bicarbonate and chloride. To be taken with meals and tablets should be swallowed intact.
Adverse Drug Reactions	Headache, infection, pain, hypertension, hypotension, thrombosis, diarrhoea, flatulence, dyspepsia, nausea, vomiting, constipation and cough. Pruritus, rash and abdominal pain.
Drug Interactions	Concurrent admin decreases the absorption of ciprofloxacin. Not to be taken concurrently with oral medications in which the safety and efficacy would be significantly affected by its reduced bioavailability.
Storage	Oral: Store at 25°C.
Mechanism of Action	Sevelamer hydrochloride is a polymeric compound. It acts by binding to phosphate molecules in the gut, limiting its absorption and thus lowering serum phosphate levels without altering calcium, aluminum, or bicarbonate concentrations. Absorption: Not systematically absorbed.
CIMS Class	Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence

sibutramine

CIMS Class : (Anti-obesity Agents)
sibutramine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related sibutramine information

Indication & Dosage	<i>Oral</i> Obesity Adult: Initially, 10 mg daily in the morning. Re-evaluate treatment in patients whose weight loss is <2 kg in the 1 st 4 wk of treatment. May increase dose to 15 mg daily. Reassess 4 wk later. Discontinue treatment if weight loss is still <2 kg. Max: 15 mg daily.
Administration	May be taken with or without food.
Overdosage	Symptoms include: Tachycardia, hypertension, headache and dizziness. Treatment is supportive and symptomatic. β -blockers may be used to control elevated BP and tachycardia.
Contraindications	History of cerebrovascular disease. History of CV disease, including history of coronary artery disease, history of stroke or transient ischaemic attack, history of heart arrhythmias, history of congestive heart failure, history of peripheral arterial disease and uncontrolled hypertension. History of eating disorders (e.g. anorexia nervosa and bulimia nervosa);

	history of congestive heart failure, history of peripheral arterial disease and uncontrolled hypertension. History of eating disorders (e.g. anorexia nervosa and bulimia nervosa); bipolar disorder, Tourette's syndrome, hyperthyroidism, phaeochromocytoma, benign prostatic hyperplasia; history of drug or alcohol abuse. Pregnancy, lactation. Severe renal or hepatic impairment.
Special Precautions	Hypertension; narrow-angle glaucoma; seizures; history of gallstones; family history of motor or verbal tics. Should not drive or operate machinery. Mild-moderate renal impairment. History of depression. History of hypertension, coronary artery disease, congestive heart failure, arrhythmias or stroke. Monitor BP and heart rate.
Adverse Drug Reactions	Dry mouth, drowsiness, dizziness, rhinitis, depression, emotional lability, migraine, skin rash, mydriasis, insomnia, constipation, diarrhoea, peripheral oedema, menstrual disorders.
Drug Interactions	Avoid concurrent admin with or within 2 wk of stopping MAOIs. Care should be taken with drugs that may raise BP or heart rate e.g. phenylpropanolamine, ephedrine or pseudoephedrine. Increased serum levels when used with drugs that inhibit CYP3A4 e.g. ketoconazole and erythromycin. Decreased serum levels when used with rifampicin, phenytoin, carbamazepine and phenobarbital. Increased risk of serotonin syndrome when used with serotonergics such as SSRIs, sumatriptan, lithium and pethidine.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Sibutramine acts by inhibiting the reuptake of norepinephrine and serotonin, and to a lesser extent, dopamine. Absorption: Well absorbed from the GI tract (oral).

	Sibutramine acts by inhibiting the reuptake of norepinephrine and serotonin, and to a lesser extent, dopamine. Absorption: Well absorbed from the GI tract (oral). Distribution: Protein-binding: 97% Metabolism: Extensive first-pass metabolism by CYP3A4. . Excretion: Mainly in urine (as inactive metabolites). Plasma elimination half-life: About 14-16 hr.
CIMS Class	Anti-obesity Agents
ATC Classification	A08AA10 - sibutramine; Belongs to the class of centrally acting antiobesity products. Used in the treatment of obesity.

sildenafil

CIMS Class : (Drugs for Erectile Dysfunction)
sildenafil

Food ⚠ - Food interaction

related sildenafil information

Indication & Dosage

Oral

Erectile dysfunction

Adult: 50 mg about 1 hr before sexual intercourse. May adjust dose depending on penile response. Max: 100 mg/dose and not to be taken > once in 24 hr.

Elderly: >65 yr: Lower initial dose at 25 mg.

CrCl (ml/min)	Dosage Recommendation
<30	Initially, 25 mg.

Hepatic impairment: Initially, 25 mg.

Special Populations: For patients taking drugs which are CYP3A4 inhibitors: initially, 25 mg. For patients on ritonavir, not >25 mg every 48 hr. Patients who are stabilised on a-blocker treatment should use an initial dose of 25 mg. Higher doses should not be taken within 4 hr of an a-blocker.

Administration

May be taken with or without food.

Overdosage

Should be managed by standard supportive care.

Contraindications

Hypersensitivity. Patients concurrently or intermittently using organic nitrates in any form.

	Hypersensitivity. Patients concurrently or intermittently using organic nitrates in any form.
Special Precautions	Caution when used in patients with anatomical deformation of penis or conditions that may predispose them to priapism (e.g. sickle cell anaemia, myeloma, or leukaemia). Mild, transient, dose-related impairment of colour discrimination (blue/green) may occur. Hepatic or severe renal impairment, bleeding disorders, active peptic ulceration, hypotension, recent history of stroke, MI, arrhythmias, unstable angina, heart failure or retinal disorders. May cause sudden loss or decrease in hearing.
Adverse Drug Reactions	Headache, flushing, respiratory tract infection, angina pectoris, AV block, migraine, syncope, tachycardia, postural hypotension, MI, cerebral thrombosis, cardiac arrest, paraesthesia, tremor, depression, herpes simplex, skin ulcer, oesophagitis, abnormal LFT, rectal haemorrhage, hypoglycaemic reaction, arthritis, deafness, retinal vascular disease, photosensitivity, accidental fall.
Drug Interactions	Inhibitors of CYP3A4 such as cimetidine and erythromycin are likely to reduce sildenafil clearance. CYP3A4 inducers such as rifampicin may decrease the plasma concentrations of sildenafil. Symptomatic hypotension when used with a-blockers. Plasma concentrations are increased by ritonavir. Potentially Fatal: May potentiate hypotensive effects of organic nitrates and nicorandil.
Food Interaction	Concurrent admin with grapefruit juice may lead to increased plasma levels of sildenafil.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled

	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Sildenafil inhibits phosphodiesterase type-5 (PDE₅) which is responsible for cGMP degradation in the corpus cavernosum. Inhibition of PDE₅ increases cGMP levels in the corpus cavernosum which results in smooth muscle relaxation and inflow of blood to the corpus cavernosum. Absorption: Rapidly absorbed after oral admin. Bioavailability: about 40%. Distribution: Widely distributed. Plasma protein binding: 96%. Metabolism: Metabolised in the liver mainly by CYP3A4 and CYP2C9. Excretion: Excreted as metabolites mainly in the faeces.
CIMS Class	Drugs for Erectile Dysfunction
ATC Classification	G04BE03 - sildenafil; Belongs to the class of drugs used in erectile dysfunction.

silver sulfadiazine

CIMS Class : (Eye Anti-infectives & Antiseptics) , (Topical Antibiotics)
silver sulfadiazine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related silver sulfadiazine information

Indication & Dosage	<i>Topical/Cutaneous</i> Treatment and prophylaxis of infection in severe burns Adult: Apply a 1% cream onto affected area once or twice daily.
Contraindications	Hypersensitivity to sulphonamides; porphyria; premature infants and infants <2 mth; pregnancy and lactation.
Special Precautions	Impaired hepatic or renal function; G6PD deficiency; maintain adequate fluid intake. Monitor blood counts. Systemic absorption, resulting in argyria may occur if it is applied to large wound areas and over prolonged periods.
Adverse Drug Reactions	Nausea, vomiting, diarrhoea; hypersensitivity, skin reactions; haematuria; crystalluria; thrombocytopenia, leucopenia, eosinophilia. Potentially Fatal: Stevens-Johnson syndrome; agranulocytosis, jaundice, hepatitis.
Drug Interactions	Potentiates antidiabetic effect of sulphonylureas. Not antagonised by PABA.
Mechanism of	Silver sulfadiazine has broad antimicrobial activity; it is active

Mechanism of Action	Silver sulfadiazine has broad antimicrobial activity; it is active against gram-positive and gram-negative bacteria as well as some yeasts and fungi. The silver salt acts mainly on the cell wall and membrane to disrupt its integrity thus allowing it to impair the essential enzymes, bacterial DNA and RNA leading to cell death. Absorption: Slowly releases sulfadiazine when it comes into contact with wound exudates. Up to 10% of sulfadiazine may be absorbed.
CIMS Class	Eye Anti-infectives & Antiseptics / Topical Antibiotics
ATC Classification	D06BA01 - silver sulfadiazine; Belongs to the class of topical sulfonamides used in the treatment of dermatological diseases.

silymarin

CIMS Class : (Cholagogues, Cholelitholytics & Hepatic Protectors)
silymarin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related silymarin information

Indication & Dosage	<i>Oral</i> Hepatic diseases Adult: 140 mg bid/tid.
Administration	Should be taken with food. (Take after meals.)
Contraindications	Hypersensitivity, pregnancy, lactation.
Special Precautions	Children.
Adverse Drug Reactions	Occasional laxative effects. Abdominal bloating, diarrhoea, flatulence, loss of appetite, anorexia, nausea, stomach upset.
Mechanism of Action	Silymarin is an active principle from the fruit of <i>Silybum marianum</i> , which contains a mixture of flavonolignans. It reduces the turnover of membrane phospholipids and stabilises the cell membranes of hepatocytes. It has potent antioxidant action and prevents lipid peroxidation.
CIMS Class	Cholagogues, Cholelitholytics & Hepatic Protectors
ATC Classification	A05BA03 - silymarin; Belongs to a class of drugs used in liver therapy.

A05BA03 - silymarin; Belongs to a class of drugs used in liver therapy.

simeticone

CIMS Class : (GIT Regulators, Antiflatulents & Anti-inflammatories)
simeticone

related simeticone information

Indication & Dosage	<i>Oral</i> Flatulence Adult: 100-250 mg 3-4 times daily as required. May be given with an antacid. <i>Oral</i> Infant colic Child: Infant: 20-40 mg to be given with feeds.
Administration	May be taken with or without food. (Take after meals & at bedtime for best results.)
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Simethicone lowers surface tension and facilitates gas dispersion by causing coalescence of gas bubbles in the GI tract, thus helping in their dispersion. Absorption: Physiologically inert. Appeared to be unabsorbed in the GI tract after oral admin. Excretion: Excreted unchanged in the faeces.
CIMS Class	GIT Regulators, Antiflatulents & Anti-inflammatories

simvastatin

CIMS Class : (Dyslipidaemic Agents)
simvastatin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related simvastatin information

Indication & Dosage

Oral

Hyperlipidaemias

Adult: Initially, 10-20 mg/day, to be taken in the evening.

May start with 40 mg once daily in patients with high CV risk or require a large reduction in cholesterol. For patients with moderate CV risk, initiate with 10 mg once daily. May adjust dose at intervals of at least 4 wk. Max: 80 mg once daily. For patients with homozygous familial hypercholesterolaemia: 40 mg once daily in the evening or 80 mg daily (given in 3 divided doses of 20 mg, 20 mg and an evening dose of 40 mg).

Renal impairment: Severe impairment: initially, 5 mg once daily with close monitoring.

Oral

Cardiovascular risk reduction

Adult: In high-risk patients (e.g. patients with DM or atherosclerotic cardiovascular disease): 20-40 mg once daily. Moderate-risk patients: 10 mg once daily.

	Adult: In high-risk patients (e.g. patients with DM or atherosclerotic cardiovascular disease): 20-40 mg once daily. Moderate-risk patients: 10 mg once daily. Renal impairment: Severe impairment: initially, 5 mg once daily with close monitoring. Special Populations: For patients taking drugs that interact with simvastatin, initially, 5 mg once daily. Max: 10 mg/day (for patients taking ciclosporin, fibrates or nicotinic acid) and 20 mg/day (for patients taking amiodarone or verapamil).
Administration	May be taken with or without food. (Avoid excessive consumption (> 1 L/day) of grapefruit juice.)
Contraindications	Acute liver disease or unexplained persistent elevations of serum transaminases. Pregnancy, lactation. Porphyria. Patients of Chinese descent should not take 80 mg dose w/ lipid-modifying dose of niacin-containing products (=1 g/day).
Special Precautions	History of liver disease. Increased risk of rhabdomyolysis in severe infection, hypotension, major surgical trauma, uncontrolled seizures or severe metabolic, endocrine and electrolyte disorder. Alcoholism; premenarcheal females; children <10 yr. Discontinue treatment if there is marked or persistent increase in serum-aminotransferase concentrations.
Adverse Drug Reactions	Headache, nausea, flatulence, heartburn, abdominal pain, diarrhoea/constipation, dysgeusia; dose-related myopathy (e.g. myalgia, muscle weakness and dark urine); serum transaminases and CPK elevations; hypersensitivity; lens opacities; blurring of vision; dizziness; sexual dysfunction; insomnia; depression and upper respiratory symptoms. Potentially Fatal: Severe rhabdomyolysis with acute renal failure.

	insomnia; depression and upper respiratory symptoms. Potentially Fatal: Severe rhabdomyolysis with acute renal failure.
Drug Interactions	May cause slight elevation of serum digoxin. May increase risk of bleeding when used with coumarins and fluindione. Serum levels may be increased when used with ranolazine, verapamil, diltiazem and imatinib. Reduced serum levels when used with carbamazepine and rifampicin. Increased risk of myopathy when used with ciclosporin, colchicine, danazol and gemfibrozil. Potentially Fatal: Concurrent use with amiodarone, itraconazole, ketoconazole, clarithromycin, erythromycin, telithromycin, nefazodone, niacin or protease inhibitors may increase the risk of rhabdomyolysis and acute renal failure.
Food Interaction	Concurrent admin with large amounts of grapefruit juice may increase serum levels of simvastatin. Serum levels may be reduced by St John's wort.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Oral: Store at 5-30°C.
Mechanism of Action	Simvastatin is a prodrug metabolised in the liver to form the active β-hydroxyacid derivative. This inhibits the conversion of HMG-CoA to mevalonic acid by blocking HMG-CoA reductase, an early and rate-limiting step in cholesterol biosynthesis. It reduces total cholesterol, LDL-cholesterol and triglycerides and increases HDL-cholesterol levels. Onset: 3 days. Absorption: Absorbed from the GI tract (oral).

	biosynthesis. It reduces total cholesterol, LDL cholesterol and triglycerides and increases HDL-cholesterol levels. Onset: 3 days. Absorption: Absorbed from the GI tract (oral). Distribution: Protein-binding: 95%. Metabolism: Extensively hepatic; undergoes metabolism by CYP3A4. Excretion: Mainly excreted in the faeces as metabolites. Urine (10-15% inactive form); 1.9 hr (elimination half-life, active metabolite).
CIMS Class	Dyslipidaemic Agents
ATC Classification	C10AA01 - simvastatin; Belongs to the class of HMG CoA reductase inhibitors. Used in the treatment of hyperlipidemia.

simvastatin + ezetimibe

CIMS Class : (Dyslipidaemic Agents)
simvastatin + ezetimibe

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related simvastatin + ezetimibe information

Indication & Dosage

Oral

Hypercholesterolaemia,

Hyperlipidaemias, Hypertriglyceridaemia, Hyperlipoproteinaemia

Adult: As tablet containing ezetimibe (mg)/simvastatin (mg): 10/10, 10/20, 10/40, 10/80. Usual starting dose: 10/20 mg daily. Dose may range from 10/10 mg to 10/80 mg daily.

Renal impairment: Severe impairment: Start only if patient is able to tolerate 10 mg/day of simvastatin. Close monitoring required.

Contraindications

Hypersensitivity, acute liver disease or unexplained persistent elevations of liver transaminases. Pregnancy, lactation. Patients of Chinese descent should not receive more than 40 mg of simvastatin with lipid-modifying dose of niacin-containing product (≤1g/day).

Special Precautions

History of liver disease. Risk of rhabdomyolysis increased in the presence of severe infection, hypotension, major surgical trauma, uncontrolled seizure disorder, severe metabolic, endocrine and electrolyte disorder. Alcoholism; premenopausal females; child <10 yr.

Adverse Drug Reactions

Headache, nausea, flatulence, heartburn, abdominal pain, diarrhoea or

Adverse Drug Reactions	Headache, nausea, flatulence, heartburn, abdominal pain, diarrhoea or constipation, dysgeusia; dose related myopathy (e.g. myalgia, muscle weakness and dark urine); serum transaminases and CPK elevations; hypersensitivity reactions; opacities; blurring of vision; dizziness; sexual dysfunction; insomnia; depression; upper resp symptoms, dizziness, sinusitis, pharyngitis; chest pain, arthralgia and fatigue. Potentially Fatal: Severe rhabdomyolysis with acute renal failure.
Drug Interactions	Simvastatin may cause slight elevation of serum digoxin. Cholestyramine and colestipol increase bioavailability of simvastatin. Increase in ezetimibe plasma levels with ciclosporin. Increased risk of myopathy when used with ciclosporin, gemfibrozil, danazol, amiodarone and verapamil. Potentially Fatal: Concurrent use with itraconazole, ketoconazole, niacin, telithromycin, clarithromycin, erythromycin, nefazodone and HIV protease inhibitors may increase the risk of rhabdomyolysis and acute renal failure. Increased risk of hemorrhage with anticoagulants.
Food Interaction	Avoid intake of large quantities of grapefruit juice.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Mechanism of Action	Simvastatin inhibits the conversion of HMG-CoA to mevalonic acid by blocking the enzyme HMG-CoA reductase, an early and rate limiting step in the biosynthesis of cholesterol. Ezetimibe localises at the brush border of the intestine where it inhibits the absorption of cholesterol, decreasing the delivery of intestinal cholesterol to the liver. Cholesterol absorption is an active process and ezetimibe inhibits the protein transporters on small intestinal enterocyte brush border that bring about this active transport. Absorption: Ezetimibe: Absorbed and extensively conjugated to a pharmacologically inactive phenolic glucuronide after oral administration. Simvastatin is absorbed and extensively conjugated to a pharmacologically inactive glucuronide after oral administration.

	border that bring about this active transport. Absorption: Ezetimibe: Absorbed and extensively conjugated to a pharmacologically active phenolic glucuronide after oral admin. Simvastatin Extensive 1st pass extraction. Distribution: Ezetimibe and simvastatin: Highly protein-bound. Metabolism: Ezetimibe: Mainly metabolised in the small intestine and liver glucuronide conjugation. Excretion: Ezetimibe: Biliary and renal excretion. Simvastatin: Urine and
CIMS Class	Dyslipidaemic Agents
ATC Classification	C10AA01 - simvastatin; Belongs to the class of HMG CoA reductase inhibitors. Used in the treatment of hyperlipidemia. C10AX09 - ezetimibe; Belongs to the class of other cholesterol and triglyceride reducers. Used in the treatment of hyperlipidemia.

sirolimus

CIMS Class : (Immunosuppressants)
sirolimus

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food $\nrightarrow$ - Food interaction

related sirolimus information

Indication & Dosage

Oral

Prophylaxis of organ rejection in kidney allograft recipients

Adult: For low-moderate risk patients: Loading dose: 6 mg on day 1, followed by a maintenance dose of 2 mg once daily, given 4 hr after ciclosporin. Adjust dose to obtain whole blood trough concentrations of 4-12 ng/ml, and reduce doses of ciclosporin and corticosteroids gradually. After 2-3 mth, ciclosporin should be gradually discontinued over 4-8 wk while dose of sirolimus is adjusted to obtain trough concentrations of 12-20 ng/ml. For patients at high immunological risk such as black Afro-Caribbean patients and/or repeat renal transplant patients, sirolimus may be continued with ciclosporin and corticosteroids for the 1st yr after transplantation. Recommended loading dose: 15 mg, followed by an initial maintenance dose of 5 mg daily; further adjustments are made based on whole blood trough concentrations.

	followed by an initial maintenance dose of 5 mg daily; further adjustments are made based on whole blood trough concentrations. Child: Used with ciclosporin and corticosteroids: >13 yr and weighing <40 kg: Loading dose of 3 mg/m² BSA, followed by initial maintenance of 1 mg/m²/day. Adjust dose to obtain whole blood trough concentrations of 4-12 ng/ml, and reduce doses of ciclosporin and corticosteroids gradually. After 2-3 mth, ciclosporin should be gradually discontinued over 4-8 wk while dose of sirolimus adjusted to obtain trough concentrations of 12-20 ng/ml. If ciclosporin withdrawal is unsuccessful, usage of sirolimus should not exceed 3 mth after transplantation. Max: 40 mg/day. Hepatic impairment: Maintenance dose should be reduced by one-third.
Administration	May be taken with or without food. (Take consistently either always w/ or always without meals. Avoid grapefruit juice.)
Overdosage	General supportive measures should be used.
Contraindications	Pregnancy and lactation.
Special Precautions	Hepatic or renal impairment. Kidney function should be monitored. Avoid exposure to sun or ultraviolet light. May increase risk of infection and development of lymphoma. Use in lung or liver transplant patients is not recommended as the safety and efficacy of sirolimus in such patients have not been established.
Adverse Drug Reactions	GI disturbances, tremor, acne, impaired renal function, hyperlipidaemia, peripheral oedema, headache, pain, asthenia and hypertension. Arthralgia, hypokalaemia, pyelonephritis, leucopenia, anaemia and angioedema. Potentially Fatal: Fatal hepatic necrosis.
Drug Interactions	Inhibitors of CYP3A4 such as ketoconazole and protease

Drug Interactions	Inhibitors of CYP3A4 such as ketoconazole and protease inhibitors may increase the plasma concentrations of sirolimus. Concurrent admin with ciclosporin may lead to changes in the rate and extent of sirolimus absorption thus the drugs should be taken at least 4 hr apart. Increased risk of calcineurin inhibitor-induced haemolytic uraemic syndrome, thrombotic thrombocytopenic purpura or thrombotic microangiopathy when used with a calcineurin inhibitor. May lead to angioneurotic oedema-type reactions when used with ACE inhibitor. May decrease response to vaccines.
Food Interaction	Concomitant use with grapefruit juice should be avoided. Concurrent use with St. John's wort may decrease serum concentrations of sirolimus.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Oral solution: Refrigerate at 2-8°C. Tablet: Store at 20-25°C. Protect from light.
Mechanism of Action	Sirolimus is a potent non-calcineurin inhibiting immunosuppressant used for renal transplantation. It inhibits T-lymphocyte activation and proliferation. It also inhibits antibody production. It has been shown to possess antifungal and antineoplastic properties. Absorption: Rapidly absorbed in the GI tract after oral admin. Distribution: Extensively bound to plasma proteins. Metabolism: Metabolised by CYP3A4 via demethylation or

	Absorption: Rapidly absorbed in the GI tract after oral admin. Distribution: Extensively bound to plasma proteins. Metabolism: Metabolised by CYP3A4 via demethylation or hydroxylation. Excretion: Mainly excreted via faeces; only about 2% excreted in the urine.
CIMS Class	Immunosuppressants
ATC Classification	L04AA10 - sirolimus; Belongs to the class of selective immunosuppressive agents. Used to induce immunosuppression.

sisomicin

CIMS Class : (Aminoglycosides)
sisomicin

P - Caution when used during pregnancy

L - Caution when used during lactation

related sisomicin information

Indication & Dosage	<i>Intramuscular</i> Susceptible Gram-negative and staphylococcal infections Adult: 3 mg/kg daily in 2-3 divided doses. May also be given as IV infusion, if needed. Renal impairment: May need to adjust maintenance doses and/or dosing intervals. <i>Topical/Cutaneous</i> Pyoderma Adult: As 0.1% cream: Apply onto the affected area(s) bid.
Contraindications	Hypersensitivity.
Special Precautions	Renal or liver impairment, myasthenia gravis, parkinsonism, dehydration, hypotension, pregnancy, lactation.
Adverse Drug Reactions	Ototoxicity, nephrotoxicity, neurotoxicity (peripheral neuropathy, confusion, lethargy, hallucination, convulsion and mental depression, occasional respiratory depression), rarely hypersensitivity reaction. Potentially Fatal: Acute renal failure especially in

	and mental depression, occasional respiratory depression), rarely hypersensitivity reaction. Potentially Fatal: Acute renal failure especially in combination with other nephrotoxic drugs.
Drug Interactions	Plasma levels increased by indometacin. Antihistamines (H ₁ -receptor blocker) may mask early signs of ototoxicity. Incompatible with some β -lactam antibiotics. Potentially Fatal: Potentiates nephrotoxicity produced by other nephrotoxic drugs including other aminoglycosides, vancomycin and some cephalosporins. Potentiates ototoxicity produced by other aminoglycosides, ethacrynic acid. Ototoxicity potentiated by furosemide.
Mechanism of Action	Sisomicin binds to 30s and 50s ribosomal subunits of susceptible bacteria disrupting protein synthesis, thus rendering the bacterial cell membrane defective.
CIMS Class	Aminoglycosides
ATC Classification	J01GB08 - sisomicin; Belongs to the class of other aminoglycosides. Used in the treatment of systemic infections.

sodium bicarbonate

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants) , (Other Drugs Acting on the Genito-Urinary System) , (Electrolytes)

P - Caution when used during pregnancy

L - Caution when used during lactation

related sodium bicarbonate information

Indication & Dosage

Oral

Urine alkalinisation

Adult: To prevent development of uric-acid renal calculi in the initial stages of uricosuric therapy for hyperuricaemia in chronic gout: Up to 10 g daily in divided doses, to be taken with a liberal amount of fluid.

Elderly: Dosage adjustments may be required.

Renal impairment: Dosage adjustments may be required.

Hepatic impairment: Dosage adjustments may be required.

Oral

Chronic metabolic acidosis

Adult: Doses providing 57 mmol (4.8 g sodium bicarbonate) or more daily as required.

Elderly: Dosage adjustments may be required.

Renal impairment: Dosage adjustments may be required.

Hepatic impairment: Dosage adjustments may be required.

Oral

Dyspepsia

Adult: 1-5 g in water, may be taken as required.

Elderly: Dosage adjustments may be required.

	Dyspepsia Adult: 1-5 g in water, may be taken as required. Elderly: Dosage adjustments may be required. Renal impairment: Dosage adjustments may be required. Hepatic impairment: Dosage adjustments may be required. <i>Intravenous</i> Severe metabolic acidosis Adult: By slow inj of a hypertonic solution of up to 8.4% (1000 mmol/L), or by continuous infusion of a weaker solution, usually 1.26% (150 mmol/L). For correction of acidosis during advanced cardiac life support procedures, 50 ml of an 8.4% solution may be given. Elderly: Dosage adjustments may be required. Renal impairment: Dosage adjustments may be required. Hepatic impairment: Dosage adjustments may be required.
Administration	Should be taken on an empty stomach (i.e. At least one hour before food or two hours after food).
Contraindications	Metabolic or respiratory alkalosis; hypernatraemia, severe pulmonary oedema; hypocalcaemia, hypochlorhydria.
Special Precautions	Epilepsy, CHF, renal impairment, liver cirrhosis, hypertension, oedema, eclampsia, aldosteronism. Monitor serum electrolyte concentrations and acid-base status regularly during treatment of acidosis. Pregnancy; lactation.
Adverse Drug Reactions	Metabolic alkalosis; mood changes, tiredness, shortness of breath, muscle weakness, irregular heartbeat; muscle hypertonicity, twitching, tetany; hypernatraemia, hyperosmolality, hypocalcaemia, hypokalaemia; stomach cramps, flatulence. Tissue necrosis at inj site.
Drug Interactions	Increases toxicity of amphetamines, ephedrine, pseudoephedrine, flecainide, quinidine and quinine. Decreases effects of lithium, chlorpropamide and salicylates due to increased clearance. May affect the absorption of certain drugs due to raised intra-gastric pH.

	quinine. Decreases effects of lithium, chlorpropamide and salicylates due to increased clearance. May affect the absorption of certain drugs due to raised intra-gastric pH.
Mechanism of Action	Sodium bicarbonate raises blood and urinary pH by dissociation to provide bicarbonate ions, which neutralises the hydrogen ion concentration. It also neutralises gastric acid via production of carbon dioxide. Onset: Oral: Rapid; IV: 15 minutes. Duration: Oral: 8-10 minutes; IV: 1-2 hr.
CIMS Class	Antacids, Antireflux Agents & Antiulcerants / Other Drugs Acting on the Genito-Urinary System / Electrolytes
ATC Classification	B05CB04 - sodium bicarbonate; Belongs to the class of salt solutions used as irrigating solutions. B05XA02 - sodium bicarbonate; Belongs to the class of electrolyte solutions used in I.V. solutions.

sodium chloride

CIMS Class : (Nasal Decongestants & Other Nasal Preparations) , (Electrolytes) , (Mouth/Throat Preparations) , (Intravenous & Other Sterile Solutions) , (Other Eye Preparations)
sodium chloride

P - Caution when used during pregnancy

related sodium chloride information

Indication & Dosage	<i>Oral</i> Chronic salt-losing conditions Adult: As modified-release preparation: 2.4-4.8 g (40-80 mmol sodium) daily accompanied by suitable fluid intake. Up to 12 g daily may be necessary in severe cases. Renal impairment: Dosage adjustment may be necessary. <i>Oral</i> Prophylaxis of muscle cramps during routine haemodialysis Adult: As modified-release preparation: 6-10 g every dialysis session. <i>Oral</i> Oral hygiene Adult: Used as mouthwash. <i>Nasal</i> Nasal congestion Adult: 0.9% used as nasal drops or spray. Child: 0.9% used as nasal drops.

	Nasal congestion Adult: 0.9% used as nasal drops or spray. Child: 0.9% used as nasal drops. <i>Intravenous</i> Replacement of fluid and electrolytes Adult: As 0.9%, 3% or 5% solution: Dosage depends on age, wt, clinical condition and laboratory determinations of the patient. Dose to be administered via a large vein, with care taken to prevent infiltration. <i>Intravenous</i> Hypernatraemia Adult: As 0.9% solution: Dosage depends on age, wt, clinical condition and laboratory determinations of the patient. Dose to be administered via a large vein, with care taken to prevent infiltration. <i>Irrigation</i> Irrigation of the bladder, eye, general skin and wound cleansing Adult: 0.9% solution is used.
Contraindications	Conditions whereby admin of sodium chloride would be detrimental. Not to be used to induce emesis. Sustained release tablets: GI disorders associated with strictures or diverticula.
Special Precautions	Hypertension, heart failure, peripheral or pulmonary oedema, impaired renal function, liver cirrhosis, preeclampsia. Maintain adequate water intake. Pregnancy. Inj of 3 or 5% sodium chloride solution should be given via a large vein at a rate not exceeding 100 ml/hr. Monitor fluid balance, serum electrolytes and acid base balance espically during prolonged treatment. Caution when used in patients who are receiving corticosteroids or corticotropin.
Adverse Drug Reactions	Hypernatraemia; thirst, reduced salivation and lachrymation,

Adverse Drug Reactions	Hypernatraemia; thirst, reduced salivation and lachrymation, fever, tachycardia, hypertension, headache, dizziness, restlessness, irritability and weakness. Potentially Fatal: Intra-amniotic inj of hypertonic solutions: Disseminated intravascular coagulation, renal necrosis, cervical and uterine lesions, pulmonary embolism, pneumonia and death.
Drug Interactions	May affect serum concentrations of lithium.
Mechanism of Action	Sodium chloride is the major extracellular cation. It is important in electrolyte and fluid balance, osmotic pressure control and water distribution as it restores sodium ions. It is used as a source of electrolytes and water for hydration, treatment of metabolic acidosis, priming solution in haemodialysis and treatment of hyperosmolar diabetes. It is also used as diluents for infusion of compatible drug additives. Absorption: Well-absorbed from the GI tract. Excretion: Mainly in the urine, with small amounts excreted in the sweat, faeces, tears and saliva.
CIMS Class	Nasal Decongestants & Other Nasal Preparations / Electrolytes / Mouth/Throat Preparations / Intravenous & Other Sterile Solutions / Other Eye Preparations
ATC Classification	A12CA01 - sodium chloride; Belongs to the class of sodium-containing preparations used as dietary supplements. B05CB01 - sodium chloride; Belongs to the class of salt solutions used as irrigating solutions. B05XA03 - sodium chloride; Belongs to the class of electrolyte solutions used in I.V. solutions.

sodium cromoglicate

CIMS Class : (Antiasthmatic & COPD Preparations) , (Nasal Decongestants & Other Nasal Preparations) , (Ophthalmic Decongestants, Anesthetics, Anti-inflammatories)
sodium cromoglicate

L - Caution when used during lactation

related sodium cromoglicate information

Indication & Dosage

Oral

Food allergy

Adult: 200 mg four times daily. May double the dose if effect is not satisfactory within 2-3 wk.

Child: 100 mg four times daily. May double the dose if effect is not satisfactory within 2-3 weeks.

Max Dosage: 40 mg/kg/day.

Renal impairment: Dosage adjustment may be needed.

Hepatic impairment: Dosage adjustment may be needed.

Oral

Mastocytosis

Adult: 200 mg four times daily. May double the dose if effect is not satisfactory within 2-3 wk.

Child: 100 mg four times daily. May double the dose if effect is not satisfactory within 2-3 weeks.

Max Dosage: 40 mg/kg/day.

Renal impairment: Dosage adjustment may be needed.

Hepatic impairment: Dosage adjustment may be needed.

	Max Dosage: 40 mg/kg/day. Renal impairment: Dosage adjustment may be needed. Hepatic impairment: Dosage adjustment may be needed. <i>Nasal</i> Allergic rhinitis Adult: 2.5 or 5 mg of a 2% or 4% soln is admin as drops or spray into each nostril 4 times daily. Renal impairment: Dosage adjustment may be needed. Hepatic impairment: Dosage adjustment may be needed. <i>Inhalation</i> Asthma prophylaxis Adult: 20 mg four times daily as dry powder/nebulised soln or 10 mg four times daily as aerosol, increased to 6-8 times daily if necessary, reduced to 5 mg four times daily once asthma has been stabilised. Additional doses may be taken before exercise. Elderly: Renal impairment: Dosage adjustment may be needed. Hepatic impairment: Dosage adjustment may be needed. <i>Ophthalmic</i> Allergic conjunctivitis Adult: Instill 2 drops of a 4% soln 4-6 times daily or apply a 4% oint bid-tid. Elderly: Renal impairment: Dosage adjustment may be needed. Hepatic impairment: Dosage adjustment may be needed.
Contraindications	Hypersensitivity.
Special Precautions	Lactation, cardiac arrhythmias, hepatic or renal dysfunction.
Adverse Drug Reactions	Nausea, headache, dizziness, unpleasant taste, joint pain and swelling, skin rashes, aggravation of asthma, pulmonary infiltrates with eosinophilia, urticaria. Bronchospasm, wheezing, cough, nasal congestion and throat irritation

	and swelling, skin rashes, aggravation of asthma, pulmonary infiltrates with eosinophilia, urticaria. Bronchospasm, wheezing, cough, nasal congestion and throat irritation following inhalation of dry powder. Intranasal use: Transient irritation of nasal mucosa. Sneezing and epistaxis (occasional). Eye drops: Transient burning and stinging.
Storage	Inhalation: Store at 25°C. Nasal: Store at 25°C. Ophthalmic: Store at 25°C. Oral: Store at 25°C.
Mechanism of Action	Cromoglycic acid inhibits degranulation of mast cells and therefore suppresses the release of histamine, leukotrienes and slow-reacting substance of anaphylaxis. Absorption: Oral: Poorly absorbed from the GIT with only 1% bioavailability. Inhalation: 8-10% of a dose of fine powder is deposited and rapidly absorbed from the lungs. Intranasal: < 7% of the dose is absorbed. Ophthalmic: 0.03% is absorbed.
CIMS Class	Antiasthmatic & COPD Preparations / Nasal Decongestants & Other Nasal Preparations / Ophthalmic Decongestants, Anesthetics, Anti-inflammatories
ATC Classification	A07EB01 - cromoglycic acid; Belongs to the class of antiallergic antiinflammatory, excluding corticosteroids. Used in the treatment of intestinal inflammation. D11AX17 - cromoglycic acid; R01AC01 - cromoglycic acid; Belongs to the class of topical antiallergic preparations, excluding corticosteroids. Used as nasal decongestants. R03BC01 - cromoglycic acid; Belongs to the class of other inhalants used in the treatment of obstructive airway diseases, antiallergic agents. S01GX01 - cromoglycic acid; Belongs to the class of other agent used as ophthalmologic antiallergics.

diseases, antiallergic agents.

S01GX01 - cromoglicic acid; Belongs to the class of other agent used as ophthalmologic antiallergics.

sodium hyaluronate

CIMS Class : (Other Drugs Acting on Musculo-skeletal System) , (Other Eye Preparations) , (Emollients & Skin Protectives)
sodium hyaluronate

P - Caution when used during pregnancy

related sodium hyaluronate information

Indication & Dosage

Intra-articular

Osteoarthritis of the knee

Adult: 20-25 mg once wkly for 5 wk or up to 30 mg once wkly for 3-4 wk. Not to repeat treatment course within 6 mth for any individual joint.

Ophthalmic

Surgical aid in the anterior segment during cataract extraction and intraocular lens implantation

Adult: Slowly admin a sufficient quantity into the eye.

Topical/Cutaneous

Skin ulcers and wounds

Adult: As cream, gel or spray: Apply a thin layer onto clean and disinfected wound/ulcer bid-tid. Cover with sterile, non-stick dressing.

Contraindications

Hypersensitivity to sodium hyaluronate or avian proteins.

Special Precautions

Monitor intraocular pressure. Pregnancy.

Adverse Drug

Ophthalmic: Transient rise in intraocular pressure.

Adverse Drug Reactions	Ophthalmic: Transient rise in intraocular pressure. Intra-articular inj: Pain and inflammation at inj site. Hypersensitivity; anaphylaxis; hypotensive crisis.
Storage	Intra-articular: Store at 2-25°C. Ophthalmic: Store at 2-25°C. Topical/Cutaneous: Store at 2-25°C.
Mechanism of Action	Sodium hyaluronate is a polysaccharide which functions as a tissue lubricant. It is widely used in ophthalmic surgery because it forms a viscoelastic solution in water which makes it a suitable substitute for aqueous and vitreous humour. Distribution: Widely distributed in body tissues and intracellular fluids. Excretion: Ophthalmic, via Canal of Schlemm.
CIMS Class	Other Drugs Acting on Musculo-skeletal System / Other Eye Preparations / Emollients & Skin Protectives

sodium nitroprusside

CIMS Class : (Other Antihypertensives)
sodium nitroprusside

P - Caution when used during pregnancy

L - Caution when used during lactation

related sodium nitroprusside information

Indication & Dosage

Intravenous

Hypertensive crisis

Adult: For patients not receiving any antihypertensives, initially 0.3-1.5 mcg/kg/min, adjust gradually according to response. Usual range 0.5-6 mcg/kg/min. Lower doses should be used in patients receiving antihypertensives. Max rate: 8 mcg/kg/min, discontinue infusion if there is no response after 10 min. May continue for a few hr if there is response. Introduce oral antihypertensive as soon as possible.

Child: Initially, 250-500 nanograms/kg/min, rate may be repeatedly doubled at intervals of 15-20 min until the desired effect is achieved or treatment is judged ineffective. Max rate: 6 mcg/kg/min.

Elderly: Lower doses may be required.

Renal impairment: Dosage adjustments may be necessary.

Intravenous

Induction of hypotension during anaesthesia

Adult: Recommended max dose: 1.5 mcg/kg/min.

	Renal impairment: Dosage adjustments may be necessary. <i>Intravenous</i> Induction of hypotension during anaesthesia Adult: Recommended max dose: 1.5 mcg/kg/min. Renal impairment: Dosage adjustments may be necessary. <i>Intravenous</i> Heart failure Adult: Initially 10-15 mcg/min, may increase by 10-15 mcg/min every 5-10 min according to response; usual range 10-200 mcg/min. Max: 280 mcg/min. Renal impairment: Dosage adjustments may be necessary.
Overdosage	Overdosage may result in excessive hypotension, cyanide or thiocyanate toxicity.
Contraindications	Hypersensitivity, compensatory hypertension.
Special Precautions	Hypothyroidism, renal and hepatic impairment, ischaemic heart disease, impaired cerebral circulation, elderly. Monitor blood thiocyanate concentration if treatment is longer than 3 days and should not exceed 100 mcg/ml. Monitor acid-base balance, venous oxygen concentration and BP. Caution to avoid extravasation. To be diluted with sterile dextrose 5% solution before infusion. Avoid sudden withdrawal. Leber's optic atrophy, low plasma-cobalamin concentrations, impaired pulmonary function. Pregnancy and lactation.
Adverse Drug Reactions	Nausea, retching, apprehension, headache, restlessness, muscle twitching, retrosternal discomfort; palpitation, dizziness, abdominal discomfort. Cyanosis and hypothyroidism (rare).
Drug Interactions	Additive effect when used with other antihypertensives. May prolong the fibrinolytic activity of alteplase. Risk of severe hypotension if used with phosphodiesterase inhibitors. May reduce serum digoxin levels.
Storage	Intravenous: Store at 20-25°C.

Storage	Intravenous: Store at 20-25°C.
Mechanism of Action	Sodium nitroprusside is a short-acting antihypertensive that acts directly on the venous and arteriolar smooth muscle causing peripheral vasodilation, thus decreasing peripheral resistance. It is also used to reduce preload and afterload in severe heart failure. Metabolism: Rapidly metabolised to cyanide in red blood cells and smooth muscle, leading to release of nitric oxide. Excretion: Cyanide is further metabolised hepatically to thiocyanate and excreted in the urine. Plasma half-life of thiocyanate is about 3 days.
CIMS Class	Other Antihypertensives

sodium phosphate

CIMS Class : (Laxatives, Purgatives) , (Electrolytes)

P - Caution when used during pregnancy

Food ⚠ - Food interaction

related sodium phosphate information

related sodium phosphate information	
Indication & Dosage	<i>Oral</i> Hypophosphataemia Adult: Up to 100 mmol of phosphate daily. Renal impairment: Dose reduction may be necessary. <i>Intravenous</i> Severe hypophosphataemia Adult: As monobasic potassium phosphate: Up to 9 mmol of phosphate given over 12 hr, repeat 12 hrly if needed. Alternatively, 0.2-0.5 mmol/kg phosphate (max: 50 mmol), may be given over 6-12 hr. <i>Rectal</i> Mild osmotic laxative for bowel evacuation and cleansing Adult: Usually contains monobasic and dibasic sodium phosphates but the composition and dosage may vary. Phosphate enemas work within 2-5 minutes. Use as directed. Renal impairment: Dose reduction may be necessary.

	directed. Renal impairment: Dose reduction may be necessary. Incompatibility: Incompatible with calcium salts.
Overdosage	May lead to severe electrolyte disturbances, including hyperphosphataemia, hypocalcaemia, hypernatraemia, or hypokalaemia, as well as dehydration and hypovolaemia. May also lead to cardiac arrhythmias, seizure, renal failure and death. Monitor carefully and treat symptomatically until stable.
Contraindications	Severe renal function, congestive heart failure, ascites, unstable angina pectoris, gastric retention, ileus or acute obstruction or pseudo-obstruction, severe chronic constipation, bowel perforation, acute colitis, toxic megacolon or hypomotility syndrome, hypertension, hyperkalaemia, oedema, low serum-calcium concentrations, infected phosphate renal calculi.
Special Precautions	Chronic renal disease, pre-existing electrolyte disturbances. Concurrent admin with drugs that may affect electrolyte levels. Correct electrolyte abnormalities before initiating therapy. Monitor renal function, serum calcium, serum phosphorus, serum potassium, and serum sodium at periodic intervals during therapy. Caution in patients taking drugs that may prolong QT interval. Ensure adequate hydration. Pregnancy. Elderly or debilitated patients.
Adverse Drug Reactions	Abdominal discomfort or pain, diarrhoea, nausea, vomiting, hypernatraemia, dehydration (with high doses). Convulsions, drowsiness, mood change, trembling, malaise, loss of appetite, muscle spasm (with long-term use). Less frequently, headaches, dizziness, mental confusion, seizures, weakness or heaviness of legs, muscle cramps, numbness, tingling, pain, arrhythmia; shortness of breath or

	frequently, headaches, dizziness, mental confusion, seizures, weakness or heaviness of legs, muscle cramps, numbness, tingling, pain, arrhythmia; shortness of breath or troubled breathing; swelling of lower legs or feet; unusual weight gain, low urine output; unusual thirst; bone and joint pain.
Drug Interactions	Concurrent use with aluminium, calcium, or magnesium salts will reduce absorption of phosphates. Vitamin D increases the GI absorption of phosphates and risk of hyperphosphataemia. Increased risk of hyperphosphataemia, hypocalcaemia, and hypernatraemia when used in patients receiving diuretics or drugs that may affect serum electrolytes. Increased risk of ectopic calcification when used concurrently with calcium supplements or calcium-containing antacids.
Food Interaction	Decreased effects with milk or dairy products due to their calcium content.
Storage	Oral: Store at 15-30°C. Rectal: Store at 15-30°C.
Mechanism of Action	Sodium phosphate can be used in the management of hypophosphataemia. It also acts as a mild osmotic laxative when given orally as dilute solutions or by the rectal route. Phosphate enemas or concentrated oral solutions are used for bowel cleansing before surgery or endoscopy procedures. Absorption: About 66% of an oral dose is absorbed from the GI tract. Metabolism: Excretion: Mainly excreted in the urine with the remaining dose via the faeces.
CIMS Class	Laxatives, Purgatives / Electrolytes
ATC Classification	A06AD17 - sodium phosphate; Belongs to the class of osmotically acting laxatives. Used in the treatment of

A06AD17 - sodium phosphate; Belongs to the class of osmotically acting laxatives. Used in the treatment of constipation.

A06AG01 - sodium phosphate; Belongs to the class of enemas. Used in the treatment of constipation.

B05XA09 - sodium phosphate; Belongs to the class of electrolyte solutions used in I.V. solutions.

somatostatin

CIMS Class : (Haemostatics)
somatostatin

related somatostatin information

Indication & Dosage	<i>Intravenous</i> Gastrointestinal haemorrhage Adult: Initially, 250 mcg as a bolus inj over 3-5 min, followed by a continuous infusion of 3.5 mcg/kg/hr until bleeding has ceased. May continue for a further 48-72 hr to prevent recurrent bleeding.
Special Precautions	Monitor blood glucose levels. May inhibit intestinal absorption thus concomitant parenteral nutrition may be recommended.
Adverse Drug Reactions	Rapid infusion may lead to abdominal discomfort, nausea, flushing, bradycardia.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Somatostatin is a polypeptide obtained synthetically or from the hypothalamus. It acts by inhibiting the release of growth hormone from the anterior pituitary. It also inhibits the release of thyrotrophin and corticotropin from the pituitary, glucagon and

	Somatostatin is a polypeptide obtained synthetically or from the hypothalamus. It acts by inhibiting the release of growth hormone from the anterior pituitary. It also inhibits the release of thyrotrophin and corticotropin from the pituitary, glucagon and insulin from the pancreas. It also regulates duodenal and gastric secretions. It may also play a role in pain perception.
CIMS Class	Haemostatics
ATC Classification	H01CB01 - somatostatin; Belongs to the class of antgrowth hormone. Used in hypothalamic hormone preparations.

somatropin

CIMS Class : (Trophic Hormones & Related Synthetic Drugs)
somatropin

P - Caution when used during pregnancy

L - Contraindicated in lactation

related somatropin information

Indication & Dosage

Subcutaneous

Growth hormone deficiency

Adult: Initially, 6 mcg/kg daily. May increase gradually according to patient response. Max: 12.5 mcg/kg/day. Reassess 9 mth after starting treatment.

Child: 25-35 mcg/kg daily. Reassess 9 mth after starting treatment.

Elderly: Lower doses may be required.

Subcutaneous

Growth retardation due to chronic renal insufficiency

Child: 45-50 mcg/kg or 1.4 mg/m² daily.

Subcutaneous

Turner's syndrome

Child: 45-50 mcg/kg or 1.4 mg/m² daily.

Subcutaneous

HIV-associated wasting or cachexia

Adult: 0.1 mg/kg daily at bedtime. May be taken on alternate days for patients at increased risk of adverse effects. Max: 6 mg/day.

	Adult: 0.1 mg/kg daily at bedtime. May be taken on alternate days for patients at increased risk of adverse effects. Max: 6 mg/day. <i>Subcutaneous</i> Prader-Willi syndrome Child: 35 mcg/kg or 1 mg/m² daily. Max: 2.7 mg daily. <i>Subcutaneous</i> Growth retardation in children who were born small for gestational age Child: 35 mcg/kg or 1 mg/m² daily. Max: 2.7 mg daily. <i>Subcutaneous</i> Short bowel syndrome Adult: 100 mcg/kg/day for 4 wk. Max: 8 mg/day. <i>Subcutaneous</i> Children with short stature homeobox-containing (SHOX) deficiency Child: 50 mcg/kg/day may be used.
Contraindications	Acute critical illness due to heart or abdominal surgery, multiple accidental trauma or respiratory failure; active neoplasms, proliferative or preproliferative diabetic retinopathy; lactation; patients with closed epiphyses. Intracranial lesions. Patients with Prader-Willi syndrome who are severely obese or have severe respiratory impairment.
Special Precautions	Monitor thyroid function; benign intracranial hypertension. DM; may require dose reduction in insulin. Pregnancy. Discontinue treatment if there is evidence of tumour growth. Monitoring in patients with scoliosis is recommended due to risk of progression of scoliosis.
Adverse Drug Reactions	Hypothyroidism, peripheral oedema; headache; muscle and joint pain; benign intracranial hypertension. Loss of glycaemic control in diabetics.

	Hypothyroidism, peripheral oedema; headache; muscle and joint pain; benign intracranial hypertension. Loss of glycaemic control in diabetics.
Drug Interactions	High doses of corticosteroid may inhibit growth-promoting effects of somatropin.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Subcutaneous: Store at 2-8°C.
Mechanism of Action	Somatropin is a synthetic human growth hormone of recombinant DNA origin. It stimulates skeletal and soft tissue growth by promoting cell division, amino acid uptake and protein synthesis. It also possesses both insulin-like and diabetogenic effects. Absorption: Well absorbed (SC/IM). Bioavailability ranges from 60-80%. Metabolism: Renal and hepatic. Excretion: Via bile. Elimination half-life: 20-30 min (IV), 3-5 hr (SC/IM).
CIMS Class	Trophic Hormones & Related Synthetic Drugs
ATC Classification	H01AC01 - somatropin; Belongs to the class of somatropin and somatropin agonists. Used in anterior pituitary lobe hormone and analogue preparations.

***somatropin information:**

sotalol

CIMS Class : (Beta-Blockers)
sotalol

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related sotalol information

Indication & Dosage

Oral

Supraventricular and ventricular arrhythmias

Adult: Initially, 80 mg daily as a single or in 2 divided doses, increased gradually every 2-3 days. Usual dose: 160-320 mg daily in 2 divided doses. Max: 640 mg daily.

Child: Neonates: Initially, 1 mg/kg bid, increased every 3-4 days, if necessary. Max: 4 mg/kg bid. 1 mth-12 yr: Initially, 1 mg/kg bid, increased as necessary every 2-3 days. Max: 4 mg/kg bid, not exceeding 80 mg bid. For refractory supraventricular tachycardia, sotalol may be given with flecainide; <1 yr: 100-250 mg/m² daily of sotalol and 40-150 mg/m² daily of flecainide.

CrCl (ml/min)	Dosage Recommendation
30-60	Halve the usual dose.
10-30	Quarter the usual dose.
<10	Not recommended.

Oral

Life-threatening ventricular arrhythmias

	<i>Oral</i>	
	Life-threatening ventricular arrhythmias	
	Adult: 480-640 mg daily.	
	CrCl (ml/min)	Dosage Recommendation
	30-60	Halve the usual dose.
	10-30	Quarter the usual dose.
	<10	Not recommended.
	<i>Intravenous</i>	
	Acute arrhythmias	
	Adult: 20-120 mg (0.5-1.5 mg/kg) given by inj over 10 min, may repeat every 6 hr if needed. To substitute for oral treatment, 0.2-0.5 mg/kg/hr infusion may be used.	
	CrCl (ml/min)	Dosage Recommendation
	30-60	Halve the usual dose.
	10-30	Quarter the usual dose.
	<10	Not recommended.
	<i>Intravenous</i>	
	Programmed electrical stimulation (to test antiarrhythmic efficacy)	
	Adult: Initially, 1.5 mg/kg inj over 10-20 minutes, followed by of 0.2-0.5 mg/kg/hr infusion.	
	CrCl (ml/min)	Dosage Recommendation
	30-60	Halve the usual dose.
	10-30	Quarter the usual dose.
	<10	Not recommended.
Administration	Should be taken on an empty stomach. (Take 1-2 hr before meals.)	
Overdosage	Rarely results in death.	
Contraindications	Bronchospasm, asthma, history of obstructive airways disease, sinus bradycardia, cardiogenic shock. 2 nd and 3 rd degree AV block, uncontrolled cardiac failure, metabolic acidosis, hypotension, severe peripheral arterial disease.	

	bronchospasm, asthma, history of obstructive airways disease, sinus bradycardia, cardiogenic shock. 2 nd and 3 rd degree AV block, uncontrolled cardiac failure, metabolic acidosis, hypotension, severe peripheral arterial disease.
Special Precautions	Pregnancy and lactation. Renal insufficiency; preexisting sick sinus syndrome; compensated heart failure; gradual withdrawal is recommended. DM, 1 st degree AV block. May mask the symptoms of hyperthyroidism and of hypoglycaemia. May unmask myasthenia gravis. May worsen psoriasis.
Adverse Drug Reactions	Nausea, sleep disorders, lassitude, diarrhoea, palpitations, bradycardia, weakness, dyspnoea, decreased sexual activity, impotence, extremity pain, back pain, asthma, visual disturbances, cardiac arrhythmias. Rebound angina, arrhythmias and MI if withdrawn abruptly. Potentially Fatal: Polymorphic ventricular tachycardia (very rare). Rebound hypertension.
Drug Interactions	Decreased effect with antacids, calcium salts, NSAIDs, ampicillin, rifampicin. May reduce response to insulin and oral hypoglycaemics. May lead to enhanced hypotension when used with aldesleukin and general anaesthetics. Increased risk of bradycardia and heart block when used with calcium channel blockers and other cardiac depressants. May develop elevated BP when used with adrenaline. Reduced absorption when used with aluminium salts and bile-acid binding resins. Decreased metabolism when used with cimetidine, hydralazine, erythromycin and fluvoxamine. Potentially Fatal: Rebound hypertension with clonidine and abrupt withdrawal of either drug. Polymorphic ventricular tachycardia with antidepressants and quinidine.
Food Interaction	Absorption may be reduced by food especially by milk.
Pregnancy	

Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 20-25°C. Oral: Store at 20-25°C.
Mechanism of Action	Sotalol is a non-cardioselective β-blocker. It increases sinus cycle length, slows heart rate, decreases AV nodal conduction and increases AV nodal refractoriness. It also prolongs AV monophasic action potentials. However, it lacks intrinsic sympathomimetic and membrane-stabilising properties. It is used in the treatment of ventricular arrhythmias. Absorption: Almost completely absorbed from the GI tract (oral); peak plasma concentrations after 2-4 hr. Distribution: Crosses the placenta and enters breast milk; crosses the blood-brain barrier and enters CSF (small amounts). Protein-binding: Low. Metabolism: Minimal metabolism. Excretion: Via urine (as unchanged). Elimination half-life: 10-20 hr.

CIMS Class	Beta-Blockers
ATC Classification	C07AA07 - sotalol; Belongs to the class of non-selective beta-blocking agents. Used in the treatment of cardiovascular diseases.

sparfloxacin

CIMS Class : (Quinolones)
sparfloxacin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related sparfloxacin information

Indication & Dosage	<i>Oral</i> Community-acquired pneumonia, Acute bacterial exacerbation of chronic bronchitis <i>Adult:</i> 100-300 mg daily, as a single dose or 2 divided doses. <i>Renal impairment:</i> Dosage adjustment may be necessary in severe impairment.
Administration	May be taken with or without food.
Contraindications	Hypersensitivity; pregnancy and lactation; children <18 yr.
Special Precautions	History of CNS disorders, pseudomembranous colitis, superinfection, severe renal dysfunction, epilepsy, G6PD deficiency, myasthenia gravis, patients with QT prolongation, uncorrected electrolyte disturbances, bradycardia, or pre-existing cardiac disease. Avoid exposure to strong sunlight or sunlamps during treatment. Discontinue treatment if patients experience tendon pain, inflammation or rupture; subsequent use of fluoroquinolones in these patients is not recommended. Avoid in MRSA infections due to high risk of resistance. Ensure adequate fluid intake to reduce risk of crystalluria.

	these patients is not recommended. Avoid in MRSA infections due to high risk of resistance. Ensure adequate fluid intake to reduce risk of crystalluria.
Adverse Drug Reactions	Diarrhoea, abdominal pain, nausea, vomiting; jaundice, renal failure, elevation of liver enzymes, BUN and creatinine; anaphylactoid reaction, headache, dizziness, convulsions; tremors, myalgia; rhabdomyolysis, thrombocytopenia and eosinophilia. Potentially Fatal: AV block; anaphylaxis.
Drug Interactions	Cations such as aluminum, magnesium, zinc and iron may reduce the bioavailability of sparfloxacin. May increase the plasma concentrations of theophylline and tizanidine. May enhance the effect of warfarin and glibenclamide. May decrease the renal clearance of methotrexate. Excretion may be reduced by probenecid. May alter serum levels of phenytoin. Potentially Fatal: Corticosteroids may increase risk of tendon rupture. Increased risk of seizures with NSAIDs. Risk of additive QT prolongation effect when used with class Ia or III antiarrhythmic drugs, astemizole, terfenadine, cisapride, erythromycin, pentamidine, phenothiazines or TCAs.
Mechanism of Action	Sparfloxacin inhibits the supercoiling activity of DNA gyrase which is an enzyme essential for DNA replication thus promoting the breakage of DNA structures. It has activity against <i>S. pneumoniae</i>, <i>S. aureus</i>, <i>H. influenzae</i>, <i>K. pneumoniae</i>, <i>M. catarrhalis</i> and <i>Mycobacterium</i> spp. Absorption: Well absorbed from the GI tract (oral); peak plasma concentrations after 3-6 hr. Distribution: Widely distributed into tissues including respiratory tissues. Protein-binding: 45%. Metabolism: Hepatic (by glucuronidation). Excretion: Excreted in equal amounts in the urine and faeces as unchanged drug and glucuronide metabolites; elimination half-life: 20 hr.

	Excretion: Excreted in equal amounts in the urine and faeces as unchanged drug and glucuronide metabolites; elimination half-life: 20 hr.
CIMS Class	Quinolones
ATC Classification	J01MA09 - sparfloxacin; Belongs to the class of quinolones, fluoroquinolone. Used in the treatment of systemic infections.

spectinomycin

CIMS Class : (Other Antibiotics)
spectinomycin

related spectinomycin information

Indication & Dosage

Intramuscular

Gonorrhoea

Adult: 2 g as single dose. In cases whereby antibiotic resistance is prevalent, 4 g (10 ml) may be given but divided as two 5 ml inj, admin to 2 different inj sites.

Child: <45 kg: 40 mg/kg as a single dose. ≥45 kg: 2 g as single dose. In cases whereby antibiotic resistance is prevalent, 4 g (10 ml) may be given but divided as two 5 ml inj, admin to 2 different inj sites.

Intramuscular

Disseminated gonococcal infection

Adult: 2 g every 12 hr.

Reconstitution: Reconstitute with supplied diluent only.

Contraindications

Hypersensitivity.

Special Precautions

Repeated doses may lead to changes in the kidney and liver function and a reduction in haemoglobin and haematocrit levels. Prolonged use may result in fungal or bacterial superinfection. All patients with gonorrhoea should be tested for syphilis at the time of diagnosis.

	levels. Prolonged use may result in fungal or bacterial superinfection. All patients with gonorrhoea should be tested for syphilis at the time of diagnosis.
Adverse Drug Reactions	Dizziness; nausea; urticaria; chills; fever; headache, insomnia, mild to moderate pain after inj. Potentially Fatal: Anaphylaxis.
Drug Interactions	May result in lithium toxicity when used concurrently.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intramuscular: Store at 20-25°C. Reconstituted solutions should be used within 24 hr after preparation.
Mechanism of Action	Spectinomycin binds to 30S subunit of the bacterial ribosome, thus inhibiting protein synthesis. It has modest activity against a wide range of gram-positive and gram-negative organisms, though anaerobic organisms are mostly resistant. Absorption: Poorly absorbed after oral admin but rapidly absorbed after IM inj. Distribution: Poor distribution into the saliva. Poorly bound to plasma proteins. Excretion: Excreted in an active form in the urine. Half-life: 1-3 hr; may be prolonged in renal impairment.
CIMS Class	Other Antibiotics
ATC Classification	J01XX04 - spectinomycin; Belongs to the class of other antibacterials. Used in the treatment of systemic infections.

***spectinomycin information:**

spiramycin

CIMS Class : (Macrolides)
spiramycin

P - Contraindicated in pregnancy
L - Caution when used during lactation

related spiramycin information

Indication & Dosage	<i>Oral</i> Protozoal infections Adult: 6-9 million units/day in 2-3 divided doses, increased to 15 million units/day, given in divided doses for severe infections. Child: and neonates: Chemoprophylaxis of congenital toxoplasmosis: 50 mg/kg bid. <i>Oral</i> Toxoplasmosis Adult: 6-9 million units/day in 2-3 divided doses, increased to 15 million units/day, given in divided doses for severe infections. Child: and neonates: Chemoprophylaxis of congenital toxoplasmosis: 50 mg/kg bid. <i>Oral</i> Susceptible infections Adult: 6-9 million units/day in 2-3 divided doses, increased to 15 million units/day, given in divided doses for severe infections.

Susceptible infections

Adult: 6-9 million units/day in 2-3 divided doses, increased to 15 million units/day, given in divided doses for severe infections.

Child: and neonates: Chemoprophylaxis of congenital toxoplasmosis: 50 mg/kg bid.

Oral

Cryptosporidiosis

Adult: 6-9 million units/day in 2-3 divided doses, increased to 15 million units/day, given in divided doses for severe infections.

Child: and neonates: Chemoprophylaxis of congenital toxoplasmosis: 50 mg/kg bid.

Intravenous

Toxoplasmosis

Adult: 1.5 million units by slow infusion every 8 hr, may double the dose in severe infections.

Intravenous

Susceptible infections

Adult: 1.5 million units by slow infusion every 8 hr, may double the dose in severe infections.

Intravenous

Cryptosporidiosis

Adult: 1.5 million units by slow infusion every 8 hr, may double the dose in severe infections.

Intravenous

Protozoal infections

Adult: 1.5 million units by slow infusion every 8 hr, may double the dose in severe infections.

Administration	May be taken with or without food.
Contraindications	Hypersensitivity; pregnancy.
Special Precautions	Hepatic impairment; lactation. Monitor liver function. History of arrhythmias or predisposition to QT interval prolongation.

Special Precautions	Hepatic impairment; lactation. Monitor liver function. History of arrhythmias or predisposition to QT interval prolongation.
Adverse Drug Reactions	Nausea, vomiting, abdominal pain, diarrhoea; urticaria, pruritus, macular rashes. Transient paraesthesia may occur. Potentially Fatal: Pseudomembranous colitis; anaphylaxis; neuromuscular blockade; ventricular arrhythmias, prolongation of QT interval.
Drug Interactions	Decreases carbidopa absorption and levodopa concentrations. Increased risk of ventricular arrhythmias when used with astemizole, cisapride and terfenadine. Risk of acute dystonia when used with fluphenazine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Spiramycin is a macrolide antibacterial that inhibits protein synthesis by irreversibly binding to the 50S subunit of the ribosomal subunit thus blocking the transpeptidation or translocation reactions of susceptible organisms resulting in stunted cell growth. Absorption: Incompletely absorbed from the GI tract (oral); peak plasma concentrations after 1.5-3 hr. Distribution: Widely distributed into tissues, enters breast milk. Protein binding: 10-25%. Metabolism: Metabolised hepatically to active metabolites. Excretion: Via bile (as metabolites), via urine (10%); 5-8 hr (elimination half-life).
CIMS Class	Macrolides
ATC Classification	J01FA02 - spiramycin; Belongs to the class of macrolides.

ATC Classification

J01FA02 - spiramycin; Belongs to the class of macrolides.

Used in the treatment of systemic infections.

spironolactone

CIMS Class : (Diuretics)
spironolactone

P - Caution when used during pregnancy

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related spironolactone information

Indication & Dosage

Oral

Oedema

Adult: Initially, 100 mg daily, may adjust dose according to response up to 400 mg daily.

Child: Neonates: 1–2 mg/kg daily; 1 mth–12 yr: 1–3 mg/kg daily; 12–18 yr: 50–100 mg daily. To be given in 1–2 divided doses.

Elderly: Initially, 25-50 mg/day in 1-2 divided doses, may increase by 25-50 mg every 5 days when necessary.

CrCl (ml/min)	Dosage Recommendation
10-50	Recommended dosing interval: Every 12-24 hr.
<10	Avoid use.

Oral

Hepatic cirrhosis with ascites and oedema

Adult: Depending on urinary sodium/potassium ratio: If >1: Initially, 100 mg daily and if <1: Initially, 200-400 mg daily.

Hepatic cirrhosis with ascites and oedema

Adult: Depending on urinary sodium/potassium ratio: If >1: Initially, 100 mg daily and if <1: Initially, 200-400 mg daily.

Child: Neonate: 1–2 mg/kg daily (Max: 7 mg/kg daily in resistant ascites); 1 mth–12 yr: 1–3 mg/kg daily (Max: 9 mg/kg daily in resistant ascites); 12–18 yr: 50–100 mg daily (Max: 400 mg daily in resistant ascites). To be given in 2 divided doses.

Elderly: Dosing adjustment may be required.

CrCl (ml/min)	Dosage Recommendation
10-50	Recommended dosing interval: Every 12-24 hr.
<10	Avoid use.

Oral

Diagnosis of primary hyperaldosteronism

Adult: 400 mg daily for 3-4 wk. Correction of serum potassium levels and hypertension gives the presumptive evidence for the diagnosis of primary aldosteronism.

Elderly: Dosing adjustment may be required.

CrCl (ml/min)	Dosage Recommendation
10-50	Recommended dosing interval: Every 12-24 hr.
<10	Avoid use.

Oral

Preoperative management of hyperaldosteronism

Adult: 100-400 mg daily. Long term maintenance in the absence of surgery: May initiate at 400 mg daily and maintain at 100-300 mg daily; lowest effective dose should be used.

Elderly: Dosing adjustment may be required.

CrCl (ml/min)	Dosage Recommendation
---------------	-----------------------

Elderly: Dosing adjustment may be required.

10-50	Recommended dosing interval: Every 12-24 hr.
-------	--

<10	Avoid use.
-----	------------

Oral

Hypertension

Adult: As monotherapy: Usual dose range: 25-50 mg daily, may increase up to 100 mg daily if needed.

Elderly: Initially, 25-50 mg/day in 1-2 divided doses, may increase by 25-50 mg every 5 days when necessary.

CrCl (ml/min)	Dosage Recommendation
---------------	-----------------------

10-50	Recommended dosing interval: Every 12-24 hr.
-------	--

<10	Avoid use.
-----	------------

Oral

Severe congestive heart failure

Adult: For patients receiving an ACE inhibitor and a loop diuretic with or without a cardiac glycoside: Initially, 12.5-25 mg daily. May increase to 50 mg daily after 8 wk of treatment depending on response.

Child: Neonates: 1–2 mg/kg daily; 1 mth–12 yr: 1–3 mg/kg daily; 12–18 yr: 50–100 mg daily. To be given in 1–2 divided doses.

Elderly: Dosing adjustment may be required.

CrCl (ml/min)	Dosage Recommendation
---------------	-----------------------

10-50	Recommended dosing interval: Every 12-24 hr.
-------	--

<10	Avoid use.
-----	------------

Oral

Diuretic-induced hypokalaemia

	<i>Oral</i>	
	Diuretic-induced hypokalaemia	
	Adult: 25-100 mg daily.	
	Child: Neonates: 1–2 mg/kg daily; 1 mth–12 yr: 1–3 mg/kg daily; 12–18 yr: 50–100 mg daily. To be given in 1–2 divided doses.	
	Elderly: Dosing adjustment may be required.	
	CrCl (ml/min)	Dosage Recommendation
	10-50	Recommended dosing interval: Every 12-24 hr.
	<10	Avoid use.
	<i>Oral</i>	
	Hirsutism	
Administration	Adult: 50-200 mg daily.	
	Elderly: Dosing adjustment may be required.	
	CrCl (ml/min)	Dosage Recommendation
	10-50	Recommended dosing interval: Every 12-24 hr.
	<10	Avoid use.
	Should be taken with food.	
Overdosage	Acute overdosage may result in drowsiness, mental confusion, maculopapular or erythematous rash, nausea, vomiting, dizziness or diarrhoea. Hyperkalemia may occur, especially in patients with impaired renal function. Induce vomiting or evacuate the stomach by lavage. Supportive treatment to maintain hydration, electrolyte balance and vital functions. For hyperkalaemia, cationic exchange resins such as sodium polystyrene sulfonate may be given orally or rectally. Persistent hyperkalemia may require dialysis.	
Contraindications	Anuria, hyperkalaemia, acute or progressive renal insufficiency. Addison's disease.	

	Anuria, hyperkalaemia, acute or progressive renal insufficiency. Addison's disease.
Special Precautions	Patients at risk of developing hyperkalaemia and acidosis; monitor serum electrolytes; renal and hepatic impairment; DM; elderly; pregnancy.
Adverse Drug Reactions	Fluid or electrolyte imbalance, gynaecomastia, GI upset, drowsiness, headache, hyponatraemia; tachycardia, hypotension, oliguria, hyperkalaemia; confusion, weakness, paraesthesia, hirsutism, mental disturbances, menstrual irregularities, loss of libido and impotence. Potentially Fatal: Fatal hyperkalaemia in combination with ACE inhibitors and previous renal impairment; agranulocytosis.
Drug Interactions	Sodium excretion effect may be inhibited by aspirin. May reduce ulcer-healing properties of carbenoxolone. Increased risk of nephrotoxicity when used with NSAIDs or ciclosporin. Hyperkalaemia may occur if given with potassium supplements, ACE inhibitors, angiotensin II antagonists, NSAIDs, ciclosporin or trilostane. May increase risk of orthostatic hypotension when used with barbiturates, narcotics or alcohol. May reduce vascular responsiveness to pressor amines. May increase half-life of digoxin. Potentially Fatal: Increased risk of lithium toxicity when used concurrently.
Food Interaction	Improved absorption if taken after food.
Lab Interference	Interferes with fluorometric measurements of plasma cortisol, immunoassays for serum digoxin, and estimations of 17-ketosteroids and 17-ketogenic steroids.
Pregnancy Category (US)	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. if used in pregnancy-induced hypertension. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store <25°C.
Mechanism of Action	Spironolactone acts on the distal renal tubules as a competitive antagonist of aldosterone. It increases the excretion of sodium chloride and water while conserving potassium and hydrogen ions. Absorption: Well absorbed from the GI tract after oral admin with a bioavailability of 90%. Distribution: About 90% bound to plasma proteins. Metabolism: Extensively metabolised. Excretion: Mainly excreted in the urine, some in the faeces, as metabolites.
CIMS Class	Diuretics
ATC Classification	C03DA01 - spironolactone; Belongs to the class of potassium-sparing agents, aldosterone antagonists. Used as diuretics.

stanozolol

CIMS Class : (Anabolic Agents)
stanozolol

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related stanozolol information

Indication & Dosage

Oral

Vascular manifestations of Behcet's syndrome

Adult: 10 mg daily.

Oral

Hereditary angioedema

Adult: Initially, 2.5-10 mg daily, reduced according to response. Maintenance: 2 mg daily or on alternate days or 2.5 mg 3 times wkly.

Child: <6 yr: 1 mg daily; 6-12 yr: Up to 2 mg daily.

Intramuscular

Anaemia

Adult: 50 mg every 2-3 wk.

Intramuscular

Catabolic disorders

Adult: 50 mg every 2-3 wk.

Intramuscular

Breast cancer in postmenopausal women

Adult: 50 mg every 2-3 wk.

	<i>Intramuscular</i> Breast cancer in postmenopausal women Adult: 50 mg every 2-3 wk. <i>Intramuscular</i> Osteopetrosis Adult: 50 mg every 2-3 wk.
Contraindications	Pregnancy and lactation; carcinoma of prostate or breast in men, hypercalcaemia, hypercalciuria, porphyria, severe hepatic impairment.
Special Precautions	Patients with cardiac, renal or hepatic disease, epilepsy or DM. Children, elderly. Monitor liver function, haematocrit and haemoglobin concentrations. Not recommended for treatment of hereditary angioedema in premenopausal women.
Adverse Drug Reactions	Peliosis hepatis, premature epiphyseal closure, cholestatic jaundice, virilism, impotence, priapism, testicular atrophy, gynaecomastia, prostatic hyperplasia, decreased libido, hirsutism, menstrual irregularities; oedema, acne. Potentially Fatal: Hepatic necrosis, hepatocellular carcinoma.
Drug Interactions	Enhances activity of insulin, sulfonylureas, levothyroxine and anticoagulants e.g. warfarin. May cause resistance to the effects of neuromuscular blockers.
Lab Interference	May interfere with laboratory tests for glucose tolerance and thyroid function.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.

	contraindicated in women who are or may become pregnant.
Mechanism of Action	Stanozolol is a structural analogue of testosterone which increases collagen production and decreases the anti-anabolic action of cortisone. It is also reported to reduce fibrin deposition. It corrects the formation of kinin or kinin-like factors which may be associated with oedema and swelling seen in hereditary angioedema. Metabolism: Hepatic. Excretion: Urine (90%), faeces (6%).
CIMS Class	Anabolic Agents
ATC Classification	A14AA02 - stanozolol; Belongs to the class of androstan derivative anabolic steroids used as systemic anabolic agents.

***stanozolol information:**

stavudine

CIMS Class : (Antivirals)
stavudine

P - Caution when used during pregnancy
L - Contraindicated in lactation

related stavudine information

Indication & Dosage	<i>Oral</i>	
	HIV infection	
	Adult: <60: 30 mg; =60 kg: 40 mg. Doses to be taken every 12 hr.	
	Child: From birth-13 days old: 500 mcg/kg; =14 days old and weighing <30 kg: 1 mg/kg; 30 kg-<60 kg: 30 mg; =60 kg: 40 mg. Doses to be taken every 12 hr.	
	CrCl (ml/min)	Dosage Recommendation
	26-50	<60 kg: 15 mg; =60 kg: 20 mg. Doses to be taken every 12 hr.
	<25	<60 kg: 15 mg; =60 kg: 20 mg. Doses to be taken every 24 hr.
Administration	May be taken with or without food.	
Overdosage	Chronic overdosage may lead to peripheral neuropathy and hepatic toxicity.	
Contraindications	Hypersensitivity. Lactation.	
Special Precautions	Hepatomegaly or other risk factors for liver disease. History of peripheral neuropathy and renal impairment. Pregnancy. Discontinue treatment if peripheral neuropathy develops;	

	Hepatomegaly or other risk factors for liver disease. History of peripheral neuropathy and renal impairment. Pregnancy. Discontinue treatment if peripheral neuropathy develops; may resume treatment at half the previous dose if symptoms resolve upon drug withdrawal. Monitor for signs of pancreatitis. Discontinue treatment if there is a rapid increase in aminotransferase concentrations, progressive hepatomegaly or steatosis, or metabolic or lactic acidosis. Increased risk of severe and fatal hepatic adverse events in patients with chronic hepatitis B or C treated with combination antiretroviral therapy.
Adverse Drug Reactions	Headache, nausea, vomiting, asthenia, chest pain, influenza-like syndrome, insomnia, abdominal pain, anorexia, neutropenia, thrombocytopenia, arthralgia, myalgia, mood changes, dyspnoea, pharyngitis, skin rashes, pruritus.
Drug Interactions	Antiviral effect inhibited by zidovudine, doxorubicin and ribavirin. Avoid concurrent admin with drugs that cause pancreatitis (e.g. IV pentamidine) or peripheral neuropathy (e.g. metronidazole, isoniazid and vincristine). Increased risk of adverse effects such as hepatotoxicity, peripheral neuropathy and pancreatitis if used with hydroxycarbamide and didanosine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 25°C.
Mechanism of Action	Stavudine is converted intracellularly to the active metabolite stavudine 5'-triphosphate which is then incorporated into the viral DNA by reverse transcriptase resulting in premature

	Stavudine is converted intracellularly to the active metabolite stavudine 5'-triphosphate which is then incorporated into the viral DNA by reverse transcriptase resulting in premature ending of the DNA chain elongation. Absorption: Rapidly absorbed from the GI tract after oral admin, food may delay its absorption; peak plasma concentrations within 1 hr. Distribution: Crosses the blood-brain barrier and negligible plasma protein binding. Metabolism: Intracellular; converted to the active antiviral triphosphate. Excretion: Urine (about 40%); 1.5 hr (elimination half-life).
CIMS Class	Antivirals
ATC Classification	J05AF04 - stavudine; Belongs to the class of nucleoside and nucleotide reverse transcriptase inhibitors. Used in the systemic treatment of viral infections.

streptokinase

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
streptokinase

P - Contraindicated in pregnancy

related streptokinase information

Indication & Dosage

Intravenous

Acute myocardial infarction

Adult: 1.5 million units as a single dose infused over 1 hr immediately after onset of symptoms.

Intravenous

Pulmonary thromboembolism

Adult: Loading dose: 250,000 units infused over 30 min. Maintenance: 100,000 units/hr for 24-72 hr depending on the condition to be treated. For cerebral retinal thrombosis, 12 hr may be sufficient. Monitor treatment by maintaining thrombin clotting time at 2-4 times normal values.

Child: Loading dose: 2500-4000 units/kg over 30 min, followed by infusion of 500-1000 units/kg/hr, continued until reperfusion occurs, up to 3 days. Initial dose may be estimated by streptokinase resistance test. Monitor treatment by maintaining thrombin clotting time at 2-4 times normal values.

Intravenous

Arteriovenous occlusions

Adult: Loading dose: 250,000 units infused over 30 min.

	normal values. <i>Intravenous</i> Arteriovenous occlusions Adult: Loading dose: 250,000 units infused over 30 min. Maintenance: 100,000 units/hr for 24-72 hr depending on the condition to be treated. For cerebral retinal thrombosis, 12 hr may be sufficient. Monitor treatment by maintaining thrombin clotting time at 2-4 times normal values. Child: Loading dose: 2500-4000 units/kg over 30 min, followed by infusion of 500-1000 units/kg/hr, continued until reperfusion occurs, up to 3 days. Initial dose may be estimated by streptokinase resistance test. Monitor treatment by maintaining thrombin clotting time at 2-4 times normal values.
Contraindications	Severe hypertension, recent stroke, cerebral neoplasm, recent history of peptic ulcer disease, ulcerative colitis, pancreatitis, subacute bacterial endocarditis, coagulation defects also due to liver or kidney disease, recent surgery, childbirth. Hypersensitivity, increased risk of cerebral bleeding, trauma. Pregnancy. Active internal bleeding, bleeding GI lesions.
Special Precautions	Mitral stenosis associated with AF. Streptokinase treatment within last 12 mth, use after prolonged or traumatic CPR; diabetic retinopathy. Elderly.
Adverse Drug Reactions	Fever, chills, back pain, abdominal pain, nausea, vomiting, arrhythmia, bruising, rash, pruritus, acute renal failure due to embolism and haemorrhage. Cerebral, peripheral and pulmonary embolism. Allergic reactions, liver enzyme abnormalities, hypotension. Potentially Fatal: Haemorrhage; anaphylactic shock.
Drug Interactions	Antagonistic effects with antifibrinolytic agents e.g. aminocaproic acid.

	Antagonistic effects with antifibrinolytic agents e.g. aminocaproic acid. Potentially Fatal: Anticoagulants, heparin, antiplatelet agents e.g. aspirin and dipyridamole affect platelet function increasing the risk of haemorrhage.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store unopened vials at room temperature. Reconstituted solutions should be kept in the refrigerator and used within 24 hr after preparation.
Mechanism of Action	Streptokinase forms a complex with plasminogen which then converts plasminogen to plasmin. Plasmin breaks down clots as well as fibrinogen and other plasma proteins. Absorption: Rapidly cleared from the circulation after IV use. Excretion: Elimination half-life of streptokinase-activator complex: 23 minutes.
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC Classification	B01AD01 - streptokinase; Belongs to the class of enzymes. Used in the treatment of thrombosis.

related streptomycin information

Indication & Dosage

Intramuscular

Tuberculosis

Adult: 15 mg/kg daily; max: 1 g daily. Reduce max daily dose to 500-750 mg in patients >40 yr. As part of an intermittent therapy: 25-30 mg/kg/day 2-3 times/wk; max: 1.5 g/dose. Not >120 g over the course of treatment should be given unless there are no other treatment options.

Child: 20–40 mg/kg (max: 1 g) daily or 25–30 mg/kg (max: 1.5 g) 2–3 times wkly.

Elderly: =60 kg: Dosage reduction is required.

Renal impairment: Modification in dose or dosing interval may be required.

CrCl (ml/min)	Dosage Recommendation
10-50	Dosing interval: Every 24-72 hr.
<10	Dosing interval: Every 72-96 hr.

Intramuscular

Mycobacterium avium complex infections

Intramuscular

Mycobacterium avium complex infections

Adult: As adjunct therapy (with macrolide, rifamycin and ethambutol): 15 mg/kg 3 times wkly for first 2-3 mth for severe disease. Longer duration may be needed in patients with extensive disease or when other agents are poorly tolerated.

Elderly: ≥60 yr: Dosage reduction is required.

Renal impairment: Modification in dose or dosing interval may be required.

CrCl (ml/min)	Dosage Recommendation
10-50	Dosing interval: Every 24-72 hr.
<10	Dosing interval: Every 72-96 hr.

Intramuscular

Bacterial endocarditis

Adult: To be used concurrently with penicillin. Streptococcal endocarditis: 1 g bid for the first wk, 500 mg bid for the second wk. Enterococcal endocarditis (in combination with penicillin): 1 g bid for 2 wk and 500 mg bid for an additional 4 wk; ototoxicity may necessitate termination of streptomycin before the completion of the 6-wk therapy.

Child: To be used concurrently with penicillin. Enterococcal endocarditis: 20–30 mg/kg daily given in 2 divided doses. Recommended treatment duration: 4-6 wk for patients native valve endocarditis and at least 6 wk for patients with prosthetic valve or other prosthetic cardiac material.

Renal impairment: Modification in dose or dosing interval may be required.

CrCl (ml/min)	Dosage Recommendation
10-50	Dosing interval: Every 24-72 hr.
<10	Dosing interval: Every 72-96 hr.

Intramuscular

Intramuscular

Brucellosis

Adult: 1 g/day for 14-21 days. To be used with oral doxycycline at 100 mg bid for 6 wk.

Child: ≥7 yr: 1 g/day (for patients ≥50 kg: 15 mg/kg daily) for 14 days . To be used with oral doxycycline at 100 mg bid for 6 wk.

Renal impairment: Modification in dose or dosing interval may be required.

CrCl (ml/min)	Dosage Recommendation
10-50	Dosing interval: Every 24-72 hr.
<10	Dosing interval: Every 72-96 hr.

Intramuscular

Plague

Adult: 2 g daily in 2 divided doses. Recommended treatment duration: At least 10 days.

Child: 30 mg/kg daily (max: 2 g daily) given in 2 or 3 divided doses. Recommended treatment duration: At least 10 days.

Renal impairment: Modification in dose or dosing interval may be required.

CrCl (ml/min)	Dosage Recommendation
10-50	Dosing interval: Every 24-72 hr.
<10	Dosing interval: Every 72-96 hr.

Intramuscular

Tularaemia

Adult: 1–2 g daily given in divided doses for 7–14 days and until the patient is afebrile for 5–7 days

Child: 15 mg/kg bid (max: 2 g daily) for at least 10–14 days.

Renal impairment: Modification in dose or dosing interval may be required.

	Child: 15 mg/kg bid (max: 2 g daily) for at least 10–14 days.	
	Renal impairment: Modification in dose or dosing interval may be required.	
	CrCl (ml/min)	Dosage Recommendation
	10-50	Dosing interval: Every 24-72 hr.
	<10	Dosing interval: Every 72-96 hr.
	Incompatibility: Incompatible with amobarbital, amphotericin B, chlorothiazide, heparin, methohexital, norepinephrine, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate when admixed.	
Contraindications	Pregnancy; hypersensitivity.	
Special Precautions	Renal impairment. Lactation. Avoid topical and inhalational streptomycin. Regular audiometric tests are recommended for prolonged therapy. Monitor renal function. Increased risk of neurotoxic effects when used in renally impaired patients. Neurotoxicity may cause respiratory paralysis especially if streptomycin is given soon after the use of anaesthesia or muscle relaxants.	
Adverse Drug Reactions	Giddiness, vertigo, tinnitus, ataxia, hypersensitivity reactions, ototoxicity and nephrotoxicity. Potentially Fatal: Anaphylactic shock, aplastic anaemia and agranulocytosis. Stevens-Johnson syndrome and toxic epidermal necrolysis.	
Drug Interactions	H ₁ -receptor blockers may mask early signs of ototoxicity. May reduce excretion of zalcitabine. May inhibit α -galactosidase activity. Potentially Fatal: Potentiates nephrotoxicity produced by other aminoglycosides, vancomycin and some cephalosporins. Potentiates ototoxicity produced by other aminoglycosides, ethacrynic acid, mannitol, furosemide and other diuretics.	

	other aminoglycosides, vancomycin and some cephalosporins. Potentiates ototoxicity produced by other aminoglycosides, ethacrynic acid, mannitol, furosemide and other diuretics.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intramuscular: Store at 2-8°C.
Mechanism of Action	Streptomycin is bactericidal which inhibits bacterial protein synthesis. Susceptible organisms include <i>Mycobacterium tuberculosis</i>, <i>Pasteurella pestis</i>, <i>P. tularensis</i>, <i>Brucella</i>, <i>H. influenzae</i>, <i>H. ducreyi</i>, <i>Klebsiella pneumoniae</i>, <i>Escherichia coli</i>, <i>Proteus</i> spp., <i>Aerobacter aerogenes</i>, <i>Streptococcus faecalis</i>, and <i>Streptococcus viridans</i>. Absorption: Well absorbed after IM admin. Poor absorption after oral admin. Distribution: Protein-binding: 34%. Distributes into most body tissues and fluids except the brain. Excretion: 30-90% of the dose via the urine by glomerular filtration (within 24 hr); 2.5 hr (elimination half-life).
CIMS Class	Aminoglycosides / Anti-TB Agents
ATC Classification	A07AA04 - streptomycin; Belongs to the class of antibiotics. Used for the treatment of intestinal infections. J01GA01 - streptomycin; Belongs to the class of aminoglycosides, streptomycin. Used in the treatment of systemic infections.

strontium ranelate

CIMS Class : (Agents Affecting Bone Metabolism)
strontium ranelate

Lab α - Lab interference

related strontium ranelate information

Indication & Dosage	<i>Oral</i> Postmenopausal osteoporosis Adult: 2 g daily. <table border="1"><thead><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr></thead><tbody><tr><td><30</td><td>Not recommended.</td></tr></tbody></table>	CrCl (ml/min)	Dosage Recommendation	<30	Not recommended.
CrCl (ml/min)	Dosage Recommendation				
<30	Not recommended.				
Administration	Should be taken on an empty stomach. (Take on an empty stomach between meals, preferably at bedtime at least 2 hr after food, milk, milk products or Ca supplements. Mix only w/ plain water & drink immediately.)				
Special Precautions	Not recommended for use in patients with CrCl <30 ml/min. Patients at increased risk of venous thromboembolism.				
Adverse Drug Reactions	Nausea and diarrhoea. Headache, loose stools and eczema. Transient reversible increases in creatine kinase activity.				
Drug Interactions	Food, milk and derivative products, and medicinal products containing calcium may reduce the bioavailability of strontium ranelate. May reduce the absorption of oral tetracycline and quinolone antibiotics.				
Lab Interference	May interfere with determination of serum and urinary calcium.				

Mechanism of Action	Strontium ranelate increases bone formation in bone tissue culture as well as osteoblast precursor replication and collagen synthesis in bone cell culture. It also reduces bone resorption by decreasing osteoclast differentiation and resorbing activity. This results in a rebalance of bone turnover in favour of bone formation. Absorption: Oral bioavailability: about 25%. May be reduced by calcium or food. Distribution: Low protein binding. Metabolism: Not metabolised. Excretion: Half-life: 60 hr. Excreted via kidneys and GI tract.
CIMS Class	Agents Affecting Bone Metabolism
ATC Classification	M05BX03 - strontium ranelate;

sucralfate

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants)
sucralfate

P - Caution when used during pregnancy

L - Caution when used during lactation

related sucralfate information

Indication & Dosage

Oral

Peptic ulcer

Adult: 1 g 4 times daily or 2 g bid for 4-8 wk, may extend up to 12 wk if necessary. Maintenance dose of 1 g bid may be given to prevent the recurrence of duodenal ulcers. Max: 8 g daily.

Child: 1 mth-2 yr: 250 mg 4-6 times daily; 2-12 yr: 500 mg 4-6 times daily and 12-18 yr: 1 g 4-6 times daily.

Oral

Chronic gastritis

Adult: 1 g 4 times daily or 2 g bid for 4-8 wk, may extend up to 12 wk if necessary. Maintenance dose of 1 g bid may be given to prevent the recurrence of duodenal ulcers. Max: 8 g daily.

Child: 1 mth-2 yr: 250 mg 4-6 times daily; 2-12 yr: 500 mg 4-6 times daily and 12-18 yr: 1 g 4-6 times daily.

Oral

Prophylaxis of gastrointestinal haemorrhage from stress ulceration

Adult: 1 g 6 times daily. Not to exceed 8 g daily.

Child: 1 mth-2 yr: 250 mg 4-6 times daily; 2-12 yr: 500 mg 4-6

	Prevention of gastrointestinal haemorrhage from stress ulceration Adult: 1 g 6 times daily. Not to exceed 8 g daily. Child: 1 mth-2 yr: 250 mg 4-6 times daily; 2-12 yr: 500 mg 4-6 times daily and 12-18 yr: 1 g 4-6 times daily.
Administration	Should be taken on an empty stomach. (Take on an empty stomach 1 hr before or 2 hr after meals.)
Overdosage	Sucralfate is poorly absorbed from the GI tract thus the risk from overdosage is minimal.
Special Precautions	Systemic aluminum toxicity may occur in patients with chronic renal failure. Neonates, children; pregnancy and lactation.
Adverse Drug Reactions	Constipation, diarrhoea, nausea, dizziness, dry mouth. GI disturbances, rash, pruritus, headache, vertigo, back pain, drowsiness.
Drug Interactions	Avoid antacids within 30 min of sucralfate admin. May reduce absorption of tetracyclines, ranitidine, ketoconazole, theophylline, phenytoin, cimetidine and digoxin (ensure a dosing interval of at least 2 hr between admin of sucralfate and other non-antacid medications).
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 20-25°C.
Mechanism of Action	Sucralfate protects GI lining against peptic acid, pepsin and bile salts by binding with positively-charged proteins in exudates forming a viscous paste-like adhesive substance thus forming a protective coating. Onset: 1-2 hr.

	forming a viscous paste-like adhesive substance thus forming a protective coating. Onset: 1-2 hr. Duration: 6 hr. Absorption: <5% after oral admin. Distribution: Acts locally at ulcer sites; unbound in GI tract to aluminum and sucrose sulfate. Excretion: Mainly in the urine.
CIMS Class	Antacids, Antireflux Agents & Antiulcerants
ATC Classification	A02BX02 - sucralfate; Belongs to the class of other drugs used in the treatment of peptic ulcer and gastro-oesophageal reflux disease (GERD).

sulfacetamide

CIMS Class : (Eye Anti-infectives & Antiseptics)
sulfacetamide

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related sulfacetamide information

Indication & Dosage	<i>Ophthalmic</i> Ocular infections Adult: As sodium: Apply 10-30% eye drops or 10% ointment into the affected eye/s. May be used up to tid.
Contraindications	Hypersensitivity; infants <2 mth.
Special Precautions	Elderly. History of allergy or asthma; G6PD deficiency; renal and hepatic impairment. Prolonged therapy requires CBC and urinalysis with microscopic examination. Maintain adequate fluid intake. Pregnancy, lactation.
Adverse Drug Reactions	Hypersensitivity skin reaction. Ophthalmic: Burning, stinging, conjunctivitis, corneal ulcers, irritation, conjunctival hyperaemia. Systemic absorption from inflamed conjunctiva. Potentially Fatal: Stevens-Johnson syndrome.
Drug Interactions	Action antagonised by PABA and procaine group of local anaesthetics. PABA present in purulent eye exudates can competitively inhibit the action of sulphacetamide.
Lab Interference	May interfere with diagnostic tests e.g. urinary glucose,

Lab Interference	May interfere with diagnostic tests e.g. urinary glucose, urobilinogen, urea and creatinine.
Storage	Ophthalmic: Store below 25°C.
Mechanism of Action	Sulfacetamide has bacteriostatic effect on a wide range of gram-positive and gram-negative organisms. It interferes with nucleic acid synthesis thus blocking conversion of PABA to the coenzyme dihydrofolic acid. Absorption: Penetrates into ocular tissues and fluids (ophthalmic). Excretion: Urine (as unchanged drug); 7-13 hr (elimination half-life).
CIMS Class	Eye Anti-infectives & Antiseptics
ATC Classification	S01AB04 - sulfacetamide; Belongs to the class of anti-infectives, sulfonamides. Used in the treatment of eye infections.

sulfadiazine

CIMS Class : (Sulphonamides)
sulfadiazine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related sulfadiazine information

Indication & Dosage

Oral

Susceptible infections

Adult: Initially, 2-4 g/day. May increase up to 6 g/day, given in divided doses.

Child: Start with 75 mg/kg, subsequently, 150 mg/kg in divided doses. Max: 6 g/day.

Renal impairment: Dosage reduction may be necessary.

Oral

Prophylaxis of rheumatic fever

Adult: >30 kg: 1 g once daily; <30 kg: 500 mg once daily.

Child: <30 kg: 0.5 g every 24 hr; >30 kg: 1 g/day.

Renal impairment: Dosage reduction may be necessary.

Oral

Nocardiosis

Adult: 4-8 g daily for at least 6 wk. May continue for many mth to prevent relapse of infection.

Renal impairment: Dosage reduction may be necessary.

Oral

	month to prevent relapse of infection. Renal impairment: Dosage reduction may be necessary. <i>Oral</i> Toxoplasmosis Adult: Including immunocompromised patients: 4-6 g/day in 4 divided doses for at least 6 wk. Subsequently, 2-4 g/day, to be continued indefinitely. Child: For congenital toxoplasmosis: <2 mth: 50 mg/kg bid for 12 mth. Renal impairment: Dosage reduction may be necessary. <i>Oral</i> Prophylaxis of toxoplasmosis in patients with HIV infection Adult: 0.5-1 g every 6 hr, to be taken with oral pyrimethamine (25-50 mg daily) and oral leucovorin (10-25 mg/day). Child: 85-120 mg/kg/day, given in 2-4 divided doses with oral pyrimethamine (1 mg/kg/day; max: 25 mg/day) and oral leucovorin (5 mg once every 3 days). Renal impairment: Dosage reduction may be necessary.
Contraindications	Hypersensitivity; severe renal/hepatic impairment, blood dyscrasias, porphyrias, pregnancy (at term), lactation.
Special Precautions	Elderly, maintain adequate fluid intake to reduce risk of crystalluria, G6PD deficiency, AIDS. Renal/hepatic impairment, history of allergy or asthma. Discontinue treatment if patient develops rash. Conduct CBC and urinalyses using microscopic examination during prolonged therapy. May exacerbate lupus erythematosus. Infants <2 mth.
Adverse Drug Reactions	Nausea, vomiting, anorexia and diarrhoea. Hypersensitivity, skin reactions; lumbar pain, haematuria, oliguria, anuria, crystallisation in urine, thrombocytopenia, leucopenia,

	Nausea, vomiting, anorexia and diarrhoea. Hypersensitivity, skin reactions; lumbar pain, haematuria, oliguria, anuria, crystallisation in urine, thrombocytopenia, leucopenia, eosinophilia, neonatal jaundice and kernicterus. Potentially Fatal: Stevens-Johnson syndrome; agranulocytosis, thrombocytopenia, jaundice in newborn.
Drug Interactions	Potentiates antidiabetic effect of sulphonylureas. Action antagonised by PABA and procaine group of local anaesthetics. Potentiates oral anticoagulants, methotrexate and phenytoin. May decrease serum levels of ciclosporin. Ascorbic acid and hexamine may increase risk of crystalluria.
Lab Interference	Interferes with estimation of urinary glucose, urobilinogen, urea and creatinine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. if administered near term. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Sulfadiazine is a short-acting sulfonamide derivative with bacteriostatic action through competitive inhibition of bacterial synthesis of folic acid. Susceptible organisms include E.coli, Klebsiella, Enterobacter, Proteus mirabilis, P.vulgaris, S.aureus, Toxoplasma, N.meningitidis,

	bacteriostatic action through competitive inhibition of bacterial synthesis of folic acid. Susceptible organisms include E.coli, Klebsiella, Enterobacter, Proteus mirabilis, P.vulgaris, S.aureus, Toxoplasma, N.meningitidis, H.influenzae. Absorption: Readily absorbed from the GI tract. Blood concentrations peak 3-6 hr after a single dose. Distribution: 20-55% bound to plasma proteins. Distributes into CSF within 4 hr of an oral dose. Excretion: Half-life: About 10 hr; prolonged in renal impairment. About 50% of a single oral dose is excreted in the urine within 24 hr.
CIMS Class	Sulphonamides
ATC Classification	J01EC02 - sulfadiazine; Belongs to the class of intermediate-acting sulfonamides. Used in the treatment of systemic infections.

sulfadiazine + trimethoprim

CIMS Class : (Antibacterial Combinations)
sulfadiazine + trimethoprim

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ✖ - Lab interference

Food ✖ - Food interaction

related sulfadiazine + trimethoprim information

Indication & Dosage

Oral

Urinary tract infections

Adult: Per tablet contains sulfadiazine 410 mg and trimethoprim 90 mg or per 5 mL suspension contains sulfadiazine 205 mg and trimethoprim 45 mg: 2 tablets or 20 mL as a single dose every 24 hr.

Child: >3 mth: Per day: 14 mg sulfadiazine/kg+3 mg trimethoprim/kg. Daily dose is divided into 2 equal doses given every 12 hr.

Contraindications

Hypersensitivity; severe renal/hepatic impairment; blood dyscrasias, porphyrias, serious hematological disorders; megaloblastic anemia secondary to folate depletion. Infants =2 mth; pregnancy (at term), lactation.

Special Precautions

Elderly, adequate fluid intake, G6PD deficiency, AIDS; actual or possible folate deficiency, child with fragile X chromosome associated with mental retardation; discontinue in case of skin rash; perform regular hematological examination.

	Elderly, adequate fluid intake, GORD deficiency, AIDS, actual or possible folate deficiency, child with fragile X chromosome associated with mental retardation; discontinue in case of skin rash; perform regular hematological examination.
Adverse Drug Reactions	Nausea, vomiting, anorexia and diarrhoea. Hypersensitivity, skin reactions; lumbar pain, haematuria, oliguria, anuria, crystallisation in urine, thrombocytopaenia, leucopaenia, eosinophilia, neonatal jaundice and kernicterus. Potentially Fatal: Stevens-Johnson syndrome; agranulocytosis, thrombocytopaenia, jaundice in new born. Mild GI disturbances; pruritus; skin rash; sulfonamide-like skin reactions; disturbances of liver enzyme values, cholestatic jaundice; raised serum creatinine and BUN; fever; anaphylaxis; aseptic meningitis; hematologic disturbances; photosensitivity; induce hyperkalemia particularly in HIV patients being treated for Pneumocystis carinii pneumonia or in the elderly.
Drug Interactions	Sulphadiazine: Potentiates antidiabetic effect of sulphonylureas. Action antagonised by para-aminobenzoic acid and procaine group of local anaesthetics. Trimethoprim: Potentiate effects of phenytoin, digoxin, procainamide, warfarin. Reduces renal excretion of zalcitabine, zidovudine and lamivudine. Dapsone; rifampicin; increase risk of nephrotoxicity when given with cyclosporin; severe hyperkalaemia when given with ACE inhibitor; depressants of bone marrow function; risk of megaloblastic anemia with other folate inhibitors eg pyrimethamine, methotrexate; hyponatraemia if receiving diuretics concurrently. Potentially Fatal: Potentiates oral anticoagulants, methotrexate and phenytoin. Ascorbic acid and hexamine may precipitate crystalluria; metabolism of oral

	diuretics concurrently. Potentially Fatal: Potentiates oral anticoagulants, methotrexate and phenytoin. Ascorbic acid and hexaminemay precipitate crystalluria; metabolism of oral hypoglycaemics may be inhibited.
Food Interaction	Avoid vit C or acidifying agents to prevent crystalluria.
Lab Interference	Interferes with estimation of urinary glucose, urobilinogen, urea and creatinine. May interfere with serum methotrexate assay where dihydrofolate reductase is used. Jaffe reaction for creatinine.
Mechanism of Action	Sulphadiazine is a short-acting sulphonamide derivative with bacteriostatic action through competitive inhibition of bacterial synthesis of folic acid. Trimethoprim inhibits enzymes folic acid pathway, preventing the reaction of the dihydrolic acid to tetrahydrofolate.
CIMS Class	Antibacterial Combinations
ATC Classification	J01EA01 - trimethoprim; Belongs to the class of trimethoprim and derivatives. Used in the treatment of systemic infections.

sulfadoxine + pyrimethamine

CIMS Class : (Antimalarials)
sulfadoxine + pyrimethamine

P - Caution when used during pregnancy

L - Contraindicated in lactation

related sulfadoxine + pyrimethamine information

Indication & Dosage

Oral

Chloroquine resistant falciparum malaria acute attack

Adult: Per tab contains pyrimethamine 25 mg and sulfadoxine 500 mg: 2-3 tabs as a single dose. Do not repeat for at least 7 days.

Child: Pyrimethamine 25mg + Sulfadoxine 500mg (Tablet):
<2 yr (5-10 kg): ½ tab as a single dose; 2-5 yr (>10-20 kg): 1 tab as a single dose; 5-10 yr (< 20-30 kg): 1½ tab as a single dose; 10-14 yr (> 30-45 kg): 2 tab as a single dose. Do not repeat for at least 7 days.

Renal impairment: Dose reduction may be needed. Severe: contra-indicated.

Hepatic impairment: Dose reduction may be needed. Severe: contra-indicated.

Overdosage

Symptoms: Headache, nausea, anorexia, vomiting, CNS stimulation, megaloblastic anaemia, leukopenia, thrombocytopenia, glossitis and crystalluria. Management: Treatment is symptomatic and supportive. Emesis and gastric lavage to reduce drug absorption. Ensure that patient

	stimulation, megaloblastic anaemia, leukopenia, thrombocytopenia, glossitis and crystalluria. Management: Treatment is symptomatic and supportive. Emesis and gastric lavage to reduce drug absorption. Ensure that patient is adequately hydrated to prevent kidney damage. Monitor renal, hepatic, and haematopoietic systems for at least 1 month after overdosage. Folinic acid may be admin for depressed platelet or WBC counts.
Contraindications	Severe renal or hepatic impairment, blood dyscrasias, hypersensitivity to components, megaloblastic anaemia due to folate deficiency, pregnancy at term and during lactation, infants = 2 mth old.
Special Precautions	Impaired renal or hepatic function, folate deficiency, severe allergy or bronchial asthma, G6PD deficiency, pregnancy. Take with plenty of water to prevent crystalluria. Avoid excessive exposure to sun. Discontinue at the first sign of rash. Discontinue if signs of folic acid deficiency develops. Regular CBC monitoring, LFT, analysis of urine for crystalluria when admin for > 3 mth. Take with food to minimise Gi effects (e.g. anorexia and vomiting).
Adverse Drug Reactions	Urticaria, serum sickness, photosensitisation, arthralgia, nausea, vomiting, abdominal pain, diarrhoea, headache, peripheral neuritis, ataxia, tinnitus, vertigo, convulsions, toxic nephrosis and pulmonary infiltrates resembling eosinophilic or allergic alveolitis. Potentially Fatal: Stevens-Johnson syndrome, toxic epidermal necrolysis, fulminant hepatic necrosis, blood dyscrasias, anaphylactoid reactions.
Drug Interactions	Increased halofantrine and chlorpromazine levels. Increased effects of warfarin. Potentially Fatal: Increased risk of myelosuppression with zidovudine, clozapine.

	effects of warfarin. Potentially Fatal: Increased risk of myelosuppression with zidovudine, clozapine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Pyrimethamine, a folic acid antagonist, inhibits the reduction of dihydrofolic acid to tetrahydrofolic acid (folinic acid). Sulfadoxine, a structural analog of p-aminobenzoic acid (PABA), competitively inhibits dihydrofolic acid synthesis which is important for PABA conversion to folic acid. This combination results in a synergistic action against susceptible plasmodia. Both have prolonged half-lives enabling single dose admin. Absorption: Peak plasma concentration: 4 hr. Distribution: Volume of distribution: 0.14 L/kg (sulfadoxine); 2.3 L/kg (pyrimethamine). Protein binding: 90% (for both drugs). Both drugs cross placenta and passes into breast milk. Metabolism: Sulfadoxine: 5% appear in blood as acetylated metabolite, 2-3% as glucuronide. Pyrimethamine converted to several metabolites. Excretion: Elimination half life: 100 hr (pyrimethamine); 200 hr (sulfadoxine). Excreted mainly via kidneys.
CIMS Class	Antimalarials
ATC Classification	P01BD01 - pyrimethamine; Belongs to the class of diaminopyrimidine antimalarials. Used in the management of malarial infections.

sulfamethizole

CIMS Class : (Sulphonamides)
sulfamethizole

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab - Lab interference

related sulfamethizole information

Indication & Dosage

Oral

Urinary tract infections

Adult: 1.5-4 g/day in 3-4 divided doses.

Child: 30-45 mg/kg/day in 4 divided doses.

Renal impairment: Dose reduction may be needed.

Hepatic impairment: Dose reduction may be needed.

Contraindications

Severe renal or hepatic failure; blood disorders; hypersensitivity to sulfonamides; acute porphyria; SLE; infants ≥ 2 mth; pregnancy and lactation.

Special Precautions

Renal or hepatic impairment; history of allergy or asthma; AIDS; G6PD deficiency (at risk of haemolytic reactions); elderly; ensure adequate fluid intake to reduce risk of crystalluria. Discontinue if rash develops.

Adverse Drug Reactions

Nausea, vomiting, anorexia, diarrhoea, hypersensitivity reactions, SLE, serum sickness-like syndrome, liver necrosis and hepatomegaly, myocarditis, pulmonary eosinophilia and fibrosing alveolitis, vasculitis, hypoglycaemia,

	reactions, SLE, serum sickness-like syndrome, liver necrosis and hepatomegaly, myocarditis, pulmonary eosinophilia and fibrosing alveolitis, vasculitis, hypoglycaemia, hypothyroidism, neurological reactions, jaundice and kernicterus in premature neonates. Pseudomembranous colitis. Potentially Fatal: Blood dyscrasias, Stevens-Johnson syndrome, toxic epidermal necrolysis, anaphylaxis.
Drug Interactions	Potentiates effects of oral anticoagulants, methotrexate, phenytoin. Increased risk of crystalluria with compounds that render the urine acidic. Increased risk of blood dyscrasias with clozapine. Increased risk of hypoglycaemia with tolbutamide. Potentially Fatal: Increased risk of kidney damage with methenamine.
Lab Interference	Interfere with tests for urea, creatinine, urinary glucose and urobilinogen.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. if administered near term. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Sulfamethizole is a short-acting sulfonamide. It is generally not used in systemic infections due to low drug

	Sulfamethizole is a short-acting sulfonamide. It is generally not used in systemic infections due to low drug concentrations in blood and tissue. Absorption: Readily absorbed from GI tract. Distribution: Protein-binding: 90%. Metabolism: Undergoes slight acetylation. Excretion: Half life: 1.5-3 hr. Rapidly excreted via urine.
CIMS Class	Sulphonamides
ATC Classification	B05CA04 - sulfamethizole; Belongs to the class of antiinfectives used as irrigating solutions. D06BA04 - sulfamethizole; Belongs to the class of topical sulfonamides used in the treatment of dermatological diseases. J01EB02 - sulfamethizole; Belongs to the class of short-acting sulfonamides. Used in the treatment of systemic infections. S01AB01 - sulfamethizole; Belongs to the class of antiinfectives, sulfonamides. Used in the treatment of eye infections.

Indication & Dosage

Oral

Susceptible infections

Adult: 960 mg bid, up to 2.88 g daily given in 2 divided doses in severe cases.

Child: 6 wk-5 mth: 120 mg bid; 6 mth-5 yr: 240 mg bid; 6-12 yr: 480 mg bid.

Renal impairment: Dosage reduction for adults and children
>12 yr:

CrCl (ml/min)	Dosage Recommendation
15-30	Half the standard dose.
<15	Not recommended.

Hepatic impairment: Avoid in severe impairment.

Oral

Respiratory tract infections

Adult: 960 mg bid, up to 2.88 g daily given in 2 divided doses in severe cases.

Child: 6 wk-5 mth: 120 mg bid; 6 mth-5 yr: 240 mg bid; 6-12 yr: 480 mg bid.

Renal impairment: Dosage reduction for adults and children

doses in severe cases.

Child: 6 wk-5 mth: 120 mg bid; 6 mth-5 yr: 240 mg bid; 6-12 yr: 480 mg bid.

Renal impairment: Dosage reduction for adults and children >12 yr:

CrCl (ml/min)	Dosage Recommendation
15-30	Half the standard dose.
<15	Not recommended.

Hepatic impairment: Avoid in severe impairment.

Oral

Urinary tract infections

Adult: 960 mg bid, up to 2.88 g daily given in 2 divided doses in severe cases.

Child: 6 wk-5 mth: 120 mg bid; 6 mth-5 yr: 240 mg bid; 6-12 yr: 480 mg bid.

Renal impairment: Dosage reduction for adults and children >12 yr:

CrCl (ml/min)	Dosage Recommendation
15-30	Half the standard dose.
<15	Not recommended.

Hepatic impairment: Avoid in severe impairment.

Oral

Gastrointestinal infections

Adult: 960 mg bid, up to 2.88 g daily given in 2 divided doses in severe cases.

Child: 6 wk-5 mth: 120 mg bid; 6 mth-5 yr: 240 mg bid; 6-12 yr: 480 mg bid.

Renal impairment: Dosage reduction for adults and children >12 yr:

CrCl (ml/min)	Dosage Recommendation

<15	Not recommended.

Hepatic impairment: Avoid in severe impairment.

Oral

***Pneumocystis (carinii) jiroveci* pneumonia**

	Hepatic impairment: Avoid in severe impairment.	
	<i>Oral</i>	
	<i>Pneumocystis (carinii) jiroveci</i> pneumonia	
	Adult: Up to 120 mg/kg/day in 2-4 divided doses for 14-21 days.	
	Child: >4 wk: Up to 120 mg/kg daily given in 2-4 divided doses for 14-21 days.	
	Renal impairment: Dosage reduction for adults and children >12 yr:	
	CrCl (ml/min)	Dosage Recommendation
	15-30	Half the standard dose.
	<15	Not recommended.
	Hepatic impairment: Avoid in severe impairment.	
	<i>Oral</i>	
	Prophylaxis of susceptible infections in AIDS patients	
	Adult: 960 mg daily.	
	Child: 450 mg/m ² (max: 960 mg) bid for 3 days in each wk, either consecutively or on alternate days.	
	Renal impairment: Dosage reduction for adults and children >12 yr:	
	CrCl (ml/min)	Dosage Recommendation
	15-30	Half the standard dose.
	<15	Not recommended.
	Hepatic impairment: Avoid in severe impairment.	
Overdosage	Nausea, vomiting, diarrhoea, mental depression, confusion, facial swelling, headache, bone marrow depression and slight elevations of serum transaminases. Empty stomach immediately by inducing emesis or by lavage. Treatment is supportive and symptomatic with monitoring of blood counts and other appropriate laboratory studies (e.g. serum electrolyte concentrations). Haemodialysis may remove only moderate amounts of the drug while peritoneal dialysis is not useful in drug removal.	
Contraindications	Hypersensitivity; severe renal or hepatic insufficiency; infants	

Contraindications	Hypersensitivity; severe renal or hepatic insufficiency; infants <4 wk; megaloblastic anaemia; pregnancy and lactation.
Special Precautions	G6PD deficiency; potential folate deficiency; hepatic and renal impairment; elderly; porphyria; thyroid dysfunction; maintain adequate hydration.
Adverse Drug Reactions	Renal failure, nausea, vomiting, diarrhoea, anorexia; skin rashes, urticaria. Potentially Fatal: Stevens-Johnson syndrome, agranulocytosis, toxic epidermal necrolysis, hepatic necrosis.
Drug Interactions	Reduced ciclosporin concentrations in blood when used concurrently. Increases toxicity of methotrexate. Inhibits phenytoin clearance. Potentiates warfarin and oral hypoglycaemics. Potentially Fatal: Co-admin with pyrimethamine causes megaloblastic anaemia. Enhancement of renal damage by ciclosporin.
Lab Interference	May also interfere with serum methotrexate assay when using the competitive binding protein technique. May interfere with the Jaffe's reaction assay for creatinine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-25°C.
Mechanism of Action	Co-trimoxazole exhibits the synergistic actions of its components (sulfamethoxazole and trimethoprim) by 10-fold. Sulfamethoxazole inhibits dihydrofolic acid formation from PABA, thus interfering with synthesis and growth of bacterial

	Co-trimoxazole exhibits the synergistic actions of its components (sulfamethoxazole and trimethoprim) by 10-fold. Sulfamethoxazole inhibits dihydrofolic acid formation from PABA, thus interfering with synthesis and growth of bacterial folic acid. Trimethoprim inhibits enzymes folic acid pathway, preventing the reaction of the dihydrolic acid to tetrahydrofolate. Co-trimoxazole possesses bactericidal effects against E coli, Klebsiellaspp, Enterobacter spp, M morganii, P mirabilis, P vulgaris, H influenzae, Strep pneumoniae, Pneumocystis (carinii) jiroveci, Cyclospora spp. Absorption: Oral: Almost complete (90-100%). Time to peak, serum: Within 1-4 hr. Distribution: Protein binding: Sulfamethoxazole: 68%; Trimethoprim: 45%. Metabolism: Sulfamethoxazole: N-acetylated and glucuronidated; Trimethoprim: Metabolised to oxide and hydroxylated metabolites. Excretion: Both are removed in urine as metabolites and unchanged drug.
CIMS Class	Antibacterial Combinations
ATC Classification	J01EA01 - trimethoprim; Belongs to the class of trimethoprim and derivatives. Used in the treatment of systemic infections. J01EC01 - sulfamethoxazole; Belongs to the class of intermediate-acting sulfonamides. Used in the treatment of systemic infections.

sulfamoxole + trimethoprim

CIMS Class : (Antibacterial Combinations)
sulfamoxole + trimethoprim

P - Caution when used during pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related sulfamoxole + trimethoprim information

Indication & Dosage	<i>Oral</i> Susceptible infections, Urinary tract infections, Ear, nose and/or throat infections, Genital infections, Gastrointestinal infections, Respiratory tract infections, Skin infections Adult: Each tablet contains sulfamoxole 400 mg and trimethoprim 60 mg: Initially, 2 tablets, followed by 1 tablet bid. Each 5 ml contains sulfamoxole 200 mg and trimethoprim 40 mg: Initially, 20 ml, followed by 10 ml bid. Child: Each 5 ml contains sulfamoxole 200 mg and trimethoprim 40 mg: 4-12 mth: Initially, 2.5-5 ml followed by 1.2-2.5 ml bid; 1-6 yr: Initially, 5-10 ml, followed by 2.5-5 ml bid, 6-12 yr: Initially, 10-15 ml, followed by 5-10 ml bid. Renal impairment: Dose reduction is advisable.
Overdosage	Nausea, vomiting, allergic reactions. If within 3 hrs of ingestion, gastric lavage to be performed, followed by IM folinic acid, vitamin B₁₂ and supportive treatment. Perform LFT once a wk and FBC twice a wk for 3 wks.

	nausea, vomiting, allergic reactions. If within 3 hrs of ingestion, gastric lavage to be performed, followed by IM folinic acid, vitamin B ₁₂ and supportive treatment. Perform LFT once a wk and FBC twice a wk for 3 wks.
Contraindications	Hypersensitivity to sulfonamides; severe renal or hepatic impairment; porphyria, SLE; serious haematological disorders; megaloblastic anemia secondary to folate depletion. Infants <2 mth; pregnancy (3rd trimester), lactation.
Special Precautions	Renal insufficiency, elderly, blood dyscrasias, G6PD deficiency, AIDS, patient with potential folate deficiency, children with fragile X chromosome associated with mental retardation. Perform regular haematological examination.
Adverse Drug Reactions	Nausea, vomiting, anorexia, diarrhoea, glossitis, stomatitis, drowsiness, headache, depression, hallucinations, hypersensitivity skin reaction, photosensitivity, drug fever, crystalluria, elevation of liver enzymes, hypothyroidism, hyponatremia, hyperkalemia, kernicterus in premature neonates, aseptic meningitis, cholestatic jaundice. Potentially Fatal: Anaphylaxis; Stevens-Johnson syndrome; blood dyscrasias e.g. agranulocytosis, aplastic anaemia; toxic epidermal necrolysis.
Drug Interactions	Concurrent use increases risk of blood dyscrasias with azathioprine, methotrexate, pyrimethamine; increased risk of hyperkalaemia with ACE inhibitors; increased risk of hyponatraemia when used with both potassium-sparing diuretics and thiazides; increases risk of bleeding with warfarin; increases risk of lithium toxicity; increases digoxin, phenytoin, procainamide, lamivudine, stavudine, repaglinide, rosiglitazone, dofetilide serum levels; decreases ciclosporin levels. Concurrent use with dapsone increases serum levels of both and increases

	stavudine, repaglinide, rosiglitazone, dofetilide serum levels; decreases ciclosporin levels. Concurrent use with dapsone increases serum levels of both and increases risk of dapsone toxicity. Concurrent may potentiate antidiabetic effect of sulphonylureas. Potentially Fatal: Concurrent use increases risk of blood dyscrasias with clozapine and pyrimethamine.
Lab Interference	Interference with tests for urea, creatinine, urinary glucose, urobilinogen, serum methotrexate (when dihydrofolate reductase is used) and creatinine assay (when Jaffe reaction is used).
Storage	Oral: Store below 25°C
Mechanism of Action	Sulfamoxole interferes with nucleic acid synthesis in microorganisms by blocking the conversion of p-aminobenzoic acid to the coenzyme dihydrofolic acid. Trimethoprim inhibits the conversion of bacterial dihydrofolic acid to tetrahydrofolic acid which is important for the synthesis of DNA.
CIMS Class	Antibacterial Combinations
ATC Classification	J01EA01 - trimethoprim; Belongs to the class of trimethoprim and derivatives. Used in the treatment of systemic infections. J01EC03 - sulfamoxole; Belongs to the class of intermediate-acting sulfonamides. Used in the treatment of systemic infections.

sulfasalazine

CIMS Class : (GIT Regulators, Antiflatulents & Anti-inflammatories) , (Disease-Modifying Anti-Rheumatic Drugs (DMARDs))
sulfasalazine

P - Contraindicated in pregnancy

L - Caution when used during lactation

related sulfasalazine information

Indication & Dosage

Oral

Inflammatory bowel disease

Adult: Initially, 1-2 g 4 times daily until remission occurs.

Maintenance: 2 g/day in divided doses.

Child: ≥2 yr: 40-60 mg/kg/day in divided doses.

Maintenance: 20-30 mg/kg/day in divided doses.

CrCl (ml/min)	Dosage Recommendation
10-30ml/min	Admin twice daily.
<10ml/min	Admin once daily.

Hepatic impairment: Avoid use.

Oral

Rheumatoid arthritis

Adult: As enteric-coated tablet: Initially, 500 mg daily for the 1st wk increased by 500 mg every wk. Max: 3 g daily in 2-4 divided doses.

Child: For polyarticular juvenile rheumatoid arthritis: ≥6 yr:

As enteric-coated tablet: 30-50 mg/kg/day in 2 divided doses.

Begin treatment with 1/4 to 2/3 of expected maintenance

dose and increase wkly to reach maintenance dose in 1 mth.

	As enteric-coated tablet: 30-50 mg/kg/day in 2 divided doses. Begin treatment with 1/4 to 2/3 of expected maintenance dose and increase wkly to reach maintenance dose in 1 mth. Max: 2 g daily.	
	CrCl (ml/min)	Dosage Recommendation
	10-30 mL/min	Admin twice daily.
	<10ml/min	Admin once daily.
	Hepatic impairment: Avoid use. <i>Rectal</i> Inflammatory bowel disease Adult: As suppository: 0.5-1 g in the morning and night, either alone or as an adjunct to oral treatment. As enema: 3 g at night, retained for at least 1 hr. Child: As suppository (may be given as divided doses): 5-8 yr: 500 mg bid; 8-12 yr: 500 mg in the morning and 1 g at night; 12-18 yr: 1 g bid. As enema (to be retained for at least 1 hr): 2-7 yr: 1-1.5 g; 7-12 yr: 1.5-2.25 g; 12-18 yr: 3 g, dose to be given at night.	
Administration	Should be taken with food. (Take after meals. Ensure adequate fluid intake.)	
Overdosage	Nausea, vomiting, gastric distress, abdominal pains, drowsiness, convulsions. Gastric lavage or emesis plus catharsis as required. Alkalinize urine. If kidney function is normal, increase fluids. If anuria is present, restrict fluids and salt, and treat accordingly. Catheterization of the ureters may be needed for complete renal blockage by crystals. Hemodialysis may facilitate removal of sulfasalazine and its metabolites. Concentrations of serum sulfapyridine may be used to monitor the progress of recovery.	
Contraindications	Hypersensitivity to sulphonamides or salicylates, porphyria, <2 yr of age, intestinal or urinary obstruction, blood dyscrasias, history of leucopenia with gold therapy.	

	Hypersensitivity to sulphonamides or salicylates, porphyria, <2 yr of age, intestinal or urinary obstruction, blood dyscrasias, history of leucopenia with gold therapy.
Special Precautions	Hepatic/renal impairment, G6PD deficiency, allergic bronchial asthma, lactation.
Adverse Drug Reactions	Headache, anorexia, nausea, vomiting, diarrhoea, abdominal discomfort, photosensitivity, crystalluria, reversible oligospermia, yellow-orange staining of contact lens, skin, urine and other body fluids, alopecia. Potentially Fatal: Severe hypersensitivity reactions, blood dyscrasias, renal and hepatic toxicity, fibrosing alveolitis.
Drug Interactions	Plasma levels reduced by rifampicin and ethambutol. Interferes with absorption of folic acid. Additive leucopaenia with gold therapy for rheumatoid arthritis. Increased haematological toxicity with azathioprine. Reduced serum levels of digoxin.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). if administered near term. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store below 25°C.
Mechanism of	Actual mechanism not determined. Sulphasalazine may

Mechanism of Action

Actual mechanism not determined. Sulphasalazine may have direct anti-inflammatory action in the colon. It also systemically interferes with secretion by prostaglandin synthesis inhibition.

Absorption: 15% of the dose is absorbed from small intestine, the rest reaches the colon where the azo bond is cleaved by the intestinal flora, producing sulfapyridine and 5-aminosalicylic acid (mesalazine). 60% of the sulfapyridine and 10-30% of the 5-aminosalicylic acid is absorbed from the colon.

Distribution: Following IV admin, vol of distribution is 7.5 L. Sulfasalazine and sulfapyridine crosses the placenta and found in breast milk. Sulfasalazine is extensively protein bound while sulfapyridine is distributed to most body tissues.

Metabolism: Absorbed sulfapyridine undergoes extensive metabolism by acetylation, hydroxylation, and glucuronidation. Slow acetylators are 2-3 times more likely to experience adverse effects from sulfapyridine compared to fast acetylators. Absorbed 5-aminosalicylic acid undergoes acetylation.

Excretion: Via urine, as unchanged sulfasalazine (15%), sulfapyridine and its metabolites (60%), and 5-aminosalicylic acid and its metabolites (20-33%).

CIMS Class

GIT Regulators, Antiflatulents & Anti-inflammatories / Disease-Modifying Anti-Rheumatic Drugs (DMARDs)

ATC Classification

A07EC01 - sulfasalazine; Belongs to the class of aminosalicylic acid and similar antiinflammatory. Used in the treatment of intestinal inflammation.

related sultamicillin information

Indication & Dosage

Oral

Urinary tract infections

Adult: 375-750 mg bid.

Child: <30 kg: 25-50 mg/kg/day in 2 divided doses. $\geq$ 30 kg:
same as adult dose.

Oral

Respiratory tract infections

Adult: 375-750 mg bid.

Child: <30 kg: 25-50 mg/kg/day in 2 divided doses. $\geq$ 30 kg:
same as adult dose.

Oral

Otitis media

Adult: 375-750 mg bid.

Child: <30 kg: 25-50 mg/kg/day in 2 divided doses. $\geq$ 30 kg:
same as adult dose.

Oral

Uncomplicated gonorrhoea

Adult: 2.25 g as single dose, together with 1 g probenecid.

	<i>Oral</i> Uncomplicated gonorrhoea Adult: 2.25 g as single dose, together with 1 g probenecid.
Contraindications	Hypersensitivity.
Special Precautions	Overgrowth of nonsusceptible organism. Periodic check for organ system dysfunction during prolonged therapy. Neonates, pregnancy, lactation.
Adverse Drug Reactions	Diarrhoea, nausea, vomiting, rashes, pruritus, blood dyscrasias, superinfections, dizziness, dyspnoea. Potentially Fatal: Anaphylaxis.
Drug Interactions	Concurrent use increases risk of bleeding with warfarin and methotrexate toxicity; decreases efficacy of oestrogen-containing oral contraceptives. Excretion of ampicillin is reduced when used with probenecid.
Lab Interference	Interferes with urinary glucose test using cupric sulfate (eg. Benedict's reagent, Clinitest); false increase of urinary protein (in Coomassie brilliant blue method); falsely increase serum albumin concentrations (in bromocresol green procedure); false positive direct antiglobulin (Coombs') test results; false-positive result in iodine-azide spot test (for sulfite oxidase deficiency); false-positive for leucine/isoleucine, phenylalanine, and β-aminoisobutyric acid in paper chromatography studies of urinary amino acids; false decrease in aminoglycoside concentrations; false increase in serum uric acid concentrations (in copper-chelate method). Transient decrease in plasma conc of total conjugated oestriol, oestriol-glucuronide, conjugated oestrone and oestradiol in pregnant women.
Mechanism of Action	Sultamicillin inhibits β-lactamases in penicillin-resistant microorganisms and it acts against sensitive organisms during the stage of active multiplication by inhibiting

	Sultamicillin inhibits β -lactamases in penicillin-resistant microorganisms and it acts against sensitive organisms during the stage of active multiplication by inhibiting biosynthesis of cell wall mucopeptide.

sumatriptan

CIMS Class : (Antimigraine Preparations)
sumatriptan

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related sumatriptan information

Indication & Dosage

Oral

Migraine

Adult: >18 yr: 50-100 mg repeated at 2-hr intervals if migraine recurs. Max: 300 mg/24 hr.

Hepatic impairment: Max: 50 mg/day.

Nasal

Migraine

Adult: 12-17 yr: 10 mg into 1 nostril, repeated at least 2 hr after the 1st dose if symptoms recur. Max: 20 mg/24 hr. >18 yr: 20 mg into 1 nostril, repeated at least 2 hr after the 1st dose if symptoms recur. Max: 40 mg/24 hr.

Hepatic impairment: Dose reduction needed.

Subcutaneous

Migraine

Adult: >18 yr: 6 mg as a single dose inj, repeated at least 1 hr after the 1st dose if symptoms persist. Max: 12 mg/24 hr.

Hepatic impairment: Dose reduction needed.

Subcutaneous

	hr after the 1st dose if symptoms persist. Max: 12 mg/24 hr. Hepatic impairment: Dose reduction needed. <i>Subcutaneous</i> Cluster headache Adult: >18 yr: 6 mg as a single dose inj, repeated at least 1 hr after the 1st dose if symptoms persist. Max: 12 mg/24 hr. Hepatic impairment: Dose reduction needed.
Administration	May be taken with or without food.
Contraindications	Not to be used prophylactically and in patients with basilar or hemiplegic or ophthalmoplegic migraine. History of MI or stroke, severe hepatic impairment, ischaemic heart disease, uncontrolled hypertension, peripheral vascular disease, hypersensitivity to sulfonamides.
Special Precautions	Conditions predisposing to seizures, presence of coronary risk factors, cardiac arrhythmias, renal or hepatic impairment, elderly, pregnancy, lactation.
Adverse Drug Reactions	Transient hypertension, hypotension, dizziness, flushing, fatigue, drowsiness, weakness, seizures, nausea and vomiting, heat, tightness in any part of body, paraesthesia, seizures, inj site reactions, irritation of nasal mucosa and epistaxis. Rebound headache with frequent use. Potentially Fatal: Cardiac arrhythmias, MI.
Drug Interactions	Concurrent use increased risk of vasospastic reaction with ergotamine and related compounds. Potentially Fatal: Increased risk of serotonin syndrome with concurrent use of SSRI, MAOIs or within 14 days of stopping MAOIs. Admin of ergotamine or related compounds within the previous 24 hr.
Food Interaction	Increased serotonergic effects and adverse events with concurrent use of St John's Wort.
Pregnancy	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Nasal: Store below 30°C. Do not freeze. Oral: Store below 30°C. Subcutaneous: Store below 30°C.
Mechanism of Action	Sumatriptan is a selective serotonin agonist that acts at 5-HT₁ receptors. It causes vasoconstriction of cranial arteries and/or inhibition of neurogenic inflammatory processes in the CNS. A small but significant delay in gastric emptying also occurs. Onset: Oral: 30 min; Intranasal: 15 min; subcutaneous: 10-15 min. Absorption: Rapidly but incompletely absorbed from the GIT (oral); peak plasma concentrations reached in 2 hr (oral), 25 min (subcutaneous), 1.5 hr (intranasal). Bioavailability for oral is 14%, subcutaneous 96% and intranasal is 16% of that achieved in subcutaneous. Distribution: Enters breast milk. Protein-binding: 14-21% Metabolism: Extensive first-pass metabolism by MAO type A Excretion: Mainly via urine (as inactive indole acetic acid derivative and its glucuronide), via faeces (as unchanged drug and metabolites). Elimination half-life: 2hr.
CIMS Class	Antimigraine Preparations
ATC Classification	N02CC01 - sumatriptan; Belongs to the class of selective serotonin (5HT ₁) agonists preparations. Used to relieve migraine.

N02CC01 - sumatriptan; Belongs to the class of selective serotonin (5HT₁) agonists preparations. Used to relieve migraine.

suxamethonium chloride

CIMS Class : (Muscle Relaxants)
suxamethonium chloride

P - Caution when used during pregnancy

L - Caution when used during lactation

related suxamethonium chloride information

Indication & Dosage	<i>Intravenous</i>
	Muscle relaxant in general anaesthesia
	Adult: As chloride: single dose of 0.3-1.1 mg/kg injected; supplementary doses of 50-100% of the initial dose may be given at 5-10 min intervals. Max dose (repeated IV injection or continuous infusion): 500 mg/hr
	Child: As chloride: <1 yr: 2 mg/kg; 1-12 yr: 1 mg/kg.
	<i>Intramuscular</i>
	Muscle relaxant in general anaesthesia
	Adult: As chloride: 3-4 mg/kg. Max total dose: 150 mg
	Child: As chloride: <1 yr: Up to 4-5 mg/kg; ≥1 yr: Up to 4 mg/kg. Max dose: 150 mg.
	Reconstitution: IV infusion: dilute to a concentration of 1–2 mg/ml (0.1–0.2%) with 5% dextrose, 5% dextrose and 0.9% sodium chloride, 0.9% sodium chloride, (1/6) M sodium lactate; given at a rate 0.5–10 mg/min depending on the response and requirements of patient.
	Incompatibility: Alkaline solutions with pH>8.5 .

	sodium chloride, 0.5% sodium chloride, (1/2) M sodium lactate; given at a rate 0.5–10 mg/min depending on the response and requirements of patient. Incompatibility: Alkaline solutions with pH>8.5 .
Contraindications	Genetic disorders of plasma pseudocholinesterase, personal/family history of malignant hyperthermia, hypersensitivity from previous neuromuscular drug, severe burns, massive trauma, extensive denervation of skeletal muscle, patients with risk of hyperkalaemia, renal impairment, angle closure glaucoma.
Special Precautions	Bone fracture, raised intraocular pressure, neuromuscular disease, infants, children, adolescents, pregnancy and lactation.
Adverse Drug Reactions	Bradycardia, tachycardia, hypotension, hypertension, raised intraocular pressure, hyperkalaemia, excessive salivation. Potentially Fatal: Respiratory depression, dysrhythmias, rhabdomyolysis, malignant hyperthermia.
Drug Interactions	Concurrent use with anticholinesterases, cyclophosphamide, antiarrhythmics, aminoglycosides, lincosamides (clindamycin and lincomycin), anticonvulsants, phenelzine, magnesium, metoclopramide, inhalation anaesthetics, exposure to organophosphate insecticides may enhance neuromuscular block of suxamethonium. Increased risk of arrhythmias with cardiac glycosides.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intramuscular: Refrigerate at 2-8°C. Intravenous: Refrigerate at 2-8°C.

	Intramuscular: Refrigerate at 2-8°C. Intravenous: Refrigerate at 2-8°C.
Mechanism of Action	Suxamethonium chloride is an ultrashort-acting depolarising type skeletal muscle relaxant. It blocks the neuromuscular junction by binding to the cholinergic receptors and depolarising it. Onset: IV: 30-60 sec; IM: 2-3 min Duration: IV: 2-6 min; IM: 10-30 min Distribution: Small amounts of suxamethonium cross the placenta Metabolism: Rapidly hydrolysed by plasma cholinesterase. Excretion: 10% excreted unchanged in urine.
CIMS Class	Muscle Relaxants

tacrolimus

CIMS Class : (Immunosuppressants) , (Other Dermatologicals)
tacrolimus

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food α - Food interaction

related tacrolimus information

Indication & Dosage

Oral

Prophylaxis of rejection in kidney graft transplant

Adult: Initially, 0.2-0.3 mg/kg/day in 2 divided doses every 12 hr.

Begin oral dose within 24 hr of transplant.

Renal impairment: Dose reduction needed.

Hepatic impairment: Severe impairment (Child-Pugh score of ≥ 10): Use lower dosages and close monitoring of blood concentrations needed.

Oral

Prophylaxis of rejection in liver graft transplant

Adult: Initially, 0.1-0.2 mg/kg/day in 2 divided doses every 12 hr.

Start treatment 12 hr after transplantation.

Child: Initially, 0.15-0.20 mg/kg/day in 2 divided doses every 12 hr.

Begin no sooner than 6 hr after transplant.

Renal impairment: Dose reduction needed.

Hepatic impairment: Severe impairment (Child-Pugh score of ≥ 10): Use lower dosages and close monitoring of blood concentrations needed.

Hepatic impairment: Severe impairment (Child-Pugh score of ≥ 10): Use lower dosages and close monitoring of blood concentrations needed.

Oral

Fistulising Crohn's disease

Adult: 200 mcg/kg/day in 2 divided doses for 10 wk.

Renal impairment: Dose reduction needed.

Hepatic impairment: Severe impairment (Child-Pugh score of ≥ 10): Use lower dosages and close monitoring of blood concentrations needed.

Oral

Prophylaxis of cardiac graft rejection

Adult: With or without antibody induction: Starting within 5 days of transplantation but no earlier than 6 hr after transplantation. 75 mcg/kg daily in 2 divided doses.

Intravenous

Prophylaxis of rejection in kidney graft transplant

Adult: Initially, 0.05-0.1 mg/kg/day as a continuous infusion over 24 hr. Start within 24 hr of transplantation for up to a max of 7 days, then transfer to oral treatment.

Renal impairment: Dose reduction needed.

Hepatic impairment: Severe impairment (Child-Pugh score of ≥ 10): Use lower dosages and close monitoring of blood concentrations needed.

Intravenous

Prophylaxis of rejection in liver graft transplant

Adult: Initially, 10-50 mcg/kg/day as a continuous infusion over 24 hr. Start treatment 12 hr after transplantation and continue for up to a max of 7 days. Transfer to oral therapy as soon as patient is able to tolerate; 1st oral dose should be given 8-12 hr after stopping infusion.

Child: Initially, 0.03-0.05 mg/kg/day as a continuous infusion over

to tolerate; 1st oral dose should be given 8-12 hr after stopping infusion.

Child: Initially, 0.03-0.05 mg/kg/day as a continuous infusion over 24hr. Begin no sooner than 6 hr post-transplant, starting at the lower end of the dosage range. Continue until the oral medication can be tolerated. Oral therapy should start 8-12hr after IV infusion discontinued.

Renal impairment: Dose reduction needed.

Hepatic impairment: Severe impairment (Child-Pugh score of ≥ 10): Use lower dosages and close monitoring of blood concentrations needed.

Intravenous

Prophylaxis of cardiac graft rejection

Adult: With or without antibody induction: Starting within 5 days of transplantation but no earlier than 6 hr after transplantation. 10–20 mcg/kg daily via infusion over 24 hr, for up to a max of 7 days. Transfer to oral therapy as soon as patient is able to tolerate; 1st oral dose to be given 8-12 hr after stopping infusion.

Topical/Cutaneous

Atopic dermatitis

Adult: >15 yr: Apply thinly 0.03% or 0.1% ointment to affected area bid. Rub in gently and completely. For short-term and intermittent use only. If no improvement after 6 wk, re-confirm diagnosis.

Child: 2-15 yr: Apply thinly 0.03% oint to affected area bid. Rub in gently and completely. For short-term and intermittent use only.

Reconstitution: Dilute concentrate with 0.9% sodium chloride or 5% dextrose injection to a concentration of 4–20 mcg/ml . Diluted solution may be stored in polyethylene or glass containers for up to 24 hr. Diluted infusion solution must not be stored in a PVC container due to reduced stability and potential for extraction of phthalates.

	solution may be stored in polyethylene or glass containers for up to 24 hr. Diluted infusion solution must not be stored in a PVC container due to reduced stability and potential for extraction of phthalates. Incompatibility: Do not use plasticized polyvinyl chloride (PVC) container as stability of the solution is decreased and polyoxyl 60 hydrogenated castor oil contained in the formulation may leach phthalates from PVC containers. Tacrolimus injection should not be mixed or co-infused with solutions of pH 9 or greater due to chemical instability in alkaline media.
Administration	Should be taken on an empty stomach. (Take on an empty stomach at least 1 hr before or 2-3 hr after meals.)
Contraindications	Hypersensitivity, lactation.
Special Precautions	Monitoring of blood trough serum concentrations to prevent organ rejection and to reduce drug-related toxicity. Topical: Used with caution on the face or neck, large areas of the body (not >50% of the total BSA), or areas of broken skin. Infections at the treatment site should be cleared prior to therapy. Delay use in patients with unknown cause of lymphadenopathy or acute infectious mononucleosis till resolution. Use in patients with Netherton's syndrome is not recommended. Pregnancy.
Adverse Drug Reactions	Systemic: Tremor, headache, paraesthesias, nausea and diarrhoea, hypertension, blood dyscrasias, leucocytosis, impaired renal function, serum electrolyte disturbances, infectious complications. Mood changes, sleep disturbances, confusion, dizziness, tinnitus, visual disturbances convulsions, alterations in glucose metabolism, ECG changes, tachycardia, myocardial hypertrophy, constipation, dyspepsia and GI haemorrhage; dyspnoea, asthma, pleural effusions; alopecia, hirsutism, skin rash and pruritus; myalgia, spasm, leg cramps, peripheral oedema, liver dysfunction and coagulation disorders. Topical: Burning, stinging, soreness, pruritus, skin disorders, headache and flu-like

	rash and pruritus; myalgia, spasm, leg cramps, peripheral oedema, liver dysfunction and coagulation disorders. Topical: Burning, stinging, soreness, pruritus, skin disorders, headache and flu-like symptoms. Increased incidence of malignancy. Potentially Fatal: Nephrotoxicity, neurotoxicity and anaphylactic reaction.
Drug Interactions	Increased nephrotoxicity with ciclosporin, aminoglycosides, amphotericin B, cisplatin, NSAIDs, vancomycin, co-trimoxazole, aciclovir, ganciclovir. Increased risk of hyperkalemia with potassium-sparing diuretics. Increased plasma concentrations and toxicity with azole antifungals, calcium-channel blockers, cimetidine, danazol, HIV-protease inhibitors, macrolide antibacterials and metoclopramide. Antacids, rifampin, rifabutin, casofungin, phenytoin, phenobarbital and carbamazepine decrease tacrolimus plasma concentrations. Concurrent admin of sirolimus and tacrolimus decrease levels of both.
Food Interaction	Food decreases rate and extent of absorption. Grapefruit and pomelo juice may increase the serum levels. St John's wort may decrease serum levels.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Topical/Cutaneous: Store at 15-30°C.
Mechanism of Action	Tacrolimus inhibits T-lymphocyte activation, although the exact mechanism of action unclear. Tacrolimus bind to cytosolic receptors known as immunophilins (i.e., cyclophilin and FK binding protein-12 [FKBP-12], respectively), forming complexes that inhibit the production of cytokines via the calcineurin pathway. Inhibition of calcineurin activity inhibits early activation of T-cells (ie. immunosuppression results).

	the production of cytokines via the calcineurin pathway. Inhibition of calcineurin activity inhibits early activation of T-cells (ie.immunosuppression results). Absorption: Incomplete and variable. Food decreased rate and extent of tacrolimus absorption. Distribution: 99% bound to plasma protein, mainly to albumin and alpha-1-acid glycoprotein, and has a high level of association with erythrocytes. Metabolism: Extensively metabolized by cytochrome P-450 system (CYP3A).
CIMS Class	Immunosuppressants / Other Dermatologicals
ATC Classification	D11AX14 - tacrolimus; Belongs to the class of other dermatologicals. Used in the treatment of dermatological diseases. L04AD02 - tacrolimus;

tadalafil

CIMS Class : (Drugs for Erectile Dysfunction)
tadalafil

Food ☒ - Food interaction

related tadalafil information

Indication & Dosage

Oral

Erectile dysfunction

Adult: Initially, 10 mg at least 30 min before sexual activity once daily, up to 20 mg as single dose. Max: Not more than once daily. If used with potent inhibitors of CYP3A4, e.g. azole antifungals or protease inhibitors: max 10 mg once every 72 hr.

CrCl (ml/min)	Dosage Recommendation
31-50	Initial dose at 5 mg/day. Max: 10 mg/48hr
<30	Max: 5 mg/24hr.

Hepatic impairment: Mild-moderate hepatic impairment (Child-Pugh category A or B): Max dose 10 mg. Severe hepatic impairment (Child-Pugh category C): Not recommended.

Administration

May be taken with or without food.

Contraindications

Concurrent use of organic nitrates, nitrates and nitric oxide donors. Men with cardiac disease for whom sexual activity is inadvisable. Recent MI (within 90 days) or stroke (within last 6 mth), hypotension (<90/50 mm Hg), unstable angina, heart failure, uncontrolled arrhythmias or hypertension.

	generally more than 60 minutes. Concomitant use with nitroglycerin is inadvisable. Recent MI (within 90 days) or stroke (within last 6 mth), hypotension (<90/50 mm Hg), unstable angina, heart failure, uncontrolled arrhythmias or hypertension.
Special Precautions	Hepatic or renal impairment; CV diseases; anatomical penile deformation; predisposition to priapism; child <18 yr. Discontinue and seek medical advice if there is sudden vision loss or decreased vision in one or both eyes or tinnitus, dizziness or sudden loss or decrease in hearing, while taking Tadalafil. Seek immediate medical advice if erection last > 4 hr.
Adverse Drug Reactions	Headache, dyspepsia, dizziness, flushing, swelling of eyelids, eye pain, conjunctival hyperemia, back pain, myalgia, visual disturbances, nasal congestion, sudden decrease or loss of hearing, tinnitus. Potentially Fatal: Stevens–Johnson syndrome, exfoliative dermatitis, severe cardiovascular events e.g. MI, stroke, sudden cardiac death;
Drug Interactions	Concurrent use increased risk of hypotension with α-blockers; increased risk of priapism with other drugs for erectile dysfunction, e.g. alprostadil; increased heart rate with theophylline; decreased tadalafil serum concentration with CYP 3A4 inducers e.g. rifampicin, efavirenz, carbamazepine, nevirapine, barbiturates, phenobarbital, phenytoin, ribabutin; increased tadalafil serum concentration with CYP3A4 inhibitors e.g. azole antifungals, protease inhibitors, cimetidine, macrolides. Potentially Fatal: Enhanced hypotensive effect with nitrates and nicorandil.
Food Interaction	Concurrent use with grapefruit juice may increase tadalafil levels, while St John's wort may decrease tadalafil levels.
Storage	Oral: Store at 15-30°C.

	Oral: Store at 15-30°C.
Mechanism of Action	Tadalafil is a phosphodiesterase type-5 inhibitor. Onset: 30 min Duration: Up to 36 hr. Absorption: Well absorbed. Peak plasma concentrations reached within 2 hr. Rate and extent of absorption not affected by food. Distribution: Widely distributed into tissues. 94% bound to plasma proteins. Metabolism: Metabolised in the liver mainly by the cytochrome P450 isoenzyme CYP3A4 to inactive metabolites. Mean half-life is 17.5 hr. Excretion: Excreted mainly as metabolites, in the faeces (61% of the dose), and to a lesser extent the urine (36% of the dose).
CIMS Class	Drugs for Erectile Dysfunction
ATC Classification	G04BE08 - tadalafil; Belongs to the class of drugs used in erectile dysfunction.

tamoxifen

CIMS Class : (Hormonal Chemotherapy)
tamoxifen

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related tamoxifen information

Indication & Dosage

Oral

Breast cancer

Adult: 20 mg daily as a single dose or in 2 divided doses.

Max: 40 mg/day.

Oral

Reduction of breast cancer incidence in women at high risk

Adult: 20 mg daily for 5 yr.

Oral

Anovulatory infertility

Adult: 20 mg daily on days 2-5 of the menstrual cycle. Max: 80 mg/day.

Contraindications

Pregnancy and lactation. History of thromboembolic events.

Special Precautions

Perform routine haematological and liver function tests in long-term therapy. Gynaecological monitoring is necessary in women.

Adverse Drug Reactions

Hot flushes, oedema, fluid retention, dry skin, vaginal

Adverse Drug Reactions	Hot flushes, oedema, fluid retention, dry skin, vaginal bleeding, vaginal discharge, pruritus vulvae, GI upsets, nausea, dizziness, rashes, blurred vision, loss of acuity, alopecia, increased liver enzymes, hypertriglyceridaemia, uterine fibroids and endometrial hyperplasia. Potentially Fatal: Blood dyscrasias, cholestasis, hepatitis, hypercalcaemia in patients with bone metastasis, thromboembolic events. Increased risk of endometrial cancer and uterine sarcoma.
Drug Interactions	Aminoglutethimide reduces plasma-tamoxifen concentration. Potentially Fatal: Concurrent use increased anticoagulant effect of warfarin; increased risk of thromboembolic events with other cytotoxic drugs.
Lab Interference	False increase of serum thyroxine concentration. False negative estrogen receptor determinations if performed within 4-6 wk after discontinuation of drug.
Storage	Oral: Store between 20-25°C.
Mechanism of Action	Tamoxifen, a triphenylethylene derivative, produces a nuclear complex by competitively binding to oestrogen receptors on tumours and other tissue targets thus, decreasing DNA synthesis and inhibiting oestrogen effect. It is only cytostatic rather than cytotoxic due to accumulation of cell in G₀ and G₁ phases. Absorption: Well absorbed from the GIT; peak plasma concentrations after 4-7 hr (oral). Distribution: Distributed into uterus (high concentrations), endometrial and breast tissues. Protein-binding: Extensive. Metabolism: Extensively metabolised in liver by the cytochrome P450 isoenzymes CYP3A4, CYP2C9, and CYP2D6, converted to desmethyldtamoxifen; undergoes

	Metabolism: Extensively metabolised in liver by the cytochrome P450 isoenzymes CYP3A4, CYP2C9, and CYP2D6, converted to desmethyldamoxifen; undergoes enterohepatic recycling. Excretion: Faeces (as conjugates), urine (small amounts); 7 days (terminal half-life).
CIMS Class	Hormonal Chemotherapy

tamsulosin

CIMS Class : (Drugs for Bladder & Prostate Disorders)
tamsulosin

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food α - Food interaction

related tamsulosin information

Indication & Dosage

Oral

Benign prostatic hyperplasia

Adult: As HCl: As modified-release preparation: 400 mcg once daily. May increase to 800 mcg once daily after 2-4 wk if necessary. If therapy is interrupted for several days, restart with 400 mcg once daily. Dose to be taken 30 minutes after the same meal each day.

CrCl (ml/min)	Dosage Recommendation
≥ 10	No dose adjustment needed.
< 10	Not studied.

Hepatic impairment: Moderate hepatic impairment (Child-Pugh classification A and B): No dose adjustment needed. Severe hepatic impairment: Avoid.

Administration

Should be taken with food. (Take $\frac{1}{2}$ hr following the same meal daily. Swallow whole, do not open/chew/crush.)

Overdosage

Hypotension, headache. Keep in supine position to restore BP and heart rate. If needed, admin of IV fluid and vasopressors. Dialysis unlikely to be of benefit.

	Hypotension, headache. Keep in supine position to restore BP and heart rate. If needed, admin of IV fluid and vasopressors. Dialysis unlikely to be of benefit.
Contraindications	Hypersensitivity to sulfonamide, severe hepatic impairment, lactation.
Special Precautions	Prostate carcinoma should be ruled out before starting the therapy. Risk of intraoperative floppy iris syndrome in patients who undergo cataract surgery. May cause orthostatic hypotension or syncope especially with first dose, if dosage is increased or an antihypertensive drug or a phosphodiesterase-5 inhibitor is added to the treatment regimen. Caution when used in patients with sulfa allergy. May cause priapism (rare); immediate medical attention is recommended. Pregnancy.
Adverse Drug Reactions	Postural hypotension, dizziness and vertigo, malaise, headache, rhinitis, pharyngitis, cough, sinusitis, diarrhoea, nausea, infection, asthenia, back pain, tooth disorder, chest pain, somnolence, insomnia, decreased libido, abnormal ejaculation, priapism, blurred vision. Risk of intraoperative floppy iris syndrome during phacoemulsification surgery.
Drug Interactions	Concomitant admin with moderate or strong inhibitors of CYP2D6 (eg. fluoxetine) or CYP3A4 (eg. ketoconazole, cimetidine) increases serum concentration.
Food Interaction	Food reduced extent and rate of absorption.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 25°C.

	Oral: Store at 25°C.
Mechanism of Action	Tamsulosin is a selective α_1 adrenoreceptor-blocking agent. Smooth muscle tone is mediated by the sympathetic nervous stimulation of α_1 adrenoreceptors, which are abundant in the prostate, prostatic capsule, prostatic urethra, and bladder neck. Blockade of these adrenoceptors can cause smooth muscles in the bladder neck and prostate to relax, resulting in an improvement in urine flow rate and reduction in symptoms in BPH. Absorption: Completely absorbed from the GI tract. Peak plasma concentrations after 1 hr; 6 hr (modified-release preparation). Distribution: Protein-binding: 99%. Metabolism: Metabolised slowly in the liver primarily by CYP2D6 and CYP3A4. Excretion: Excreted in urine (76%) and faeces (21%). Plasma elimination half life: 4-5.5 hr; as modified-release preparation : 10-13 hr.
CIMS Class	Drugs for Bladder & Prostate Disorders
ATC Classification	G04CA02 - tamsulosin; Belongs to the class of alpha-adrenoreceptor antagonists. Used in the treatment of benign prostatic hypertrophy.

tamsulosin + dutasteride

CIMS Class : (Drugs for Bladder & Prostate Disorders)
tamsulosin + dutasteride

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related tamsulosin + dutasteride information

related tamsulosin + dutasteride information	
Indication & Dosage	<i>Oral</i> Benign prostatic hyperplasia Adult: Per tab contains tamsulosin 0.4 mg and dutasteride 0.5 mg: 1 tab once daily.
Contraindications	Hypersensitivity, severe liver impairment. Pregnancy, lactation, child, adolescent.
Special Precautions	Excreted in semen therefore use of condom is recommended. Women of childbearing potential should avoid handling leaking capsules of dutasteride. Prostate carcinoma should be ruled out before starting the therapy. Blood donation to be avoided during and at least 6 mths after discontinuance of drug.
Adverse Drug Reactions	Impotence, decreased libido, ejaculation disorders, breast tenderness and enlargement, postural hypotension, dizziness and vertigo, headache, infection, asthenia, back pain, chest pain, somnolence, insomnia, rhinitis, pharyngitis, cough,

	tenderness and enlargement, postural hypotension, dizziness and vertigo, headache, infection, asthenia, back pain, chest pain, somnolence, insomnia, rhinitis, pharyngitis, cough, sinusitis, diarrhoea, nausea, tooth disorder, blurred vision.
Drug Interactions	Concomitant admin with moderate or strong inhibitors of CYP2D6 (eg. fluoxetine) or CYP3A4 (eg.ketoconazole, cimetidine) increases tamsulosin serum concentration; increase in blood concentrations of dutasteride in the presence of inhibitors of CYP3A4/5 such as ritonavir, ketoconazole, verapamil, diltiazem, cimetidine, troleandomycin, and ciprofloxacin.
Food Interaction	Food prolongs time to reach max concentration.
Lab Interference	Dutasteride decreased serum prostate-specific antigen (PSA) but does not alter ratio of free to total PSA.
Mechanism of Action	Tamsulosin is a selective α -1 adrenoceptor blocker. It blocks α -1 adrenoceptors, which are abundant in the prostate, prostatic capsule, prostatic urethra, and bladder neck, resulting relaxation of these adrenoceptors in the bladder neck and prostate. Thus, there is an improvement in urine flow rate and reduction in symptoms of benign prostatic hypertrophy (BPH). Dutasteride inhibits 5 α -reductase, the enzyme responsible for conversion of testosterone to 5 α -dihydrotestosterone (DHT). DHT appears to be the principal androgen responsible for stimulation of prostatic growth.
CIMS Class	Drugs for Bladder & Prostate Disorders
ATC Classification	G04CA02 - tamsulosin; Belongs to the class of alpha-adrenoreceptor antagonists. Used in the treatment of benign prostatic hypertrophy. G04CB02 - dutasteride; Belongs to the class of testosterone-5-alpha reductase inhibitors. Used in the treatment of benign prostatic hypertrophy.

tazarotene

CIMS Class : (Psoriasis, Seborrhea & Ichthyosis Preparations) , (Acne Treatment Preparations)
tazarotene

P - Contraindicated in pregnancy
L - Contraindicated in lactation

related tazarotene information

Indication & Dosage	<i>Topical/Cutaneous</i> Stable plaque psoriasis Adult: >18 yr: Apply a thin layer of 0.05% or 0.1% cream or gel to cleansed dry affected area, once daily in the evening. If needed, moisturiser should be applied at least 1 hr prior to application of tazarotene. <i>Topical/Cutaneous</i> Acne Adult: >12 yr: Apply a thin layer of 0.1% cream or gel to cleansed dry affected area, once daily in the evening. <i>Topical/Cutaneous</i> Photoaging Adult: >17 yr: Apply a thin layer of 0.1% cream or gel to cover entire face (including eyelids) once daily before retiring.
Overdosage	Excessive topical use cause marked redness, peeling or discomfort. Accidental oral ingestion produces similar adverse effects as those associated with excessive oral

	Excessive topical use cause marked redness, peeling or discomfort. Accidental oral ingestion produces similar adverse effects as those associated with excessive oral intake of Vitamin A or other retinoids. Monitor and take supportive measures as necessary.
Contraindications	Pregnancy, lactation. Eczema. Sunburnt conditions. Hypersensitivity.
Special Precautions	Avoid contact with eyes, mouth, mucous membranes. Abraded skin. Avoid exposure to sun or UV light. Do not use >10% of BSA. Do not use cream with occlusive dressing. Wash hands after application. Do not use cream/gel in amounts more than instructed. Women of child bearing potential should take birth control measures. Negative pregnancy test to be obtained within 2 wk prior to initiation and start therapy during normal menstrual period.
Adverse Drug Reactions	Pruritus, burning/stinging, erythema, skin peeling, irritation, worsening of psoriasis, rash, dry skin, bleeding, localised oedema, hypertriglyceridaemia, desquamation, contact dermatitis, discolouration of skin, photosensitivity.
Drug Interactions	Increased drying effect effect with concomitant use of dermatologic medications and cosmetics that have irritant or strong drying effect. Increased risk of photosensitivity with drugs known to be photosensitisers.
Mechanism of Action	Tazarotene is a synthetic acetylenic retinoid, that is applied topically. It is de-esterified in the skin to its active form, tazarotenic acid, which affects cell proliferation and differentiation by modulating gene expression in acne and psoriasis. Distribution: Tazarotenic acid: >99% bound to plasma proteins, half-life:18 hr. Metabolism: Undergoes esterase hydrolysis to form its

	Distribution: Tazarotenic acid: >99% bound to plasma proteins, half-life:18 hr. Metabolism: Undergoes esterase hydrolysis to form its active metabolite, tazarotenic acid. Excretion: Eliminated via urine and faeces.
CIMS Class	Psoriasis, Seborrhea & Ichthyosis Preparations / Acne Treatment Preparations
ATC Classification	D05AX05 - tazarotene; Belongs to the class of other topical agents used in the treatment of psoriasis.

tegaserod

CIMS Class : (GIT Regulators, Antiflatulents & Anti-inflammatories)
tegaserod

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related tegaserod information

Indication & Dosage

Oral

Chronic idiopathic constipation,

Constipation-predominant irritable bowel syndrome

Adult: 6 mg taken bid for 4-6 wk continued for another 4-6 wk in responsive patients.

Renal impairment: Severe impairment: Not recommended.

Hepatic impairment: Moderate to severe impairment: Not recommended.

Administration

Should be taken on an empty stomach. (Take on an empty stomach before meals.)

Contraindications

Severe renal or moderate to severe hepatic impairment; history of bowel obstruction or symptomatic gallbladder disease; suspected sphincter of Oddi dysfunction or abdominal adhesions; known hypersensitivity. Patients currently experiencing or who frequently experience diarrhoea. Lactation.

Special Precautions

Discontinue immediately if rectal bleeding, bloody diarrhoea,

Special Precautions	Discontinue immediately if rectal bleeding, bloody diarrhoea, new or sudden worsening of abdominal pain occurs. Mild hepatic impairment; child <18 yr; pregnancy.
Adverse Drug Reactions	Diarrhoea, abdominal pain, nausea, flatulence, headache, dizziness, migraine, leg or back pain, arthropathy, insomnia, hypotension, arrhythmia, ischaemic colitis. Potentially Fatal: MI, stroke.
Food Interaction	Food reduces bioavailability by 40-65% and C_{max} 20-40%. T_{max} is prolonged from approx 1-2 hrs.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 25°C.
Mechanism of Action	Tegaserod, is a prokinetic with partial agonistic activity at 5HT₄. Activation of these receptors stimulate peristaltic reflex and intestinal secretion as well as inhibit visceral sensitivity. Absorption: Bioavailability: 10%. Peak plasma concentrations after 1 hr. Distribution: Protein-binding: 98% primarily to α-acid glycoprotein. Widely distributed into tissues. Metabolism: Extensively hepatic by oxidation, conjugation and glucuronidation; hydrolysis in the stomach. Excretion: Faeces (as unchanged drug), urine (as metabolites). Terminal half life: 11hr.
CIMS Class	GIT Regulators, Antiflatulents & Anti-inflammatories

	GIT Regulators, Antiflatulents & Anti-inflammatories
ATC Classification	A03AE02 - tegaserod; Belongs to the class of drugs acting on serotonin receptors. Used in the treatment of functional bowel disorders.

***tegaserod information:**

CIMS Class : (Other Antibiotics)
teicoplanin

related teicoplanin information

Indication & Dosage	<i>Parenteral</i> Severe Gram-positive infections Adult: Initially, 6 mg/kg on first day, followed by 3 mg/kg/day. Severe infection: 6 mg/kg every 12 hr for the 1st 3 doses followed by 6 mg/kg/day. Doses may be given via IM inj, IV bolus or IV infusion over 30 minutes. Child: Loading dose: 10 mg/kg every 12 hr for 3 doses followed by 6-10 mg/kg/day depending on severity of the infection. Neonates: Loading dose: 16 mg/kg on the 1st day, followed by maintenance doses of 8 mg/kg/day by IV infusion. Renal impairment: Usual dose to be given for first 3 days, thereafter adjust dose according to CrCl. <table border="1" data-bbox="685 1600 1180 1835"> <thead> <tr> <th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr> </thead> <tbody> <tr> <td>40-60</td><td>1/2 initial dose given daily or initial dose every 2 days.</td></tr> <tr> <td><40</td><td>1/3 initial dose given daily or initial dose every 3 days.</td></tr> </tbody> </table> <i>Intravenous</i>	CrCl (ml/min)	Dosage Recommendation	40-60	1/2 initial dose given daily or initial dose every 2 days.	<40	1/3 initial dose given daily or initial dose every 3 days.
CrCl (ml/min)	Dosage Recommendation						
40-60	1/2 initial dose given daily or initial dose every 2 days.						
<40	1/3 initial dose given daily or initial dose every 3 days.						

	<i>Intravenous</i> Prophylaxis of Gram-positive infection in high-risk patients undergoing surgery Adult: 400 mg as single dose at induction of anesth. <i>Intravenous</i> Continuous ambulatory peritoneal dialysis (CAPD)-associated peritonitis Adult: If the patient is febrile, an initial loading dose of 400 mg may be given. Teicoplanin is added to the dialysis solution at a concentration of 20 mg/litre; dose is added into each bag of solution in the first wk, followed by alternate bags in the second wk and then in the overnight dwell bag in the third wk. Renal impairment: Dose adjustment may be required. Incompatibility: Incompatible with aminoglycosides and should not be mixed before injection.
Contraindications	Hypersensitivity.
Special Precautions	Preexisting renal insufficiency, hypersensitivity to vancomycin. Perform periodic haematological studies, renal, LFT. Pregnancy, lactation.
Adverse Drug Reactions	Fever, chills, allergic reactions, GI disturbances, headache, dizziness, "red-man" syndrome, disturbances in liver enzymes, renal impairment, ototoxicity, blood dyscrasias. Pain, erythema, thrombophlebitis, abscess at site of admin. Potentially Fatal: Stevens-Johnson syndrome, toxic epidermal necrolysis.
Drug Interactions	Other nephrotoxic and/or neurotoxic drugs.
Storage	Intravenous: Store below 25°C. Reconstituted solutions

Storage	Intravenous: Store below 25°C. Reconstituted solutions may be stored for 24 hr at 2-8°C. Parenteral: Store below 25°C. Reconstituted solutions may be stored for 24 hr at 2-8°C.
Mechanism of Action	Glycopeptide antibiotic with spectrum of activity is similar to vancomycin but teicoplanin may be more active in vitro against enterococci and some anaerobic organisms but some coagulase-negative Staphylococci are less sensitive to teicoplanin than to vancomycin. Absorption: Poorly absorbed from the GI tract. IM bioavailability: 90%. Peak plasma concentrations: 1 hr (IV); 2-4 hr (IM). Distribution: Protein binding: 90-95%. Poor penetration into the CSF. It is taken up into white blood cells. Excretion: Excreted unchanged via urine (97%).
CIMS Class	Other Antibiotics
ATC Classification	J01XA02 - teicoplanin; Belongs to the class of glycopeptide antibacterials. Used in the treatment of systemic infections.

telmisartan

CIMS Class : (Angiotensin II Antagonists)
telmisartan

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food $\square$ - Food interaction

related telmisartan information

Indication & Dosage	<i>Oral</i> Hypertension Adult: Initially, 40 mg once daily. Max: 80 mg/day. Renal impairment: Severe impairment/ Haemodialysis: Initial dose 20 mg/day. Hepatic impairment: Mild to moderate: Max 40 mg/day. Severe: Contra-indicated
Administration	May be taken with or without food.
Overdosage	Hypotension, dizziness, tachycardia or bradycardia. Supportive treatment to be instituted. Not removed by haemodialysis.
Contraindications	Severe hepatic impairment, biliary obstructive disorders. Pregnancy. Lactation.
Special Precautions	Hepatic insufficiency, biliary obstruction, renal impairment, renal artery stenosis. Correct volume depletion before initiating treatment. Monitor serum potassium levels regularly, especially in elderly and renally-impaired patients.

	renally artery stenosis. Correct volume depletion before initiating treatment. Monitor serum potassium levels regularly, especially in elderly and renally-impaired patients.
Adverse Drug Reactions	URTI, dizziness, back pain, sinusitis, pharyngitis and diarrhoea. Slight elevations in liver enzymes. Potentially Fatal: Rarely angioedema, rash, pruritus and urticaria.
Drug Interactions	Concurrent use increases digoxin concentration; increases risk of lithium toxicity; increases risk of hyperkalaemia with potassium sparing diuretics, heparin.
Food Interaction	Food slightly reduces the bioavailability.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Telmisartan is a nonpeptide AT₁ angiotensin II receptor antagonist. Exerts antihypertensive activity by preventing angiotensin II from binding to AT₁ receptors thus inhibiting the vasoconstriction and aldosterone-secreting effects of angiotensin II. Absorption: Rapidly absorbed. Dose dependent

	the vasoconstriction and aldosterone-secreting effects of angiotensin II. Absorption: Rapidly absorbed. Dose dependent bioavailability 42% (after 40 mg dose); 58% (after 160-mg dose). Peak plasma concentrations: 0.5-1hr. Distribution: Protein binding: 99%. Metabolism: Undergoes conjugation with glucuronic acid to form inactive metabolites. Excretion: Excreted almost entirely as unchanged drug in faeces via bile. <1% excreted via urine. Terminal elimination half-life: 24 hr.
CIMS Class	Angiotensin II Antagonists
ATC Classification	C09CA07 - telmisartan; Belongs to the class of angiotensin II antagonists. Used in the treatment of cardiovascular disease.

temozolomide

CIMS Class : (Cytotoxic Chemotherapy)
temozolomide

P - Contraindicated in pregnancy
L - Caution when used during lactation

related temozolomide information

Indication & Dosage	<i>Oral</i> Glioblastoma multiforme Adult: 75 mg/m² once daily for 42 days with focal radiotherapy (concomitant phase). Do not reduce dose during concomitant phase but interrupt or discontinue therapy depending on toxicity. Continue if absolute neutrophil count (ANC)= 1.5x10⁹/L, thrombocyte count =100x10⁹/L and Common Toxicity Criteria (CTC) non-haematological toxicity = Grade 1 (except for alopecia, nausea and vomiting). Initiate monotherapy 4 wk after completing concomitant phase: 150 mg/m² once daily for 5 days followed by a 23 day break (1 cycle). In cycle 2, increase dose to 200 mg/m² once daily for 5 days, if ANC =1.5x10⁹/L, thrombocyte count =100x10⁹/L and CTC non-haematological toxicity for cycle 1 is = Grade 2 (except for alopecia, nausea and vomiting). If dose cannot be increased in cycle 2, do not increase dose in subsequent cycles. Dose used in cycle 2 is given for the rest of the cycles, toxicity allowing, up to 6 cycles. <i>Oral</i>

	increased in cycle 2, do not increase dose in subsequent cycles. Dose used in cycle 2 is given for the rest of the cycles, toxicity allowing, up to 6 cycles. <i>Oral</i> Recurrent or progressive malignant gliomas Adult: Previously untreated with chemotherapy: 200 mg/m² once daily for 5 days, followed by a 23 day break (1 cycle). Previously treated with chemotherapy: 150 mg/m² daily for 5 days followed by 23 day break (1 cycle) increased to 200 mg/m² daily for the 2nd cycle if there is no haematological toxicity. Child: >3 yr: Previously untreated with chemotherapy: 200 mg/m² once daily for 5 days, followed by a 23 day break (1 cycle). Previously treated with chemotherapy: 150 mg/m² daily for 5 days followed by 23 day break (1 cycle) increased to 200 mg/m² for the 2nd cycle if there is no haematological toxicity. <i>Oral</i> Metastatic melanoma Adult: 200 mg/m² daily for 5 days every 28 days.
Administration	Should be taken on an empty stomach. (Take on an empty stomach at least 1 hr before meals.)
Contraindications	Hypersensitivity to dacarbazine. Severe myelosuppression. Pregnancy.
Special Precautions	Severe hepatic and renal impairment. Elderly >70 yr, children. Women of child bearing potential should avoid becoming pregnant during therapy. Males should be advised not to father a child up to 6 mth after treatment and to consider cryoconservation of sperms due to possibility of irreversible infertility. Unknown if distributed into breastmilk, discontinue nursing due to potential risk. May impair ability to drive or operate machinery. Swallow capsules whole with a full glass of water on an empty stomach or at bedtime. Do not

	irreversible infertility. Unknown if distributed into breastmilk, discontinue nursing due to potential risk. May impair ability to drive or operate machinery. Swallow capsules whole with a full glass of water on an empty stomach or at bedtime. Do not take a 2nd dose if capsules are vomited. Monitor CBC wkly during concomitant therapy and on day 22 of each 28 day treatment cycle, followed by wkly blood count until recovery. Hepatitis screening and prophylactic therapy with antiviral agents as clinically indicated to be considered. Prophylaxis for <i>Pneumocystis jirovecii</i> (or <i>Pneumocystis carinii</i>) pneumonia (PCP) needed for all patients receiving concomitant temozolomide and radiation therapy for the 42-day regimen; if patients experience lymphocytopenia during the concomitant phase of therapy, PCP prophylaxis should be continued until recovery from lymphocytopenia. Monitor closely for PCP development in all patients. Anti-emetic prophylaxis recommended.
Adverse Drug Reactions	Nausea, vomiting, taste perversion, constipation, diarrhoea, abdominal pain, stomatitis, anorexia, headache, fatigue, convulsions, dizziness, memory impairment, impaired concentration, tremors, blurred vision, hearing impairment, speech disorder, rash, infection, oral candidiasis, dyspnoea, coughing, neutropenia, thrombocytopenia, leucopenia, anaemia, hyperglycemia, decreased wt, insomnia, anxiety, alopecia, muscle weakness, urinary incontinence, increased alanine aminotransferase. Rarely, myelodysplastic syndrome and secondary malignancies.
Drug Interactions	Reduced effectiveness of vaccines and generalised infection may occur in patients immunised with live vaccines. Decreased temozolomide clearance with valproic acid. Potentially Fatal: Increased risk of myelosuppression with other myelosuppressive agents. Increased risk of myelosuppression with colony stimulating factors (e.g.

	Decreased temozolomide clearance with valproic acid. Potentially Fatal: Increased risk of myelosuppression with other myelosuppressive agents. Increased risk of myelosuppression with colony stimulating factors (e.g. filgrastim, molgramostim and lenograstim) if given at the same time, colony stimulating factors to be used 24 hr before or until 24 hr after chemotherapy.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Temozolomide, a triazene, is an inactive prodrug. It is chemically hydrolysed to 3-methyl-(triazene-1-yl)imidazole-4-carboxamide (MTIC), the active metabolite of dacarbazine. The cytotoxicity of MTIC is believed to be due alkylation of DNA, mainly at the O⁶ and N⁷ positions of guanine. Absorption: Rapidly and completely absorbed from GI tract. Peak plasma concentration: 0.5-1.5 hr. Rate and extent of absorption decreased by food. Distribution: Protein binding: 15%. Cross blood-brain barrier. Metabolism: Undergoes rapid nonenzymatic conversion at physiologic pH to the reactive compound MTIC and to temozolomide acid metabolite. MTIC is further hydrolysed to 5-amino-imidazole-4-carboxamide (AIC) and methylhydrazine. Excretion: Excreted mainly in urine as unchanged drug, AIC, temozolomide acid metabolite and unidentified polar metabolites. Plasma half life: 1.8 hr.
CIMS Class	Cytotoxic Chemotherapy

CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01AX03 - temozolomide; Belongs to the class of other alkylating agents. Used in the treatment of cancer.

***temozolomide information:**

tenofovir disoproxil fumarate + emtricitabine

CIMS Class : (Antivirals)

tenofovir disoproxil fumarate + emtricitabine

P - Caution when used during pregnancy

L - Contraindicated in lactation

related tenofovir disoproxil fumarate + emtricitabine information

Indication & Dosage

Oral

HIV-1 infection

Adult: ≥18 yr: As tablet containing 200 mg of emtricitabine and 300 mg of tenofovir disoproxil fumarate: 1 tablet once daily. For patients with swallowing difficulties, tablet may be disintegrated in approx 100 ml of water, orange juice or grape juice and consumed immediately.

Renal impairment: Patient on haemodialysis: Not recommended.

CrCl (ml/min)	Dosage Recommendation
30-49	1 tablet every 48 hr.
<30	Not recommended.

Overdosage

Treatment is supportive and monitor for signs of toxicity.

Haemodialysis may be helpful as it can remove up to 30% of the emtricitabine dose and 10% of the tenofovir dose.

Unknown if peritoneal dialysis is useful.

Contraindications

Lactation. Not to be used for treatment of chronic hepatitis B virus (HBV) infection.

Special

Liver impairment. Renal impairment; avoid in CrCl <30ml/min

Special Precautions

Liver impairment. Renal impairment; avoid in CrCl <30ml/min and in patients on dialysis. Pregnancy. Not to be used with other emtricitabine, tenofovir disoproxil fumarate or other cytidine analogues (e.g. lamivudine and zalcitabine) preparations. Avoid use in antiretroviral-experienced patients with K65R mutation; in treatment experienced patients, use of combination drug to be guided by laboratory testing and treatment history. Increased risk for severe and potentially fatal hepatic adverse reactions in patients with HIV and hepatitis B or C virus co-infection treated with antiretroviral agents. If combination drug is discontinued in patients co-infected with HIV and HBV, monitor hepatic function for several months for acute exacerbation of hepatitis. Discontinue therapy if there is a rapid rise in aminotransferase concentrations, progressive hepatomegaly or steatosis, metabolic or lactic acidosis of unknown cause. Test for presence of chronic HBV before initiating therapy. Check CrCl before initiation of therapy and monitor renal function (CrCl and serum phosphate) every 4 wkly during the 1st year and then every 3 mthly (more frequently in patients at risk for renal impairment). Bone monitoring needed for patient with history of pathologic bone fracture or at risk of osteopenia. Monitor child exposed *in utero* to combination drug for possible mitochondrial dysfunction.

Adverse Drug Reactions

Nausea, vomiting, diarrhoea, abdominal pain, dyspepsia, flatulence, pain, hypersensitivity, increased pigmentation, asthenia, osteonecrosis, osteomalacia, metabolic abnormalities (e.g. hyperglycaemia, insulin resistance, hypercholesterolaemia, hypertriglyceridaemia, hyperlactataemia), lipodystrophy, elevated lipase, amylase,

	abnormalities (e.g. hyperglycaemia, insulin resistance, hypercholesterolaemia, hypertriglyceridaemia, hyperlactataemia), lipodystrophy, elevated lipase, amylase, creatine kinase or transaminases levels, hyperbilirubinaemia, insomnia, abnormal dreams. Neutropenia, anaemia, Immune Reactivation Syndrome. Renal impairment, acute renal failure, Fanconi syndrome. Potentially Fatal: Lactic acidosis and severe hepatomegaly with steatosis.
Drug Interactions	Decreased atazanavir concentration with tenofovir unless also co-administered with ritonavir. Increased serum concentration of both tenofovir and emtricitabine or co-administered drug if taken with drugs that are eliminated by active tubular secretion. Potentially Fatal: Increased risk of renal impairment with recent or concurrent use of nephrotoxic agents (e.g. aminoglycosides, amphotericin B, foscarnet, ganciclovir, pentamidine, vancomycin, cidofovir or interleukin-2); monitor renal function wkly if unavoidable. Increased didanosine levels and thereby increasing risk of pancreatitis and peripheral neuropathy, with a high treatment failure rate with concurrent use; avoid concurrent use. Do not use emtricitabine with lamivudine due to similar resistance profile. Increased risk of lactic acidosis with α-interferon.
Storage	Oral: Store between 15-30°C (59-86°F).
Mechanism of Action	Tenofovir disoproxil fumarate, a diester prodrug of tenofovir, is rapidly converted to tenofovir, an acyclic nucleoside phosphonate (nucleotide) analogue of adenosine 5'-monophosphate while emtricitabine is a synthetic nucleoside analogue of cytidine. Both emtricitabine and tenofovir inhibit HIV-1 reverse transcriptase, resulting in DNA chain termination.

	or tenofovir disoproxil fumarate while emtricitabine is a synthetic nucleoside analogue of cytidine. Both emtricitabine and tenofovir inhibit HIV-1 reverse transcriptase, resulting in DNA chain termination. Absorption: Tenofovir: Rapidly absorbed; converted to tenofovir after oral doses; oral bioavailability: approx 25% after fasting, increased when taken with a high fat meal; peak plasma concentrations reached in 1 hr (fasting) to 2 hr (with food). Emtricitabine: Rapidly and well absorbed from GI tract; peak plasma concentrations achieved in 1-2 hours; bioavailability: 93% (capsules); 75% (oral solution). Distribution: Tenofovir: Widely distributed into most tissues, especially kidneys, liver and intestinal contents; protein binding: <0.7% to plasma proteins, 7% to serum protein. Emtricitabine: Protein binding: <4%, independent of concentration. Metabolism: Emtricitabine: Limited metabolism. Excretion: Tenofovir: Excreted renally by glomerular filtration and active tubular secretion; terminal elimination half life: 12-18 hr. Emtricitabine: Excreted largely unchanged in the urine and to a lesser extent in the faeces; plasma elimination half-life: 10 hr.
CIMS Class	Antivirals
ATC Classification	J05AF09 - emtricitabine; Belongs to the class of nucleoside and nucleotide reverse transcriptase inhibitors. Used in the systemic treatment of viral infections.

tenofovir disoproxil fumarate

CIMS Class : (Antivirals)
tenofovir disoproxil fumarate

P - Caution when used during pregnancy

L - Contraindicated in lactation

related tenofovir disoproxil fumarate information

Indication & Dosage	<i>Oral</i> HIV infection, Chronic hepatitis B Adult: ≥18 yr: 300 mg once daily. Renal impairment: Haemodialysis patients: 300 mg once every 7 days or 300 mg after a cumulative total of 12 hr of dialysis. <table><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr><tr><td>30-49</td><td>300 mg every 48 hr.</td></tr><tr><td>10-29</td><td>300 mg every 72-96 hr</td></tr></table>	CrCl (ml/min)	Dosage Recommendation	30-49	300 mg every 48 hr.	10-29	300 mg every 72-96 hr
CrCl (ml/min)	Dosage Recommendation						
30-49	300 mg every 48 hr.						
10-29	300 mg every 72-96 hr						
Overdosage	Treatment is supportive. Haemodialysis may be beneficial.						
Contraindications	Lactation. Not for treatment for chronic hepatitis B virus infection. Do not co-administer with fixed dose combinations containing tenofovir.						
Special Precautions	Renal impairment, hepatomegaly or at risk for liver disease. Elderly and pregnancy. Discontinue therapy if there is a rapid rise in aminotransferase concentrations, progressive hepatomegaly or steatosis, metabolic or lactic acidosis of unknown cause. Monitor creatinine clearance and serum phosphorus routinely in patients at risk of renal impairment.						

	rise in aminotransferase concentrations, progressive hepatomegaly or steatosis, metabolic or lactic acidosis of unknown cause. Monitor creatinine clearance and serum phosphorus routinely in patients at risk of renal impairment. Bone monitoring for patients with history of pathologic bone fracture or at risk of osteopenia. Test for presence of chronic hepatitis B virus (HBV) before initiating therapy. If tenofovir is discontinued in patients co-infected with HIV and HBV, monitor hepatic function for several mth for exacerbation of hepatitis. Monitor child exposed <i>in utero</i> to combination drug for possible mitochondrial dysfunction.
Adverse Drug Reactions	Diarrhoea, nausea, vomiting, abdominal pain, flatulence, dyspepsia, anorexia, skin rash, peripheral neuropathy, headache, dizziness, insomnia, depression, dyspnoea, asthenia, sweating, myalgia, myopathy, body fat redistribution, osteomalacia. Hypophosphataemia, raised amylase and liver enzymes, hepatitis, hypertriglyceridaemia, hyperglycaemia, neutropenia, nephritis, nephrogenic diabetes insipidus, renal impairment, proximal tubulopathy, Fanconi syndrome, immune reconstitution syndrome. Potentially Fatal: Lactic acidosis with severe hepatomegaly with steatosis; severe acute exacerbations of hepatitis B. Acute renal failure.
Drug Interactions	Decreased atazanavir concentration with tenofovir unless also co-administered with ritonavir. Increased serum concentration of tenofovir or co-administered drug if taken with drugs that are eliminated by active tubular secretion. Potentially Fatal: Increased risk of renal impairment with recent or concurrent use of nephrotoxic agents (e.g. aminoglycosides, amphotericin B, foscarnet, ganciclovir, pentamidine, vancomycin, cidofovir or interleukin-2); monitor renal function wkly if unavoidable. Increased didanosine levels and thereby increasing risk of

	amphotericin B, didanosine, didanosine, amphotericin B, ribavirin, ganciclovir, pentamidine, vancomycin, cidofovir or interleukin-2); monitor renal function wkly if unavoidable. Increased didanosine levels and thereby increasing risk of pancreatitis and peripheral neuropathy, with a high treatment failure rate with concurrent use; avoid concurrent use.
Storage	Oral: Store between 15-30 °C (59-86 °F).
Mechanism of Action	Tenofovir disoproxil fumarate, a diester prodrug of tenofovir, is a nucleotide reverse transcriptase inhibitor. After oral absorption, tenofovir disoproxil fumarate is rapidly converted to tenofovir and then undergo subsequent phosphorylation by cellular enzymes to the active tenofovir diphosphate, which inhibits the activity of HIV-1 reverse transcriptase. Absorption: Rapidly absorbed; converted to tenofovir after oral doses. Oral bioavailability: Approx 25% after fasting, increased when taken with a high fat meal. Peak plasma concentrations reached in 1 hr (fasting) to 2 hr (with food). Distribution: Widely distributed into most tissues, especially kidneys, liver and intestinal contents. Protein binding: <0.7% to plasma proteins, 7% to serum protein. Excretion: Excreted renally by glomerular filtration and active tubular secretion. Terminal elimination half life: 12-18 hr.

tenoxicam

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
tenoxicam

P - Contraindicated in pregnancy

Food ⚠ - Food interaction

related tenoxicam information

Indication & Dosage	<i>Oral</i> Pain and inflammation associated with musculoskeletal and joint disorders Adult: 20 mg as a single daily dose given for 7 days in acute musculoskeletal disorders and up to 14 days in severe cases. Max: 40 mg/day (short term use). <i>Parenteral</i> Pain and inflammation associated with musculoskeletal and joint disorders Adult: Initially, 20 mg IM/IV as a single dose given for 1-2 days.
Administration	Should be taken with food. (Take w/ or immediately after meals.)
Contraindications	Active or history of recurrent GI bleed or peptic ulcer, hypersensitivity to NSAIDs, severe heart failure, haemorrhagic diathesis, asthma, pregnancy (3 rd trimester).
Special Precautions	History of peptic ulceration, renal, cardiac or hepatic impairment, cerebrovascular disease, fluid retention,

	History of peptic ulceration, renal, cardiac or hepatic impairment, cerebrovascular disease, fluid retention, inflammatory bowel disease, pregnancy, elderly.
Adverse Drug Reactions	GI upsets including epigastric pain and gastritis, nausea, hypersensitivity reactions, headache, dizziness, sleep disturbances. Potentially Fatal: CV thrombotic events, blood dyscrasias, nephrotoxicity, hepatotoxicity, toxic epidermal necrolysis, Stevens-Johnson syndrome.
Drug Interactions	Risk of nephrotoxicity may be increased with ACE inhibitors, ciclosporin, tacrolimus or diuretics. Increased risk of hyperkalemia with ACE inhibitors, potassium sparing diuretics. Potentially Fatal: Concurrent use increased concentrations of lithium, methotrexate, cardiac glycoside; increased risk of bleeding with anticoagulants and other NSAIDs.
Food Interaction	Absorption slowed but overall bioavailability not reduced.
Storage	Oral: Do not store above 30°C Parenteral: Do not store above 30°C
Mechanism of Action	Tenoxicam is a potent inhibitor of prostaglandin synthesis by blocking the enzyme cyclo-oxygenase. Additional actions contributing to its anti-inflammatory effect includes inhibition of leucocyte function including phagocytosis and chemotaxis, and scavenging free O₂ radicals. It has no effect on renal function at the usual doses. Absorption: Absorbed well from the GIT (oral); peak plasma concentrations after 2 hr (fasting), 6 hr (non-fasting). Distribution: Penetrates synovial fluid. Protein-binding: 98.5% Metabolism: Hepatic; completely to inactive metabolites.

	Distribution: Penetrates synovial fluid. Protein-binding: 98.5% Metabolism: Hepatic; completely to inactive metabolites. Excretion: Via urine (as metabolites), via bile (as conjugates of the metabolites); 60-75 hr (elimination half-life)
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AC02 - tenoxicam; Belongs to the class of non-steroidal antiinflammatory and antirheumatic products, oxicams. Used in the treatment of inflammation and rheumatism.

terazosin

CIMS Class : (Other Antihypertensives) , (Drugs for Bladder & Prostate Disorders)
terazosin

P - Caution when used during pregnancy

L - Caution when used during lactation

related terazosin information

Indication & Dosage

Oral

Hypertension

Adult: Initially, 1 mg at bedtime, gradually increased at 7-day intervals according to patient's response.

Maintenance: 2-10 mg once daily. Max: 20 mg/day in 1 or 2 divided doses.

Max Dosage: 20 mg daily in a single or 2 divided doses.

Oral

Benign prostatic hyperplasia

Adult: 1 mg at bedtime gradually increased at 7-day intervals according to patient's response. Maintenance: 5-10 mg once daily. Max: 20mg daily.

Administration

May be taken with or without food.

Contraindications

Hypersensitivity to quinazoline derivatives.

Special Precautions

Elderly. Syncope and orthostatic associated with first dose phenomenon. Pregnancy and lactation.

Adverse Drug Reactions

Orthostatic hypotension, syncope, dizziness, fatigue,

Adverse Drug Reactions	Orthostatic hypotension, syncope, dizziness, fatigue, somnolence, peripheral oedema, headache, nasal congestion, nausea, blurred vision, postural hypotension, palpitations, priapism.
Drug Interactions	Decreased antihypertensive effect with NSAIDs. Orthostatic hypotension potentiated by other antihypertensive agents.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Terazosin is an α_1-adrenoceptor antagonist with a longer duration of action than prazosin. It blocks peripheral postsynaptic receptors resulting to decreased arterial tone. It relaxes smooth muscle of the bladder neck causing a reduction of bladder outlet obstruction. It reduces BP with minimal effect on heart rate. In the prostate, terazosin reduces the vascular tone which is the dynamic component in benign prostatic enlargement. Terazosin can increase urinary flow rates in patients with benign prostatic hyperplasia (BPH). Onset: 15 min. Duration: 24 hr. Absorption: Rapid and almost complete from the GI tract; bioavailability 90%; peak plasma concentrations after 1 hr (oral). Distribution: Protein-binding: 90-94% Metabolism: Hepatic. Excretion: Faeces and urine (as unchanged drug and metabolites); 12 hr (elimination half-life).

	Metabolism: Hepatic. Excretion: Faeces and urine (as unchanged drug and metabolites); 12 hr (elimination half-life).
CIMS Class	Other Antihypertensives / Drugs for Bladder & Prostate Disorders
ATC Classification	G04CA03 - terazosin; Belongs to the class of alpha-adrenoreceptor antagonists. Used in the treatment of benign prostatic hypertrophy.

terbinafine

CIMS Class : (Antifungals) , (Topical Antifungals & Antiparasites)
terbinafine

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related terbinafine information

Indication & Dosage

Oral

Dermatophytosis

Adult: 250 mg once daily for 2-4 wk in tinea cruris, 6 wk for tinea pedis, 4 wk for tinea corporis and 6-12 wk for nail infections.

Child: 10-20 kg: 62.5 mg; 20-40 kg: 125 mg; >40 kg: 250 mg. Doses to be taken once daily. Treatment is usually given for 2 wk for tinea capitis; 2-4 wk for tinea cruris; 4 wk for tinea corporis; 6 wk in tinea pedis; 6-12 wk for nail infections.

CrCl (ml/min)	Dosage Recommendation
<50	Half the usual oral dose.

Topical/Cutaneous

Dermatophytosis

Adult: Apply a 1% cream/solution once or bid. 1-2 wk to treat tinea corporis and tinea cruris; 1-wk course is for tinea pedis; 2-wk course in cutaneous candidiasis and pityriasis

	Adult: Apply a 1% cream/solution once or bid. 1-2 wk to treat tinea corporis and tinea cruris; 1-wk course is for tinea pedis; 2-wk course in cutaneous candidiasis and pityriasis versicolor	
Administration	May be taken with or without food.	
Contraindications	Hypersensitivity, active or chronic liver disease, lactation.	
Special Precautions	Preexisting liver or renal impairment, pregnancy. Perform liver function tests prior to oral therapy.	
Adverse Drug Reactions	Anorexia, nausea, abdominal pain, taste disturbances, diarrhoea, rash, urticaria. Potentially Fatal: Liver failure, Stevens-Johnson syndrome, neutropaenia.	
Drug Interactions	Possible increase in levels in drugs metabolised by CYP450 2D6. Decreased terbinafine concentration with rifampicin; increased terbinafine concentration with cimetidine.	
Food Interaction	Oral bioavailability increased when administered with food.	
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).	
Storage	Oral: Tab: Store below 25°C. Protect from light.	
Mechanism of Action	Terbinafine causes fungal cell death by inhibiting squalene epoxidase, the main enzyme in sterol biosynthesis, resulting in ergosterol deficiency within fungal cell walls. It has fungicidal activity against dermatophytes and some yeast. Absorption: Absorbed well from the GI tract with 40% bioavailability (oral), minimal absorption (topical); peak plasma concentrations after 2 hr (oral). Distribution: Distributed into stratum corneum of the skin,	

	bioavailability (oral), minimal absorption (topical); peak plasma concentrations after 2 hr (oral). Distribution: Distributed into stratum corneum of the skin, nail plate, hair (concentrations higher than plasma) and breastmilk. Protein-binding: Extensive. Metabolism: Hepatic; converted to inactive metabolites. Excretion: Via urine; 17-36 hr (plasma elimination half-life); up to 400 hr (terminal elimination half-life) in prolonged therapy.
CIMS Class	Antifungals / Topical Antifungals & Antiparasites
ATC Classification	D01AE15 - terbinafine; Belongs to the class of other antifungals for topical use. Used in the treatment of fungal infection. D01BA02 - terbinafine; Belongs to the class of antifungals for systemic use. Used in the treatment of fungal infection.

terbutaline

CIMS Class : (Antiasthmatic & COPD Preparations) , (Drugs Acting on the Uterus)
terbutaline

P - Caution when used during pregnancy

L - Caution when used during lactation

related terbutaline information

Indication & Dosage

Oral

Acute bronchospasm

Adult: Initially, 2.5 or 3 mg tid increased to 5 mg tid if necessary; as modified-release tablet: 7.5 mg bid.

Child: 75 mcg/kg tid; usual dose for >7 yr: 2.5 mg bid-tid.

Inhalation

Acute bronchospasm

Adult: As metered dose inhaler: 250 mcg or 500 mcg every 4-6 hrs. Max: 2000 mcg/24hr. As nebuliser: 5-10 mg inhaled 2-4 times or 1-2mg/hr given as a 0.01% nebuliser solution in sodium chloride 0.9%.

Child: As metered dose inhaler: 250 mcg or 500 mcg every 4-6 hrs. Max: 2000 mcg/24hr. As nebuliser: 2-5 mg inhaled 2-4 times.

Parenteral

Severe bronchospasm

Adult: 250-500 mcg SC, IM or slow IV Inj up to 4 times daily, or by IV infusion 3-5 mcg/ml run at a infusion rate of

	Severe bronchospasm Adult: 250-500 mcg SC, IM or slow IV Inj up to 4 times daily, or by IV infusion 3-5 mcg/ml run at a infusion rate of 0.5-1 mL/min. Child: >2 yrs: 10 mcg/kg by SC, IM or slow IV injection. Max total dose: 300mcg. <i>Intravenous</i> Uncomplicated premature labour Adult: 5 mcg/min for 20 min, increased every 20 min in steps of 2.5 mcg/min until contractions have ceased (usually 10 mcg/min sufficient), continue for 1 hr then decrease every 20 min in steps of 2.5 mcg/min to lowest dose that maintains suppression, continue at this level for 12 hrs. Max: 20mcg/min. Switch to oral at 2.5-10mg every 4-6hr if indicated and tolerated. Continue as long as needed to prolong pregnancy.
Administration	May be taken with or without food.
Overdosage	Headache, anxiety, tremor, nausea, palpitations, hypotension, tachycardia and arrhythmia, hypokalaemia, hyperglycaemia and lactic acidosis. Supportive and symptomatic treatment; use β -blockers (eg. metoprolol) cautiously for treatment of arrhythmias; IV loop diuretic for treatment of pulmonary oedema; IV propranolol 1 -2mg, if increased tendency to uterine bleed during Caesarean section.
Contraindications	Hypersensitivity to sympathomimetics. Any condition of mother or foetus in which prolongation of pregnancy is dangerous.
Special Precautions	Arrhythmias, hyperthyroidism, hypertension, diabetes, myocardial insufficiency, history of seizures, heart disease.
Adverse Drug Reactions	Fine skeletal muscle tremor esp hands, dizziness, anxiety,

Adverse Drug Reactions	Fine skeletal muscle tremor esp hands, dizziness, anxiety, flushes, sweating, nausea, vomiting, lethargy, tinnitus, tachycardia, palpitations, muscle cramps, headache, paradoxical bronchospasm. IV: Transient hyperglycemia, transient hypokalaemia. Potentially Fatal: (IV): MI, pulmonary oedema, ketoacidosis.
Drug Interactions	Antagonised effects of β-blockers. Increased risk of hypokalaemia with xanthine derivatives, corticosteroids and diuretics; increased risk of arrhythmias with inhaled anaesthetics, sympathomimetics.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Terbutaline is a direct-acting sympathomimetic which relaxes bronchial smooth muscle by selective action on β_2 receptors. It also decreases uterine contractility. Onset: Inhalation: 5 min; Oral: 30 min. Duration: Inhalation: 3-4 hr; Oral: 8 hr. Absorption: Absorbed from the GI tract. Distribution: Some amounts cross the placenta and appear in breast milk. Half-life: 3 to 4 hr. Metabolism: 60% of absorbed dose undergoes first-pass metabolism by sulphate conjugation in the liver and gut wall. Excretion: Via the urine partly as inactive conjugates and partly as unchanged drug.
CIMS Class	Antiasthmatic & COPD Preparations / Drugs Acting on the

	Antiasthmatic & COPD Preparations / Drugs Acting on the Uterus
ATC Classification	R03AC03 - terbutaline; Belongs to the class of adrenergic inhalants, selective beta-2-adrenoreceptor agonists. Used in the treatment of obstructive airway diseases. R03CC03 - terbutaline; Belongs to the class of adrenergics for systemic use, selective beta-2-adrenoreceptor agonists. Used in the treatment of obstructive airway diseases.

terconazole

CIMS Class : (Preparations for Vaginal Conditions)
terconazole

P - Caution when used during pregnancy

L - Contraindicated in lactation

related terconazole information

Indication & Dosage	<i>Vaginal</i> Vulvovaginal candidiasis Adult: 40 mg (as 0.8% vag cream) or 80 mg (as pessary) at bedtime for 3 consecutive nights or 20 mg (as 0.4% cream) at bedtime for 7 consecutive nights.
Contraindications	Hypersensitivity. Lactation.
Special Precautions	Discontinue if irritation or flu-like symptoms develop. May damage latex or rubber contraceptives. Patients <18 yrs. Pregnancy.
Adverse Drug Reactions	Vulvovaginal burning, vulvar itching, dysmenorrhoea, genital, body and abdominal pain. Flu-like syndrome with headache, fever, chills and hypotension with doses >80 mg.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Vaginal: Store between 15-30°C.

Storage	Vaginal: Store between 15-30°C.
Mechanism of Action	Terconazole disrupts ergosterol synthesis by binding to fungal cytochrome P450. It is active in vitro against Candida spp and other fungi. It has some antibacterial activity in vitro but not against usual vag flora eg, lactobacilli. Absorption: Intravaginal: 5-16% absorbed Metabolism: Hepatic metabolism Excretion: Excreted in urine and faeces.
CIMS Class	Preparations for Vaginal Conditions
ATC Classification	G01AG02 - terconazole; Belongs to the class of triazole derivative antiinfectives. Used in the treatment of gynecological infections.

terfenadine

This product is no longer actively marketed.
CIMS Class : (Antihistamines & Antiallergics)
terfenadine

P - Caution when used during pregnancy

L - Caution when used during lactation

Food $\square$ - Food interaction

related terfenadine information

Indication & Dosage

Oral

Allergic conditions

Adult: >12 yr and >50 kg: 60-120 mg in the morning or 60 mg bid. Max: 120 mg daily.

CrCl (ml/min)	Dosage Recommendation
<40	Half the usual daily dose

Contraindications

Porphyria.

Special Precautions

Child and elderly. Avoid in patients with cardiac or significant hepatic disease, electrolyte imbalance, or known or suspected prolongation of the QT interval. Lactation, pregnancy.

Adverse Drug Reactions

Anxiety, palpitations, insomnia, mild GI disturbances, erythema multiforme and galactorrhoea.

Potentially Fatal: Ventricular arrhythmias including torsades de pointes. Palpitations, dizziness, syncope or convulsions may indicate arrhythmias. Hepatitis.

	Potentially Fatal: Ventricular arrhythmias including torsades de pointes. Palpitations, dizziness, syncope or convulsions may indicate arrhythmias. Hepatitis.
Food Interaction	Grapefruit juice may inhibit the metabolism of terfenadine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Terfenadine, a piperidine derivative, is a non-sedating H₁ receptor antagonist antihistamine. Absorption: Rapidly absorbed from GI tract. Peak plasma concentrations: within 2 hr. Distribution: Protein binding: 97% (terfenadine). Does not appear to cross the blood-brain barrier to significant extent. Limited amounts of fexofenadine, but not terfenadine detected in breast milk. Elimination half-life: 16-23 hr (terfenadine). Metabolism: Prodrug and undergoes extensive first-pass metabolism in the liver to active (carboxylic acid derivative fexofenadine) and inactive metabolites. Excretion: Excreted in the urine and faeces (traces of unchanged drug and metabolites)
CIMS Class	Antihistamines & Antiallergics
ATC Classification	R06AX12 - terfenadine; Belongs to the class of other agents used as systemic antihistamines.

terlipressin

CIMS Class : (Haemostatics)
terlipressin

P - Contraindicated in pregnancy

related terlipressin information

Indication & Dosage	<i>Intravenous</i> Acute oesophageal variceal haemorrhage Adult: Initially, 2 mg followed by 1 or 2 mg every 4-6 hr until bleeding is controlled, for up to 72 hr.
Contraindications	Hypersensitivity, vascular disease esp coronary artery disease, chronic nephritis (until normal blood-nitrogen conc attained). Pregnancy.
Special Precautions	Patients with hypertension, arteriosclerosis, cardiac disorders, conditions which may be aggravated by water retention, eg. heart failure.
Adverse Drug Reactions	Abdominal cramps, cardiac arrhythmias, headache, transient blanching, increased arterial pressure. Potentially Fatal: MI, cardiac failure.
Storage	Intravenous: Store below 25°C.
Mechanism of Action	Terlipressin, a synthetic triglycyl-lysine derivative of vasopressin, is a inactive prodrug. It has pressor and antidiuretic effects. Following IV injection, lysine vasopressin are released following the enzymatic cleavage of 3 glycyl

	vasopressin, is a inactive prodrug. It has pressor and antidiuretic effects. Following IV injection, lysine vasopressin are released following the enzymatic cleavage of 3 glycy moieties. Duration: 4-6 hr.
CIMS Class	Haemostatics
ATC Classification	H01BA04 - terlipressin; Belongs to the class of vasopressin and analogues. Used in posterior pituitary lobe hormone preparations.

testosterone and derivatives

CIMS Class : (Androgens & Related Synthetic Drugs)
testosterone and derivatives

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related testosterone and derivatives information

Indication & Dosage

Oral

Male hypogonadism

Adult: Initially, 120-160 mg daily of the undecylate ester followed by a maintenance dose of 40-120 mg daily.

Buccal

Male hypogonadism

Adult: 30 mg bid.

Intramuscular

Male hypogonadism

Adult: 50-400 mg every 2-4 wk for the cypionate; 50-400 mg every 2-4 wk for the enantate (or an initial dose of 250 mg every 2-3 wk followed by a maintenance dose every 3-6 wk); up to 50 mg 2-3 times wkly for the propionate.

Subcutaneous

Male hypogonadism

Adult: As SC implant: 100-600 mg. A dose of 600 mg is usually able to maintain plasma testosterone level within physiological range for 4-5 mth.

	Adult: As SC implant: 100-600 mg. A dose of 600 mg is usually able to maintain plasma testosterone level within physiological range for 4-5 mth. <i>Transdermal</i> Male hypogonadism Adult: As patch delivering 2.5-7.5 mg daily: Apply to the back, abdomen, thighs, upper arms as directed. As scrotal patch containing 10 or 15 mg (supplying 4-6 mg in 24 hr): Use as directed. <i>Intramuscular</i> Inoperable metastatic breast cancer Adult: As enanthate: 200-400 mg every 2-4 wk.
Contraindications	Hypercalcaemia or hypercalciuria, males with breast or prostate carcinoma. Pregnancy and lactation.
Special Precautions	Cardiovascular disorders, skeletal metastases, renal or hepatic impairment, epilepsy, migraine, diabetes or other conditions which may be aggravated by fluid retention, eg heart failure. Elderly, prepubertal boys. Monitor signs of virilization (females) and development of priapism or excessive sexual stimulation (males). Periodic haemoglobin, lipid determinations and rectal prostate examination.
Adverse Drug Reactions	Fluid and electrolyte retention; increased vascularity of the skin; hypercalcaemia, impaired glucose tolerance; increased bone growth and skeletal weight; increase LDL cholesterol; increase haematocrit and fibrinolytic activity; headache, depression and GI bleeding. Males: spermatogenesis suppression, priapism, gynaecomastia, prostatic hyperplasia and accelerate growth of malignant prostate neoplasms. Females: suppression of lactation, ovarian activity and menstruation; virilization, clitoris hypertrophy, increased libido, oily skin, acne, hirsutism, male pattern baldness. Children: Closure of the epiphyses and stop linear growth in

	females. suppression of lactation, ovarian activity and menstruation; virilization, clitoris hypertrophy, increased libido, oily skin, acne, hirsutism, male pattern baldness. Children: Closure of the epiphyses and stop linear growth in early puberty, symptoms of virilisation. Precocious sexual development, increased frequency of erection in boys, and clitoral enlargement in girls. IM: urticaria, inflammation at Inj site, postinjection induration, furunculosis. Transdermal: local irritation. Buccal: Gum irritation, bitter taste, gum pain, tenderness. Potentially Fatal: Peliosis hepatis, liver toxicity, malignant neoplasm.
Drug Interactions	Enhance activities of ciclosporine, antidiabetics, thyroxine, anticoagulants. Long term use of testosterone may cause resistance to effects of neuromuscular blockers. Enhance fluid retention from corticosteroids.
Lab Interference	May decrease protein bound iodine (PBI) and thyroxine-binding globulin concentrations. May cause a decrease in excretion of creatinine and creatine and increase in excretion of 17-ketosteroids.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Mechanism of Action	Testosterone is the principal endogenous androgen responsible for promoting the growth and development of male sexual organs and maintaining secondary sex characteristics in androgen-deficient males. Absorption: Absorbed from GI tract, skin, and oral mucosa Distribution: 80% bound to sex-hormone binding globulin. Undergo enterohepatic recirculation. Half-life of testosterone:

	Absorption: Absorbed from GI tract, skin, and oral mucosa Distribution: 80% bound to sex-hormone binding globulin. Undergo enterohepatic recirculation. Half-life of testosterone: 10 to 100 min. Metabolism: Hepatic to active and inactive metabolites. Excretion: Excreted via urine as metabolites; and faeces as unchanged drug (6%)
CIMS Class	Androgens & Related Synthetic Drugs
ATC Classification	G03BA03 - testosterone; Belongs to the class of 3-oxoandrostens (4) derivative androgens used in androgenic hormone preparations.

tetanus immunoglobulin

CIMS Class : (Vaccines, Antisera & Immunologicals)
tetanus immunoglobulin

P - Caution when used during pregnancy

L - Caution when used during lactation

related tetanus immunoglobulin information

Indication & Dosage	<i>Intramuscular</i> Passive immunisation against tetanus Adult: Prophylaxis: 250 units, increased to 500 units if >24 hr have elapsed or following burns or there is risk of heavy contamination. Treatment: 150 units/kg, given by IM inj into multiple sites. Child: Prophylaxis: 250 units, increased to 500 units if >24 hr have elapsed or following burns or there is risk of heavy contamination. Treatment: 150 units/kg, given by IM inj into multiple sites.
Special Precautions	Caution when used in patients with coagulation disorders or thrombocytopenia. Not to be used for IV admin. Pregnancy, lactation. If adsorbed tetanus vaccine is to be used concurrently, the vaccine and immunoglobulin should be administered with separate syringes and into different inj sites with separate lymphatic drainage. Patients should be observed for at least 20 minutes after admin.
Adverse Drug	Inj-site reactions: Pain, soreness and tenderness. Increased

Adverse Drug Reactions	Inj-site reactions: Pain, soreness and tenderness. Increased temperature, angioneurotic oedema, nephritic syndrome, anaphylactic shock.
Drug Interactions	May reduce the efficacy of live vaccines.
Storage	Intramuscular: Store at 2-8°C. Do not freeze.
Mechanism of Action	Tetanus immunoglobulin is used for passive immunisation against tetanus. Absorption: Well absorbed.
CIMS Class	Vaccines, Antisera & Immunologicals

tetrabenazine

CIMS Class : (Neuromuscular Disorder Drugs)
tetrabenazine

P - Caution when used during pregnancy

L - Contraindicated in lactation

related tetrabenazine information

Indication & Dosage	<i>Oral</i> Movement disorders Adult: Initially 12.5 mg bid, increased gradually to 12.5-25 mg tid. Max: 200mg daily. If no improvement at max dose for 7 days, drug unlikely to be of benefit. Elderly: Initially 12.5 mg daily, increased gradually. <i>Oral</i> Moderate to severe tardive dyskinesia Adult: Initially 12.5 mg daily increased gradually according to response.
Overdosage	Drowsiness, sweating, hypotension, and hypothermia. Supportive and symptomatic treatment.
Contraindications	Lactation.
Special Precautions	May exacerbate symptoms of parkinsonism. Caution to be exercised when driving or performing skilled tasks. Pregnancy.
Adverse Drug Reactions	Drowsiness, extrapyramidal symptoms, parkinsonism, depression, orthostatic hypotension, GI disturbances.

	Drowsiness, extrapyramidal symptoms, parkinsonism, depression, orthostatic hypotension, GI disturbances. Potentially Fatal: Neuroleptic malignant syndrome (NMS).
Drug Interactions	Tetrabenazine should not be given with or within 14 days of discontinuation of MAOI therapy. Blocks action of reserpine. Decreases effects of levodopa and worsen parkinsonism. Increased risk of extrapyramidal side effects when given with amantadine, metoclopramide, antipsychotics.
Storage	Oral: Store below 30°C.
Mechanism of Action	Tetrabenazine act by depleting nerve endings of dopamine in the brain and is used to control movement disorders. Absorption: Poorly and erratically absorbed from the GIT (oral). Metabolism: Extensive hepatic first-pass metabolism reduced to hydroxytetrabenazine. Excretion: Via urine (as metabolites).
CIMS Class	Neuromuscular Disorder Drugs
ATC Classification	N07XX06 - tetrabenazine;

tetracycline

CIMS Class : (Tetracyclines)
tetracycline

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ☒ - Lab interference

Food ☒ - Food interaction

related tetracycline information

Indication & Dosage

Oral

Susceptible infections

Adult: As hydrochloride: 250 or 500 mg every 6 hrs, increased to 4 g daily in severe infections.

Child: As hydrochloride: =12 yr: usual adult dose. Max: 2 g daily.

Renal impairment: Mild impairment: Avoid.

Hepatic impairment: Max: 1 g daily.

Oral

Acne

Adult: As hydrochloride: 500 mg-1 g daily in 4 divided doses for 1–2 wk or until clinical improvement occurs, then decreased slowly to maintenance dose of 125–500 mg daily until clinical improvement allows discontinuation of the drug.

Renal impairment: Mild: Avoid

Hepatic impairment: Max: 1g/day.

Intrapleural

	Renal impairment: Mild: Avoid Hepatic impairment: Max: 1g/day. <i>Intrapleural</i> Pleural effusions Adult: As hydrochloride: 500 mg dissolved in 30-50 mL of 0.9% NaCl instilled into pleural spaces.
Administration	Should be taken on an empty stomach. (Take on an empty stomach 1 hr before or 2 hr after meals w/ a full glass of water, in upright position. May be taken w/ meals to reduce GI discomfort.)
Contraindications	Hypersensitivity; pregnancy, lactation, children; renal impairment.
Special Precautions	Hepatic impairment. Myasthenia gravis, SLE. Should be administered with plenty of water, while sitting or standing, and well before going to bed to avoid oesophageal ulceration. Avoid exposure to sunlight. Periodic evaluation of renal, hepatic and haematological system during prolonged therapy.
Adverse Drug Reactions	Oesophageal ulceration, nausea, vomiting, oral candidiasis, diarrhoea, epigastric burning, sore throat, black hairy tongue, pancreatitis, onycholysis, discolouration of tooth (children with developing teeth) and nails, tinnitus, visual disturbances, superinfections, photosensitivity, hypersensitivity, Potentially Fatal: Anaphylaxis, hepatotoxicity, nephrotoxicity, blood dyscrasias.
Drug Interactions	Absorption reduced by divalent and trivalent cations, Fe prep and antacids. Decreases effectiveness of oral contraceptives. Concurrent use may increase levels of lithium, digoxin, halofantrine and theophylline; decrease concentrations of atovaquone; increase anticoagulant effects with warfarin; increase risk of ergotism with ergot alkaloids.

	of lithium, digoxin, halofantrine and theophylline; decrease concentrations of atovaquone; increase anticoagulant effects with warfarin; increase risk of ergotism with ergot alkaloids. Potentially Fatal: Nephrotoxic effects exacerbated by diuretics, methoxyflurane or other nephrotoxic drugs; avoid concurrent use with potentially hepatotoxic drugs. Increased incidence of benign intracranial hypertension with retinoids.
Food Interaction	Absorption reduced by milk, milk products, antacids containing aluminum, magnesium iron preparations and food.
Lab Interference	Interferes with diagnostic tests eg, urinary determination of glucose, false increase in fluorometric determinations of urine catecholamines.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Tetracycline exhibits its bacteriostatic action by reversible binding to the 30s subunits of the ribosome thus preventing protein synthesis and arresting cell growth. It has a broad spectrum of antimicrobial activity including Chlamydiaceae, Mycoplasma spp., Rickettsia spp., spirochaetes, many aerobic and anaerobic Gram-positive and Gram-negative pathogenic bacteria, and some protozoa. Absorption: Absorbed incompletely from the GIT (oral) with

	Chlamydiaeae, Mycoplasma spp., Rickettsia spp., spirochaetes, many aerobic and anaerobic Gram-positive and Gram-negative pathogenic bacteria, and some protozoa. Absorption: Absorbed incompletely from the GIT (oral) with oral bioavailability 60-80%; absorption affected by the presence of divalent or trivalent metal ions, food and milk. Distribution: Widely distributed to body tissues and fluids, CSF (low, may be increased in meningitis), saliva (small amounts), eye, lung, bone (newly formed), teeth (recently calcified and newly developed). Crosses the placenta into the foetal circulation and enters breast milk. Protein-binding: 20-65%. Half life: 6-12 hr. Excretion: Via urine by glomerular filtration (as unchanged, 55% via oral and 60% via IV); may be increased in alkaline urine. Via bile; may undergo enterohepatic reabsorption.
CIMS Class	Tetracyclines
ATC Classification	A01AB13 - tetracycline; Belongs to the class of local anti-infective and antiseptic preparations. Used in the treatment of diseases of the mouth. D06AA04 - tetracycline; Belongs to the class of topical tetracycline and derivatives agents used in the treatment of dermatological diseases. J01AA07 - tetracycline; Belongs to the class of tetracyclines. Used in the treatment of systemic infections. S01AA09 - tetracycline; Belongs to the class of antibiotics. Used in the treatment of eye infections. S02AA08 - tetracycline; Belongs to the class of anti-infectives used in the treatment of ear infections. S03AA02 - tetracycline; Belongs to the class of anti-infectives used in ophthalmologic and otologic preparations.

thalidomide

CIMS Class : (Immunosuppressants) , (Antileprotics)
thalidomide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related thalidomide information

Indication & Dosage	<i>Oral</i> Erythema nodosum leprosum (Type 2) Adult: 100-300 mg once daily at bedtime, reduced gradually by 50 mg every 2-4 wk once a satisfactory reponse is achieved. Not for monotherapy if moderate or severe neuritis present. Max: 400 mg/day. Patients < 50 kg: Initially, 100 mg daily. <i>Oral</i> Multiple myeloma Adult: Initial dose of 200 mg once daily, increased by 100 mg at wkly intervals according to patient tolerance. Max: 800 mg daily.
Administration	Should be taken on an empty stomach. (Take on an empty stomach at least 1 hr after a meal, w/ a full glass of water.)
Contraindications	Pregnancy and lactation.
Special Precautions	All females of childbearing potential must use 2 reliable forms of contraception simultaneously 4 wk before starting therapy, during and 4 wk after therapy is discontinued.

	All females of childbearing potential must use 2 reliable forms of contraception simultaneously 4 wk before starting therapy, during and 4 wk after therapy is discontinued. Therapy to be stopped immediately if pregnancy occurs. Male: Use of barrier methods of contraception if partner is of child-bearing potential. Do not donate blood or sperm during therapy. Patient should not drive or operate machinery. Discontinue therapy if any skin rash develops. Do not resume therapy if the rash is exfoliative, purpuric, or bullous, or if Stevens-Johnson syndrome or toxic epidermal necrolysis suspected.
Adverse Drug Reactions	Severe and irreversible peripheral neuropathy, constipation, dizziness, orthostatic hypotension, drowsiness, somnolence, bradycardia, increase of viral load in HIV-infected patients, hypersensitivity reaction. Potentially Fatal: Stevens-Johnson syndrome, toxic epidermal necrolysis and blood dyscrasias.
Drug Interactions	Thalidomide enhances sedative activity of barbiturates, alcohol, chlorpromazine and reserpine. Avoid use of other drugs that have the potential to cause peripheral neuropathy. Increased risk of thromboembolic events with darbepoetin-alfa and doxorubicin. Potentially Fatal: Increased risk of bone marrow suppression with peg interferon alfa.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Mechanism of Action	Thalidomide is a synthetic glutamic acid derivative immunomodulator with anti-inflammatory, antiangiogenic, sedative and hypnotic activity.

	Thalidomide is a synthetic glutamic acid derivative immunomodulator with anti-inflammatory, antiangiogenetic, sedative and hypnotic activity. Absorption: Slowly absorbed from GI tract. Peak plasma concentrations: 3 to 6 hr. Food may delay but does not significantly affect extent of absorption of thalidomide. Distribution: Crosses the placenta, distributed into the semen. Elimination half-life: 5-7 hr. Metabolism: Exact metabolic fate unknown, it appears to undergo non-enzymatic hydrolysis in plasma.
CIMS Class	Immunosuppressants / Antileptotics
ATC Classification	L04AX02 - thalidomide; Belongs to the class of other immunosuppressive agents. Used to induce immunosuppression.

theophylline

CIMS Class : (Antiasthmatic & COPD Preparations)
theophylline

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related theophylline information

Indication & Dosage	<i>Oral</i> Acute bronchospasm Adult: As conventional tablet: 5 mg/kg every 6-8 hr. Child: As conventional tablet: 5 mg/kg every 4-6 hr. Hepatic impairment: Dose adjustment needed.
	<i>Oral</i> Chronic bronchospasm Adult: As conventional dosage form: 300-1000 mg in divided doses, every 6-8 hr. As modified-release preparations: 175-500 mg every 12 hr. Rate of absorption of modified released preparations varies for different brands. Child: <2 yr: Not recommended; 2-6 yr: ¼ the adult dose; 20-35 kg (about 45 lb): ½ the adult dose. Rate of absorption of modified released preparations varies for different brands. Hepatic impairment: Dose adjustment needed.
	<i>Oral</i> Apnoea in infants Child: Initial dose in neonates: ≤24 days: 1 mg/kg every 12 hr; >24 days: 2 mg/kg every 12 hr.
	<i>Oral</i> Apnoea in infants Child: Initial dose in neonates: ≤24 days: 1 mg/kg every 12 hr; >24 days: 2 mg/kg every 12 hr.

	<i>Oral</i> Apnoea in infants Child: Initial dose in neonates: ≤24 days: 1 mg/kg every 12 hr; >24 days: mg/kg every 12 hr. Full-term infants: initial daily dosage calculated based formula, given in 3-4 divided doses: daily dose (mg/kg) = (0.2 X age in wk loading dose is needed, 5 mg/kg (or in those already on theophylline, 1 m each 2 mcg/ml increase in serum-theophylline concentration). <i>Intravenous</i> Severe bronchospasm Adult: Patients who are not taking theophylline or other xanthine medicat mg/kg as loading dose by IV infusion over 20-30 minutes followed by mai 0.4 mg/kg/hr. Child: Patients who are not taking theophylline or other xanthine medicati mg/kg as loading dose by IV infusion over 20-30 minutes, followed by mai dose: 1-9 yr: 0.8 mg/kg/hr; >9 yr: 0.6-0.7 mg/kg/hr. Hepatic impairment: Dose adjustment needed. Special Populations: Reduce dose in patients with cor pulmonale, heart failure, liver disease and in the elderly. Increase maintenance dose for sm
Administration	May be taken with or without food. (May be taken w/ meals to reduce GI discomfort. Some individual prep must be taken w/ meals or on an empty Ref to monographs for individual formulations.)
Overdosage	Nausea, vomiting, diarrhoea, agitation, tremor, hypertonicity, hyperventila diuresis and repeated vomiting (sometimes haematemesis), cardiac arrhy including tachycardia, hypotension, electrolyte disturbances including hypokalaemia, hyperglycaemia, hypophosphataemia, hypercalcaemia, me acidosis, respiratory alkalosis and convulsions. Other reported effects incl dementia, toxic psychosis, symptoms of acute pancreatitis, rhabdomyolys renal failure and acute compartment syndrome. Empty stomach by lavage 2 hr of overdose, with repeated oral doses of activated charcoal and osm laxative, especially if modified-release tablets taken. Symptomatic and su treatment with monitoring of serum theophylline concentrations. Non-sele

	2 hr of overdose, with repeated oral doses of activated charcoal and osm laxative, especially if modified-release tablets taken. Symptomatic and su treatment with monitoring of serum theophylline concentrations. Non-sele βblockers to be used in non-asthmatic patient for tachycardia, IV diazepam barbiturate to control convulsions, disopyramide may be used in patients v ventricular arrhythmias and convulsions. In severe cases, general anaesth neuromuscular blockade with ventilation may be needed. Charcoal haemoperfusion or haemodialysis may be helpful especially in CHF or live disease.
Contraindications	Hypersensitivity to xanthine derivatives, porphyria.
Special Precautions	Admin IV inj very slowly to avoid direct stimulation of the CNS and CVS. C failure, hypertension, epilepsy, hyperthyroidism, history of peptic ulcer dis renal or hepatic dysfunction, glaucoma, DM, severe hypoxaemia, chronic alcoholism, acute febrile illness. On influenza immunization or active influ infection, COPD and cor pulmonale. Smokers may need higher dose. Pre lactation, children and elderly.
Adverse Drug Reactions	Nausea, vomiting, abdominal pain, diarrhoea, headache, insomnia, dizzin anxiety, restlessness, tremor, palpitations. Potentially Fatal: Convulsions, cardiac arrhythmias, hypotension and suc death after too rapid IV inj.
Drug Interactions	Other xanthines. Theophylline clearance reduced by high dose allopurinol antiarrhythmics, cimetidine, disulfiram, propranolol, methotrexate, aciclovir ne, pentoxifylline, tacrine, ticlopidine, fluvoxamine, interferon-a, macrolide antibiotics, quinolones, oral contraceptives, thiabendazole and viloxazine. Theophylline clearance increased by phenytoin, anticonvulsants, ritonavir, rifampicin, sulfinpyrazone, aminoglutethimide, barbiturates, ipriflavone, cigarette smoking. Concurrent use decreased lithium, alprazolam levels. Increased risk of arrhythmias with e sympathomimetic, general anaesthetics. Increased heart rate with tadalaf
Food Interaction	St John's wort may increase theophylline levels. Avoiding giving enteral fe hour before or after theophylline to prevent reduction in theophylline level:

	St John's wort may increase theophylline levels. Avoiding giving enteral feedings 1 hour before or after theophylline to prevent reduction in theophylline levels.
Lab Interference	May cause false positive elevations of serum uric acid (by Bittner or colorimetric method) and increase in urinary catecholamines. Serum theophylline concentrations may be falsely elevated by furosemide, sulfathiazole, phenylbutazone, probenecid, theobromine, caffeine-containing beverages chocolate and paracetamol if measured by spectrophotometric methods. Theophylline can inhibit the effects of adenosine infusions used in conjunction with radionuclide myocardial imaging, if not withheld 12-24 hr before procedure. Theophylline reduces the diagnostic accuracy of myocardial imaging using dipyridamol.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the fetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the fetus.
Mechanism of Action	Theophylline competitively blocks phosphodiesterase which increases cAMP in smooth muscle tissue concentrations causing bronchodilatation, diuresis, CNS and cardiac stimulation, and gastric acid secretion. Absorption: Rapid and completely absorbed following oral and rectal (enema) administration, slow after rectal (suppositories) and IM administration. For oral administration, rate but not extent of absorption. Peak serum concentrations: 1-2 hr (liquid preparations, capsules or uncoated tablets); 4 hr (modified-release preparations). Distribution: Rapidly distributed throughout extracellular fluids and body tissues. Crosses the placenta and enters breast milk. Protein binding: 40%. Metabolism: Hepatic metabolism via cytochrome P450 isoenzyme CYP1A2, CYP2E1 and CYP3A3. Serum half-life: 6-12 hr (healthy, non-smoking adult); 1-5 hr (children); 4-5 hr (cigarette smokers); 10-45 hr (neonates and premature infants). Excretion: Via urine as metabolites and unchanged drug; small amount excreted in feces as unchanged drug.
CIMS Class	Antiasthmatic & COPD Preparations
ATC	R03DA04 - theophylline; Belongs to the class of other systemic drugs used in the treatment of asthma.

ATC
Classification

R03DA04 - theophylline; Belongs to the class of other systemic drugs use
treatment of obstructive airway diseases, xanthines.

thiamine

CIMS Class : (Vitamin B-Complex / with C)
thiamine

Lab ∞ - Lab interference

related thiamine information

Indication & Dosage	<i>Oral</i> Treatment and prophylaxis of mild chronic thiamine deficiency Adult: 10-25 mg daily in single or divided doses. <i>Oral</i> Thiamine deficiency Adult: Up to 300 mg daily. <i>Parenteral</i> Wernicke-Korsakoff syndrome Adult: Initially, 100 mg by slow IV Inj over 10 min, then 50-100 mg/day IM or IV until the patient can take oral thiamine. Incompatibility: Alkaline or neutral solutions and with oxidizing and reducing agents.
Administration	Should be taken with food.
Special Precautions	Parenteral admin. Increased daily requirements in pregnancy and lactation.
Adverse Drug Reactions	IV: Warm sensation, tingling, pruritus, pain, urticaria, weakness, sweating, nausea, restlessness, tightness of the

	IV: Warm sensation, tingling, pruritus, pain, urticaria, weakness, sweating, nausea, restlessness, tightness of the throat, angioedema, respiratory distress, cyanosis, pulmonary oedema, GI bleeding, transient vasodilation and hypotension, vascular collapse. IM: Tenderness and induration. Potentially Fatal: Very rarely, fatal anaphylactic shock.
Drug Interactions	May enhance the effect of neuromuscular blocking agents.
Lab Interference	False-positive results in the phosphotungstate method for uric acid determination and in the urine spot test with Ehrlich's reagent for urobilinogen. High doses of thiamine reportedly interfere with the Schack and Waxler spectrophotometric determination of theophylline serum concentrations.
Storage	Oral: Store between 15-30°C. Parenteral: Store between 15-30°C.
Mechanism of Action	Thiamine, a water soluble vitamin, combines with ATP to form thiamine pyrophosphate, an essential coenzyme in carbohydrate metabolism. Absorption: Well-absorbed from the GI tract after oral admin and rapidly and completely absorbed following IM administration. Distribution: Widely distributed in most body tissues; enters breastmilk. Excretion: Excess thiamine is excreted in the urine as metabolites and unchanged drug.
CIMS Class	Vitamin B-Complex / with C

thiocolchicoside

CIMS Class : (Muscle Relaxants)
thiocolchicoside

related thiocolchicoside information

Indication & Dosage	<i>Oral</i> Muscle spasms Adult: Initially, 16 mg daily. <i>Intramuscular</i> Muscle spasms Adult: Up to 8 mg daily.
Adverse Drug Reactions	Photosensitivity reactions.
Mechanism of Action	Thiocolchicoside is a muscle relaxant which has been claimed to possess GABA-mimetic and glycinergic actions.
CIMS Class	Muscle Relaxants
ATC Classification	M03BX05 - thiocolchicoside; Belongs to the class of otheragents used as centrally-acting muscle relaxants.

thiopental sodium

CIMS Class : (Anaesthetics - Local & General)
thiopental sodium

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related thiopental sodium information

Indication & Dosage

Intravenous

Induction of anaesthesia

Adult: 100-150 mg of a 2.5 or 5% solution injected over 10-15 sec repeated every 30-60 sec according to response or as a continuous infusion of a 0.2 or 0.4% solution. Max: 500mg. Max in pregnancy: 250mg.

Child: 2-7 mg/kg over 10-15 seconds; repeated after 1 minute if needed..

Elderly: Dose reduction may be needed.

Renal impairment: Dose reduction may be needed.

Hepatic impairment: Dose reduction may be needed.

Intravenous

Status epilepticus

Adult: In conjunction with assisted ventilation: 75-125 mg as a 2.5% solution.

Child: 5 mg/kg by slow IV inj followed by, neonates: continuous iv infusion of 2.5 mg/kg/hr; >1 month: 2-8 mg/kg/hr. Adjust infusion dose according to response.

Child: 5 mg/kg by slow IV inj followed by, neonates:

continuous iv infusion of 2.5 mg/kg/hr; >1 month: 2-8 mg/kg/hr. Adjust infusion dose according to response.

Elderly: Dose reduction may be needed.

Renal impairment: Dose reduction may be needed.

Hepatic impairment: Dose reduction may be needed.

Intravenous

Reduction of raised intracranial pressure

Adult: Intermittent bolus inj of 1.5–3.5 mg/kg, if adequate ventilation is provided.

Child: 3 mth-15 yr: initial 5-10-mg/kg IV followed by a continuous IV infusion at 1–4 mg/kg/hr.

Elderly: Dose reduction may be needed.

Renal impairment: Dose reduction may be needed.

Hepatic impairment: Dose reduction may be needed.

Incompatibility: Incompatible with acidic and oxidising substances, eg. amikacin sulfate, benzylpenicillin salts, cefapirin sodium, codeine phosphate, ephedrine sulfate, fentanyl citrate, glycopyrronium bromide, morphine sulfate, pentazocine lactate, prochlorperazine edisilate, suxamethonium salts and tubocurarine chloride. Do not use sterile water in IV infusion concentrations <2% since use of the resulting hypotonic solutions will cause haemolysis.

Incompatibility: Incompatible with acidic and oxidising substances, eg. amikacin sulfate, benzylpenicillin salts, cefapirin sodium, codeine phosphate, ephedrine sulfate, fentanyl citrate, glycopyrronium bromide, morphine sulfate, pentazocine lactate, prochlorperazine edisilate, suxamethonium salts and tubocurarine chloride. Do not use sterile water in IV infusion concentrations <2% since use of the resulting hypotonic solutions will cause haemolysis.

	suxamethonium salts and tubocurarine chloride. Do not use sterile water in IV infusion concentrations <2% since use of the resulting hypotonic solutions will cause haemolysis.
Overdosage	Acute lethal dose in human is unknown and variable. Lethal dose can be as low as 10 mcg/ml if co-admin with other CNS depressants or alcohol. Pulmonary (eg. apnea, laryngospasm, coughing), cardiovascular (eg. hypotension progressing to shock) and CNS effects. Discontinue drug and maintain patent airway, using assisted or controlled respiration and oxygen as necessary. Close monitoring of vital signs (eg. respiratory rate), fluid intake, blood gases and serum electrolytes. Laryngospasm may be relieved with a skeletal muscle relaxant, positive-pressure ventilation, endotracheal intubation or even tracheostomy.
Contraindications	Porphyria; dyspnoea or respiratory obstruction.
Special Precautions	Hypovolaemia; history of severe asthma, severe cardiac disease, severe anaemia, hyperkalaemia, toxemia, myasthenia gravis, myxoedema; severe renal or hepatic disease; muscular dystrophies, adrenocortical insufficiency; increased intracranial pressure; elderly, pregnancy, lactation. Avoid extravasation or intra-arterial administration. IV inj of concentrated thiopental solution e.g. 5% may cause thrombophlebitis.
Adverse Drug Reactions	Coughing, hiccupping, sneezing, muscle twitching, laryngospasm, bronchospasm. IV: tissue necrosis (if extravasation occurs). Intra-arterial: Severe arterial spasm with burning pain, blanching of forearm and hands and gangrene of digits. Potentially Fatal: Respiratory depression, arrhythmias, circulatory failure and anaphylactoid reactions.
Drug Interactions	Possible increase in difficulty in producing anaesthesia in patients taking alcohol or CNS depressants. Additive action

	Possible increase in difficulty in producing anaesthesia in patients taking alcohol or CNS depressants. Additive action with other CNS depressants including sedatives, hypnotics, nitrous oxide or alcohol. Increased hypotension and excitatory effects with phenothiazine antipsychotics. Increased hypnotic effect with antipsychotic. Decreased requirement of thiopental sodium with metoclopramide, sulfisoxazole, aspirin, meprobamate, probenecid and other highly protein bound drugs. Potentially Fatal: Increased resp depression with opioids.
Food Interaction	Use of valerian, kava kava or St John's wort may prolong effect of thiopental. All herbal medicines should be stopped 2 wk prior to elective surgery.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 20-25°C.
Mechanism of Action	Thiopental sodium, a short-acting barbiturate anaesthetic, is a CNS depressant inducing hypnosis and anaesthesia but not analgesia. It has also been used in the control of refractory tonic-clonic status epilepticus and to reduce increased intracranial pressure in neurosurgical patients. Onset: IV: 30 sec. Rectal: 8-10 min. Distribution: Crosses the placenta and enters breast milk. Protein-binding: 80% Metabolism: Hepatic; mostly converted to inactive metabolites.

	Protein-binding: 80% Metabolism: Hepatic; mostly converted to inactive metabolites. Excretion: Elimination half-life: 10-12 hr (adults); 6 hr (childn); 26-28 hr (obese and pregnant patients).
CIMS Class	Anaesthetics - Local & General

thioridazine

CIMS Class : (Antipsychotics)
thioridazine

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab - Lab interference

related thioridazine information

Indication & Dosage

Oral

Schizophrenia

Adult: Initially, 50-100 tid daily and slowly titrated upwards at no more than 100 mg wkly. Max: 800 mg daily in 2-4 divided doses.

Child: 2–12 yr: Initially, 0.5 mg/kg daily in divided doses, increased gradually until optimum effect obtained. Max: 3 mg/kg daily.

Renal impairment: Lower initial doses and more gradual dosage increase.

Hepatic impairment: Lower initial doses and more gradual dosage increase.

Oral

Depression

Adult: Initially, 25 mg tid, titrated to 20–200 mg daily.

Renal impairment: Lower initial doses and more gradual dosage increase.

Hepatic impairment: Lower initial doses and more gradual dosage increase.

	Hepatic impairment: Lower initial doses and more gradual dosage increase. Incompatibility: Oral liquid thioridazine should not be admin simultaneously with carbamazepine oral suspension.
Administration	Should be taken with food.
Overdosage	Overdosage may produce effects that are extensions of the adverse reactions. Extrapyramidal reactions, hypotension, sedation, CNS depression progressing to coma or CNS stimulation with convulsions followed by respiratory depression, shock (e.g. ECG changes and cardiac arrhythmias), increased QT and PR intervals, non-specific ST and T wave changes, torsades de pointes, myocardial depression, agitation, urinary retention, oliguria, uremia, blurring of vision, hypothermia, hyperthermia, mydriasis, miosis, tremor, muscle twitching, rigidity, seizures, muscular hypotonia, respiratory and/or vasomotor collapse and pulmonary oedema. Treatment is symptomatic and supportive with ECG monitoring for at least 24 hr or as long as QT interval is prolonged. A patent airway should be established and adequate oxygenation and ventilation maintained. Emesis (less preferable due to risk of dystonia and potential of aspiration of vomitus) or gastric lavage followed by repeated doses of activated charcoal. Management of arrhythmias include ventricular pacing, defibrillation, admin of IV magnesium sulfate, lidocaine, phenytoin or isoproterenol with correction of electrolyte abnormalities and acid-base balance. Lidocaine should be admin cautiously due to increased risk of seizures.
Contraindications	Hypersensitivity to phenothiazines, comatose states, pre-exisitng CNS depression, severe CVS disorders, uncorrected hypokalaemia or any electrolyte imbalance, known or suspected QT prolongation, history of ventricular arrhythmias including torsades de pointes and porphyria. Bone-marrow suppression, phaeochromocytoma, or prolactin-dependent tumours, angle-closure glaucoma, history of jaundice, parkinsonism, DM, hypothyroidism, myasthenia gravis, paralytic ileus, prostatic hyperplasia,

	ventricular arrhythmias including torsades de pointes and porphyria. Bone-marrow suppression, phaeochromocytoma, or prolactin-dependent tumours, angle-closure glaucoma, history of jaundice, parkinsonism, DM, hypothyroidism, myasthenia gravis, paralytic ileus, prostatic hyperplasia, or urinary retention. Patients with reduced activity of cytochrome P450 isoenzyme CYP2D6.
Special Precautions	Pregnancy, lactation; renal or hepatic impairment, epilepsy. Perform ECG screening and electrolyte measurement before therapy, after each dose increase and at 6-mthly intervals. Monitor for visual defects on long-term therapy. May impair ability to perform skilled tasks. Withdrawal of drug to be carried out gradually over 1-2 wk.
Adverse Drug Reactions	Drowsiness, sedation, dry mouth, nasal congestion, blurring of vision, tremor, mydriasis, constipation, urinary retention, tachycardia, postural hypotension, sexual dysfunction, pigmentary retinopathy (high doses and prolonged therapy), contact dermatitis, tardive dyskinesias. Potentially Fatal: Neuroleptic malignant syndrome. Sudden deaths due to cardiac arrhythmias and arrest.
Drug Interactions	Potentiates adverse effects of anticholinergics. Concurrent use of TCAs leads to raised blood levels of both drugs. May antagonise effects of levodopa, bromocriptine and other dopamine agonists. Avoid co-admin with drugs that cause electrolyte imbalance. Monitor phenytoin therapy due to inconsistent effects of thioridazine on phenytoin levels. Potentially Fatal: Increased risk of QT prolongation with class IA and class II antiarrhythmics, astemizole, cisapride, pimozide, droperidol, erythromycin IV, sparfloxacin, terfenadine, clarithromycin and other drugs that may prolong QT interval. Potentiates CNS depression with opioids. Increased risk of arrhythmias with ephedrine-like drugs e.g. phenylpropanolamine. Increased thioridazine levels with fluvoxamine, pindolol, propranolol, ritonavir and other CYP2D6 isoenzymes inhibitors (e.g. fluoxetine, paroxetine).
Lab Interference	Urinary metabolites may cause urine to darken and result in

	Urinary metabolites may cause urine to darken and result in false-positive test results for urobilinogen, amylase, uroporphyrins, porphobilinogens and 5-hydroxyindolacetic acid. False-positive test results for phenylketonuria and pregnancy test (e.g. frog test, Gravindex®, HCG test, Pregnosticon®, UCG test).
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Tablet/oral concentrate: Store 15-30°C.
Mechanism of Action	Thioridazine, a phenothiazine antipsychotic, exhibits strong α-adrenergic blocking effects and depresses the release of hypothalamic and hypophyseal hormones by blocking postsynaptic mesolimbic, dopaminergic receptors in the brain. Duration: 4-5 days. Distribution: Protein-binding (Thioridazine and metabolites): >95%. Crosses the placenta and is distributed into breast milk Metabolism: Hepatic by the cytochrome P450 isoenzyme CYP2D6; converted to active metabolites, mesoridazine and sulforidazine. Excretion: 4-10 hr (plasma half-life).
CIMS Class	Antipsychotics
ATC Classification	N05AC02 - thioridazine; Belongs to the class of phenothiazine antipsychotics with piperidine structure. Used in the management of psychosis.

tianeptine

CIMS Class : (Antidepressants)
tianeptine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food $\square$ - Food interaction

related tianeptine information

Indication & Dosage	<i>Oral</i> Depression Adult: 12.5 mg tid. Elderly: Dose reduction to total daily dose of 25 mg. Renal impairment: Reduce total daily dose to 25 mg/day.
Administration	Should be taken on an empty stomach. (Take before main meals.)
Overdosage	Gastric lavage followed by symptomatic treatment and monitoring of CV, respiratory, metabolic and renal function.
Contraindications	Childn <15 yrs. Pregnancy and lactation.
Special Precautions	General anaesthesia; tasks requiring mental alertness. Avoid abrupt withdrawal, dosage to be decreased gradually over 7-14 days.
Adverse Drug Reactions	Abdominal pain, fatigue, nausea, constipation, lack of appetite, insomnia, drowsiness, palpitations, muscular or joint pain, headache, vertigo, tremour, dry mouth, hepatitis (rare)

	abdominal pain, fatigue, nausea, constipation, lack of appetite, insomnia, drowsiness, palpitations, muscular or joint pain, headache, vertigo, tremour, dry mouth, hepatitis (rare)
Food Interaction	Decreased absorption with alcohol.
Storage	Oral: Store below 30°C.
Mechanism of Action	Tianeptine exerts its antidepressant action by increasing the presynaptic re-uptake of serotonin.
CIMS Class	Antidepressants
ATC Classification	N06AX14 - tianeptine; Belongs to the class of other agents used in the management of depression.

tibolone

CIMS Class : (Oestrogens & Progesterones & Related Synthetic Drugs)
tibolone

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related tibolone information

Indication & Dosage	<i>Oral</i> Prophylaxis of postmenopausal osteoporosis, Menopausal vasomotor symptoms <i>Adult:</i> 2.5 mg daily.
Administration	May be taken with or without food.
Contraindications	Known or suspected oestrogen dependent tumours in women, present or history of breast cancer, undiagnosed vaginal bleeding, severe liver disease, history or current CV or cerebrovascular disorders, untreated endometrial hyperplasia, porphyria, pregnancy and lactation, premenopausal women.
Special Precautions	Liver disease, history or risk factors of thromboembolic disorder, impaired glucose tolerance, hypercholesterolaemia, hypertriglyceridaemia, hypertension, cholelithiasis, SLE, uterine fibroids, endometriosis and history of endometrial hyperplasia. Disorders that may be worsened by fluid retention, eg. renal dysfunction, migraine, epilepsy. Discontinue in the event of thromboembolic or abnormal liver

	hyperplasia. Disorders that may be worsened by fluid retention, eg. renal dysfunction, migraine, epilepsy. Discontinue in the event of thromboembolic or abnormal liver function results, significant increase in BP, new onset of migraine-type headache. Not recommended in women within 1 yr of menopause because of irregular vaginal bleeding. Stop tibolone 4 wk before elective surgery especially when prolonged immobilisation after surgery is expected. Adjustment of antidiabetic medications may be needed.
Adverse Drug Reactions	Weight gain; dizziness; rash; pruritus; headache; migraine; visual disturbances; GI symptoms; facial hair growth; altered liver function; ankle oedema; depression; arthralgia or myalgia; irregular vaginal bleeding. Potentially Fatal: Breast or endometrial cancer and stroke.
Drug Interactions	Enzyme inducers eg, barbiturates, phenytoin, carbamazepine and rifampicin may accelerate tibolone metabolism. Increased anticoagulant effects of warfarin.
Mechanism of Action	Tibolone is a steroid that possesses oestrogenic, progestogenic and weak androgenic properties. Absorption: Rapidly and extensively absorbed after oral admin. Peak plasma concentrations after 1-1.5 hr (oral). Metabolism: Converted into 3 active metabolites with 2 having predominantly oestrogenic property and 1 with progestogenic and androgenic property. Excretion: Faeces (via the bile); via the urine (about 30% of a dose). The 2 main metabolites have an elimination half-life of about 7 hr.
CIMS Class	Oestrogens & Progestones & Related Synthetic Drugs
ATC Classification	G03CX01 - tibolone;

<10	Initial IV loading dose of 3 g, followed by 2 g every 12 hr (or 1 g IM every 6 hr).
<10> with hepatic impairment	Initial IV loading dose of 3 g, followed by 2 g IV every 24 hr or 1 g IM every 12 hr.

Intravenous

Intravenous

Peritonitis

Adult: 200-300 mg/kg daily by infusion in divided doses every 4 or 6 hr.

Child: 200-300 mg/kg by infusion in divided doses every 4 or 6 hr.

Renal impairment: Peritoneal dialysis patients: 3 g every 12 hr; haemodialysis patients: 2 g every 12 hr plus an additional dose of 3 g after each dialysis session.

CrCl (ml/min)	Dosage Recommendation
30-60	Initial IV loading dose of 3 g, followed by 2 g every 4 hr.
10-30	Initial IV loading dose of 3 g, followed by 2 g every 8 hr.
<10	Initial IV loading dose of 3 g, followed by 2 g every 12 hr (or 1 g IM every 6 hr).
<10> with hepatic impairment	Initial IV loading dose of 3 g, followed by 2 g IV every 24 hr or 1 g IM every 12 hr.

Intravenous

Bone and joint infections

Adult: 200-300 mg/kg daily by infusion in divided doses every 4 or 6 hr.

Child: 200-300 mg/kg by infusion in divided doses every 4 or 6 hr.

Renal impairment: Peritoneal dialysis patients: 3 g every 12 hr; haemodialysis patients: 2 g every 12 hr plus an additional dose of 3 g after each dialysis session.

CrCl (ml/min)	Dosage Recommendation
30-60	Initial IV loading dose of 3 g, followed by 2 g every 4 hr.
10-30	Initial IV loading dose of 3 g, followed by 2 g every 8 hr.
<10	Initial IV loading dose of 3 g, followed by 2 g every 12 hr (or 1 g IM every 6 hr).

	<10	Initial IV loading dose of 3 g, followed by 2 g every 12 hr (or 1 g IM every 6 hr).
	<10> with hepatic impairment	Initial IV loading dose of 3 g, followed by 2 g IV every 24 hr or 1 g IM every 12 hr.
	<i>Parenteral</i> Uncomplicated urinary tract infections Adult: 1 g IM/slow IV Inj every 6 hr. Child: 50-100 mg/kg in divided doses every 6-8 hr. Do not inject >2 g into each IM site.	
	<i>Parenteral</i> Complicated urinary tract infections Adult: 150-200 mg/kg daily by IV infusion in divided doses every 4 or 6 hr. Child: 150-200 mg/kg daily by IV infusion in divided doses every 4 or 6 hr. Renal impairment: Peritoneal dialysis patients: 3 g every 12 hr; haemodialysis patients: 2 g every 12 hr plus an additional dose of 3 g after each dialysis session.	
	CrCl (ml/min)	Dosage Recommendation
	30-60	Initial IV loading dose of 3 g, followed by 2 g every 4 hr.
	10-30	Initial IV loading dose of 3 g, followed by 2 g every 8 hr.
	<10	Initial IV loading dose of 3 g, followed by 2 g every 12 hr (or 1 g IM every 6 hr).
	<10 with hepatic impairment	Initial IV loading dose of 3 g, followed by 2 g IV every 24 hr or 1 g IM every 12 hr.
	Incompatibility: Incompatible with aminoglycosides.	
Contraindications	Hypersensitivity to penicillins.	
Special Precautions	Restricted sodium diet. Very high doses in poor renal function (risk of neurotoxicity) or heart failure. Avoid contact, skin sensitisation may occur. Monitor electrolyte	

	Restricted sodium diet. Very high doses in poor renal function (risk of neurotoxicity) or heart failure. Avoid contact, skin sensitisation may occur. Monitor electrolyte concentrations, renal, hepatic and haematological status during prolonged and high dose therapy. Jarisch-Herxheimer reaction may be seen in spirochete infections particularly syphilis; avoid intrathecal route.
Adverse Drug Reactions	Pain at the inj site and phlebitis; electrolyte disturbances (hypokalaemia or hypernatraemia); dose-dependent coagulation defect; purpura and haemorrhage; hypersensitivity reactions; haemolytic anaemia; interstitial nephritis; neutropenia; CNS toxicity including convulsions; diarrhoea; pseudomembranous colitis. Haemorrhagic cystitis especially in cystic fibrosis patients. Potentially Fatal: Anaphylaxis.
Drug Interactions	Probenecid decreases clearance of ticarcillin. Increased bleeding risk with warfarin, acenocoumarol. Possible increase in ciclosporin, methotrexate levels with concurrent use. Possible contraceptive failure with combined oral contraceptives.
Lab Interference	May interfere with diagnostic tests for urinary glucose using copper sulfate, direct Coombs' test, and test for urinary or serum proteins. May interfere with diagnostic tests that use bacteria.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Ticarcillin is bactericidal through inhibition of the final

Mechanism of Action	Ticarcillin is bactericidal through inhibition of the final cross-linking stage of peptidoglycan production by binding and inactivating transpeptidases thus inhibiting bacterial cell wall synthesis. It is active against gram-positive bacteria, gram-negative cocci, <i>Pseudomonas aeruginosa</i>, spirochetes, actinomycetes and has an extended spectrum of gram-negative bacteria compared to benzylpenicillin. Absorption: Not absorbed from GI tract. Peak plasma concentrations: 0.5-1 hr (IM). Distribution: Widely distributed. Protein-binding: 50%. Plasma half-life: 70 min; 50 min (patients with cystic fibrosis). Metabolism: Limited metabolism. Excretion: 90% excreted unchanged in urine.
CIMS Class	Penicillins
ATC Classification	J01CA13 - ticarcillin; Belongs to the class of penicillins with extended spectrum. Used in the treatment of systemic infections.

ticlopidine

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
ticlopidine

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related ticlopidine information

Indication & Dosage

Oral

Prophylaxis of thrombotic stroke

Adult: >18 yr: 250 mg bid.

Renal impairment: Dose reduction or discontinuance if haemorrhagic or haematopoietic complications occur.

Hepatic impairment: Severe: contraindicated.

Oral

Ischaemic heart disease

Adult: >18 yr: 250 mg bid.

Renal impairment: Dose reduction or discontinuance if haemorrhagic or haematopoietic complications occur.

Hepatic impairment: Severe: contraindicated.

Oral

Intermittent claudication

Adult: >18 yr: 250 mg bid.

Renal impairment: Dose reduction or discontinuance if haemorrhagic or haematopoietic complications occur.

Hepatic impairment: Severe: contraindicated.

	Renal impairment: Dose reduction or discontinuance if haemorrhagic or haematopoietic complications occur. Hepatic impairment: Severe: contraindicated. <i>Oral</i> Prophylaxis of subacute stent occlusion after intracoronary stenting Adult: >18 yr: 250 mg bid for 4 wk, in conjunction with aspirin, starting at the time of stent placement. Renal impairment: Dose reduction or discontinuance if haemorrhagic or haematopoietic complications occur. Hepatic impairment: Severe: contraindicated.
Administration	Should be taken with food.
Overdosage	GI haemorrhage, convulsions, hypothermia, dyspnoea, loss of equilibrium and abnormal gait.
Contraindications	Pre-existing or history of blood dyscrasias; haemostatic disorder or active pathological bleeding (eg. bleeding peptic ulcer, intracranial bleeding); severe hepatic dysfunction. Hypersensitivity. Lactation.
Special Precautions	Patients with increased risk of bleeding from trauma, surgery or pathological disorder. Moderate to severe renal impairment. May need to stop therapy 10-14 days before elective surgery. Full blood counts should be performed prior to therapy and every 2 wk during the first 3 mth of treatment. Pregnancy.
Adverse Drug Reactions	Diarrhoea, nausea, dyspepsia, bleeding, pupura, skin rash, increase in serum cholesterol concentration, elevation of LFTs, hepatitis, cholestatic jaundice. Potentially Fatal: Neutropenia, agranulocytosis, thrombotic thrombocytopenic purpura and aplastic anaemia.
Drug Interactions	Reduced clearance with cimetidine; corticosteroid may antagonise effects on bleeding time. Avoid concurrent use

	Reduced clearance with cimetidine; corticosteroid may antagonise effects on bleeding time. Avoid concurrent use with clopidogrel. Potentially Fatal: Risk of haemorrhage increased with NSAIDs and oral anticoagulants; decreased metabolism of theophylline, phenytoin and bupropion.
Food Interaction	Increased risk of bleeding with Ginkgo biloba and Kanger-karyu.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Ticlopidine inhibits adenosine diphosphate-mediated platelet aggregation. Absorption: Rapidly and almost completely absorbed from the GI tract (oral). Oral bioavailability increased by 20% when taken after meals. Distribution: Protein-binding: Extensive. Metabolism: Hepatic: Extensive. Excretion: As metabolites; via urine (60%), via faeces (25%). Terminal half-life: 30-50 hr.
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC Classification	B01AC05 - ticlopidine; Belongs to the class of platelet aggregation inhibitors excluding heparin. Used in the treatment of thrombosis.

timolol

CIMS Class : (Beta-Blockers) , (Antiglaucoma Preparations)
timolol

P - Contraindicated in pregnancy

related timolol information

Indication & Dosage

Oral

Hypertension

Adult: As maleate: 10 mg daily, increased according to response every 7 or more days. Maintenance: 10-40 mg/day in single or 2 divided doses. Max: 60 mg daily. Doses >30 mg should be given in 2 divided doses.

Renal impairment: Dose reduction may be needed.

Hepatic impairment: Dose reduction may be needed.

Oral

Prophylaxis of migraine

Adult: As maleate: 10-20 mg daily in 1-2 divided doses. Max: 30 mg daily.

Renal impairment: Dose reduction may be needed.

Hepatic impairment: Dose reduction may be needed.

Oral

Angina pectoris

Adult: As maleate: 5 mg bid, increased every 3 or more days to not > 10 mg daily. Maintenance: 35-45 mg daily in divided doses. Max: 60 mg daily.

Renal impairment: Dose reduction may be needed.

	Adult: AS maleate: 5 mg bid, increased every 3 or more days to not > 10 mg daily. Maintenance: 35-45 mg daily in divided doses. Max: 60 mg daily. Renal impairment: Dose reduction may be needed. Hepatic impairment: Dose reduction may be needed. <i>Oral</i> Post myocardial infarction Adult: AS maleate: Initially, 5 mg bid for 2 days, starting 1-4 wk after MI, increased up to 10 mg bid, if necessary. Renal impairment: Dose reduction may be needed. Hepatic impairment: Dose reduction may be needed. <i>Ophthalmic</i> Open-angle glaucoma Adult: Eye drop: Initially, instil 1 drop of 0.25% solution bid, increased to 0.5% solution if there is inadequate response; decrease to 1 drop daily if controlled. Gel-forming eyedrop: Instil 1 drop of 0.25% or 0.5% preparation in affected eyes once daily. <i>Ophthalmic</i> Ocular hypertension Adult: Eye drop: Initially, instil 1 drop of 0.25% solution bid, increased to 0.5% solution if there is inadequate response; decrease to 1 drop daily if controlled. Gel-forming eyedrop: Instil 1 drop of 0.25% or 0.5% preparation in affected eyes once daily.
Administration	Should be taken with food.
Overdosage	Symptomatic bradycardia, hypotension, bronchospasm and acute heart failure. Gastric lavage followed by symptomatic and supportive treatment.
Contraindications	Present or history of bronchial asthma, COPD, present or history of bronchospastic disease, sinus bradycardia, 2nd and 3rd degree heart block, overt heart failure, cardiogenic

	Present or history of bronchial asthma, COPD, present or history of bronchospastic disease, sinus bradycardia, 2nd and 3rd degree heart block, overt heart failure, cardiogenic shock. Pregnancy.
Special Precautions	Due to systemic absorption, side effects associated with β -blockers may occur. Heart block, cerebrovascular insufficiency, myasthenia gravis. May mask signs of hypoglycaemia, hyperthyroidism. Abrupt withdrawal may precipitate thyroid storm in patients suspected of developing thyrotoxicosis. Avoid sudden withdrawal in patients with ischaemic heart disease.
Adverse Drug Reactions	Fatigue, coldness of extremities, paraesthesia, GI symptoms, skin rash, alopecia, dry mouth, bradycardia. Ophthalmic use: Blurred vision, burning, stinging, ocular irritation, decreased corneal sensitivity, visual disturbances, diplopia, ptosis, cystoid macular oedema, pseudopemphigoid, choroidal detachment following filtration surgery. Systemic absorption with systemic effects may occur. Potentially Fatal: Heart failure, heart block, bronchospasm, respiratory failure.
Drug Interactions	Hypotensive action may be reduced by NSAIDs. Increased hypotensive effect of antihypertensives, aldesleukin, general anaesthetics, catecholamine-depleting drugs e.g. reserpine. Increased risk of bradycardia with digoxin. Decreased response to sympathomimetics. Increased timolol levels with CYP2D6 inhibitors e.g. quinidine. Increased risk of prolongation of AV conduction with calcium-channel blockers and digoxin. May exacerbate rebound hypertension following discontinuance of clonidine. Additive effects on β-blockade with other β-blockers.
Pregnancy	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Ophthalmic: Store at 15-30°C (59-86°F). Oral: Store at 15-30°C (59-86°F).
Mechanism of Action	Timolol is a non-selective β-adrenergic receptor blocker which does not have significant intrinsic sympathomimetic, direct myocardial depressant or local anaesthetic activity. It decreases intraocular pressure by reducing aqueous humor formation or increase outflow. Onset: Topical: 30 min. Duration: As long as 24 hr. Absorption: Almost completely absorbed from GI tract. Peak plasma concentration in 1-2 hr. Distribution: Protein-binding: Low. Crosses the placenta and distributed into breastmilk. Metabolism: Undergo first-pass metabolism. Plasma half-life: 4hr. Excretion: Excreted in urine as metabolites and unchanged drug.

	half-life: 4hr. Excretion: Excreted in urine as metabolites and unchanged drug.
CIMS Class	Beta-Blockers / Antiglaucoma Preparations
ATC Classification	C07AA06 - timolol; Belongs to the class of non-selective beta-blocking agents. Used in the treatment of cardiovascular diseases. S01ED01 - timolol; Belongs to the class of beta blocking agents used in the treatment of glaucoma and miosis.

Adult: 2 g given 12 hr before surgery.

Renal impairment: Haemodialysis: additional dose may be

Propylaxis of postoperative anaerobic bacterial infections

Adult: 2 g given 12 hr before surgery.

Renal impairment: Haemodialysis: additional dose may be needed.

Oral

Eradication of *H. pylori* associated with peptic ulcer disease

Adult: 500 mg bid; given with clarithromycin and omeprazole for 7 days.

Renal impairment: Haemodialysis: additional dose may be needed.

Oral

Intestinal amoebiasis

Adult: Single daily dose of 2 g for 2 or 3 days. Tinidazole therapy to be followed by a luminal amoebicide (e.g. paromomycin).

Child: A single daily dose of 50-60 mg/kg daily for 3 days. Tinidazole therapy to be followed by a luminal amoebicide (e.g. paromomycin).

Renal impairment: Haemodialysis: additional dose may be needed.

Oral

Hepatic amoebiasis

Adult: 1.5-2 g as a single daily dose for 3-6 days. Tinidazole therapy to be followed by a luminal amoebicide (e.g. paromomycin).

Child: A single daily dose of 50-60 mg/kg for 5 days. Tinidazole therapy to be followed by a luminal amoebicide (e.g. paromomycin).

Renal impairment: Haemodialysis: additional dose may be needed.

Oral

Renal impairment: Haemodialysis: additional dose may be needed.

Oral

Giardiasis

Adult: 2 g as a single dose. In trichomoniasis, sexual partners should be treated.

Child: 50-75 mg/kg as a single dose, repeat this dose if necessary.

Renal impairment: Haemodialysis: additional dose may be needed.

Oral

Trichomoniasis

Adult: 2 g as a single dose. In trichomoniasis, sexual partners should be treated.

Child: 50-75 mg/kg as a single dose, repeat this dose if necessary.

Renal impairment: Haemodialysis: additional dose may be needed.

Oral

Acute necrotising ulcerative gingivitis

Adult: 2 g as a single dose.

Renal impairment: Haemodialysis: additional dose may be needed.

Intravenous

Anaerobic bacterial infections

Adult: Initially, 800 mg/400 ml infused at a rate of 10 ml/min followed by 800 mg daily or 400 mg bid until oral therapy can be substituted.

Renal impairment: Haemodialysis: additional dose may be needed.

Intravenous

Skin and soft tissue infections

needed.

Intravenous

Skin and soft tissue infections

Adult: Initially, 800 mg/400 ml infused at a rate of 10 ml/min followed by 800 mg daily or 400 mg bid until oral therapy can be substituted.

Renal impairment: Haemodialysis: additional dose may be needed.

Intravenous

Pneumonia

Adult: Initially, 800 mg/400 ml infused at a rate of 10 ml/min followed by 800 mg daily or 400 mg bid until oral therapy can be substituted.

Renal impairment: Haemodialysis: additional dose may be needed.

Intravenous

Peritonitis

Adult: Initially, 800 mg/400 ml infused at a rate of 10 ml/min followed by 800 mg daily or 400 mg bid until oral therapy can be substituted.

Renal impairment: Haemodialysis: additional dose may be needed.

Intravenous

Lung abscess

Adult: Initially, 800 mg/400 ml infused at a rate of 10 ml/min followed by 800 mg daily or 400 mg bid until oral therapy can be substituted.

Renal impairment: Haemodialysis: additional dose may be needed.

Intravenous

Endometritis

Adult: Initially, 800 mg/400 ml infused at a rate of 10 ml/min followed by 800 mg daily or 400 mg bid until oral therapy can

	Endometritis Adult: Initially, 800 mg/400 ml infused at a rate of 10 ml/min followed by 800 mg daily or 400 mg bid until oral therapy can be substituted. Renal impairment: Haemodialysis: additional dose may be needed. <i>Intravenous</i> Prophylaxis of postoperative anaerobic bacterial infections Adult: 1.6 g given as a single infusion prior to surgery. Renal impairment: Haemodialysis: additional dose may be needed.
Administration	Should be taken with food. (Take during or immediately after meals.)
Overdosage	Treatment is symptomatic and supportive. Gastric lavage and dialysis may be useful.
Contraindications	Blood dyscrasias, organic neurologic disorders, hypersensitivity to 5-nitroimidazole derivatives, porphyria. Lactation, pregnancy (1st trimester).
Special Precautions	Alcohol should be avoided until 72 hr after stopping therapy. Discontinue if abnormal neurological signs (e.g. dizziness, incoordination, ataxia) develop. CNS diseases, pregnancy (2nd and 3rd trimester).
Adverse Drug Reactions	Metallic taste, nausea, headache, vomiting, dark urine, flushing, anorexia, diarrhoea, tiredness, transient leucopenia. Potentially Fatal: Hypersensitivity.
Drug Interactions	Possible decrease in absorption with colestyramine. Possible increase in anticoagulant effect of warfarin. Monitor for toxicity if used with ciclosporin, tacrolimus or lithium.
Food Interaction	Disulfiram-like reaction with alcohol.

Food Interaction	Disulfiram-like reaction with alcohol.
Lab Interference	May cause falsely decreased values in tests where determinations are based on the decrease in ultraviolet absorbance that occurs during oxidation of NADH to NAD e.g. alanine aminotransferase (ALT), aspartate aminotransferase (AST), lactate dehydrogenase (LDH), triglycerides or glucose.
Storage	Oral: Store below 25°C.
Mechanism of Action	Tinidazole, a 5 nitroimidazole derivative with antimicrobial actions similar to metronidazole, is active against both protozoa (e.g. Trichomonas vaginalis, Entamoeba histolytica and Giardia lamblia) and obligate anaerobic bacteria. It damages DNA strands or inhibit DNA synthesis in microorganism. Absorption: Almost completely absorbed from the GI tract (oral); peak plasma concentrations after 2 hr. Distribution: Widely distributed; breast milk, CSF, saliva, bile and body tissues (high concentrations similar to plasma), crosses the placenta. Protein-binding: 12%. Metabolism: Converted to an active hydroxy metabolite. Plasma elimination half-life: 12-14 hr. Excretion: Via urine (as unchanged drug and metabolites), via faeces (small amounts).
CIMS Class	Other Antibiotics / Antiamoebics
ATC Classification	J01XD02 - tinidazole; Belongs to the class of imidazole derivative antibacterials. Used in the treatment of systemic infections. P01AB02 - tinidazole; Belongs to the class of nitroimidazole derivatives antiprotozoals. Used in the treatment amoebiasis

infections.

P01AB02 - tinidazole; Belongs to the class of nitroimidazole derivatives antiprotozoals. Used in the treatment amoebiasis and other protozoal diseases.

tioguanine

CIMS Class : (Cytotoxic Chemotherapy)
tioguanine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related tioguanine information

Indication & Dosage	<i>Oral</i> Acute myeloid leukaemia, Chronic myeloid leukaemia, Acute lymphoblastic leukaemia Adult: As a single agent chemotherapy: Initially 2 mg/kg/day, increased to 3 mg/kg/day after 4 wk if no improvement and no leukocyte or platelet depression. Alternatively, induction therapy: 100-200 mg/m²/day in 1-2 divided doses over a period of 5-20 days. Maintenance therapy: Intermittent or continuous daily doses between 60-200 mg/m². In combination with other cytotoxic drugs: Refer to currently published protocols for dose, method and sequence of admin. Dose and duration depends on the combination of cytotoxic drug used. Child: As a single agent chemotherapy: Initially 2 mg/kg/day, increased to 3 mg/kg/day after 4 wk if no improvement and no leukocyte or platelet depression. Alternatively, induction therapy: 60-200 mg/m²/day in 1-2 divided doses over a period of 5-20 days. Maintenance therapy: Intermittent or continuous daily doses between 60-200 mg/m². In

	no leukocyte or platelet depression. Alternatively, induction therapy: 60-200 mg/m²/day in 1-2 divided doses over a period of 5-20 days. Maintenance therapy: Intermittent or continuous daily doses between 60-200 mg/m². In combination with other cytotoxic drugs: Refer to currently published protocols for dose, method and sequence of admin. Dose and duration depends on the combination of cytotoxic drug used. Renal impairment: Dosage adjustment may be needed. Hepatic impairment: Dosage adjustment may be needed. Special Populations: Inherited deficiency of the enzyme thiopurine methyltransferase: Dose reductions needed.
Overdosage	Nausea, vomiting, malaise, hypotension, diaphoresis, myelosuppression and azotaemia. Induce emesis to reduce absorption of drug. Treatment is symptomatic and supportive. There is no known antidote. Haemodialysis unlikely to be helpful.
Contraindications	Pregnancy, lactation, prior resistance to drug. Immunisation with live vaccines.
Special Precautions	Renal or hepatic impairment. Inherited deficiency of thiopurine methyltransferase. Resistance to tioguanine therapy in Lesch-Nyhan syndrome. Monitor haemoglobin concentration, haematocrit, total WBC count, differential count and platelet count at least once a wk or more frequently during therapy. Discontinue treatment temporarily at first signs of unusually large decrease in leukocytes, platelets or haemoglobin. Resume therapy if leukocyte or platelet count increases or stays at an acceptable level for 2-3 days. Withhold therapy if there is worsening of LFT, jaundice, hepatomegaly, anorexia with tenderness in the right hypochondrium, or if there is evidence of toxic hepatitis, biliary stasis or severe bone marrow depression. Not

	2-3 days. Withhold therapy if there is worsening of LFT, jaundice, hepatomegaly, anorexia with tenderness in the right hypochondrium, or if there is evidence of toxic hepatitis, biliary stasis or severe bone marrow depression. Not recommended for maintenance therapy or long-term continuous treatments due to hepatotoxicity.
Adverse Drug Reactions	Myelosuppression especially leukopenia, thrombocytopenia, anaemia; hyperuricaemia; nausea; vomiting; diarrhoea; anorexia and stomatitis; rash; dermatitis; jaundice; increased risk of infections. Potentially Fatal: Hepatotoxicity, life-threatening infections due to myelosuppression.
Drug Interactions	Increased risk of hepatotoxicity, portal hypertension and oesophageal varices during long-term continuous therapy with busulfan. Increased haematological toxicity with aminosalicylate derivatives (e.g. olsalazine, mesalazine or sulfasalazine), which may inhibit the thiopurine methyltransferase enzyme. May decrease phenytoin or carbamazepine levels.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 15-25°C (59-77°F).
Mechanism of Action	Tioguanine, an antineoplastic that acts as an antimetabolite, has actions similar to those of mercaptopurine. It is an analogue of the natural purine, guanine and is rapidly converted to ribonucleotides which are then incorporated into the DNA and RNA after repeated dosing. The cytotoxic effects arise from the substitution of the ribonucleotides into DNA. Tioguanine has some immunosuppressive activity and

	the DNA and RNA after repeated dosing. The cytotoxic effects arises from the substitution of the ribonucleotides into DNA. Tioguanine has some immunosuppressive activity and there is complete cross-resistance between tioguanine and mercaptopurine. Absorption: Incomplete and variable absorption from GI tract. Average bioavailability: 30%. Distribution: Does not cross the blood-brain barrier significantly; crosses the placenta. Metabolism: Rapidly and extensively metabolised in liver and other tissues. Inactivated mainly by methylation to aminomethylthiopurine; some are deaminated to thioxanthine which may be further oxidised by xanthine oxidase to thiouric acid. Inactivation is independent of xanthine oxidase and is unaffected by enzyme inhibition. Excretion: Excreted in urine mainly as metabolites and unchanged drug (negligible).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01BB03 - tioguanine; Belongs to the class of antimetabolites, purine analogues. Used in the treatment of cancer.

tiotropium bromide

CIMS Class : (Antiasthmatic & COPD Preparations)
tiotropium bromide

P - Caution when used during pregnancy

L - Caution when used during lactation

related tiotropium bromide information

Indication & Dosage	<i>Inhalation</i>	
	Maintenance therapy in chronic obstructive pulmonary disease	
	Adult: >18 yr: 1 cap (18 mcg of tiotropium) inhaled daily, with the inhalation device, at the same time of day.	
	CrCl (ml/min)	Dosage Recommendation
	=50	Use with caution and monitor closely.
Contraindications	Hypersensitivity to atropine and its derivatives (e.g. ipratropium).	
Special Precautions	Narrow-angle glaucoma; prostatic hypertrophy or bladder-neck obstruction; renal impairment. Pregnancy and lactation. Discontinue if immediate hypersensitivity (e.g. angioedema) or paradoxical bronchospasm occurs. Discontinue if eye pain, red eye, visual halos, and other signs of acute narrow-angle glaucoma.	
Adverse Drug Reactions	Dry mouth, constipation, cough and local irritation, tachycardia, urinary retention, UTI, upper respiratory tract infection, hypersensitivity reactions, pupil dilation, blurred vision, myalgia, dyspepsia, rash. Pharyngitis, sinusitis,	

	Dry mouth, constipation, cough and local irritation, tachycardia, urinary retention, UTI, upper respiratory tract infection, hypersensitivity reactions, pupil dilation, blurred vision, myalgia, dyspepsia, rash. Pharyngitis, sinusitis, rhinitis and epistaxis reported with the use of inhalation powder.
Storage	Inhalation: Store at 15-30°C (59-86°F). Do not store in the inhalation device.
Mechanism of Action	Tiotropium bromide, a long-acting quaternary ammonium antimuscarinic, is structurally related to ipratropium. It is a nonselective competitive antagonist of muscarinic (M₁-M₅) receptors and causes bronchodilation by inhibiting the actions of acetylcholine and other cholinergic stimuli at M₃ receptors in the smooth muscle of the respiratory tract. Absorption: Bioavailability 20% (lungs). Distribution: Protein-binding: 72%. Metabolism: Undergoes some metabolism by non-enzymatic cleavage and by cytochrome P450 isoenzymes CYP2D6 and CYP3A4. Excretion: Excreted largely unchanged in urine. Terminal half-life: 5-6 days.
CIMS Class	Antiasthmatic & COPD Preparations
ATC Classification	R03BB04 - tiotropium bromide; Belongs to the class of other inhalants used in the treatment of obstructive airway diseases, anticholinergics.

tirofiban

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
tirofiban

related tirofiban information

Indication &
Dosage

Intravenous

Acute coronary syndrome

Adult: Loading dose: 0.4 mcg/kg/minute for 30 minutes followed by 0.1 mcg/kg/minute. Patients undergoing percutaneous coronary intervention (PCI): Loading dose: 0.4 mcg/kg/minute for 30 minutes followed by 0.1 mcg/kg/minute given during angiography and for 12–24 hr after angioplasty or atherectomy. Patients who require CABG: Discontinue tirofiban at least 4–6 hr before CABG. All patients should receive aspirin before start of tirofiban therapy and unfractionated heparin simultaneously with the start of tirofiban therapy, unless contra-indicated. Max duration of treatment: 108 hr.

CrCl (ml/min)	Dosage Recommendation
<30	Reduce dose by 50%.

Reconstitution: Preparing inj concentrate for infusion: Withdraw and discard 50-100 ml of solution from a 250 or 500 ml bag, respectively, of 0.9% sodium chloride or 5% dextrose inj and replace this volume with 50 ml (12.5 mg of

	Withdraw and discard 50-100 ml of solution from a 250 or 500 ml bag, respectively, of 0.9% sodium chloride or 5% dextrose inj and replace this volume with 50 ml (12.5 mg of tirofiban) or 100 mL (25 mg of tirofiban) of tirofiban inj to achieve a final tirofiban concentration of 50 mcg/ml. Incompatibility: Do not admin diazepam in the same IV line.
Overdosage	Bleeding, usually mucosal and localised bleeding at the arterial puncture site for cardiac catheterisation. In severe cases, intracranial haemorrhages and retroperitoneal bleeding. Management: Discontinue infusion and transfusions of blood and/or thrombocytes if required. Tirofiban can be removed by haemodialysis.
Contraindications	History of thrombocytopenia with glycoprotein IIb/IIIa receptor antagonist. Active internal bleeding. Active peptic ulcer within the past 3 mth. History of bleeding diathesis within the previous 30 days; history of stroke within 30 days or history of intracranial haemorrhage; history or findings suggestive of aortic dissection; intracranial neoplasm, arteriovenous malformation, or aneurysm; acute pericarditis; vasculitis; haemorrhagic retinopathy; uncontrolled hypertension >180/110 mm Hg; anaemia. Recent major surgery or severe trauma. Traumatic or protracted CPR, organ biopsy or lithotripsy within the past 2 wk. Serious hepatic impairment.
Special Precautions	Anaemia, thrombocytopenia or known history of platelet function disturbance. Puncture of a non-compressible vessel within 24 hr, recent epidural procedure, severe CHF, cardiogenic shock. Discontinue in case of uncontrolled bleeding or require emergency surgery or thrombolytic therapy. Severe renal impairment. Monitor platelet counts, haematocrit and haemoglobin before and periodically (e.g. within the first 6 hr of the loading infusion and daily thereafter). Monitor activated clotting time (ACT) or aPTT if

	therapy. Severe renal impairment. Monitor platelet counts, haematocrit and haemoglobin before and periodically (e.g. within the first 6 hr of the loading infusion and daily thereafter). Monitor activated clotting time (ACT) or aPTT if on concurrent heparin therapy. Defer PCI for at least 4 hr after initiation of therapy. Elderly, females, patients with low body weight.
Adverse Drug Reactions	Bleeding, thrombocytopenia, bradycardia, dissection of the coronary artery, dizziness, oedema, pelvic pain, sweating, nausea, fever, headache, rashes. Potentially Fatal: Anaphylaxis.
Storage	Intravenous: Store between 15-30°C. Protect from light. Avoid freezing. Discard unused portions.
Mechanism of Action	Tirofiban, a synthetic nonpeptide tyrosine derivative, is a platelet glycoprotein (GP IIb/IIIa)-receptor inhibitor. It reversibly inhibits binding of fibrinogen to the glycoprotein IIb/IIIa receptors of platelets. Duration: 4-8 hr. Distribution: Plasma half-life: 2 hr. Protein-binding: 65%. Volume of distribution: 22-42 L. Metabolism: Limited metabolism. Excretion: Eliminated largely unchanged in the urine, with some biliary excretion in the faeces.
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC Classification	B01AC17 - tirofiban; Belongs to the class of platelet aggregation inhibitors excluding heparin. Used in the treatment of thrombosis.

tizanidine

CIMS Class : (Muscle Relaxants)
tizanidine

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related tizanidine information

Indication & Dosage

Oral

Spasticity

Adult: >18 yr: Initially, 2 mg once daily increased according to response by 2-mg increments at intervals of at least 3-4 days up to 24 mg daily in 3-4 divided doses. Max: 8 mg/dose. Max: 24 mg/day.

Elderly: Not recommended.

CrCl (ml/min)	Dosage Recommendation
<25	Initially, 2 mg once daily, gradually increasing the dose before increasing the frequency of admin.

Hepatic impairment: Avoid or use with extreme caution.

Oral

Painful muscle spasm associated with musculoskeletal conditions

Adult: >18 yr: 2-4 mg tid.

Elderly: Not recommended.

CrCl (ml/min)	Dosage Recommendation
<25	Initially, 2 mg once daily, gradually increasing the

	Elderly: Not recommended. <table> <tr> <td><25</td><td>Initially, 2 mg once daily, gradually increasing the dose before increasing the frequency of admin.</td></tr> </table> Hepatic impairment: Avoid or use with extreme caution.	<25	Initially, 2 mg once daily, gradually increasing the dose before increasing the frequency of admin.
<25	Initially, 2 mg once daily, gradually increasing the dose before increasing the frequency of admin.		
Overdosage	Nausea, vomiting, hypotension, miosis, dizziness, respiratory distress, coma, restlessness and somnolence. Treatment is supportive and symptomatic. Gastric lavage or use activated charcoal to reduce drug absorption. Patient to be well hydrated.		
Contraindications	Severe hepatic dysfunction.		
Special Precautions	Hepatic or renal insufficiency. Children, elderly, pregnancy and lactation. Monitor LFT regularly. Stop treatment if liver enzymes are raised persistently >3 times upper limit of normal range. Avoid abrupt withdrawal of therapy.		
Adverse Drug Reactions	Drowsiness, fatigue, dizziness, insomnia, headache, anxiety, nausea, dryness of mouth, GI disturbances, hypotension, bradycardia, muscle pain and weakness, transient increase in serum transaminases, hallucinations. Potentially Fatal: Hepatitis.		
Drug Interactions	Potentiates hypotensive effect of antihypertensives. Increased CNS effects with alcohol and CNS depressants. Increased bradycardia with β-blockers and digoxin. Increased serum concentration of tizanidine with CYP1A2 inhibitors e.g. zileuton, ciprofloxacin and other fluoroquinolones, antiarrhythmics, cimetidine, famotidine, oral contraceptives, aciclovir and ticlopidine. Decreased serum concentrations of tizanidine with rifampicin. Use with caution with drugs that may prolong QT interval.		
Food Interaction	Tablets and capsules bioequivalent if taken under fasting conditions but differs when taken with food. Tablets: Food		

	Tablets and capsules bioequivalent if taken under fasting conditions but differs when taken with food. Tablets: Food increases the median time to peak plasma concentration from about 60 min to about 85 min but increases the mean peak plasma concentration and extent of absorption by about 30%. Capsules: Food increases the median time to peak plasma concentration from about 1 hr to 3 hr; decreases mean peak plasma concentration by 20% while increases the extent of absorption by about 10%. Amount absorbed from capsule is 80% of amount absorbed from tablet when taken with food. Admin of the capsule contents sprinkled on applesauce: 15-20% increase in peak plasma concentration and amount absorbed and a 15-min decrease in median lag time and time to achieve peak plasma concentration, compared with admin of intact capsule under fasting.
Mechanism of Action	Tizanidine, an α_2-adrenergic agonist, is a centrally acting muscle relaxant structurally related to clonidine. It reduces spasticity by increasing presynaptic inhibition of motor neurons and has no direct effect on skeletal muscle, the neuromuscular junction or on monosynaptic spinal reflexes. Absorption: Absorbed from the GI tract (oral); peak plasma concentrations in 1-2 hr. Distribution: Protein-binding: 30%. Elimination half-life: 2-4 hr. Metabolism: Extensive hepatic first-pass metabolism mainly via the cytochrome P450 isoenzyme CYP1A2. Excretion: Via urine (mainly as inactive metabolites).
CIMS Class	Muscle Relaxants
ATC Classification	M03BX02 - tizanidine; Belongs to the class of other agents used as centrally-acting muscle relaxants.

tobramycin

CIMS Class : (Aminoglycosides) , (Eye Anti-infectives & Antiseptics)
tobramycin

P - Contraindicated in p
L - Caution when used durin

related tobramycin information

Indication & Dosage

Parenteral

Susceptible infections

Adult: 3-5 mg/kg/day, to be given in 3-4 divided doses for 7-10 days. Dose to be given via IM/IV infusion in 50-100 ml of 0.9% sodium chloride or 5% glucose over 20-60 minutes.

Child: IM/IV infusion over 20-60 min: 6-7.5 mg/kg daily in 3-4 divided doses for 7-10 days. Premature and full-term neonates: 2 mg/kg bid. Treatment is given for 7-10 days.

Renal impairment: Initial loading dose of 1 mg/kg, subsequent dosage and frequency of admin adjusted based on serum concentration.

Parenteral

Mild to moderate urinary tract infections

Adult: 2-3 mg/kg once daily for 7-10 days. Dose to be given via IM/IV infusion in 50-100 ml of 0.9% sodium chloride or 5% glucose over 20-60 minutes.

Renal impairment: Initial loading dose of 1 mg/kg, subsequent dosage and frequency of admin adjusted based on serum concentration.

Inhalation

Cystic fibrosis

Adult: 300 mg every 12 hr inhaled from a suitable nebuliser for 28 days, then repeat in cycles of 28 days as needed. Do not give doses

	Cystic fibrosis Adult: 300 mg every 12 hr inhaled from a suitable nebuliser for 28 days, then repeat for 28 days and repeat in cycles of 28 days as needed. Do not give doses apart. <i>Ophthalmic</i> Ocular infections Adult: As 0.3% eye drop: Mild to moderate infections: Instill 1-2 drops into eye every 4 hr. Severe infections: Instill 2 drops into affected eye every 30 minutes initially until improvement, reduce treatment frequency before discontinuation. As 0.3% eye ointment: Mild to moderate infections: Apply half-inch ribbon bid-tid into affected eye. Severe infections: Apply a half-inch into the affected eye every 3-4 hr until improvement, reduce treatment frequency before discontinuation. Incompatibility: Inactivated by b-lactam-type antibiotics (e.g. penicillins and cephalosporins).
Overdosage	If orally ingested, toxicity is less likely as it is poorly absorbed from an intestinal tract. In parenteral overdose, nephrotoxicity may occur if trough blood concentrations fail to fall below 2 mcg/ml. Auditory and vestibular toxicities occur in patients treated for >10 days; abnormal renal function; dehydrate patients; or receiving medications with additive auditory toxicities. Ototoxic and symptoms (e.g. dizziness, tinnitus, vertigo, loss of high-tone acuity) may manifest even after the drug has been discontinued. Neuromuscular blockade, respiratory failure and prolonged respiratory paralysis may also occur. Treatment is supportive and symptomatic. Neuromuscular blockade may be reversed by administration of calcium salts. Monitor fluid balance, creatinine clearance and total plasma levels until the serum tobramycin level falls below 2 mcg/ml. Ensure adequate hydration in patients with normal renal function. In patients with abnormal renal function, aggressive therapy e.g. haemodialysis may be beneficial.
Contraindications	Hypersensitivity to aminoglycosides; pregnancy.
Special Precautions	Preexisting renal and auditory or vestibular impairment; dehydration; neuromuscular blockade, muscular disorders (e.g. myasthenia gravis,

Special Precautions	Preexisting renal and auditory or vestibular impairment; dehydration; neuromuscular blockade, muscular disorders (e.g. myasthenia gravis, parkinsonism); neonates; elderly; lactation. Avoid peak plasma concentration ≥ 10 mcg/ml or trough concentrations >2 mcg/ml when used parenterally.
Adverse Drug Reactions	Nausea, vomiting, dizziness or vertigo, acute renal failure, interstitial nephritis, acute tubular necrosis, electrolyte imbalances, purpura, encephalopathy, convulsions, mental depression, hallucinations, ototoxicity, blood dyscrasias, increased LFT and bilirubin concentrations. Topical: Ocular toxicity and hypersensitivity reactions (e.g. itching and oedema of the eyelid), conjunctivitis, erythema, punctate keratitis and tearing. Potentially Fatal: Neuromuscular blockade, respiratory paralysis, anaphylaxis.
Drug Interactions	Increased nephrotoxicity or ototoxicity with etacrynic acid, furosemide, other aminoglycosides, cefalotin, cisplatin, vancomycin, piperacillin, ciclosporin, ticarcillin. Decrease serum tobramycin levels with miconazole. Potentially Fatal: Increased neuromuscular-blocking activity with magnesium and other neuromuscular-blocking agents.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters). Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Ophthalmic: Store at 8-27°C (46-80°F). Parenteral: Store between 15-30°C (59-86°F).
Mechanism of Action	Tobramycin acts by binding to 30S ribosomal subunits thus interfering with bacterial protein synthesis. It is active against many aerobic gram-negative bacteria.

	Tobramycin acts by binding to 30S ribosomal subunits thus interfering with bacterial protein synthesis. It is active against many aerobic gram-negative bacteria and some aerobic gram-positive bacteria but inactive against Chlamydia, fungi, viruses, and most anaerobic bacteria. Absorption: Rapid and complete absorption (IM); peak plasma concentration after 30-90 min (IM). Poor oral absorption. Distribution: Crosses the placenta. Excretion: Via the urine; elimination half-life: 2-3 hr.
CIMS Class	Aminoglycosides / Eye Anti-infectives & Antiseptics
ATC Classification	J01GB01 - tobramycin; Belongs to the class of other aminoglycosides. Used in the treatment of systemic infections. S01AA12 - tobramycin; Belongs to the class of antibiotics. Used in the treatment of eye infections.

tobramycin + dexamethasone

CIMS Class : (Eye Antiseptics with Corticosteroids)
tobramycin + dexamethasone

P - Caution when used during pregnancy

L - Caution when used during lactation

related tobramycin + dexamethasone information

Indication & Dosage	<i>Ophthalmic</i> Ocular inflammation with suspected or confirmed bacterial infection Adult: As suspension containing tobramycin 0.3% and dexamethasone 0.1%: 1-2 drops instilled into the conjunctival sac(s) 4-6 hrly. Dosage may be increased to every 2 hrly during the initial 24-48 hr, decrease frequency gradually as improvement seen. As ointment containing tobramycin 0.3% and dexamethasone 0.1%: Apply about ½ inch of ointment into the conjunctival sac(s) up to 3-4 times daily.
Contraindications	Viral infections of corneal and conjunctiva (e.g. epithelial herpes simplex keratitis, vaccinia, varicella). Mycobacterial or fungal infection of the eye.
Special Precautions	Pregnancy and lactation. Avoid prolonged use, monitor intraocular pressure routinely. Safety and effectiveness in children <2 yr not established.
Adverse Drug	Hypersensitivity reactions, lid itching and swelling,

Adverse Drug Reactions	Hypersensitivity reactions, lid itching and swelling, conjunctival erythema, increase in intraocular pressure, glaucoma, optic nerve damage, posterior subcapsular cataract formation and delayed wound healing. Secondary infections especially after prolonged use.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Ophthalmic: Suspension: Store between 8-27°C (46-80°F); shake well before using. Ointment: Store between 8-27°C (46-80°F).
Mechanism of Action	Tobramycin, an aminoglycoside antibiotic, has actions similar to that of gentamicin and is active against Staphylococci, Streptococci, <i>Pseudomonas aeruginosa</i> , <i>Escherichia coli</i> , <i>Klebsiella pneumoniae</i> , <i>Enterobacter aerogenes</i> , <i>Proteus mirabilis</i> , <i>Morganella morganii</i> , most <i>Proteus vulgaris</i> strains, <i>Haemophilus influenzae</i> and <i>H. aegyptius</i> , <i>Moraxella lacunata</i> , <i>Acinetobacter calcoaceticus</i> and some <i>Neisseria</i> species. Dexamethasone, a synthetic fluorinated corticosteroid, has mainly glucocorticoid activity and suppresses inflammatory response.
CIMS Class	Eye Antiseptics with Corticosteroids
ATC Classification	A01AC02 - dexamethasone; Belongs to the class of local corticosteroid preparations. Used in the treatment of diseases of the mouth. C05AA09 - dexamethasone; Belongs to the class of products containing corticosteroids for topical use. Used in the

diseases of the mouth.

C05AA09 - dexamethasone; Belongs to the class of products containing corticosteroids for topical use. Used in the treatment of hemorrhoids.

D07AB19 - dexamethasone; Belongs to the class of moderately potent (group II) corticosteroids. Used in the treatment of dermatological diseases.

D07XB05 - dexamethasone; Belongs to the class of moderately potent (group II) corticosteroids in other combinations. Used in the treatment of dermatological diseases.

D10AA03 - dexamethasone; Belongs to the class of topical corticosteroids used in the treatment of acne.

H02AB02 - dexamethasone; Belongs to the class of glucocorticoids. Used in systemic corticosteroid preparations.

J01GB01 - tobramycin; Belongs to the class of other aminoglycosides. Used in the treatment of systemic infections.

R01AD03 - dexamethasone; Belongs to the class of topical corticosteroids used as nasal decongestants.

S01AA12 - tobramycin; Belongs to the class of antibiotics. Used in the treatment of eye infections.

S01BA01 - dexamethasone; Belongs to the class of corticosteroids. Used in the treatment of inflammation of the eye.

S01CB01 - dexamethasone; Belongs to the class of corticosteroids/antiinfectives/mydriatics combinations. Used in the treatment of eye diseases.

S02BA06 - dexamethasone; Belongs to the class of corticosteroids used in the treatment of inflammation of the ear.

S03BA01 - dexamethasone; Belongs to the class of corticosteroids used in ophthalmologic and otologic

corticosteroids used in the treatment of inflammation of the ear.

S03BA01 - dexamethasone; Belongs to the class of corticosteroids used in ophthalmologic and otologic preparations.

tolbutamide

CIMS Class : (Antidiabetic Agents)
tolbutamide

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ✖ - Lab interference

related tolbutamide information

Indication & Dosage

Oral

Type 2 diabetes mellitus

Adult: Initially, 1-2 g daily, given either as a single dose with breakfast or, more commonly in divided doses. Maintenance dose: 0.25-2 g daily. Max: 3 g daily.

Elderly: Dose adjustments may be needed.

Renal impairment: Dose adjustments may be needed.

Hepatic impairment: Dose adjustments may be needed.

Intravenous

Diagnosis of insulinoma and other pancreatic disorders

Adult: 1 g IV as a 5% solution over 2-3 minutes.

Elderly: Dose adjustments may be needed.

Renal impairment: Dose adjustments may be needed.

Hepatic impairment: Dose adjustments may be needed.

Administration

Should be taken with food.

Overdosage

Symptoms: Hypoglycaemia. Management: In mild hypoglycemia without loss of consciousness or neurologic

	Symptoms: Hypoglycaemia. Management: In mild hypoglycemia without loss of consciousness or neurologic findings, treat with oral glucose, drug dosage and meal patterns adjustments. In severe hypoglycaemia with coma, seizure or other neurological impairment, immediate hospitalisation is needed. In hypoglycaemic coma, rapid IV inj of concentrated (50%) dextrose, followed by continuous infusion of a more dilute (10%) dextrose inj in order to maintain the blood glucose > 100 mg/dl. Monitor closely for a minimum of 24-48 hr as hypoglycaemia may recur.
Contraindications	Diabetes complicated by ketosis, acidosis, diabetic coma; as sole therapy in IDDM; severe renal impairment.
Special Precautions	Renal, hepatic, adrenocortical or thyroid function impairment; stress due to surgery or trauma, history of hepatic porphyria. Pregnancy and lactation. Frequently monitor glucose and hepatic function during initial phase.
Adverse Drug Reactions	Hypoglycaemia, nausea, epigastric fullness, heartburn, headache, allergic skin reactions, jaundice, hyponatraemia, hepatic dysfunction, photosensitivity, syndrome of inappropriate secretion of antidiuretic hormone (SIADH) and blood dyscrasias.
Drug Interactions	Hypoglycaemic symptoms masked by β-blockers. Hypoglycaemic effect reduced by corticosteroids, thiazide diuretics, β-blockers, niacin, oral contraceptives, sympathomimetics, thyroid preparations, estrogens, phenytoin, phenothiazines, calcium-channel blocking agents and isoniazid. Hypoglycaemic effect enhanced by dicoumarol, salicylates, phenylbutazone, fibrates (e.g. clofibrate, gemfibrozil), chloramphenicol, cyclophosphamide and azole antifungals. Disulfiram-like reaction with alcohol.
Lab Interference	May give false-positive result for urinary albumin with test

Lab Interference	May give false-positive result for urinary albumin with test using heat and acetic acid or sulfosalicylic acid. Tolbutamide may interfere with test results of radioactive iodine uptake by decreasing uptake of radioactive iodine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Tolbutamide acts mainly by enhancing insulin secretion and is only effective when some residual pancreatic β-cell activity is present. It may enhance peripheral sensitivity to insulin and reduce basal hepatic glucose production during long-term admin. Duration: 10 hr. Absorption: Readily absorbed from the GI tract. Distribution: Protein-binding: Extensive (95%). Half-life: 4-25 hr. Distributed into breastmilk. Metabolism: Metabolised in the liver by cytochrome P450 isoenzyme CYP2C9. Excretion: Excreted in the urine mainly as metabolites with little hypoglycaemic activity.
CIMS Class	Antidiabetic Agents
ATC Classification	A10BB03 - tolbutamide; Belongs to the class of sulfonamides, urea derivatives. Used in the treatment of diabetes. V04CA01 - tolbutamide; Belongs to the class of diagnostic agents used to test for diabetes.

tolnaftate

CIMS Class : (Topical Antifungals & Antiparasites)
tolnaftate

related tolnaftate information

Indication & Dosage	<i>Topical/Cutaneous</i> Superficial dermatophyte infections, Pityriasis versicolor Adult: Apply a 1% gel/solution/powder/cream bid for 2-6 wk; repeat if necessary. Continue treatment for 2 wk after disappearance of all symptoms to prevent recurrence of infection.
Contraindications	Hypersensitivity. Nail and scalp infections.
Special Precautions	Exposure to eyes. For external use only. Discontinue treatment if condition does not improve within 10 days.
Adverse Drug Reactions	Irritation, pruritus, contact dermatitis.
Storage	Topical/Cutaneous: Store at 15-30°C.
Mechanism of Action	Tolnaftate is an antifungal which inhibits growth of dermatophytes e.g. Epidermophyton, Microsporum, trichophyton spp, and Malassezia furfur by distorting the hyphae and stopping mycelial growth. It is inactive against Candida spp or bacteria. Onset: 24-72 hr.
CIMS Class	Topical Antifungals & Antiparasites

CIMS Class	Topical Antifungals & Antiparasites
ATC Classification	D01AE18 - tolnaftate; Belongs to the class of other antifungals for topical use. Used in the treatment of fungal infection.

tolterodine

CIMS Class : (Drugs for Bladder & Prostate Disorders)
tolterodine

P - Contraindicated in pregnancy

related tolterodine information

Indication & Dosage

Oral

Overactive bladder

Adult: >18 yr: As immediate release preparation: 2 mg bid, reduce to 1 mg bid if needed to reduce side effects. Reduce to 1 mg bid in patients concurrently taking CYP3A4 inhibitors. As extended release preparation: 4 mg once daily, may reduce to 2 mg daily if needed to reduce side effects. Reduce to 2 mg daily in patients concurrently taking CYP3A4 inhibitors.

CrCl (ml/min)	Dosage Recommendation
≥30	1 mg bid (as immediate-release tablets) or 2 mg once daily (as extended-release capsules).

Hepatic impairment: 1 mg bid (as immediate-release tablets) or 2 mg once daily (as extended-release capsules).

Overdosage

Symptoms: Severe central anticholinergic effects (e.g. hallucinations, severe excitation), accommodation disturbances, micturition difficulties and QT prolongation. Management: Treatment is symptomatic and supportive. Reduce absorption by gastric lavage and activated charcoal. Severe central anticholinergic effects may be treated with

	disturbances, micturition difficulties and QT prolongation. Management: Treatment is symptomatic and supportive. Reduce absorption by gastric lavage and activated charcoal. Severe central anticholinergic effects may be treated with physostigmine. Mydriasis may be managed by pilocarpine eye drops and/or placing patient in dark room. Convulsions or marked excitation can be managed by benzodiazepines and β-blockers may be used in tachycardia.
Contraindications	Severe ulcerative colitis, toxic megacolon, urinary retention, gastric retention, myasthenia gravis, uncontrolled narrow-angle glaucoma, pregnancy.
Special Precautions	Bladder flow obstruction, GI obstructive disorders, renal or hepatic impairment, autonomic neuropathy, hiatus hernia, risk of decreased GI motility, patients at risk of QT interval prolongation (e.g. electrolyte disturbances, bradycardia, pre-existing cardiac disorder).
Adverse Drug Reactions	Dry mouth, chest pain, headache, somnolence, fatigue, dry skin, abdominal pain, constipation, dyspepsia, diarrhoea, dizziness, anxiety, wt gain, abnormal vision, dry eyes, paraesthesia, nervousness, urinary retention.
Drug Interactions	Increased risk of overdose with potent CYP3A4 inhibitors e.g. macrolide antibiotics (erythromycin and clarithromycin), azole antifungals (e.g. ketoconazole and itraconazole), protease inhibitors, ciclosporin or vinblastine. Increased risk of torsade de pointes with drugs that prolong the QT interval (e.g. class Ia and class III antiarrhythmics). Increased risk of 'cholinergic neurogenic hypersensitivity' with centrally acting anticholinesterases (e.g. donepezil, rivastigmine). Increased risk of antimuscarinic side effects with antimuscarinic drugs.
Storage	Oral: Store at 15-30°C. Protect from light.
Mechanism of Action	Tolterodine is a competitive muscarinic receptor antagonist with actions similar to atropine. It is used in the management

Mechanism of Action	Tolterodine is a competitive muscarinic receptor antagonist with actions similar to atropine. It is used in the management of urge urinary incontinence, urgency and frequency. Absorption: Peak plasma concentration in 1-3 hr. Absolute bioavailability: 17%; 65% (poor metabolisers). Distribution: Protein-binding: Extensive (mainly to α_1-acid glycoprotein). Half-life: 2-3 hr; 10 hr (poor metabolisers). Metabolism: Metabolised mainly in the liver by the CYP2D6 to active 5-hydroxymethyl tolterodine (in extensive metabolisers accounting for majority of population). Poor metabolisers, accounting for 7% of population: Metabolised via CYP3A4 to inactive N-dealkylated metabolites. Clinical use not affected by metabolism differences as tolterodine and its CYP2D6-dependent metabolite, 5-hydroxymethyl tolterodine are equipotent. Excretion: Excreted in the urine, mainly as metabolites and some as unchanged drug (<1%) and via faeces (17%).
CIMS Class	Drugs for Bladder & Prostate Disorders
ATC Classification	G04BD07 - tolterodine; Belongs to the class of urinary antispasmodics. Used in the treatment of urological problems.

topiramate

CIMS Class : (Anticonvulsants)
topiramate

P - Caution when used during pregnancy

L - Contraindicated in lactation

related topiramate information

Indication & Dosage

Oral

Adjunct for seizures associated with the Lennox-gastaut syndrome

Adult: Initially, 25 mg at night for 1 wk, thereafter increase in steps of 25–50 mg at intervals of 1–2 wk until effective dose is achieved. Doses >25 mg/day should be taken in 2 divided doses. Usual dose: 200–400 mg daily. Max: 800 mg daily.

Child: 2-16 yr: Initially, 25 mg nightly for the 1st wk increased at intervals of 1-2 wk by increments of 1-3 mg/kg daily according to response. Daily doses of >25 mg should be taken in 2 divided doses. Usual dose: 5-9 mg/kg daily. Max: 30 mg/kg/day.

Renal impairment: Moderate to severe: Doses should be halved. Haemodialysis: Supplemental dose equal to about ½ of the daily dose should be given in divided doses (at the start and finish of haemodialysis).

Hepatic impairment: Dosage adjustment may be needed.

Oral

Epilepsy

start and finish of haemodialysis).

Hepatic impairment: Dosage adjustment may be needed.

Oral

Epilepsy

Adult: Monotherapy: Initially, 25 mg at night for 1 wk, thereafter increase in steps of 25–50 mg at intervals of 1–2 wk. Doses >25 mg/day should be taken in 2 divided doses. Usual dose: 100–400 mg daily. Max: 400 mg daily. Adjunctive treatment: Initially, 25 mg at night for 1 wk, thereafter increase in steps of 25–50 mg at intervals of 1–2 wk until effective dose is achieved. Doses >25 mg/day should be taken in 2 divided doses. Usual dose: 200–400 mg daily. Max: 800 mg daily.

Child: 10–16 yr: Initially, 0.5–1 mg/kg at night for the 1st wk, increased at intervals of 1–2 wk by increments of 0.5 to 1 mg/kg daily. Usual dose: 3–6 mg/kg daily. Daily doses >25 mg should be taken in 2 divided doses. Max: 16 mg/kg/day.

Renal impairment: Moderate to severe: Doses should be halved. Haemodialysis: Supplemental dose equal to about $\frac{1}{2}$ of the daily dose should be given in divided doses (at the start and finish of haemodialysis).

Hepatic impairment: Dosage adjustment may be needed.

Oral

Prophylaxis of migraine

Adult: >16 yr: Initially 25 mg daily at night for 1 wk, increased in steps of 25-mg at wkly intervals. Usual dose: 50–100 mg daily in 2 divided doses. Daily doses >25 mg should be taken in 2 divided doses.

Renal impairment: Moderate to severe: Doses should be halved. Haemodialysis: supplemental dose equal to about $\frac{1}{2}$ of the daily dose should be given in divided doses (at the start and finish of haemodialysis).

Hepatic impairment: Dosage adjustment may be needed.

	of the daily dose should be given in divided doses (at the start and finish of haemodialysis). Hepatic impairment: Dosage adjustment may be needed.
Administration	May be taken with or without food.
Overdosage	Symptoms: Convulsions, drowsiness, speech disturbances, blurred vision, diplopia, impaired mental status, lethargy, abnormal co-ordination, stupor, hypotension, abdominal pain, agitation, metabolic acidosis, dizziness and depression. Management: Empty stomach by emesis or gastric lavage and activated charcoal if recent ingestion. Treatment is supportive and keep patient well hydrated. Haemodialysis is useful in drug removal.
Contraindications	Lactation.
Special Precautions	Renal or hepatic impairment, pregnancy. May impair ability to drive or operate machinery. Maintain adequate hydration to reduce the risk of renal calculi especially in predisposed patients. Measure serum bicarbonate at baseline and periodically during treatment. Avoid abrupt withdrawal; decrease dose by 100 mg daily at wkly intervals. Seek immediate medical attention if blurred vision or eye pain. Monitor closely for decreased sweating and increased body temperature, especially in hot weather. Ensure proper hydration before and during activities or exposure to warm temperatures.
Adverse Drug Reactions	Confusion, dizziness, drowsiness, generalised slowing of mental and physical activity, difficulty with concentrations, ataxia, paresthesia, anorexia, weight loss, abnormal vision, metabolic acidosis, mood or mental changes, behavioural disturbances, depression, fatigue, agitation, nervousness, anxiety, oligohidrosis, hyperthermia and hyperammonaemic encephalopathy.

	disturbances, depression, fatigue, agitation, nervousness, anxiety, oligohidrosis, hyperthermia and hyperammonaemic encephalopathy.
Drug Interactions	Coadmin with antiepileptic drugs e.g. phenytoin, carbamazepine, phenobarbital decreases plasma concentration of topiramate. Possible increase in phenytoin levels. Increased risk of renal stone formation with carbonic anhydrase inhibitors e.g. acetazolamide. Increased risk of CNS depression with CNS depressants and alcohol. Increased risk of hyperammonaemia and encephalopathy with valproic acid. Increased risk of contraceptive failure in women taking combined oral contraceptives.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Topiramate is a sulfamate-substituted monosaccharide with precise mechanism of action unknown. It may be due to various mechanisms e.g. blocking of voltage-dependent sodium channels; augmenting the activity of γ-aminobutyric acid (GABA) at GABA-A receptor; antagonising AMPA/kainate glutamate receptors; inhibiting carbonic anhydrase. Absorption: Readily absorbed from the GI tract (oral); peak plasma concentrations after 2 hr. Bioavailability unaffected by food. Distribution: Protein-binding: 9-17%. Volume of distribution in man is double that in woman. Crosses the placenta, distributed into breast milk. Metabolism: Not extensively metabolised.

	in man is double that in woman. Crosses the placenta, distributed into breast milk. Metabolism: Not extensively metabolised. Excretion: Excreted by urine (as unchanged drug and metabolites); elimination half-life: 21 hr. Children has a higher clearance and shorter elimination half-life than adults.
CIMS Class	Anticonvulsants
ATC Classification	N03AX11 - topiramate; Belongs to the class of other antiepileptics. Used in the management of epilepsy.

topotecan

CIMS Class : (Cytotoxic Chemotherapy)
topotecan

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related topotecan information

Indication & Dosage

Intravenous

Small cell lung cancer

Adult: 1.5 mg/m²/day by IV infusion over 30 min on days 1-5 of a 21-day course. Min: 4 courses to be given (provided blood counts and haemoglobin have adequately recovered).

In the event of severe neutropenia or platelet count falls below 25,000 cells/mm³, reduce dose to 1.25 mg/m².

Alternatively, in the event of severe neutropenia, granulocyte colony-stimulating factor (G-CSF) to be given following the subsequent course (before resorting to dose reduction) starting from day 6 of the course (24 hr after topotecan treatment completion).

CrCl (ml/min)	Dosage Recommendation
20-30	Initial dose 0.75 mg/m ² .

Hepatic impairment: Severe: Avoid.

Intravenous

Ovarian carcinoma

Adult: 1.5 mg/m²/day by IV infusion over 30 min on days 1-5

Intravenous

Ovarian carcinoma

Adult: 1.5 mg/m²/day by IV infusion over 30 min on days 1-5 of a 21-day course. Min: 4 courses to be given (provided blood counts and haemoglobin have adequately recovered).

In the event of severe neutropenia or platelet count falls below 25,000 cells/mm³, reduce dose to 1.25 mg/m².

Alternatively, in the event of severe neutropenia, granulocyte colony-stimulating factor (G-CSF) to be given following the subsequent course (before resorting to dose reduction) starting from day 6 of the course (24 hr after topotecan treatment completion).

CrCl (ml/min)	Dosage Recommendation
---------------	-----------------------

20-30	Initial dose 0.75 mg/m ² .
-------	---------------------------------------

Hepatic impairment: Severe: Avoid.

Intravenous

Cervical cancer

Adult: As combination therapy with cisplatin: 0.75 mg/m², by IV infusion over 30 min on days 1, 2 and 3 of a 21-day course; cisplatin 50 mg/m² as IV infusion after topotecan on day 1. Dosage adjustments for subsequent courses are specific for each drug. If severe febrile neutropenia or if the platelet count drops below 10,000 cells/mm³, topotecan dose to be reduced to 0.6 mg/m². Alternatively, in severe febrile neutropenia, granulocyte colony-stimulating factor (G-CSF) to be given from day 4 of the subsequent course (before resorting to dose reduction), 24 hr after topotecan treatment completion; if febrile neutropenia recurs despite G-CSF, topotecan dosage to be further reduced to 0.45 mg/m² for subsequent courses.

Renal impairment: Treatment to be initiated only if serum creatinine ≤1.5 mg/dl.

Hepatic impairment: Severe: avoid.

	Renal impairment: Treatment to be initiated only if serum creatinine ≤ 1.5 mg/dl. Hepatic impairment: Severe: avoid. Reconstitution: Add 4 ml of sterile water for inj to the vial containing 4 mg of topotecan in order to obtain a solution with 1 mg/ml of topotecan. The required daily dose is further diluted in a suitable volume (e.g. 50-250 ml) of 5% dextrose or 0.9% sodium chloride inj and infused IV over a period of 30 min. Solution should be prepared immediately before use. Incompatibility: Incompatible with ticarcillin sodium, potassium clavulanate, dexamethasone sodium phosphate, fluorouracil and mitomycin.	
Administration	Cap: May be taken with or without food. (Swallow whole, do not open/ chew/ crush.)	
Overdosage	Symptoms: Bone marrow suppression.	
Contraindications	Severe bone marrow depression (e.g. baseline neutrophil count of <1500 cells/mm ³ and platelet count $<100,000$ /mm ³). Pregnancy, lactation, severe renal or hepatic impairment.	
Special Precautions	Preexisting bone marrow depression. Frequent monitoring of peripheral blood cell counts during treatment. Do not continue subsequent courses until neutrophils recover to >1000 cells/mm ³ , platelets recover to $>100,000$ cells/mm ³ and haemoglobin levels recover to 9.0 g/dl (with transfusion if needed). May impair ability to drive or operate machinery.	
Adverse Drug Reactions	Neutropenia (nadir of white cell count occurs about 9-12 days after admin), thrombocytopenia and anaemia. GI upset, total alopecia, headache, dyspnoea. Fatigue, weakness, malaise, pruritus and hyperbilirubinaemia.	

	days after admin), thrombocytopenia and anaemia. GI upset, total alopecia, headache, dyspnoea. Fatigue, weakness, malaise, pruritus and hyperbilirubinaemia.
Drug Interactions	Increased clearance with phenytoin. G-CGF to be given 24 hr after completion of treatment with topotecan as concurrent admin may prolong duration of neutropenia. Increased bone marrow suppression with other cytotoxic drugs (e.g. cisplatin) so dose reduction may be needed.
Food Interaction	Possible decrease in activity with St John's wort.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Unopened vial: Store at 20-25°C; protect from light. Reconstituted solution: Stable for 24 hr at 20-25°C in ambient light.
Mechanism of Action	Topotecan, an alkaloid, is a semi-synthetic derivative of camptothecin which inhibits topoisomerase I, preventing DNA replication and translocation. It acts in the S phase of DNA synthesis. Distribution: Widely distributed. Protein-binding: 35%. Terminal half-life: 2-3 hr. Metabolism: Undergoes reversible hydrolysis to inactive hydroxy acid form; small amounts demethylated in the liver. Excretion: Excreted in urine.
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01XX17 - topotecan; Belongs to the class of other antineoplastic agents. Used in the treatment of cancer.

torasemide

CIMS Class : (Diuretics)
torasemide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related torasemide information

Indication & Dosage

Oral

Hypertension

Adult: 2.5-5 mg once daily. Max: 5 mg daily.

Oral

Oedema in patients with hepatic cirrhosis

Adult: Initially, 5-10 mg once daily, given together with an aldosterone antagonist or a potassium-sparing diuretic, titrated upwards until the desired diuretic response is obtained. Max: 40 mg daily.

Oral

Oedema

Adult: 5 mg once daily, increased to 20 mg once daily if necessary. Max: 40 mg/day.

Intravenous

Oedema

Adult: 10-20 mg daily as IV inj slowly over 2 min. Max: 200 mg daily.

Administration

May be taken with or without food.

	May be taken with or without food.
Overdosage	Symptoms: Marked diuresis with severe dehydration and electrolytes disturbances. Somnolence, confusion, hypotension, circulatory collapse and GI disturbances. Management: Reduce or stop torasemide. There is no antidote and treatment involves simultaneous replacement of fluid and electrolytes. Haemodialysis unlikely to be useful.
Contraindications	Hypersensitivity to sulfonylureas, renal failure with anuria, hepatic coma and pre-coma, hypotension, cardiac arrhythmias. Pregnancy and lactation.
Special Precautions	Risk of hyperuricaemia, gout and DM. Correct electrolyte disturbances and disorders of micturition before treatment. Monitor electrolyte balance, glucose, uric acid, creatinine and lipids regularly. May impair ability to drive or operate machinery.
Adverse Drug Reactions	Electrolyte disturbances e.g. hypokalaemia, dehydration, dry mouth, headache, dizziness, hypotension, weakness, drowsiness, confusional states, loss of appetite, cramps, increased serum uric acid, glucose, lipids, urea and creatinine, increase in LFT, metabolic alkalosis, tinnitus and hearing loss.
Drug Interactions	Increased risk of severe hypokalaemia with amphotericin B, corticosteroids, carbenoxolone, hypokalaemia-causing medications. Increased risk of lithium toxicity. Increased potential for ototoxicity and nephrotoxicity with nephrotoxic or ototoxic medications e.g. aminoglycosides. High dose salicylates may increase the risk of salicylate toxicity. Increased risk of toxicity with digoxin. Reduced diuretic effect with NSAIDs. Increased risk of hypotension with antihypertensives.

	Increased risk of toxicity with digoxin. Reduced diuretic effect with NSAIDs. Increased risk of hypotension with antihypertensives.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Torsemide, a sulfonylurea loop diuretic, acts from within the lumen of the thick ascending portion of the loop of Henle, where it inhibits the $\text{Na}^+/\text{K}^+/\text{2Cl}^-$-carrier system. Onset: Diuresis: Oral: Within 1 hr; IV: Within 10 min. Duration: Diuresis: Oral and IV: 8 hr. Absorption: Absorbed rapidly and almost completely (oral). Peak serum levels after 1-2 hr. Food decreases rate but not extent of absorption. Distribution: Protein-binding: >99%. Apparent distribution volume: 16 L. Metabolism: Metabolised by the cytochrome P450 isoenzyme CYP2C9. Elimination half-life: 3.5 hr. Excretion: Excreted by urine as unchanged drug (24%) and metabolites.
CIMS Class	Diuretics
ATC Classification	C03CA04 - torasemide; Belongs to the class of high-ceiling sulfonamide diuretics. Used to promote excretion of urine.

tramadol

CIMS Class : (Analgesics (Opioid))
tramadol

P - Caution when used during pregnancy
L - Contraindicated in lactation

related tramadol information

Indication & Dosage

Oral

Moderate to severe pain

Adult: As conventional tablet: 50-100 mg every 4-6 hr. Max: 400 mg daily. As extended-release tablet: 50-100 mg once or twice daily. Max: 300 mg daily.

Elderly: Lower initial dose. Max: 300 mg daily (>75 yr).

Max Dosage: 400 mg daily.

CrCl (ml/min)	Dosage Recommendation
10-<30	As conventional tablet: increase dosage interval to 12 hr; max: 200 mg/day.
<10	Contraindicated.

Hepatic impairment: As conventional tablet: Increase dosage interval to 12 hr in severe impairment e.g. 50 mg bid in hepatic cirrhosis. As extended-release tablet: Contraindicated in Child Pugh Class C.

Parenteral

Moderate to severe pain

Adult: IM/IV inj over 2-3 min/IV infusion: 50-100 mg given every 4-6 hr.

Moderate to severe pain

Adult: IM/IV inj over 2-3 min/IV infusion: 50-100 mg given every 4-6 hr.

Elderly: Lower initial dose. Max: 300 mg daily (>75 yr).

CrCl (ml/min)	Dosage Recommendation
10-<30	Increase dosage interval to 12 hr.
<10	Contraindicated.

Hepatic impairment: Severe: Increase dosage interval to 12 hr.

Parenteral**Postoperative pain**

Adult: IM/IV inj over 2-3 min/IV infusion: Initially, 100 mg followed by 50 mg every 10-20 min if necessary up to 250 mg for the 1st hr. Maintenance: 50-100 mg every 4-6 hr. Max: 600 mg daily.

Elderly: Lower initial dose. Max: 300 mg daily (>75 yr).

CrCl (ml/min)	Dosage Recommendation
10-<30	Increase dosage interval to 12 hr.
<10	Contraindicated.

Hepatic impairment: Severe: increase dosage interval to 12 hr.

Rectal**Moderate to severe pain**

Adult: 100 mg suppository up to 4 times daily.

Elderly: Lower initial dose. Max: 300 mg daily (>75 yr).

CrCl (ml/min)	Dosage Recommendation
<30	Increase dosage interval to 12 hr.
<10	Contraindicated.

Hepatic impairment: Severe: Increase dosage interval to 12 hr.

Incompatibility: Incompatible with injections of diazepam, diclofenac sodium, indometacin, midazolam, piroxicam, phenylbutazone, aciclovir, clindamycin and lysine aspirin if mixed in the same syringe.

	diclofenac sodium, indometacin, midazolam, piroxicam, phenylbutazone, aciclovir, clindamycin and lysine aspirin if mixed in the same syringe.	
Administration	May be taken with or without food.	
Overdosage	Symptoms: Miosis, vomiting, cold and clammy skin, respiratory depression, lethargy, flaccid skeletal muscle, coma, seizures, bradycardia, hypotension, cardiac arrest, cardiac collapse and death. Management: Treatment is supportive and ensure adequate ventilation. Although naloxone will reverse some, but not all, symptoms of tramadol overdosage, there is an increased risk of seizures which has to be taken into consideration. Haemodialysis is unlikely to be helpful.	
Contraindications	Suicidal patients, acute alcoholism; head injuries; raised intracranial pressure; severe renal impairment; lactation.	
Special Precautions	Hypothyroidism; adrenocortical insufficiency; renal or hepatic impairment; history of epilepsy or increased risk of seizures; inflammatory or obstructive bowel disease; myasthenia gravis; respiratory depression; prostatic hyperplasia. Pregnancy.	
Adverse Drug Reactions	Sweating, dizziness, nausea, vomiting, dry mouth, fatigue, asthenia, somnolence, confusion, constipation, flushing, headache, vertigo, tachycardia, palpitations, miosis, insomnia, orthostatic hypotension, seizures, CNS stimulation e.g. hallucinations. Potentially Fatal: Respiratory depression.	
Drug Interactions	Possible increase in anticoagulation with warfarin. Increased risk of seizures with SSRI, TCA. Increased risk of serotonin syndrome with mirtazapine, venlafaxine, SSRI and MAOI; tramadol should not be given to patients receiving MAOIs or within 14 days of their discontinuation. Reduced analgesic	

	syndrome with mirtazapine, venlafaxine, SSRI and MAOI; tramadol should not be given to patients receiving MAOIs or within 14 days of their discontinuation. Reduced analgesic efficacy of tramadol with carbamazepine, 5-HT₃-receptor antagonist e.g. ondansetron. Increased respiratory and CNS depression with CNS depressants e.g. alcohol, opioids, anaesthetic agents, narcotics, phenothiazines, tranquilisers or sedative hypnotics.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 20-25°C (68-77°F). Parenteral: Do not store above 30°C.
Mechanism of Action	Tramadol inhibits reuptake of norepinephrine, serotonin and enhances serotonin release. It alters perception and response to pain by binding to mu-opiate receptors in the CNS. Onset: Oral (conventional tablet): 1 hr. Duration: Oral (conventional tablet): 3-6 hr. Absorption: Readily absorbed from the GI tract (oral). Distribution: Widely distributed. Crosses the placenta and enters breast milk. Metabolism: Extensive hepatic first-pass metabolism; converted to O-desmethyldramadol (active) by N- and O-demethylation via the cytochrome P450 isoenzymes CYP3A4 and CYP2D6 and glucuronidation or sulfation. Excretion: Via urine (as metabolites); 6 hr (elimination half-life).

tramadol + paracetamol

CIMS Class : (Analgesics (Opioid)) , (Analgesics (Non-Opioid) & Antipyretics)
tramadol + paracetamol

P - Caution when used during pregnancy

L - Caution when used during lactation

related tramadol + paracetamol information

Indication & Dosage	<i>Oral</i> Moderate to severe pain Adult: =12 yr: As combination tablet containing tramadol hydrochloride 37.5 mg and paracetamol 325 mg: 2 tablets every 6 hr. Max: 8 tablets daily. Child: =12 yr: As combination tablet containing tramadol hydrochloride 37.5 mg and paracetamol 325 mg: 2 tablets at least every 6 hrly. Max: 8 tablets daily. <table border="1"><thead><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr></thead><tbody><tr><td>10-30</td><td>Max: 2 tablets 12 hrly.</td></tr></tbody></table>	CrCl (ml/min)	Dosage Recommendation	10-30	Max: 2 tablets 12 hrly.
CrCl (ml/min)	Dosage Recommendation				
10-30	Max: 2 tablets 12 hrly.				
Overdosage	Symptoms: Tramadol: CNS depression, respiratory depression, lethargy, seizure, cardiac arrest, coma. Paracetamol: hepatic necrosis, hepatic failure, renal tubular necrosis, hypoglycemia and coagulation defects. Management: Treatment is supportive and symptomatic with maintenance of respiratory and circulatory functions. Oral methionine or IV N-acetylcysteine may be admin up to at least 48 hr after the paracetamol overdose. Naloxone may be used to reverse respiratory depression caused by				

	methionine or IV N-acetylcysteine may be admin up to at least 48 hr after the paracetamol overdose. Naloxone may be used to reverse respiratory depression caused by tramadol but may increase seizure risk. Haemodialysis and haemofiltration unlikely to be helpful.
Contraindications	Hypersensitivity to tramadol, paracetamol or opioids. Situations where opioid use may be contra-indicated (e.g. acute intoxication with alcohol, hypnotic drugs, centrally-acting analgesics, opioids or psychotropic drugs). Severe hepatic impairment, uncontrolled epilepsy. Concurrent use or within 2 wk of discontinuation from MAOIs.
Special Precautions	Not recommended in severe renal impairment (CrCl <10 ml/min), severe respiratory insufficiency, liver disease or opioid dependent patients. Increased intracranial pressure or head injury, patients at risk of seizures or on drugs that may lower the seizure threshold (e.g. SSRI, TCA, antipsychotics, centrally acting analgesics or local anaesthesia), biliary tract disorders, in a state of shock or unconsciousness. May impair ability to drive or operate machinery. Avoid abrupt withdrawal. May cause withdrawal symptoms, dependence and abuse. Elderly. Pregnancy, lactation.
Adverse Drug Reactions	Nausea, vomiting, constipation, diarrhoea, abdominal pain, dry mouth, dyspepsia, flatulence, dizziness, somnolence, headache, confusion, mood changes, nightmares, amnesia, sweating, pruritus. Potentially Fatal: Severe anaphylactic reactions.
Drug Interactions	Increased risk serotonin syndrome with SSRI and triptans. Increased risk of seizures of SSRI, TCA, antipsychotics, centrally acting analgesics or local anaesthesia. Decreased tramadol levels with carbamazepine. Decreased analgesic efficacy of tramadol with ondansetron. Increased INR

	Increased risk of seizures of SSRI, TCA, antipsychotics, centrally acting analgesics or local anaesthesia. Decreased tramadol levels with carbamazepine. Decreased analgesic efficacy of tramadol with ondansetron. Increased INR with warfarin. Potentially Fatal: Increased risk of serotonin syndrome with MAOIs, avoid concurrent use or within 2 wk of discontinuation from MAOIs. Increased risk of CNS and respiratory depression with CNS depressants (e.g. alcohol, opioids, anaesthetic agents, narcotics, phenothiazines, tranquilizers or sedative hypnotics).
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store between 15 - 30°C (59 - 86°F).
Mechanism of Action	Tramadol is a centrally acting opioid analgesic which binds to mu-opioid receptors and weakly inhibits the reuptake of norepinephrine and serotonin. Paracetamol, a para-aminophenol derivative, has analgesic, antipyretic and weak anti-inflammatory activity. Used together, tramadol and paracetamol combination has a faster onset of action compared to tramadol alone and longer duration of action compared to paracetamol alone. Onset: 17 minutes Duration: 5 hr Absorption: Tramadol: Readily absorbed from GI tract; mean absolute bioavailability 75-90%. Paracetamol: Readily absorbed from GI tract, peak plasma concentrations reached in 10-60 minutes. Distribution: Tramadol: Widely distributed, crosses the

	absorbed from GI tract, peak plasma concentrations reached in 10-60 minutes. Distribution: Tramadol: Widely distributed, crosses the placenta and distributes into the breast milk; protein binding: 20%. Paracetamol: Widely distributed; crosses placenta and distributes into breast milk; negligible protein binding. Metabolism: Tramadol: Undergoes metabolism by the cytochrome P450 isoenzymes CYP3A4 and CYP2D6; one of the metabolites, O-desmethyltramadol is pharmacologically active. Paracetamol: Metabolised in liver. Excretion: Tramadol: Excreted via urine as metabolites (60%) and unchanged drug (30%); elimination half-life of O-desmethyltramadol: 7 hr. Paracetamol: Excreted mainly in urine as metabolites and unchanged drugs (<5%); elimination half life: 1-3 hr.
CIMS Class	Analgesics (Opioid) / Analgesics (Non-Opioid) & Antipyretics
ATC Classification	N02AX02 - tramadol; Belongs to the class of other opioids. Used to relieve pain. N02BE01 - paracetamol; Belongs to the class of anilide preparations. Used to relieve pain and fever.

Administration	May be taken with or without food.	
Overdosage	Symptoms: Severe hypotension. Management: Treatment is symptomatic. Activated charcoal may be used in severe overdose if presented within 1 hr of ingestion. If hypotension persists, sympathomimetics may be given, although they may not be required. Infusion of normal saline solution and haemodialysis may also be helpful.	
Contraindications	Aortic stenosis or outflow tract obstruction; renovascular disease; ascites. Pregnancy and lactation. Hypersensitivity or history of angioedema related to previous treatment with an ACE inhibitor, unilateral or bilateral renal artery stenosis.	
Special Precautions	Renal and hepatic impairment, idiopathic or hereditary angioedema, severe heart failure, patients likely to be salt or water depleted, liver cirrhosis. Conduct regular WBC counts in patient with collagen vascular disease. Monitor renal function during first few wk and then periodically. Discontinue if jaundice develops or marked increase in LFT. Discontinue diuretics 2-3 days before starting therapy and resume later if necessary. Elderly.	

	Discontinue if jaundice develops or marked increase in LFT. Discontinue diuretics 2-3 days before starting therapy and resume later if necessary. Elderly.
Adverse Drug Reactions	Dizziness, headache, fatigue, GI disturbances, diarrhoea, taste disturbances, persistent dry cough and other upper respiratory tract symptoms, skin rashes, angioedema, hypersensitivity reactions, renal impairment, hyperkalaemia, hyponatraemia, chest pain, palpitations, tachycardia, pancreatitis, cholestatic jaundice, alopecia, paraesthesias, impotence, eosinophilic pneumonitis, hypotension, hyperuricaemia. Potentially Fatal: Fulminant hepatic necrosis, blood dyscrasias especially neutropenia.
Drug Interactions	Additive hyperkalaemic effects with potassium-sparing diuretics, potassium supplements, heparin, LMWH and other drugs that can cause hyperkalaemia. Diminished antihypertensive effects with NSAIDs. Increased risk of lithium toxicity with concurrent use. Increased risk of hypotension with alcohol, diuretics and other agents that lower BP. Increased risk of nephrotoxicity and hyperkalaemia with ciclosporin, tacrolimus. Increased risk of granulocytopenia with interferon.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 20-25°C (68-77°F).
Mechanism of Action	Trandolapril is a prodrug of trandolaprilat, which is a inhibitor of angiotensin-converting enzyme (ACE). It prevents conversion of angiotensin I to angiotensin II, a potent peripheral vasoconstrictor. Lower levels of angiotensin II

of angiotensin-converting enzyme (ACE). It prevents conversion of angiotensin I to angiotensin II, a potent peripheral vasoconstrictor. Lower levels of angiotensin II results in an increase in plasma renin activity and reduction in aldosterone secretion. Reduced aldosterone leads to diuresis, natriuresis and a small increase in serum potassium. Trandolapril can also minimise or prevent the development of left ventricular dilatation and dysfunction following acute MI.

Onset: 1 hr.

Duration: At least 24 hr.

Absorption: Bioavailability: 40-60%. Peak plasma concentrations in 4-6 hr. Food may decrease the rate but not extent of absorption.

Distribution: Plasma protein-binding: >80%. Volume of distribution: 18 L.

Metabolism: Metabolised in liver to active and inactive metabolites.

Excretion: Excreted via urine (33%) and faeces (66%).

CIMS Class	ACE Inhibitors
ATC Classification	C09AA10 - trandolapril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

***trandolapril information:**

Note that there are some more drugs interacting with trandolapril
trandolapril further details are available in official CIMS India

tranexamic acid

CIMS Class : (Haemostatics)
tranexamic acid

P - Caution when used during pregnancy

L - Caution when used during lactation

related tranexamic acid information

Indication & Dosage

Oral

Short-term management of haemorrhage

Adult: 1-1.5 g or 15-25 mg/kg 2-4 times daily.

Child: 25 mg/kg bid or tid.

Renal impairment: Adjust dose based on serum creatinine concentration: 120-250 micromol/l: 15 mg/kg bid daily; 250-500 micromol/l: 15 mg/kg once daily; >500 micromol/l: 7.5 mg/kg once daily or 15 mg/kg once every 48 hr.

Oral

Management of hereditary angioedema

Adult: 1-1.5 g bid or tid.

Child: 25 mg/kg bid or tid.

Renal impairment: Adjust dose based on serum creatinine concentration: 120-250 micromol/l: 15 mg/kg bid daily; 250-500 micromol/l: 15 mg/kg once daily; >500 micromol/l: 7.5 mg/kg once daily or 15 mg/kg once every 48 hr.

Intravenous

Short-term management of haemorrhage

Adult: 0.5-1 g or 10 mg/kg tid or 25-50 mg/kg daily by

	7.5 mg/kg once daily or 15 mg/kg once every 48 hr. Intravenous Short-term management of haemorrhage Adult: 0.5-1 g or 10 mg/kg tid or 25-50 mg/kg daily by continuous infusion. Child: 10 mg/kg bid or tid. Renal impairment: Adjust dose based on the serum-creatinine concentration: 120-250 micromol/l: 10 mg/kg bid daily; 250-500 micromoles/l: 10 mg/kg once daily; >500 micromol/l: 5 mg/kg once daily or 10 mg/kg once every 48 hr. Incompatibility: Incompatible with benzylpenicillin.
Administration	May be taken with or without food.
Overdosage	Symptoms: Nausea, vomiting, orthostatic symptoms and/or hypotension.
Contraindications	Severe renal failure, active intravascular clotting, thromboembolic disease, colour vision disorders, subarachnoid bleeding.
Special Precautions	Mild to moderate renal impairment, irregular menstrual bleeding, previous history of thromboembolic disease, haematuria. Monitor closely in disseminated intravascular coagulation. Monitor LFT and eye examination regularly during long-term use. Discontinue if disturbance in colour vision occurs. Avoid IV inj rate >1 ml/minute due to risk of hypotension. Pregnancy, lactation.
Adverse Drug Reactions	Diarrhoea, nausea, vomiting, disturbances in colour vision, giddiness, hypotension (after rapid IV inj), thromboembolic events.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled

	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Store at 15-30°C (59-86°F). Oral: Store at 15-30°C (59-86°F).
Mechanism of Action	Tranexamic acid is an antifibrinolytic agent that competitively inhibits breakdown of fibrin clots. It blocks binding of plasminogen and plasmin to fibrin, thereby preventing haemostatic plug dissolution. Absorption: Absorbed from the GI tract; peak plasma concentrations after 3 hr (oral). Bioavailability: 30-50%, unaffected by food intake. Distribution: Widely throughout the body. Protein-binding: Very low. Crosses the placenta and distributed into breast milk. Excretion: Urine (as unchanged drug); 2 hr (elimination half-life).
CIMS Class	Haemostatics
ATC Classification	B02AA02 - tranexamic acid; Belongs to the class of amino acid antifibrinolytics. Used in the treatment of hemorrhage.

trazodone hydrochloride

CIMS Class : (Anxiolytics) , (Antidepressants)
trazodone hydrochloride

P - Contraindicated in pregnancy
L - Caution when used during lactation

related trazodone hydrochloride information

Indication & Dosage	<i>Oral</i> Depression Adult: Initially, 150 mg daily increased by 50-mg increments every 3-4 days up to 300-400 mg daily if necessary. Daily dosage may be given in divided doses or as a single dose at night. Max: 600 mg daily in divided doses in severely depressed patients. Elderly: Initially, 100 mg daily up to 300 mg daily. Daily dosage may be given in divided doses or as a single dose at night. Renal impairment: Severe: use with caution. Hepatic impairment: Severe: use with caution. <i>Oral</i> Anxiety Adult: Initially, 75 mg daily increased to 300 mg daily if necessary. Daily dosage may be given in divided doses or as a single dose at night. Renal impairment: Severe: use with caution. Hepatic impairment: Severe: use with caution.

	necessary. Daily dosage may be given in divided doses or as a single dose at night. Renal impairment: Severe: use with caution. Hepatic impairment: Severe: use with caution.
Administration	Should be taken with food. (Take shortly after a meal or a light snack.)
Overdosage	Symptoms: drowsiness, dizziness, vomiting, priapism, respiratory arrest, convulsions and changes in ECG . Management: Gastric lavage may be considered in life-threatening cases. Activated charcoal may also be used if used within 1 hr (in adults who have taken more than 1 g or children more than 150 mg). Treatment is symptomatic and supportive. Haemodialysis is unlikely to be useful.
Contraindications	Immediate recovery phase post MI, porphyria. Pregnancy.
Special Precautions	Cardiovascular disorders, epilepsy, severe hepatic or renal insufficiency. Lactation. Monitor closely during initial therapy for signs of suicide. Discontinue if signs of hepatic dysfunction, blood dyscrasias or prolonged erection. Withdraw gradually. May impair ability to drive or operate machinery.
Adverse Drug Reactions	Drowsiness, dizziness, restlessness, confusional state, headache, nausea, vomiting, weakness, weight loss, dry mouth, constipation, diarrhoea, tremor, bradycardia or tachycardia, orthostatic hypotension, oedema, blurred vision, priapism, skin rash, syndrome of inappropriate secretion of antidiuretic hormone. Potentially Fatal: Blood dyscrasias, hepatocellular damage, neuroleptic malignant syndrome.
Drug Interactions	May diminish action of some antihypertensives (e.g. clonidine). Increased trazodone concentrations with potent CYP3A4 inhibitors such as azole antifungals, HIV-protease inhibitors and macrolides. Reduced trazodone concentrations

	may enhance action of some anti-hypertensives (e.g. clonidine). Increased trazodone concentrations with potent CYP3A4 inhibitors such as azole antifungals, HIV-protease inhibitors and macrolides. Reduced trazodone concentrations with CYP3A4 inducers such as carbamazepine. Increased risk of excessive hypotension and hepatotoxicity with phenothiazines. Decreased anticoagulant effect of warfarin. Increased digoxin or phenytoin levels with trazodone. Increased risk of neurotoxicity, serotonin syndrome with lithium. Sedative effect enhanced by alcohol and other CNS depressants (sedatives, hypnotics, antihistamines, opioid analgesics). Potentially Fatal: Dangerous combination with MAOIs. Trazodone should not be given within 2 wk of discontinuing MAOIs and MAOIs should not be started within 1 wk of discontinuing trazodone.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store below 30°C.
Mechanism of Action	Trazodone is a triazolopyridine antidepressant which selectively inhibits serotonin re-uptake at presynaptic neurons. Unlike TCAs, peripheral re-uptake of noradrenaline is not affected. It does not have very significant antimuscarinic properties but has a marked sedative action. Absorption: Readily absorbed from the GI tract (oral); peak plasma concentrations after 1 hr (empty stomach), 2 hr (with food). Distribution: Enters breast milk (small amounts). Protein-binding: 89-95%. Metabolism: Extensively hepatic by N-oxidation and

	100d). Distribution: Enters breast milk (small amounts). Protein-binding: 89-95%. Metabolism: Extensively hepatic by N-oxidation and hydroxylation. Metabolised to its active metabolite m-chlorophenylpiperazine via cytochrome P450 isoenzyme CYP3A4. Excretion: Urine (as metabolites), faeces; 5-9 hr (terminal elimination half-life).
CIMS Class	Anxiolytics / Antidepressants
ATC Classification	N06AX05 - trazodone; Belongs to the class of other agents used in the management of depression.

tretinoin

CIMS Class : (Acne Treatment Preparations) , (Other Dermatologicals) , (Cytotoxic Chemotherapy)
tretinoin

- P - Contraindicated in pregnancy
- L - Contraindicated in lactation
- Food ⚠ - Food interaction

related tretinoin information

Indication & Dosage	<i>Oral</i> Acute promyelocytic leukaemia Adult: A daily dose of 45 mg/m² daily in 2 divided doses, continue treatment until 30 days after complete remission or 90 days of treatment given, whichever occurs first. To increase duration of remission, consolidation therapy, usually with an anthracycline- and cytarabine-based regimen, is given concurrently or subsequently, depending on the leukocyte count. Child: A daily dose of 45 mg/m² daily in 2 divided doses, continue treatment until 30 days after complete remission or 90 days of treatment given, whichever occurs first. To increase duration of remission, consolidation therapy, usually with an anthracycline- and cytarabine-based regimen, is given concurrently or subsequently, depending on the leukocyte count. Reduce dose if serious or intolerable drug toxicity. However, the safety and efficacy < 45 mg/m² daily in
---------------------	--

	given concurrently or subsequently, depending on the leukocyte count. Reduce dose if serious or intolerable drug toxicity. However, the safety and efficacy < 45 mg/m² daily in paediatric patients have not been established. Renal impairment: Decrease to 25 mg/m² daily. Hepatic impairment: Decrease to 25 mg/m² daily. <i>Topical/Cutaneous</i> Acne Adult: Apply a 0.01-0.1% cream/gel/alcoholic solution once or bid onto affected area which has been previously cleansed to remove excessive oiliness and dried 15-30 min prior to application. Therapeutic response may be seen after 6-8 wk. <i>Topical/Cutaneous</i> Mottled hyperpigmentation, roughness and fine wrinkling of photodamaged skin Adult: Wash face with mild soap, pat dry and wait for 20-30 min before applying 0.02-0.05% preparation once daily at night. Therapeutic response may be seen after 6 mth.
Administration	Should be taken with food.
Overdosage	Symptoms: transient headache, facial flushing, cheilosis, abdominal pain, dizziness and ataxia.
Contraindications	Hypersensitivity to retinoids. Application to eczematous, sunburnt or abraded skin. Pregnancy, lactation.
Special Precautions	Topical: avoid concomitant topical applications, esp keratolytic agents. Avoid exposure to sunlight, UV light and weather extremes (e.g. cold). Keep away from eyes, mouth, angles of nose, mucous membranes or open wounds. In case of severe local erythema, oedema, blistering or crusting, use less frequently or discontinue. Avoid medicated or drying soaps, abrasive soaps and cleansers, frequent washing and harsh scrubbing. Avoid use of topical preparations with high concentrations of alcohol, menthol, spices or lime. Oral:

	soaps, abrasive soaps and cleansers, frequent washing and harsh scrubbing. Avoid use of topical preparations with high concentrations of alcohol, menthol, spices or lime. Oral: Children, hepatic or renal impairment. Reduce dose if intractable headache occurs. Discontinue temporarily if LFT exceed 5 times upper limit of normal. Monitor closely for leukocytosis or respiratory compromise. Monitor haematologic profile, coagulation parameters, LFT, serum triglyceride and cholesterol concentrations regularly.
Adverse Drug Reactions	Initial exacerbation of symptoms, skin irritation, stinging on application, oedema, blistering, crusting of the skin, erythema, scaling, photosensitivity, temporary hypo/hyperpigmentation. Oral: Haemorrhage, reversible hypercholesterolemia and/or hypertriglyceridemia, acidosis, hypothermia, pseudotumour cerebri, infection, dizziness, paresthesias, anxiety, dryness of skin and mucous membranes, nausea, vomiting, GI haemorrhage, mucositis, decreased appetite, rash, pruritus, increased sweating, alopecia, bone pain, peripheral oedema, renal insufficiency, earache, visual disturbances, neurotoxicity. Potentially Fatal: Retinoic acid syndrome, cardiac arrhythmia, disseminated intravascular coagulation, blood dyscrasias, cardiac arrest, cerebral haemorrhage.
Drug Interactions	Enhances percutaneous absorption of minoxidil. Increased risk of fatal thrombotic complications with antifibrinolytic. Increased tretinoin concentrations with azole antifungals. Enhances peeling action of sulphur, resorcinol, benzoyl peroxide, salicylic acid. Increased photosensitivity with photosensitising medications eg, thiazides, tetracyclines, fluoroquinolones, phenothiazines and sulfonamides. Potentially Fatal: Increased risk of intracranial pressure with tetracyclines.

	fluoroquinolones, phenothiazines and sulfonamides. Potentially Fatal: Increased risk of intracranial pressure with tetracyclines.
Food Interaction	Dong quai and St. John's wort may potentiate photosensitisation. Increased risk of vitamin A toxicity with vit A supplements or food/preparations rich in vit A eg, cod liver oil and halibut fish oil.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store 15-30°C (59-86°F). Topical/Cutaneous: Solution / gel: Store below 30°C (86°F). Cream: Store below 80°F.
Mechanism of Action	Tretinoin is a trans-retinoic acid form of vitamin A. It stimulates mitosis and turnover of follicular epithelial cells and reduce their cohesiveness. This facilitates extrusion of existing comedones and prevents formation of new comedone. It also exhibits thinning effect on the stratum corneum. In acute promyelocytic leukaemia, it induces cellular differentiation and decreases proliferations. Absorption: Well absorbed from the GIT, peak plasma concentrations after 1-2 hrs (oral). Oral bioavailability: 50%. Distribution: Highly bound to plasma proteins. Metabolism: Hepatic by cytochrome P450 isoenzyme;

	concentrations after 1-2 hrs (oral). Oral bioavailability: 50%. Distribution: Highly bound to plasma proteins. Metabolism: Hepatic by cytochrome P450 isoenzyme; converted to isotretinoin, 4-oxo-trans-retinoic acid and 4-oxo-cis-retinoic acid. Excretion: Urine and faeces; 0.5-2 hrs (terminal elimination half-life).
CIMS Class	Acne Treatment Preparations / Other Dermatologicals / Cytotoxic Chemotherapy
ATC Classification	D10AD01 - tretinoin; Belongs to the class of topical retinoid preparations used in the treatment of acne. L01XX14 - tretinoin; Belongs to the class of other antineoplastic agents. Used in the treatment of cancer.

triamcinolone

CIMS Class : (Mouth/Throat Preparations) , (Corticosteroid Hormones) , (Topical Corticosteroids)
triamcinolone

P - Caution when used during pregnancy

L - Caution when used during lactation

related triamcinolone information

Indication & Dosage

Oral

Allergic and inflammatory disorders

Adult: 4-48 mg daily.

Nasal

Treatment and prophylaxis of allergic rhinitis

Adult: As acetate: Initially, 2 sprays (110 mcg) into each nostril once daily, reduced to 1 spray (55 mcg) when under control.

Child: 6-12 yr: as acetate: 1 spray (55 mcg) into each nostril once daily. Increased to 220 mcg daily in severe cases.

Intramuscular

Suppression of allergic and inflammatory disorders

Adult: As acetate: 20-80 mg via deep IM into gluteal muscles. As diacetate: 40 mg inj.

Child: As acetate: deep IM into gluteal muscle: initial 0.11 to 1.6 mg/kg/day in 3-4 divided doses. Do not use in premature infants and infants of low birth weight as it

Child: As acetoneide: deep IM into gluteal muscle: initial 0.11 to 1.6 mg/kg/day in 3-4 divided doses. Do not use in premature infants and infants of low birth weight as it contains benzyl alcohol.

Intramuscular

Symptomatic control for hay fever

Adult: As acetoneide: 40-100 mg via deep IM into gluteal muscles. As diacetate: 40 mg wkly.

Child: As acetoneide: deep IM into gluteal muscle: initial 0.11 to 1.6 mg/kg/day in 3-4 divided doses. Do not use in premature infants and infants of low birth weight as it contains benzyl alcohol.

Intra-articular

Inflammatory joint diseases

Adult: As acetoneide: Smaller joints: 2.5-5 mg (up to 10 mg), larger joints: 5-15 mg (up to 40 mg). Max: 20-80 mg/treatment. As hexacetoneide: Initial: 2-20 mg/day.

Intradermal

Inflammatory skin conditions

Adult: As acetoneide: 1-3 mg/site. Max: 30 mg in total if several sites of inj used. As diacetate: 5 mg in divided doses for small lesions or up to 48 mg in divided doses for large lesions. Max: 12.5 mg/inj site. Max: 25 mg/lesion. As hexacetoneide: max 500 mcg per square inch or 80 mcg/cm² of affected skin.

Mouth/Throat

Mouth ulceration

Adult: A small amount (about 0.6 cm) of the 0.1% paste is pressed onto the lesion without rubbing until a thin film develops. Apply 2 or 3 times daily, preferably after meals. Re-evaluate if recovery does not occur after 7 days of treatment.

Topical/Cutaneous

	develops. Apply 2 or 3 times daily, preferably after meals. Re-evaluate if recovery does not occur after 7 days of treatment. <i>Topical/Cutaneous</i> Inflammatory skin conditions Adult: As acetoneide: Apply a 0.025-0.5% cream/lotion/ointment sparingly onto affected area 2-3 times daily. Lower concentrations may be used up to 4 times daily.
Administration	Should be taken with food.
Contraindications	Untreated systemic fungal, bacterial, viral or parasitic infection, hypersensitivity. Neonates (Parenteral)
Special Precautions	Diabetes; hypertension, renal and liver impairment; glaucoma; psychosis; delayed tissue healing; cirrhosis; heart failure; recent MI; hypothyroidism; osteoporosis; peptic ulceration; thromboembolic disorders. Monitor height in children on prolonged therapy. Avoid rapid drug withdrawal. Elderly, children, pregnancy, lactation.
Adverse Drug Reactions	HPA axis suppression, intracranial hypertension, Cushing's syndrome, growth retardation in children; osteoporosis, fractures. Peptic ulceration; glaucoma; hyperglycaemia; GI upsets; increased appetite; increased fragility of skin; behavioural changes. Topical: Systemic absorption if applied to large areas, broken skin or under occlusive dressing. Potentially Fatal: Acute adrenal insufficiency may be precipitated by infection or trauma in patients on long-term corticosteroid therapy or rapid withdrawal.
Drug Interactions	Lowering of plasma salicylates levels. Increased risk of GI bleeding and ulceration with NSAIDs. Antagonised blood glucose-lowering effects of the antidiabetics. Increased risk of hyperkalaemia with amphotericin B, β agonists, β-blockers, potassium-depleting diuretics, theophylline. Increased clearance of the triamcinolone

	of hyperkalaemia with amphotericin B, β agonists, β-blockers, potassium-depleting diuretics, theophylline. Increased clearance of the triamcinolone with cyclosporin, carbamazepine, phenytoin, barbiturate, rifampicin. Infections may develop if given with live vaccines.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. D in 1st trimester. Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intra-articular: Store between 20-25°C (68–77°F). Intradermal: Store between 20-25°C (68–77°F). Intramuscular: Store between 20-25°C (68–77°F). Topical/Cutaneous: Store between 15-30°C.
Mechanism of Action	Triamcinolone has mainly glucocorticoid activity. It suppresses the migration of polymorphonuclear leukocytes and reduces capillary permeability thereby decreasing inflammation. Absorption: Absorbed systemically (topical). Distribution: Crosses the placenta. Protein-binding: Plasma albumin (much smaller extent than hydrocortisone). Excretion: Elimination half-life: 2-5 hr (plasma).

	Distribution: Crosses the placenta. Protein-binding: Plasma albumin (much smaller extent than hydrocortisone). Excretion: Elimination half-life: 2-5 hr (plasma).
CIMS Class	Mouth/Throat Preparations / Corticosteroid Hormones / Topical Corticosteroids
ATC Classification	A01AC01 - triamcinolone; Belongs to the class of local corticosteroid preparations. Used in the treatment of diseases of the mouth. D07AB09 - triamcinolone; Belongs to the class of moderately potent (group II) corticosteroids. Used in the treatment of dermatological diseases. D07XB02 - triamcinolone; Belongs to the class of moderately potent (group II) corticosteroids in other combinations. Used in the treatment of dermatological diseases. H02AB08 - triamcinolone; Belongs to the class of glucocorticoids. Used in systemic corticosteroid preparations. R01AD11 - triamcinolone; Belongs to the class of topical corticosteroids used as nasal decongestants. R03BA06 - triamcinolone; Belongs to the class of other inhalants used in the treatment of obstructive airway diseases, glucocorticoids. S01BA05 - triamcinolone; Belongs to the class of corticosteroids. Used in the treatment of inflammation of the eye.

triamterene

CIMS Class : (Diuretics)
triamterene

P - Caution when used during pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related triamterene information

Indication & Dosage

Oral

Oedema

Adult: 150-250 mg/day in 2 divided doses, after breakfast and lunch. Maintenance: doses may be given on alternate days. Max: 300 mg/day.

Renal impairment: Use with caution. Severe: avoid.

Hepatic impairment: Severe: avoid.

Oral

Hypertension

Adult: In combination with other diuretics e.g. hydrochlorothiazide: Initially, 50 mg daily.

Renal impairment: Use with caution. Severe: avoid.

Hepatic impairment: Severe: avoid.

Administration

Should be taken with food. (Take after meals.)

Overdosage

Symptoms: electrolyte imbalance, especially hyperkalemia. GI disturbances such as nausea, vomiting, weakness, hypotension. Management: Empty stomach by emesis or

	Symptoms: electrolyte imbalance, especially hyperkalemia. GI disturbances such as nausea, vomiting, weakness, hypotension. Management: Empty stomach by emesis or gastric lavage. Treatment is supportive and symptomatic. Monitor electrolyte pattern and fluid balance closely. Severe hypotension may be relieved by admin of pressor agents such as norepinephrine. Dialysis may be useful.
Contraindications	severe renal or hepatic impairment, preexisting or drug-induced hyperkalemia, patients at risk of respiratory or metabolic acidosis. Lactation.
Special Precautions	Renal and hepatic impairment; cirrhosis; DM; hyponatraemia; hyperuricaemia; history of nephrolithiasis; depleted folic acid stores. Monitor electrolyte concentrations closely, especially potassium levels. Observe for signs of liver damage, blood dyscrasias or other idiosyncratic reactions. Discontinue treatment if urinary calculus is passed. Pregnancy and elderly.
Adverse Drug Reactions	Photosensitivity reactions; increase in uric acid concentrations; megaloblastic anaemia; thrombocytopenia; hyperkalaemia; nephrolithiasis; renal failure; GI disturbances such as nausea, vomiting, diarrhoea; dry mouth; fatigue; dizziness; skin rash, muscle cramps; headache; orthostatic hypotension; increased BUN concentrations, LFT abnormalities.
Drug Interactions	Increased risk of hyperkalemia with potassium supplements, other potassium-sparing diuretics, ACE inhibitors, angiotensin II receptor antagonists, trilostane, potassium-containing medications (such as parenteral penicillin G potassium), eplerenone, tacrolimus, ciclosporin, LMWH. Increased risk of bone marrow suppression with methotrexate. Potentially Fatal: Increased risk of nephrotoxicity with

	LMWH. Increased risk of bone marrow suppression with methotrexate. Potentially Fatal: Increased risk of nephrotoxicity with NSAIDs and ciclosporin. Increased risk of lithium toxicity.
Lab Interference	May cause pale blue fluorescence in urine which may interfere with methods of enzyme assay that depend on fluorometry, e.g. determinations of lactic dehydrogenase activity. Interferes with fluorometric assay of quinidine due to similar fluorescence spectra.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. if used in pregnancy-induced hypertension. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store between 15-30°C (59-86°F).
Mechanism of Action	Triamterene is a potassium sparing diuretic which appears to act mainly on the distal renal tubules. It increases the excretion of Na and reduces the excretion of potassium. It adds to the natriuretic but reduces the kaliuretic effects of other diuretics. It is structurally similar to folate and has anti-folate activity. Onset: Diuresis: 2-4 hr. Duration: Diuresis: 7-9 hr. Absorption: Rapid but variable absorption from GI tract.

	Onset: Diuresis: 2-4 hr. Duration: Diuresis: 7-9 hr. Absorption: Rapid but variable absorption from GI tract. Bioavailability: 50%. Distribution: Crosses the placenta; may be distributed into breast milk. Protein binding: 60%. Metabolism: Extensively metabolised. Plasma half-life: 2 hr. Excretion: Mainly excreted in the urine as metabolites and unchanged triamterene.
CIMS Class	Diuretics
ATC Classification	C03DB02 - triamterene; Belongs to the class of other potassium-sparing agents. Used as diuretics.

triclosan

CIMS Class : (Skin Antiseptics & Disinfectants) , (Acne Treatment Preparations)
triclosan

related triclosan information

Indication & Dosage	<i>Topical/Cutaneous</i> Oral hygiene, Acne, Disinfection of hands and wounds, Skin disinfection Adult: Available in concentrations up to 2% in soaps, creams, and solutions.
Adverse Drug Reactions	Contact dermatitis.
Mechanism of Action	Triclosan, a chlorinated bisphenol antiseptic, is active against fungi, gram-positive and gram-negative bacteria.
CIMS Class	Skin Antiseptics & Disinfectants / Acne Treatment Preparations
ATC Classification	D08AE04 - triclosan; Belongs to the class of phenol and derivatives antiseptics. Used in the treatment of dermatological diseases. D09AA06 - triclosan; Belongs to the class of ointment dressings with antiinfectives. Used in treatment of wounds.

trifluoperazine

CIMS Class : (Antipsychotics) , (Antiemetics) , (Anxiolytics)
trifluoperazine

P - Caution when used during pregnancy
L - Contraindicated in lactation

related trifluoperazine information

Indication & Dosage	<i>Oral</i> Psychoses Adult: 2-5 mg bid gradually increased to 15-20 mg daily, or 40 mg daily in severe or resistant psychoses. Child: Max: 5 mg daily in divided doses adjusted according to age, body weight and response. Elderly: Initiate at lower dose and increase gradually.
	<i>Oral</i> Nausea and vomiting Adult: 1-2 mg bid. Max 6 mg daily. Child: 3-5 yrs: max 1 mg daily in divided doses; 6-12 yrs: max 4 mg daily. Elderly: Initiate at lower dose and increase gradually.
	<i>Oral</i> Short-term management of anxiety Adult: 1-2 mg bid. Max: 6 mg daily. Max duration: 12 wk. Child: 3-5 yr: max 1 mg daily in divided doses; 6-12 yr: max 4 mg daily in divided doses. Elderly: Initiate at lower dose and increase gradually.

	Adult: 1-2 mg bid, max 6 mg daily; max duration: 12 hrs. Child: 3-5 yr: max 1 mg daily in divided doses; 6-12 yr: max 4 mg daily in divided doses. Elderly: Initiate at lower dose and increase gradually. <i>Intramuscular</i> Acute psychosis Adult: 1-2 mg by deep IM, repeated if necessary every 4-6 hr. Max: 6 mg daily. Child: 1 mg by deep IM once or twice daily. Elderly: Initiate at lower dose and increase gradually.
Administration	Should be taken with food.
Overdosage	Symptoms: extrapyramidal side effects, CNS depression, somnolence, agitation, restlessness, convulsions, ECG changes, cardiac arrhythmias, fever, autonomic reactions such as hypotension, dry mouth and ileus. Management: Treatment is symptomatic and supportive. Maintain an open airway as dysphagia and respiratory difficulty may occur in severe overdosage. Gastric lavage may be performed. Do not induce emesis as dystonic reaction of the head or neck may develop and this may lead to aspiration of vomitus. Extrapyramidal symptoms may be treated with anti-parkinsonism drugs, barbiturates, or diphenhydramine hydrochloride. If pressor agents are required, norepinephrine bitartrate and phenylephrine HCl may be used but not epinephrine. This is because trifluoperazine may reverse the usual elevating action of these agents and cause a further drop in blood pressure. Haemodialysis is not likely to be useful.
Contraindications	Preexisting CNS depression and coma; bone marrow depression, blood dyscrasias, liver disease, hypersensitivity to phenothiazines, prolactin dependent tumours. Pregnancy (1 st trimester), lactation.

	depression, blood dyscrasias, liver disease, hypersensitivity to phenothiazines, prolactin dependent tumours. Pregnancy (1 st trimester), lactation.
Special Precautions	Cardiovascular disease, epilepsy, angle-closure glaucoma, exposure to extreme temperatures, elderly, parkinson's disease, myasthenia gravis, benign prostatic hyperplasia, DM, renal and hepatic impairment. Discontinue trifluoperazine at least 48 hr before myelography and do not resume for at least 24 hr after procedure. Do not use trifluoperazine in control of nausea and vomiting occurring either prior to myelography or postprocedure with metrizamide. Pregnancy.
Adverse Drug Reactions	Drowsiness, dry mouth, blurred vision, dizziness, sedation, antimuscarinic effects, postural hypotension, akathisia, muscle weakness, anorexia, insomnia, rash, amenorrhoea, fatigue, increased prolactin levels, extrapyramidal side effects. Potentially Fatal: Neuroleptic malignant syndrome, blood dyscrasias.
Drug Interactions	Increased CNS depression with CNS depressants such as opiates or other analgesics, barbiturates or other sedatives, general anaesthetics, or alcohol. Increased risk of side effects with drugs with antimuscarinic properties e.g. TCA, antiparkinsonian drugs. Antagonised effects of dopaminergic drugs such as levodopa. Increased risk of hypotension with antihypertensives, trazodone. Reverses antihypertensive effect of guanethidine. Increased risk of severe extrapyramidal side-effects or severe neurotoxicity with lithium. Possible decrease in absorption with antacids.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or

	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C
Mechanism of Action	Trifluoperazine inhibits dopamine D₂ receptors in the brain. It has weak anticholinergic and sedative effects but strong extrapyramidal and antiemetic effects. It controls severely disturbed, agitated or violent behaviour but may also be used for nonpsychotic anxiety. Absorption: Readily absorbed from GI tract. Peak plasma concentrations: 1.5-6 hr. Bioavailability: subject to interindividual variation. Distribution: Protein binding: highly bound. Distributed into breast milk. Excretion: Terminal half life: 22 hr.
CIMS Class	Antipsychotics / Antiemetics / Anxiolytics
ATC Classification	N05AB06 - trifluoperazine; Belongs to the class of phenothiazine antipsychotics with piperazine structure. Used in the management of psychosis.

triflupromazine

CIMS Class : (Antipsychotics) , (Antiemetics)
triflupromazine

P - Caution when used during pregnancy

related triflupromazine information

Indication & Dosage

Intramuscular

Psychoses

Adult: 60-150 mg daily.

Child: IM: >2½ yr: 200-250 mcg/kg daily. Max: 10mg daily.

Elderly: or debilitated patients: Dose reduction is recommended.

Parenteral

Nausea and vomiting

Adult: IV: 1 mg/dose; max: 3 mg daily. IM: 5-15 mg, repeated after 4 hr if necessary; max: 60 mg daily.

Child: IM: >2½ yr: 200-250 mcg/kg daily. Max: 10mg daily.

Elderly: or debilitated patients: Dose reduction is recommended.

Contraindications

Preexisting CNS depression and coma; bone marrow depression, blood dyscrasias, liver disease, hypersensitivity to phenothiazines, prolactin dependent tumours. Pregnancy (1st trimester), lactation.

Special Precautions

Cardiovascular disease, epilepsy, angle-closure glaucoma, exposure to extreme temperatures, parkinson's disease,

	Cardiovascular disease, epilepsy, angle-closure glaucoma, exposure to extreme temperatures, parkinson's disease, myasthenia gravis, benign prostatic hyperplasia, DM, renal and hepatic impairment. Discontinue triflupromazine at least 48 hr before myelography and do not resume for at least 24 hr after procedure. Do not use in control of nausea and vomiting occurring either prior to myelography or postprocedure with metrizamide. Pregnancy, elderly.
Adverse Drug Reactions	Blurred vision, dry mouth, urinary hesitancy/retention, constipation, orthostatic hypotension, allergic rash, akathisia, dystonias, muscle weakness, anorexia, insomnia. Potentially Fatal: Blood dyscrasias, malignant neuroleptic syndrome.
Drug Interactions	Increased CNS depression with CNS depressants such as opiates or other analgesics, barbiturates or other sedatives, general anaesthetics, or alcohol. Increased risk of side effects with drugs with antimuscarinic properties e.g. TCA, antiparkinsonian drugs. Antagonised effects of dopaminergic drugs such as levodopa. Increased risk of hypotension with antihypertensives, trazodone. Reverses antihypertensive effect of guanethidine. Increased risk of severe extrapyramidal side-effects or severe neurotoxicity with lithium. Possible decrease in absorption with antacids.
Mechanism of Action	Triflupromazine is a phenothiazine with general properties similar with chlorpromazine.
CIMS Class	Antipsychotics / Antiemetics
ATC Classification	N05AA05 - triflupromazine; Belongs to the class of phenothiazine antipsychotics with aliphatic side-chain. Used in the management of psychosis.

trihexyphenidyl hydrochloride

CIMS Class : (Antiparkinsonian Drugs)
trihexyphenidyl hydrochloride

P - Caution when used during pregnancy

L - Caution when used during lactation

related trihexyphenidyl hydrochloride information

Indication & Dosage	<i>Oral</i> Prophylaxis of drug-induced extrapyramidal symptoms Adult: Initially, 1 mg daily, increased gradually to usual maintenance dose of 5-15 mg daily in 3-4 divided doses. Max dose: 15 mg daily. Elderly: May require smaller doses. <i>Oral</i> Idiopathic parkinsonism Adult: Initially, 1 mg daily in 3-4 divided doses, increased gradually over a period of several days in steps of 2 mg, up to 6-10 mg daily according to response. For advanced cases: 12-15 mg daily in 3-4 divided doses. For postencephalitic patients: Larger doses may be required. Elderly: May require smaller doses. Max Dosage: 15 mg daily.
Administration	Should be taken with food. (Best taken w/ meals. Take before meals if dry mouth occurs, after meals if drooling/nausea occurs. Take at the same time each day.)

	Should be taken with food. (Best taken w/ meals. Take before meals if dry mouth occurs, after meals if drooling/nausea occurs. Take at the same time each day.)
Overdosage	Overdosage may lead to psychiatric disturbances.
Contraindications	Patients with closed-angle glaucoma, chronic pulmonary disease, sick sinus syndrome, thyrotoxicosis, cardiac failure with tachycardia.
Special Precautions	Glaucoma, obstructive disease of GI or genitourinary tracts. In elderly males with possible prostatic hypertrophy. Liver and renal disorders. Pregnancy and lactation.
Adverse Drug Reactions	Dry mouth, blurring of vision, constipation, urinary retention, glaucoma, confusion, drowsiness, restlessness, hallucinations. Potentially Fatal: Arrhythmias, AV dissociation, multiple ventricular ectopics.
Drug Interactions	Delayed absorption of other oral drugs. Potentially Fatal: Additive anticholinergic activity with tricyclic antidepressants, antiparkinsonian drugs, antihistaminics, phenothiazine and quinidine.
Mechanism of Action	Trihexyphenidyl is a tertiary amine antimuscarinic, which competitively inhibits the effects of acetylcholine at the muscarinic receptors of autonomic effector sites innervated by parasympathetic nerves. It also brings about direct and indirect antispasmodic action on smooth muscle. Onset: 1 hr. Absorption: Trihexyphenidyl is absorbed well from the GI tract after oral admin with effects visible after 1 hr. Excretion: Mainly in the urine.
CIMS Class	Antiparkinsonian Drugs

***trihexyphenidyl hydrochloride information:**

trimetazidine hydrochloride

CIMS Class : (Anti-Anginal Drugs)
trimetazidine hydrochloride

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related trimetazidine hydrochloride information

Indication & Dosage	<i>Oral</i> Angina pectoris, Meniere's disease Adult: As conventional tab: 40-60 mg daily in divided doses.
Administration	Should be taken with food.
Contraindications	Hypersensitivity. Pregnancy and lactation.
Adverse Drug Reactions	GI disturbances, vomiting, nausea.
Storage	Oral: Store below 30°C.
Mechanism of Action	Trimetazidine is a cellular acting anti-ischaemic agent. It has 3 main properties by which it acts as a cytoprotective agent. It inhibits the anaerobic glycolysis and fatty acid metabolism, thus allowing only aerobic glycolysis. This action helps to restore the energy balance in the cell. It inhibits acidosis and free radical accumulation in the cell. All these action help the cell to restore the normal ionic and metabolic balance. Absorption: Rapidly absorbed. Peak plasma concentration: within 2 hr (conventional tab); 5 hr (modified release). Excretion: Via urine, mainly as unchanged drug. Half life: 6

	Absorption: Rapidly absorbed. Peak plasma concentration: within 2 hr (conventional tab); 5 hr (modified release). Excretion: Via urine, mainly as unchanged drug. Half life: 6 hr (conventional); 7 hr (modified release).
CIMS Class	Anti-Anginal Drugs
ATC Classification	C01EB15 - trimetazidine; Belongs to the class of other preparations used in cardiac therapy.

trimipramine maleate

CIMS Class : (Antidepressants)
trimipramine maleate

P - Caution when used during pregnancy
L - Contraindicated in lactation

related trimipramine maleate information

Indication & Dosage	<i>Oral</i> Depression Adult: Initially 50-75 mg daily, increased gradually as necessary to 150-300 mg daily. May be given in divided doses during the day or as a single dose at night. Elderly: Initial 50-75 mg daily, increased gradually if necessary. Max: 100 mg daily.
Administration	May be taken with or without food.
Overdosage	Symptoms: Hypotensive collapse, convulsions, cardiac arrhythmias, acidosis and coma. Management: Gastric lavage should be carried out as soon as possible. Treatment is supportive and symptomatic with ECG monitoring. Intubate and ventilate the patient before convulsions develop. If convulsions occur, treat with IV diazepam. Treatment should be continued for at least 3 days even if the patient appears to have recovered, due to the long half life of trimipramine.
Contraindications	Recent MI, cardiac arrhythmias, heart block; mania; porphyria, severe liver disease. Neonates and children.

	Recent MI, cardiac arrhythmias, heart block; mania; porphyria, severe liver disease. Neonates and children. Lactation.
Special Precautions	Narrow-angle glaucoma; prostatic hypertrophy; history of epilepsy; hyperthyroidism; patients requiring anaesthesia. Pregnancy. Withdraw gradually to decrease risk of withdrawal symptoms. Monitor liver function in long term treatment. May impair ability to drive or operate machinery.
Adverse Drug Reactions	Dry mouth, accommodation disturbances, tachycardia, constipation, hesitancy of micturation, drowsiness, sweating, postural hypotension, skin rashes, cholestatic jaundice, hypomania, convulsions, cardiac arrhythmias and peripheral neuropathy. Agitation, confusion (elderly). Potentially Fatal: Agranulocytosis and thrombocytopenia.
Drug Interactions	Decreased antihypertensive effects of guanethidine, guanfacine, debrisoquine, betanidine and possibly clonidine. Increased CNS depression with CNS depressants such as alcohol, sedatives, hypnotics or barbiturates. Increased trimipramine levels with protease inhibitors, SSRIs, selegiline, tramadol, quinidine, diltiazem and verapamil. Decreased trimipramine levels with barbiturates. Increased risk of arrhythmias with drugs that prolong QT intervals. Increased risk of serotonin syndrome with linezolid. Increased antimuscarinic adverse effects with nefopam. Risk of neurotoxicity and serotonin syndrome with lithium. Potentially Fatal: Not to be given concurrently with, or within 2 wk of cessation of, therapy with MAOI and MAOI should be restarted at least 7-14 days after trimipramine has been stopped. Exaggerated response such as hypertension, cardiac arrhythmias with sympathomimetic drugs.

	restarted at least 7-14 days after trimipramine has been stopped. Exaggerated response such as hypertension, cardiac arrhythmias with sympathomimetic drugs.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Trimipramine is a dibenzazepine TCA with antimuscarinic and sedative properties. It prevents the neuronal reuptake of noradrenaline in the CNS. Absorption: Absorbed readily from the GI tract (oral); peak plasma concentrations after 2 hr. Distribution: Protein-binding: Extensive. Metabolism: Hepatic; converted to desmethyylimipramine (active). Excretion: Via urine (as metabolites); 23 hr (elimination half-life).
CIMS Class	Antidepressants
ATC Classification	N06AA06 - trimipramine; Belongs to the class of non-selective monoamine reuptake inhibitors. Used in the management of depression.

triprolidine hydrochloride

CIMS Class : (Antihistamines & Antiallergics)
triprolidine hydrochloride

P - Caution when used during pregnancy

L - Contraindicated in lactation

related triprolidine hydrochloride information

Indication & Dosage	<i>Oral</i> Allergic conditions Adult: 2.5 mg every 4-6 hr. Max: 10 mg daily. Child: 4 mth-<2 yr: 0.313 mg every 4-6 hr; max: 1.252 mg daily. 2-<4 yr: 0.625 mg every 4-6 hr; max: 2.5 mg daily. 4-<6 yr: 0.938 mg every 4-6 hr; max: 3.744 mg daily. 6-<12 yr: 1.25 mg every 4-6 hr; max: 5 mg daily. ≥12 yr: 2.5 mg every 4-6 hr; max: 10 mg daily.
Administration	May be taken with or without food.
Overdosage	Symptoms: Antimuscarinic, extrapyramidal and CNS side effects. In children or elderly, very often, CNS stimulation predominates over CNS depression and causes ataxia, excitement, tremors, psychoses, hallucinations, convulsions, hyperpyrexia, cardiorespiratory collapse and coma. In adults, CNS depression predominates and results in drowsiness, coma, convulsions, respiratory failure and CV collapse.
Contraindications	Hypersensitivity to acrivastine; child < 4 mth; lactation.

Contraindications	Hypersensitivity to acrivastine; child < 4 mth; lactation.
Special Precautions	Angle-closure glaucoma; urinary retention; prostatic hypertrophy; pyloroduodenal obstruction; epilepsy. May impair ability to drive or operate machinery. Broken or eczematous skin (topical use). Child <6 yr should take only under the direction of a physician. Elderly, pregnancy.
Adverse Drug Reactions	CNS depression, headache, psychomotor impairment, dry mouth, thickened respiratory tract secretions, blurred vision, urinary difficulty or retention, constipation, increased gastric reflux, nausea, vomiting, diarrhoea, epigastric pain, myalgia, paraesthesias, extrapyramidal effects, tremor, sleep disturbances, depression, confusion, tinnitus, hypotension and hair loss. Potentially Fatal: Blood dyscrasias.
Drug Interactions	Increased sedation with CNS depressants eg, alcohol, barbiturates, hypnotics, opioid analgesics, anxiolytics, sedatives and antipsychotics. Increased antimuscarinic side effects with other antimuscarinic drugs e.g.atropine, TCA and MAOI. May mask signs of ototoxicity caused by aminoglycosides.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store between 15-30°C.
Mechanism of Action	Triprolidine is an antihistamine derived from alkylamine that has antimuscarinic and mild sedative effects. May also be used in fixed dose combination with pseudoephedrine

	Triprolidine is an antihistamine derived from alkylamine that has antimuscarinic and mild sedative effects. May also be used in fixed dose combination with pseudoephedrine hydrochloride. Distribution: Distributed into breast milk. Metabolism: A carboxylated derivative makes up about half of the dose excreted in the urine. Excretion: Excreted via urine as metabolites. Reported half life: 3-5 hr or more.
CIMS Class	Antihistamines & Antiallergics
ATC Classification	R06AX07 - triprolidine; Belongs to the class of other agents used as systemic antihistamines.

triprolidine + pseudoephedrine

CIMS Class : (Cough & Cold Preparations)
triprolidine + pseudoephedrine

P - Caution when used during pregnancy

L - Caution when used during lactation

related triprolidine + pseudoephedrine information

Indication & Dosage

Oral

Cold and flu, Allergic rhinitis

Adult: Each tablet contains triprolidine HCl 2.5 mg and pseudoephedrine HCl 60 mg: 1 tablet 4-6 hrly, up to 4 times a day. As syrup containing triprolidine HCl 1.25 mg and pseudoephedrine HCl 30 mg/5 ml: 10 ml 4-6 hrly, up to 4 times daily.

Child: Each tablet contains triprolidine HCl 2.5 mg and pseudoephedrine HCl 60 mg: > 12 yr: 1 tablet 4-6 hrly, up to 4 times a day. As syrup containing triprolidine HCl 1.25 mg and pseudoephedrine HCl 30 mg/5 ml: 6-12 yr: 5 ml 4-6 hrly, up to 4 times daily. 2-5 yr: 2.5 ml 4-6 hrly, up to 4 times daily; may be diluted 1:1-1:4 with syrup BP.

Overdosage

Symptoms: Drowsiness, lethargy, dizziness, ataxia, weakness, difficulty passing urine, dry skin, tachycardia, hypertension, high fever, hyperactivity, irritability, seizures and respiratory depression. Management: Gastric lavage may be performed up to 3 hr after overdose. Treatment is supportive and symptomatic. Acid diuresis or dialysis may be

	hypertension, high fever, hyperactivity, irritability, seizures and respiratory depression. Management: Gastric lavage may be performed up to 3 hr after overdose. Treatment is supportive and symptomatic. Acid diuresis or dialysis may be helpful in pseudoephedrine elimination.
Contraindications	Concurrent use or within 2 wk of stopping MAOIs. Severe hypertension or coronary artery disease.
Special Precautions	Severe hepatic impairment. Moderate to severe renal impairment. DM, hyperthyroidism, increased intraocular pressure, prostatic hypertrophy, hypertension, heart disease. May affect ability to drive or operate machinery. Pregnancy and lactation.
Adverse Drug Reactions	Dry mouth, nose and throat; skin rashes, tachycardia, drowsiness, sleep disturbances, urinary retention. Rarely, hallucinations.
Drug Interactions	Increased BP with other sympathomimetic agents (e.g. decongestants, TCA, appetite suppressants). Reduced hypotensive effects of methyldopa, α- and β-adrenergic blockers. Increased side effects (e.g. somnolence, agitation) with atomoxetine. Potentially Fatal: Increased risk of hypertensive crisis with furazolidine, avoid concurrent use. Increased risk of hypertensive crisis with MAOIs; avoid concurrent use or within 2 wk after stopping MAOIs. Increased risk of psychosis with bromocriptine.
Storage	Oral: Tablet: Do not store above 25°C. Syrup: Do not store above 25°C. Diluted syrup can be stored up to 4 wk at 25°C.
Mechanism of Action	Triprolidine hydrochloride is a potent competitive histamine H_1 -receptor antagonist with antimuscarinic and mild sedative properties. Pseudoephedrine, an α - and β -adrenergic receptor agonist, mediates vasoconstriction via direct stimulation of α -adrenergic receptors of the respiratory

	H₁ receptor antagonist with antimuscarinic and mild sedative properties. Pseudoephedrine, an α- and β-adrenergic receptor agonist, mediates vasoconstriction via direct stimulation of α-adrenergic receptors of the respiratory mucosa. Onset: Antihistaminic effects: 1-2 hr; decongestant effects: Within 30 min Duration: Antihistaminic effects: At least 8 hr; decongestant effects: At least 4 hr. Absorption: Pseudoephedrine: Readily absorbed from GI tract. Distribution: Triprolidine: Enters into breast milk. Pseudoephedrine: Enters into breast milk. Excretion: Triprolidine: Half life 3-5 hr. Pseudoephedrine: Excreted in urine mainly as unchanged drug and some as the hepatic metabolite, half life 5.5 hr (at urine pH between 5.0-7.0), decreased if urine is acidic and increased if urine is alkaline.
CIMS Class	Cough & Cold Preparations
ATC Classification	R01BA02 - pseudoephedrine; Belongs to the class of systemic sympathomimetic preparations used as nasal decongestants. R06AX07 - triprolidine; Belongs to the class of other agents used as systemic antihistamines.

triptorelin

CIMS Class : (Trophic Hormones & Related Synthetic Drugs) , (Hormonal Chemotherapy)
triptorelin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related triptorelin information

Indication & Dosage	<i>Parenteral</i>
	Prostate cancer
	Adult: 3 or 3.75 mg by IM Inj every 4 wk using 1 mth depot preparation. The 1st dose may be preceded with 0.1 mg daily for 7 days by SC inj. Alternatively, 11.25 mg IM every 12 wk using the 3 mth depot formulation.
	<i>Intramuscular</i>
	Uterine fibroids
	Adult: 3 or 3.75 mg by IM Inj every 4 wk for up to 6 mth. Begin treatment during the 1st 5 days of the menstrual cycle.
	<i>Intramuscular</i>
	Endometriosis
	Adult: 3 or 3.75 mg by IM Inj every 4 wk for up to 6 mth. Begin treatment during the 1st 5 days of the menstrual cycle.
	<i>Subcutaneous</i>
	Female infertility
	Adult: In conjunction with gonadotrophins, 0.1 mg daily by

	<i>Subcutaneous</i> Female infertility Adult: In conjunction with gonadotrophins, 0.1 mg daily by SC Inj starting from the 2nd day of the menstrual cycle for 10-12 days. <i>Parenteral</i> Precocious puberty Child: 50 mcg/kg, using the 3 mg depot preparation by IM Inj every 4 wk. Alternatively, using the 3.75 mg depot preparation, <20 kg 1.875 mg, 20-30 kg 2.5 mg, >30 kg 3.75 mg by IM or SC inj; first 3 doses to be given at 14 day intervals with further doses given every 4 wk.
Contraindications	Hypersensitivity to triptorelin and other luteinising hormone-releasing hormone (LHRH) or LHRH agonists; as sole treatment in prostate cancer patients with spinal cord compression or evidence of spinal metastases; progressive brain tumours in children. Pregnancy; lactation.
Special Precautions	Patients with pituitary adenoma; weight-related amenorrhoea until weight corrected; polycystic ovary disease or endometriotic cysts; metabolic bone disease. Monitor closely as there may be initial worsening of signs and symptoms during first few wk of therapy. Contraceptive measures to be taken to protect against unwanted ovulation in females.
Adverse Drug Reactions	Hot flushes, weight gain, sleep disturbances, headache, hypertension, weight gain, decreased libido, abnormal vision, mood disorders, nausea, abdominal pain or discomfort, rash and impotence. Transient pain, redness or local inflammation at the inj site may occur. Prostate cancer: During first few wk, bone pain, worsening of urinary obstruction symptoms and/or worsening of neurological signs of vertebral metastases (back pain, weakness or paresthesia of the lower limbs). Gynaecomastia, vertigo and dizziness. Endometriosis: Initial

	worsening of neurological signs of vertebral metastases (back pain, weakness or paresthesia of the lower limbs). Gynaecomastia, vertigo and dizziness. Endometriosis: Initial worsening of pelvic pain, dysmenorrhoea with heavy menstrual bleeding or spotting. Sweating, vaginal dryness, dyspareunia, breast pain, hair loss, small loss in bone density. Precocious puberty: Mild or moderate withdrawal bleeding in the first mth of treatment. Potentially Fatal: Anaphylactic shock.
Drug Interactions	Decrease in LHRH receptors in pituitary with hyperprolactinaemic drugs antagonises effects of triptorelin.
Lab Interference	Suppression of pituitary-gonadal axis may lead to misleading results of pituitary-gonadal function tests if conducted during treatment and after cessation of therapy.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Mechanism of Action	Triptorelin is a synthetic analogue of natural gonadotropin-releasing hormone. Initial admin stimulates the release of pituitary gonadotrophins with a transient increase in testosterone levels in men and in oestradiol levels in women, leading to an initial worsening of symptoms during the first wk. Prolonged admin leads to a suppression of gonadotrophins and a decrease in plasma testosterone or oestradiol after approximately 20 days, which is maintained for as long as triptorelin is admin. Absorption: Rapidly absorbed with peak plasma concentrations after 40 minutes (subcutaneous inj). Excretion: Half life: 7.5 hr.

CIMS Class	Trophic Hormones & Related Synthetic Drugs / Hormonal Chemotherapy
ATC Classification	L02AE04 - triptorelin; Belongs to the class of gonadotropin releasing hormone analogues. Used in endocrine therapy.

tropicamide

CIMS Class : (Mydriatic Drugs)
tropicamide

P - Caution when used during pregnancy

related tropicamide information

Indication & Dosage

Ophthalmic

Production of mydriasis

Adult: Instill 1-2 drops of a 0.5% solution 15-20 minutes before examination.

Ophthalmic

Production of cycloplegia

Adult: Instill 1-2 drops of a 1% solution repeated after 5 minutes. An additional drop may be admin after 20-30 minutes for prolonged effect.

Contraindications

Hypersensitivity. Narrow-angle glaucoma or shallow anterior chamber.

Special Precautions

Elderly, children, pregnancy. Hypertension, hyperthyroidism, DM, cardiac disorders. To reduce systemic absorption, press on the lacrimal sac for 1-2 minutes following instillation. Do not drive or engage in hazardous activities and protect eyes from bright illumination when pupils are dilated. May fail to produce adequate cycloplegia in children.

Adverse Drug Reactions

Increased intraocular pressure, transient stinging, dry mouth, blurred vision, photophobia, tachycardia, headache,

	Increased intraocular pressure, transient stinging, dry mouth, blurred vision, photophobia, tachycardia, headache, superficial punctate keratitis, systemic anticholinergic effects, severe CNS disturbances in children (rare).
Drug Interactions	May antagonise effects of ophthalmic carbachol, pilocarpine, or cholinesterase inhibitors.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Ophthalmic: Store between 15-30°C. Do not refrigerate.
Mechanism of Action	Tropicamide is a tertiary amine antimuscarinic which causes relaxation of the sphincter muscle of the iris resulting in pupillary dilatation. It also causes paralysis of the ciliary muscle leading to loss of accommodation. Onset: Mydriasis: 20-40 min; cycloplegia: 30 min. Duration: Mydriasis: 6 hrs; cycloplegia: 6 hrs.
CIMS Class	Mydriatic Drugs
ATC Classification	S01FA06 - tropicamide; Belongs to the class of anticholinergics used in the treatment of mydriasis and cycloplegia.

tryptophan

CIMS Class : (Antidepressants)
tryptophan

related tryptophan information

Indication & Dosage	<i>Oral</i> Adjunct in treatment-resistant depression Adult: As L-tryptophan: 1 g tid. Max: 6 g daily. Elderly: Dose reduction may be needed. Renal impairment: Dose reduction may be needed. Hepatic impairment: Dose reduction may be needed.
Overdosage	Symptoms: Drowsiness and vomiting. Management: Treatment is supportive.
Contraindications	History of eosinophilia-myalgia syndrome associated with tryptophan treatment.
Special Precautions	May affect ability to drive or operate machinery. Monitor for suicidal thoughts or clinical worsening of depression during initial treatment period. Renal or hepatic impairment. Elderly.
Adverse Drug Reactions	Nausea (take after food to minimise nausea), headache, lightheadedness, drowsiness, eosinophilia-myalgia syndrome.
Drug Interactions	Increased risk of serotonin syndrome with SSRI. Possible decrease in levodopa plasma levels with tryptophan. Potentially Fatal: Increased risk of severe behavioural and

	Increased risk of serotonin syndrome with SSRI. Possible decrease in levodopa plasma levels with tryptophan. Potentially Fatal: Increased risk of severe behavioural and neurological toxicity with MAOI, start with lower initial dose of tryptophan if needed.
Mechanism of Action	Tryptophan is an essential amino acid which is the precursor of serotonin. It may be used as an adjunctive therapy in treatment-resistant depression. It is sometimes administered with pyridoxine and ascorbic acid. Due to its association with eosinophilia-myalgia syndrome, the use of tryptophan as dietary supplements (e.g. for insomnia) is limited or restricted. Absorption: Readily absorbed from GI tract. Distribution: Protein binding: Extensive, to plasma albumin. Metabolism: By liver to metabolites e.g. hydroxytryptophan and kynurenine derivatives. Excretion: Elimination half life (oral or IV L-tryptophan): 1-3 hr.
CIMS Class	Antidepressants
ATC Classification	N06AX02 - tryptophan; Belongs to the class of other agents used in the management of depression.

***tryptophan information:**

urofollitropin

CIMS Class : (Trophic Hormones & Related Synthetic Drugs)
urofollitropin

P - Contraindicated in pregnancy

related urofollitropin information

Indication & Dosage

Injection

Female infertility

Adult: Initially, 150 IU daily SC/IM for the first 5 days. Adjust subsequent dosing based on clinical monitoring (e.g. serum oestradiol levels and vaginal ultrasound). Dose adjustments should not be made more frequently than once every 2 days and be =75-150 units per adjustment. Max dose: 450 units daily and max course of treatment: 12 days. Stop treatment when adequate response obtained as determined by oestrogen monitoring or ultrasonic visualisation of follicles. A single dose of chorionic gonadotrophin 5000 to 10 000 units is given to induce ovulation after 1-2 days. Urofollitropin treatment may be tried again in future cycles.

Injection

Polycystic ovarian syndrome

Adult: Initially, 150 IU daily SC/IM for the first 5 days. Adjust subsequent dosing based on clinical monitoring (e.g. serum oestradiol levels and vaginal ultrasound). Dose adjustments should not be made more frequently than once every 2 days and be =75-150 units per adjustment. Max dose: 450 units

	subsequent dosing based on clinical monitoring (e.g. serum oestradiol levels and vaginal ultrasound). Dose adjustments should not be made more frequently than once every 2 days and be =75-150 units per adjustment. Max dose: 450 units daily and max course of treatment: 12 days. Stop treatment when adequate response obtained as determined by oestrogen monitoring or ultrasonic visualisation of follicles. A single dose of chorionic gonadotrophin 5000 to 10 000 units is given to induce ovulation after 1-2 days. Urofollitropin treatment may be tried again in future cycles. <i>Injection</i> In vitro fertilisation procedures or other assisted conception techniques Adult: In conjunction with other agents: 150-225 units of FSH daily SC/IM from day 2 or 3 of menstrual cycle. Alternatively, begin therapy with clomifene citrate and continue with urofollitropin; or urofollitropin may be given after gonadorelin analogue is given to suppress gonadotrophin release. Continue treatment until an adequate response is obtained and admin 5000 to 10 000 units of chorionic gonadotrophin 1-2 days after final injection of urofollitropin. Oocyte retrieval is performed 34-35 hr later. <i>Injection</i> Male infertility Adult: In conjunction with chorionic gonadotrophin, 150 units of FSH SC/IM 3 times a wk, continue for at least 4 mth.
Contraindications	Pregnancy, ovarian cysts or enlargement not due to polycystic ovary syndrome, primary ovarian failure, organic intracranial lesion e.g. pituitary tumour, uncontrolled thyroid and adrenal dysfunction, presence of any cause of infertility other than anovulation, abnormal bleeding of undetermined origin.
Special	May result in multiple pregnancies. Abnormal genital

Special Precautions	May result in multiple pregnancies. Abnormal genital bleeding, hormone sensitive malignancies, ovarian cysts not caused by polycystic ovary syndrome. Exclude and treat other causes of infertility e.g. pituitary or hypothalamic lesions, adrenal or thyroid disorders and hyperprolactinaemia.
Adverse Drug Reactions	Nausea, vomiting, joint pain, ovarian hyperstimulation syndrome, adnexal torsion, mild to moderate ovarian enlargement, abdominal pain, ovarian cysts, local reaction at inj site, headaches, haemoperitoneum, benign and malignant ovarian neoplasms, ascites, pleural effusion, hypovolaemia, thromboembolic disorders. Weight gain, acne and gynaecomastia in men. Potentially Fatal: Ovarian cysts rupture, intraperitoneal haemorrhage.
Drug Interactions	Increased risk of ovarian hyperstimulation syndrome with drugs with luteinising hormone activity.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Mechanism of Action	Urofollitropin, a gonadotrophin obtained from postmenopausal women's urine, possesses follicle-stimulating hormone (FSH) activity but almost no luteinising activity. Admin for 7-12 days results in follicular growth and maturation in females. When sufficient follicular maturation has occurred, human chorionic gonadotrophin should be given to induce ovulation.

	growth and maturation in females. When sufficient follicular maturation has occurred, human chorionic gonadotrophin should be given to induce ovulation. Absorption: Peak plasma concentration: 10 hr (after multiple dosing).
CIMS Class	Trophic Hormones & Related Synthetic Drugs
ATC Classification	G03GA04 - urofollitropin; Belongs to the class of gonadotropins. Used as ovulation stimulants.

urokinase

P - Contraindicated in pregnancy

related urokinase information

related urokinase information	
Indication & Dosage	<i>Intravenous</i> Deep vein thrombosis Adult: Initially, 4400 units/kg dissolved in 15 ml of sodium chloride 0.9%, infused IV over 10 minutes followed by 4400 units/kg/hr for 12-24 hr. <i>Parenteral</i> Acute myocardial infarction Adult: 6000 units/min infused into the coronary artery for 2 hr preceded by IV heparin. Alternatively, 2-3 million units IV is given over 45-90 min. <i>Intravenous</i> Peripheral arterial thromboembolism Adult: As solution containing 2000 units/ml: Infuse into the clot via a catheter at a rate of 4000 units/minute for 2 hr. Monitor response using angiography. If clot is not removed, advance the catheter into the occluded vessel and continue infusion at the same rate for another 2 hr. May repeat procedure, if needed, up to 4 times. Once blood flow is re-established, partially withdraw the catheter and continue infusing at 1000 units/minute until the remaining clot has

Intravenous

Deep vein thrombosis

Adult: Initially, 4400 units/kg dissolved in 15 ml of sodium chloride 0.9%, infused IV over 10 minutes followed by 4400 units/kg/hr for 12-24 hr.

Parenteral

Acute myocardial infarction

Adult: 6000 units/min infused into the coronary artery for 2 hr preceded by IV heparin. Alternatively, 2-3 million units IV is given over 45-90 min.

Intravenous

Peripheral arterial thromboembolism

Adult: As solution containing 2000 units/ml: Infuse into the clot via a catheter at a rate of 4000 units/minute for 2 hr. Monitor response using angiography. If clot is not removed, advance the catheter into the occluded vessel and continue infusion at the same rate for another 2 hr. May repeat procedure, if needed, up to 4 times. Once blood flow is re-established, partially withdraw the catheter and continue infusing at 1000 units/minute until the remaining clot has

infusion at the same rate for another 2 hr. May repeat procedure, if needed, up to 4 times. Once blood flow is re-established, partially withdraw the catheter and continue infusing at 1000 units/minute until the remaining clot has lysed.

Intravenous

Pulmonary embolism

Adult: Initially, 4400 units/kg dissolved in 15 ml sodium chloride 0.9%, infused over 10 min followed by 4400 units/kg/hr for 12 hr. Alternatively, 15000 units/kg as bolus Inj into the pulmonary artery; may repeat inj, adjust dose according to plasma fibrinogen concentrations up to 3 times in 24 hr.

Injection

Clearance of occluded catheters and shunts

Adult: 5000 - 25000 units in 2 ml sodium chloride 0.9% instilled into affected IV catheter or shunt and clamped for up to 4 hr. Aspirate the lysate and repeat the procedure if needed. Alternatively, infuse a solution containing 5000 units of urokinase in 200 mL of sodium chloride 0.9% into the device over 30 minutes.

Irrigation

Break down of clots in hyphaema

Adult: To prepare the solution: Dissolve 5000 units in 2 ml of sterile distilled water. Irrigate the anterior chamber slowly with 0.3 ml of the solution; leave solution *in situ* for 3 minutes and then wash out with saline. Repeat procedure 5 times. If residual clot is still present at the end of the treatment, leave 0.3 ml of the solution in the anterior chamber for 24-48 hr.

Overdosage

Symptoms: Haemorrhage. Management: Inhibitors such as tranexamic acid can be given. In serious cases, human fibrinogen, Factor XII, packed red cells or whole blood may be given as needed. Avoid using dextran for volume

	Symptoms: Haemorrhage; management: inhibitors such as tranexamic acid can be given. In serious cases, human fibrinogen, Factor XII, packed red cells or whole blood may be given as needed. Avoid using dextran for volume deficiency correction.
Contraindications	Active internal bleeding; history of cerebrovascular accident; recent (within 2 mth) trauma of any kind including surgery; aneurysm; known bleeding diathesis; severe uncontrolled hypertension. Recent history of peptic ulcer disease, oesophageal varices, ulcerative colitis or other bleeding GI lesions; pancreatitis; subacute bacterial endocarditis; coagulation defects including those due to liver or kidney disease, or after recent surgery, childbirth or trauma. Increased risk of cerebral bleeding e.g. recent stroke or cerebral neoplasm. Pregnancy.
Special Precautions	Any vascular punctures or invasive procedures should be avoided as far as possible during, and immediately before and after urokinase therapy and if unavoidable done with great care. External chest compression. Caution in conditions eg, possibility of left heart thrombus, subacute bacterial endocarditis, coagulation defects, cerebrovascular disease, diabetic retinopathy and any conditions in which bleeding could be dangerous. Monitor for reperfusion arrhythmias when used in MI.
Adverse Drug Reactions	Bleeding, pyrexia, haematuria, thromboembolic episodes, hypersensitivity reactions. Potentially Fatal: Severe bleeding, anaphylaxis.
Drug Interactions	Reduced thrombolytic effect when given again some time later due to development of high levels of antibodies. Potentially Fatal: Platelet inhibitors eg, aspirin and indometacin can potentiate the action of urokinase and cause haemorrhage. Heparin and oral

	Potentially Fatal: Platelet inhibitors eg, aspirin and indometacin can potentiate the action of urokinase and cause haemorrhage. Heparin and oral anticoagulants may increase risk of bleeding.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Injection: Store below 25°C. Intravenous: Store below 25°C. Irrigation: Store below 25°C. Parenteral: Store below 25°C.
Mechanism of Action	Urokinase, an enzyme isolated from human urine, directly converts plasminogen into plasmin, which is a proteolytic enzyme with fibrinolytic effects. It is a fibrin non-specific thrombolytic as it affects both unbound and fibrin bound plasminogen. Metabolism: Hepatic; rapidly cleared from the circulation after IV administration. Excretion: 20 min (elimination half-life).
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC Classification	B01AD04 - urokinase; Belongs to the class of enzymes. Used in the treatment of thrombosis.

ursodeoxycholic acid

CIMS Class : (Cholagogues, Cholelitholytics & Hepatic Protectors)
ursodeoxycholic acid

P - Contraindicated in pregnancy
L - Caution when used during lactation

related ursodeoxycholic acid information

related ursodeoxycholic acid information	
Indication & Dosage	<i>Oral</i> Dissolution of cholesterol-rich gallstones Adult: 6-12 mg/kg daily as a single dose at bedtime or in 2-3 divided doses continued for 3-4 mth after radiological disappearance of stones. Doses may be divided unequally with a higher dose given before bedtime to counteract increase in biliary cholesterol saturation which occurs in early morning. Max: 15 mg/kg. Hepatic impairment: Chronic liver disease (except primary biliary cirrhosis): use with caution. <i>Oral</i> Primary biliary cirrhosis Adult: 10-15 mg/kg daily in 2-4 divided doses. <i>Oral</i> Prophylaxis of gallstones in patients undergoing rapid weight loss Adult: 300 mg bid. Hepatic impairment: Chronic liver disease (except primary biliary cirrhosis): use with caution.

	Adult: 300 mg bid. Hepatic impairment: Chronic liver disease (except primary biliary cirrhosis): use with caution.
Administration	Should be taken with food.
Contraindications	Calcified and pigment gallstones, radio opaque gallstones. Nonfunctioning gall bladders; chronic liver and peptic ulcer disease. Inflammatory disease of colon and small intestine. Pregnancy.
Special Precautions	50% of successfully treated patients will develop further gallstones within 10 yr. Lactation.
Adverse Drug Reactions	Diarrhoea, pruritus, nausea, vomiting, gallstone calcification.
Drug Interactions	Cholestyramine, charcoal and antacids may reduce effectiveness. Aluminum-based antacids may reduce absorption. Oestrogens and clofibrate may counteract effectiveness of ursodeoxycholic acid by increasing cholesterol elimination in bile. Possible increase in ciclosporin serum concentration. Decreased effectiveness of dapsone. Possible decrease in serum ciprofloxacin and nitrendipine.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Ursodeoxycholic acid suppresses hepatic synthesis and secretion of cholesterol and also inhibits intestinal absorption of cholesterol. Absorption: Rapidly and completely absorbed from the GI tract. Distribution: Protein binding: 96-98%. Undergoes

	absorption of cholesterol. Absorption: Rapidly and completely absorbed from the GI tract. Distribution: Protein binding: 96-98%. Undergoes enterohepatic recycling. Metabolism: Partly conjugated in the liver before being excreted into the bile. Free and conjugated forms undergo 7α-dehydroxylation to lithocholic acid under the influence of gut bacteria. Some are reabsorbed and then further conjugated and sulfated by the liver. Excretion: Faeces.
CIMS Class	Cholagogues, Cholelitholytics & Hepatic Protectors
ATC Classification	A05AA02 - ursodeoxycholic acid; Belongs to the class of bile acids. Used in bile therapy.

vaccine, dtp

CIMS Class : (Vaccines, Antisera & Immunologicals)
vaccine, dtp

P - Caution when used during pregnancy

L - Caution when used during lactation

related vaccine, dtp information

Indication & Dosage	<i>Intramuscular</i> Active immunisation against diphtheria, tetanus and pertussis Child: >6 wk: For primary immunisation: 3 doses of 0.5 ml to be given at intervals of 4-8 wk between doses (usually, at 2, 4 and 6 mth of age). 4th dose should be given at about 15-20 mth of age but at least 6 mth from the 3rd dose. A 5th dose may be given to children at 4-6 yr of age or prior to school-entry, if the 4th dose was received at younger than 4th yr of age. Dose should be injected via deep IM inj into the anterolateral muscles of the thigh or the deltoid of the arm. Whenever possible, the same product should be used for all doses. Refer to full prescribing information as dosing instructions may vary with brand. <i>Intramuscular</i> Booster immunisation against diphtheria, tetanus and pertussis Adult: Adacel®(19-64 yr): 0.5 ml as a single dose, given via deep IM inj into the deltoid muscle of the upper arm. At least

Booster immunisation against diphtheria, tetanus and pertussis

Adult: Adacel®(19-64 yr): 0.5 ml as a single dose, given via deep IM inj into the deltoid muscle of the upper arm. At least 5 yr should have elapsed since the last dose of tetanus toxoid, diphtheria toxoid and/or pertussis containing vaccine. Shorter intervals (as short as 2 yr) may be used in high-risk patients e.g. healthcare workers, or during pertussis outbreaks.

Child: Boostrix® (10-18 yr) or Adacel®(11-18 yr): 0.5 ml as a single dose, given via deep IM inj preferably into the deltoid muscle. At least 5 yr should have elapsed since the last dose of tetanus toxoid, diphtheria toxoid and/or pertussis containing vaccine.

Intramuscular

Prophylaxis of tetanus in wound management

Adult: Adacel®: Patient should have completed the primary immunisation against tetanus; if wounds are minor and uncomplicated, a booster dose (0.5 ml) may be given if patient has not received any tetanus toxoid within the last 10 yr; if wounds are tetanus-prone (e.g. contaminated with faeces, dirt or soil), a booster dose (0.5 ml) may be given if patient has not received tetanus toxoid within the last 5 yr.

Child: Boostrix® (10-18 yr) or Adacel® (11-18 yr):

Adolescents should have completed the primary immunisation against tetanus; if wounds are minor and uncomplicated, a booster dose (0.5 ml) may be given if patient has not received any tetanus toxoid within the last 10 yr; if wounds are tetanus-prone (e.g. contaminated with faeces, dirt or soil), a booster dose (0.5 ml) may be given if patient has not received tetanus toxoid within the last 5 yr.

Contraindications

Hypersensitivity. History of encephalopathy within 7 days of vaccination with pertussis-containing vaccine. Vaccine should

	Hypersensitivity. History of encephalopathy within 7 days of vaccination with pertussis-containing vaccine. Vaccine should not be used in patients with progressive neurologic disorder, progressive encephalopathy or uncontrolled epilepsy.
Special Precautions	Caution when patient develops one or more of the following symptoms within 48 hr of vaccination: Temperature $\geq 40.5^{\circ}\text{C}$ (not due to an identifiable cause), collapse or shock-like state or persistent and inconsolable crying lasting ≥ 3 hr. Seizures, with or without fever, within 3 days after vaccination. Patients who have experienced serious Arthus-type hypersensitivity reaction following a previous dose of tetanus toxoid should not receive tetanus toxoid-containing vaccine more frequently than once every 10 yr. Caution when used in patients with family history of seizures or other CNS disorders. Not to be used in patients with bleeding disorders or patients on anticoagulant treatment unless benefit outweighs risk. Pregnancy and lactation.
Adverse Drug Reactions	Pain, swelling and redness at the inj site. Fever, headache, fatigue and GI symptoms e.g. nausea, diarrhoea, abdominal pain.
Drug Interactions	Immune response to vaccines may be reduced in patients who are receiving immunosuppressive treatment e.g. cytotoxics, high dose corticosteroids, irradiation.
Storage	Intramuscular: Store at $2-8^{\circ}\text{C}$.
Mechanism of Action	Vaccine, DTP is used for the active immunisation of diphtheria, tetanus and pertussis in children from 6 wk to 6 yr of age.
CIMS Class	Vaccines, Antisera & Immunologicals
ATC Classification	J06AA01 - diphtheria antitoxin; Belongs to the class of immune sera. Used in the treatment of acute infectious

J06AA01 - diphtheria antitoxin; Belongs to the class of immune sera. Used in the treatment of acute infectious diseases caused by toxigenic strains.

J06AA02 - tetanus antitoxin; Belongs to the class of immune sera. Used in the treatment of acute infectious diseases caused by toxigenic strains.

vaccine, hepatitis a

CIMS Class : (Vaccines, Antisera & Immunologicals)
vaccine, hepatitis a

related vaccine, hepatitis a information

Indication & Dosage	<i>Intramuscular</i> Active immunisation against hepatitis A Adult: Single dose of 0.5 ml or 1 ml depending on the product and the age of the patient. Booster dose is usually given 6-12 mth after the initial dose. To be given via SC admin in haemophiliacs. Child: Same as adult.
Contraindications	Hypersensitivity. Vaccines prepared in egg cultures are contraindicated in patients with hypersensitivity reactions to egg. Severe immunodeficiency. Malignant disease being treated with chemotherapy or radiotherapy and for at least 6 mth after stopping treatment. Patients with compromised immune system such as those on high-dose systemic corticosteroids, immunosuppressants or HIV positive.
Special Precautions	Alcohol or disinfectant used for cleaning the skin prior to inj should be allowed to evaporate completely before vaccination to prevent vaccine inactivation.
Adverse Drug Reactions	Transient soreness, erythema, induration at inj site. Fever, malaise, Potentially Fatal: Anaphylaxis.

	Transient soreness, erythema, induration at inj site. Fever, malaise, Potentially Fatal: Anaphylaxis.
Drug Interactions	Reduced response to vaccination when used concurrently with immunosuppressants such as corticosteroids or antineoplastics.
Mechanism of Action	Hepatitis A antigen is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells. It is used for active immunisation against hepatitis A infection.
CIMS Class	Vaccines, Antisera & Immunologicals

vaccine, hepatitis b

CIMS Class : (Vaccines, Antisera & Immunologicals)
vaccine, hepatitis b

related vaccine, hepatitis b information

Indication & Dosage	<i>Intramuscular</i> Active immunisation against hepatitis B Adult: Basic course includes 3 doses; 2nd and 3rd doses to be given 1 and 6 mth after the 1st dose respectively. Deltoid area is preferred in adults and older children. Dose depends on the product used. Typical doses are 10 or 20 mcg. Doses should be given via SC admin in haemophiliacs. Child: Basic course includes 3 doses; 2nd and 3rd doses to be given 1 and 6 mth after the 1st dose respectively. Deltoid area is preferred in older children while anterolateral thigh is the preferred site in neonates, infants and younger children. Dose depends on the product used. Typical doses are 5 or 10 mcg.
Contraindications	Previous confirmed anaphylactic reaction to a previous dose of a vaccine containing the same antigens. Hypersensitivity. Vaccines prepared in egg cultures are contraindicated in patients with hypersensitivity reactions to egg. Severe immunodeficiency. Malignant disease being treated with chemotherapy or radiotherapy and for at least 6 mth after stopping treatment. Patients with compromised immune

	immunodeficiency. Malignant disease being treated with chemotherapy or radiotherapy and for at least 6 mth after stopping treatment. Patients with compromised immune system such as those on high-dose systemic corticosteroids, immunosuppressants or HIV positive.
Special Precautions	If any alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination otherwise inactivation of live vaccines may occur.
Adverse Drug Reactions	Abdominal pain and GI disturbance, and musculoskeletal and joint pain and inflammation. Dizziness and sleep disturbance. CV effects include occasional hypotension and, rarely, tachycardia. Dysuria, visual disturbances and earache.
Drug Interactions	Reduced response to vaccination when used concurrently with immunosuppressants such as corticosteroids or antineoplastics.
Mechanism of Action	Hepatitis B vaccines are used for active immunisation against hepatitis B infection. Two types of vaccine have been available each containing hepatitis B surface antigen (HBsAg) adsorbed onto aluminium hydroxide or a similar adsorbent.
CIMS Class	Vaccines, Antisera & Immunologicals

vaccine, mmr

CIMS Class : (Vaccines, Antisera & Immunologicals)
vaccine, mmr

P - Contraindicated in pregnancy
L - Caution when used during lactation

related vaccine, mmr information

Indication & Dosage	<i>Parenteral</i> Active immunisation against measles, mumps and rubella Adult: Given by IM or SC (if there is bleeding disorder). A complete course consists of 2 doses of 0.5 ml; ensure an interval of 3 mth between the 2 doses. If protection against measles is needed urgently, the 2nd dose may be given 1 mth after the 1st dose. For protection against measles after exposure, doses should be given within 72 hr of contact. Child: Given by IM or SC (if there is bleeding disorder). =12 mth: A complete course consists of 2 doses of 0.5 ml; 1st dose to be given shortly after 1 yr old and the 2nd dose to be given before school entry. Doses may be given at any age, allowing an interval of 3 mth between the 2 doses. If the vaccine is administered before the child is 1 yr old, re-immunisation with the standard 2 doses is necessary when the child is =12 mth old. If protection against measles is needed urgently, the 2nd dose may be given 1 mth after the 1st dose; if the 2nd dose is given before the child is 18 mths

	re immunisation with the standard 2 doses is necessary when the child is ≥ 12 mth old. If protection against measles is needed urgently, the 2nd dose may be given 1 mth after the 1st dose; if the 2nd dose is given before the child is 18 mths old, the child should receive the routine dose before starting school at 3-5 yr old. For protection against measles after exposure: MMR vaccine may be used in susceptible children >6 mths old and doses should be given within 72 hr of contact; these children should still receive the routine MMR vaccine at the recommended ages. Reconstitution: Reconstitute vaccine with the provided diluent. Mix thoroughly. Discard if powder does not dissolve. Use immediately after reconstitution.
Contraindications	Current febrile respiratory illness or other febrile infection. Patients receiving immunosuppressive therapy; primary and acquired immunodeficiency states. Blood dyscrasias, cancers affecting the bone marrow or lymphatic systems. Pregnancy. Active untreated tuberculosis.
Special Precautions	Patients with history of cerebral injury or seizures. Patients with thrombocytopenia and those who develop thrombocytopenia after 1st dose. For patients with active tuberculosis, tuberculosis treatment should be started before using the vaccine. Vaccination may be deferred in patients with moderate or severe acute illness. Pregnancy should be avoided for 28 days after vaccination. Lactation.
Adverse Drug Reactions	Inj-site reactions such as pain and induration. Fever, rash, measles-like rash.
Drug Interactions	Immune globulins may reduce the efficacy of vaccines. May reduce the diagnostic effect of tuberculin tests. Potentially Fatal: Concurrent use with immunosuppressants may increase the adverse effects of vaccines; may also

	reduce the diagnostic effect of tuberculin tests. Potentially Fatal: Concurrent use with immunosuppressants may increase the adverse effects of vaccines; may also reduce the efficacy of vaccines.
Storage	Parenteral: Powder: Store at 2-8°C. Freezing does not affect potency. Diluent: May store in refrigerator or at room temperature; do not freeze. Reconstituted solution: Store at 2-8°C; protect from light; discard if not used within 8 hr.
Mechanism of Action	Vaccine, MMR contains live attenuated measles, mumps and rubella viruses. It is used in the active immunisation against these diseases.
CIMS Class	Vaccines, Antisera & Immunologicals

vaccine, poliomyelitis

CIMS Class : (Vaccines, Antisera & Immunologicals)
vaccine, poliomyelitis

related vaccine, poliomyelitis information

Indication & Dosage	<i>Intramuscular</i> Active immunisation against poliomyelitis Adult: As a combination product with diphtheria, tetanus, pertussis (acellular component) and H. influenzae vaccine: 3 doses at intervals of 4 wk. Booster doses are not necessary except for those at special risk such as travellers to endemic area or healthcare workers in possible contact with the virus. Child: 3 doses at intervals of 4 wk starting at 2 mth of age. 2 booster doses are recommended; one before school entry and the other before school leaving.
Administration	May be taken with or without food. (Administer directly or mix w/ syrup, milk, bread or a sugar lump.)
Contraindications	Previous anaphylactic reactions to a dose of the vaccine.
Special Precautions	May contain traces of neomycin, streptomycin and polymyxin B. Increased risk of vaccine-associated paralytic poliomyelitis in immunocompromised patients.
Adverse Drug Reactions	Pain and tenderness at the inj site. Fever, headache and malaise.

	Pain and tenderness at the inj site. Fever, headache and malaise. Potentially Fatal: Anaphylaxis.
Drug Interactions	Reduced immune response in patients who are taking immunosuppressants.
Mechanism of Action	Poliomyelitis vaccines are used for active immunisation against poliomyelitis.

vaccine, rabies

CIMS Class : (Vaccines, Antisera & Immunologicals)
vaccine, rabies

P - Caution when used during pregnancy

L - Caution when used during lactation

related vaccine, rabies information

Indication & Dosage	<i>Intramuscular</i> Active immunisation against rabies Adult: Pre-exposure vaccination: A primary course consists of 3 doses; 1 ml on days 0, 7 and 28 (3rd dose may be given on day 21 if needed). Booster dose: 1 ml based on antibody titers (for continuous exposure: serology should be done every 6 mth (immunise when antibody titer falls below acceptable levels); for frequent exposure: booster immunisation or serology every 2 yr; for infrequent exposure: no recommendation). Post-exposure vaccination: Clean the wound with soap and water immediately. Vaccinate as soon as possible after exposure and may be stopped if it is shown that the patient was not at risk. For persons who did not receive proper primary immunisation: 5 doses of 1 ml each should be given on days 0, 3, 7, 14 and 28 (patients should also receive rabies immunoglobulins with the 1st dose); for persons who have received primary immunisation: 2 doses of 1 ml should be given on days 0 and 3. Child: Pre-exposure vaccination: A primary course consists of 3 doses; 1 ml on days 0, 7 and 28 (3rd dose may be given on day 21

who have received primary immunisation: 2 doses of 1 ml should be given on days 0 and 3.

Child: Pre-exposure vaccination: A primary course consists of 3 doses; 1 ml on days 0, 7 and 28 (3rd dose may be given on day 21 if needed). Booster dose: 1 ml based on antibody titers (for continuous exposure: serology should be done every 6 mth (immunise when antibody titer falls below acceptable levels); for frequent exposure: booster immunisation or serology every 2 yr; for infrequent exposure: no recommendation). Post-exposure vaccination: Clean the wound with soap and water immediately. Vaccinate as soon as possible after exposure and may be stopped if it is shown that the patient was not at risk. For persons who did not receive proper primary immunisation: 5 doses of 1 ml each should be given on days 0, 3, 7, 14 and 28 (patients should also receive rabies immunoglobulins with the 1st dose); for persons who have received primary immunisation: 2 doses of 1 ml should be given on days 0 and 3.

Elderly: Pre-exposure vaccination: A primary course consists of 3 doses; 1 ml on days 0, 7 and 28 (3rd dose may be given on day 21 if needed). Booster dose: 1 ml based on antibody titers (for continuous exposure: serology should be done every 6 mth (immunise when antibody titer falls below acceptable levels); for frequent exposure: booster immunisation or serology every 2 yr; for infrequent exposure: no recommendation). Post-exposure vaccination: Clean the wound with soap and water immediately. Vaccinate as soon as possible after exposure and may be stopped if it is shown that the patient was not at risk. For persons who did not receive proper primary immunisation: 5 doses of 1 ml each should be given on days 0, 3, 7, 14 and 28 (patients should also receive rabies immunoglobulins with the 1st dose); for persons who have received primary immunisation: 2 doses of 1 ml should be given on days 0 and 3.

	who have received primary immunisation: 2 doses of 1 ml should be given on days 0 and 3. Reconstitution: Reconstitute with the provided diluent.
Special Precautions	Possibility of immune complex reaction 2-21 days after booster doses of HDCV (Human diploid cell cultures rabies vaccine); symptoms include arthralgia, arthritis, nausea, malaise, angioedema, fever and vomiting. Caution when used in patients with bleeding disorders, patients on anticoagulant treatment, severely immunocompromised patients. Not to be used in patients with confirmed diagnosis of rabies. Postexposure prophylaxis may be started regardless of the length of time from likely exposure, as long as clinical signs of rabies infection are not present. Pregnancy, lactation.
Adverse Drug Reactions	Headache, dizziness, malaise, abdominal pain, nausea, myalgia. Inj-site reactions such as itching, swelling, pain.
Drug Interactions	Concurrent use with immunosuppressants may reduce the efficacy of vaccines.
Storage	Intramuscular: Before reconstitution: Store at 2-8°C. Do not freeze, protect from light. After reconstitution, use immediately.
Mechanism of Action	Rabies vaccine is an inactivated virus vaccine that is used for active immunisation against rabies. It can be used for pre- and post-exposure immunisation. For post-exposure immunisation, it is often used in conjunction with rabies immunoglobulins as it takes about 7-10 days for the specific antibodies to develop. Onset: IM: Rabies antibody: Approx 7-10 days. Duration: =1 yr. Absorption: Peak effect: Approx 30-60 days.

Parenteral

Postexposure prophylaxis of tetanus

	IM/SC of tetanus toxoid adsorbed via deep inj. 0.5 ml every 10 yr. <i>Parenteral</i> Postexposure prophylaxis of tetanus Adult: Emergency booster dose of 0.5 ml tetanus toxoid (IM/SC) or tetanus toxoid adsorbed (Deep IM Inj) to be given: if previously received <3 doses of a tetanus toxoid-containing preparation. Emergency dose is also needed if the wound is clean and minor and >10 yr have lapsed since primary immunisation or last booster dose of tetanus toxoid-containing preparation. For all other wounds, emergency dose is needed if >5 yr have lapsed since primary immunisation or the last booster dose of tetanus toxoid-containing preparation.
Special Precautions	Do not administer IV. Use subcutaneous route in bleeding disorders. Withhold vaccination in moderate or severe febrile illness. Pregnancy, lactation, history of Guillian-Barre syndrome.
Adverse Drug Reactions	Mild inj site reactions eg transient swelling, rash, fever, malaise, tiredness, nausea, vomiting, arthralgias, pruritus, dizziness. Potentially Fatal: Anaphylactic reactions.
Drug Interactions	Decreased immunologic response with concurrent immunosuppressants. Neutralisation of tetanus immune globulin and tetanus toxoid adsorbed if not given at different sites using different syringes.
Storage	Parenteral: Store at 2–8°C. Do not freeze.
Mechanism of Action	Tetanus toxoid and tetanus toxoid adsorbed induces active immunity to the tetanus antigen by stimulating the immune system to produce specific antitoxin. They are not indicated for the treatment of active tetanus infection.
CIMS Class	Vaccines, Antisera & Immunologicals
ATC Classification	J07AM01 - tetanus toxoid; Belongs to the class of tetanus bacterial vaccines. Used in vaccination.

vaccine, typhoid

CIMS Class : (Vaccines, Antisera & Immunologicals)
vaccine, typhoid

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related vaccine, typhoid information

related vaccine, typhoid information	
Indication & Dosage	<i>Oral</i> Active immunisation against typhoid fever caused by <i>Salmonella typhi</i> Adult: Per enteric-coated capsule contains <i>S.typhi</i>, Ty21a, not less than 2×10^9 viable cells. Primary immunisation: Take 1 capsule on alternate days (day 1, 3 and 5) for a total of 3 doses; all doses should be completed at least 1 wk before potential exposure. Booster immunisation: Repeat full course of primary immunisation every 5 yr if exposure continues. Child: ≥6 yr: Per enteric-coated capsule contains <i>S.typhi</i>, Ty21a, not less than 2×10^9 viable cells. Primary immunisation: Take 1 capsule on alternate days (day 1, 3 and 5) for a total of 3 doses; all doses should be completed at least 1 wk before potential exposure. Booster immunisation: Repeat full course of primary immunisation every 5 yr if exposure continues. Elderly: Per enteric-coated capsule contains <i>S.typhi</i>, Ty21a,

immunisation: Repeat full course of primary immunisation every 5 yr if exposure continues.

Elderly: Per enteric-coated capsule contains *S.typhi*, Ty21a, not less than 2×10^9 viable cells. Primary immunisation: Take 1 capsule on alternate days (day 1, 3 and 5) for a total of 3 doses; all doses should be completed at least 1 wk before potential exposure. Booster immunisation: Repeat full course of primary immunisation every 5 yr if exposure continues.

Intramuscular

Active immunisation against typhoid fever caused by *Salmonella typhi*

Adult: Per dose (0.5 ml) contains approx 25 mcg purified Vi capsular polysaccharide of *Salmonella typhi*(Ty2 strain).

Initial: 0.5 ml, to be given at least 2 wk before expected exposure. Booster immunisation: Repeat dose every 3 yr if exposure continues.

Child: =2 yr: Per dose (0.5 ml) contains approx 25 mcg purified Vi capsular polysaccharide of *Salmonella typhi* (Ty2 strain). Initial: 0.5 ml, to be given at least 2 wk before expected exposure. Booster immunisation: Repeat dose every 3 yr if exposure continues.

Elderly: Per dose (0.5 ml) contains approx 25 mcg purified Vi capsular polysaccharide of *Salmonella typhi*(Ty2 strain). Initial: 0.5 ml, to be given at least 2 wk before expected exposure. Booster immunisation: Repeat dose every 3 yr if exposure continues.

Administration

Should be taken on an empty stomach. (Take 1 hr before meals.)

Contraindications

Vaccination should be postponed in patients with acute febrile illness or acute GI illness. Oral vaccine: Not to be used in congenital or acquired immunodeficient state,

	Vaccination should be postponed in patients with acute febrile illness or acute GI illness. Oral vaccine: Not to be used in congenital or acquired immunodeficient state, including patients receiving immunosuppressive or antimetabolic drugs.
Special Precautions	Not for treatment of typhoid fever. Vaccination may not provide full protection thus, travellers should be advised to take all necessary precautions to avoid contact or ingestion of potentially contaminated food or water sources. IM admin: Caution when used in patients with a history of bleeding disorders, patients on anticoagulant treatment or severely immunocompromised patients. Pregnancy, lactation.
Adverse Drug Reactions	Oral: Headache, fever, rash, abdominal pain, nausea, diarrhoea, vomiting, anaphylactic reaction, demyelinating disease, myalgia, pain, urticaria, sepsis and weakness. IM: fever, malaise, headache, inj-site reactions (such as pain, swelling and tenderness), nausea, vomiting.
Drug Interactions	Concurrent use with antibiotics or immunoglobulins may reduce the efficacy of typhoid vaccine. Mefloquine may increase the efficacy of typhoid vaccine. May reduce the diagnostic effect of tuberculin tests. Potentially Fatal: Concurrent use with immunosuppressants may increase the adverse effects of live vaccines.
Food Interaction	Avoid alcohol within 2 hr of consuming the capsule.
Storage	Intramuscular: Store between 2-8°. Do not freeze. Oral: Store at 2-8°C.
Mechanism of Action	Typhoid vaccine exists in 2 forms: A capsular polysaccharide for parenteral admin and a live oral vaccine. Each dose of the capsular polysaccharide vaccine contains 25 mcg of the Vi polysaccharide antigen. The live oral typhoid vaccine contains an attenuated strain of <i>Salmonella typhi</i> , Ty21a,

	the capsular polysaccharide vaccine contains 25 mcg of the Vi polysaccharide antigen. The live oral typhoid vaccine contains an attenuated strain of <i>Salmonella typhi</i>, Ty21a, and is given as capsules containing not $<2 \times 10^9$ bacteria per dose. Onset: Immunity to <i>Salmonella typhi</i>: Oral: About a wk. Duration: Immunity: Oral: Approx 4-7 yr; Parenteral: Typhim Vi®: More than 17-21 mth, Typherix®: Approx 3 yr.
CIMS Class	Vaccines, Antisera & Immunologicals

valaciclovir

CIMS Class : (Antivirals)
valaciclovir

P - Caution when used during pregnancy

L - Caution when used during lactation

related valaciclovir information

Indication & Dosage

Oral

Herpes zoster (shingles)

Adult: 1 g tid for 7 days; commence within 72 hr of rash.

Renal impairment: Patients on haemodialysis: 1 g daily after haemodialysis.

CrCl (ml/min)	Dosage Recommendation
15-30	1 g bid.
<15	1 g daily.

Hepatic impairment: Use with caution.

Oral

Genital herpes

Adult: Initial episode: 1 g bid for up to 10 days, begin course within 72 hr of symptom onset.

CrCl (ml/min)	Dosage Recommendation
10-29	1 g once daily.
<10	500 mg once daily.

Hepatic impairment: Use with caution.

Oral

Prophylaxis of herpes simplex infections

Adult: Immunocompetent patients: 500 mg daily in 1-2

Oral

Prophylaxis of herpes simplex infections

Adult: Immunocompetent patients: 500 mg daily in 1-2 divided doses. Immunocompromised patients: 500 mg bid.

Renal impairment: Patients on haemodialysis: immunocompetent patients: 250 mg once daily after haemodialysis; immunocompromised patients: 500 mg once daily after haemodialysis

CrCl (ml/min)	Dosage Recommendation
<15	Immunocompetent patients: 250 mg once daily; immunocompromised patients: 500 mg once daily .

Hepatic impairment: Use with caution.

Oral

Herpes simplex infections of skin and mucous membranes

Adult: Initial episode: 500 mg bid for up to 10 days, start treatment as early as possible. For recurrent episodes, 500 mg bid for 5 days, begin during prodromal period or as soon as symptoms appear.

Renal impairment: Patients on haemodialysis: 500 mg daily after haemodialysis.

CrCl (ml/min)	Dosage Recommendation
<15	500 mg once daily.

Hepatic impairment: Use with caution.

Oral

Recurrent genital herpes

Adult: 500 mg bid for 3 days within 24 hr of first sign or symptom.

CrCl (ml/min)	Dosage Recommendation
≥29	500 mg once daily.

Hepatic impairment: Use with caution.

Oral

Suppression of recurrent episodes of genital herpes

Hepatic impairment: Use with caution.		
<i>Oral</i>		
Suppression of recurrent episodes of genital herpes		
Adult: Immunocompetent patients: 1 g once daily or 500 mg once daily for patients with ≥ 9 recurrences per year; HIV infected patients with CD4 cells count ≥ 100 cells/mm ³ : 500 mg bid up to 6 mth.		
CrCl (ml/min)	Dosage Recommendation	
≥ 29	500 mg once daily if normal dose is 1 g once daily or HIV infected patients; 500 mg every 48 hr if normal dose is 500 mg once daily.	
Hepatic impairment: Use with caution.		
<i>Oral</i>		
Reduction of transmission of genital herpes		
Adult: In combination with safer sex practices and abstinence when lesions are present, 500 mg once daily for infected partner with history of ≥ 9 recurrences per yr.		
CrCl (ml/min)	Dosage Recommendation	
<15	250 mg once daily.	
Hepatic impairment: Use with caution.		
<i>Oral</i>		
Prophylaxis of cytomegaloviral infections in immunocompromised patients		
Adult: 2 g 4 times daily for 90 days, started within 72 hr after transplant.		
Child: >12 yr: 2 g 4 times daily for 90 days, started within 72 hr after transplant.		
Renal impairment: Patients on haemodialysis: 1.5 g once daily after haemodialysis.		
CrCl (ml/min)	Dosage Recommendation	
50 to <75	1.5 g four times daily	
25 to <50	1.5 g tid	
10 to <25	1.5 g bid	
<10	1.5 g once daily.	
Hepatic impairment: Use with caution.		

	Hepatic impairment: Use with caution. <i>Oral</i> Herpes labialis Adult: 2 g 12 hrly for 1 day, admin at earliest symptom of cold sore (e.g. tingling, itching or burning). <table><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr><tr><td>30-49</td><td>1 g 12 hrly for 1 day.</td></tr><tr><td>10-29</td><td>500 mg 12 hrly for 1 day.</td></tr><tr><td><10</td><td>500 mg as a single dose.</td></tr></table> Hepatic impairment: Use with caution.	CrCl (ml/min)	Dosage Recommendation	30-49	1 g 12 hrly for 1 day.	10-29	500 mg 12 hrly for 1 day.	<10	500 mg as a single dose.	
CrCl (ml/min)	Dosage Recommendation									
30-49	1 g 12 hrly for 1 day.									
10-29	500 mg 12 hrly for 1 day.									
<10	500 mg as a single dose.									
Administration	May be taken with or without food. (May be taken w/ meals to reduce GI discomfort.)									
Overdosage	Symptoms: Nausea, vomiting, neurological effects (e.g. headache, confusion, hallucinations, seizures, coma), elevations of serum creatinine and subsequent renal failure. Management: Observe closely for signs of toxicity. Haemodialysis can enhance removal of aciclovir from the blood.									
Contraindications	Hypersensitivity to valaciclovir, aciclovir.									
Special Precautions	Dehydration; renal or hepatic impairment, pregnancy, lactation. Maintain adequate hydration. Monitor renal function daily especially during first 10 days post transplant.									
Adverse Drug Reactions	Headache, nausea, vomiting, diarrhoea, rash, photosensitivity, LFT abnormalities, psychiatric reactions (e.g. confusion, hallucinations and thinking disorders) especially at high doses. Potentially Fatal: Hepatitis; renal failure; blood dyscrasias; thrombotic thrombocytopenic purpura-hemolytic uremic syndrome.									
Drug Interactions	Reduced clearance with probenecid. Increased risk of renal									

Drug Interactions	Reduced clearance with probenecid. Increased risk of renal toxicity with ceftriaxone, ciclosporin and other nephrotoxic drugs. Increased risk of neutropenia with mycophenolate.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store below 30°C.
Mechanism of Action	Valaciclovir is the L-valine ester of aciclovir. A prodrug, it is rapidly converted to aciclovir by intestinal and hepatic metabolism. Aciclovir inhibits DNA synthesis and viral replication and has antiviral activity against herpes simplex virus types 1 (HSV-1) and 2 (HSV-2) and varicella-zoster virus. Absorption: Readily absorbed from GI tract. Bioavailability of aciclovir (after valaciclovir admin): 54%. Peak plasma concentrations of aciclovir: 1.5 hr. Food does not affect bioavailability. Distribution: Protein binding: 15%. Crosses placenta. Metabolism: Rapidly converted to active aciclovir by first pass intestinal or hepatic metabolism. Elimination half life of aciclovir: 3 hr. Excretion: Excreted via urine mainly as aciclovir and metabolites with <1% of valaciclovir excreted unchanged.
CIMS Class	Antivirals
ATC Classification	J05AB11 - valaciclovir; Belongs to the class of nucleosides and nucleotides excluding reverse transcriptase inhibitors. Used in the systemic treatment of viral infections.

J05AB11 - valaciclovir; Belongs to the class of nucleosides and nucleotides excluding reverse transcriptase inhibitors.
Used in the systemic treatment of viral infections.

valdecoxib

This product is no longer actively marketed.

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
valdecoxib

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related valdecoxib information

Indication & Dosage

Oral

Osteoarthritis

Adult: 10 mg once daily.

CrCl (ml/min)	Dosage Recommendation
<30	Initiate with caution.

Hepatic impairment: Child-Pugh scale 7-9: Initiate with caution. Child-Pugh scale >10: Avoid.

Oral

Rheumatoid arthritis

Adult: 10 mg once daily.

CrCl (ml/min)	Dosage Recommendation
<30	Initiate with caution.

Hepatic impairment: Child-Pugh scale 7-9: Initiate with caution. Child-Pugh scale >10: Avoid.

Oral

Dysmenorrhoea

Adult: 20 mg bid.

Hepatic impairment: Child-Pugh scale 7-9: Initiate with caution. Child-Pugh scale >10: Avoid.

	Adult: 20 mg bid. Hepatic impairment: Child-Pugh scale 7-9: Initiate with caution. Child-Pugh scale >10: Avoid.	
Administration	May be taken with or without food.	
Contraindications	Hypersensitivity to sulfonamides, NSAIDs and other COX 2 inhibitors; asthma, urticaria; severe hepatic impairment; pregnancy (third trimester); lactation. Active GI bleed or ulceration, severe CHF, inflammatory bowel disease.	
Special Precautions	Mild to moderate hepatic impairment; history of ulcer disease or GI bleeding; dehydration, hypertension, history of heart failure, left ventricular dysfunction, pre-existing oedema. Monitor Hb or haematocrit values for signs and symptoms of anaemia.	
Adverse Drug Reactions	Hypertension, back pain, myalgia, peripheral oedema, influenza-like symptoms, dizziness, headache, abdominal fullness, abdominal pain, diarrhoea, dyspepsia, flatulence, nausea, myalgia, sinusitis. Potentially Fatal: Toxic epidermal necrolysis, exfoliative dermatitis.	
Drug Interactions	Concomitant admin of aspirin may result in an increased risk of GI ulceration and complications. It decreases the antihypertensive effect of antihypertensives e.g. ACE inhibitors. It increases plasma conc of dextromethorphan. It significantly decreases lithium serum clearance and renal clearance.	
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.	
Storage	Oral: Store below 30°C.	

Storage	Oral: Store below 30°C.
Mechanism of Action	Valdecoxib acts by selectively inhibiting prostaglandin synthesis primarily by blocking cyclooxygenase (COX-2) enzyme. It was withdrawn worldwide in April 2005, following risk of serious skin reactions and cardiovascular side effects. Onset: 60 min. Absorption: Peak plasma concentrations after 2.25-3 hrs (oral). Distribution: Protein-binding: 98% Metabolism: Extensively hepatic. Excretion: Urine (as metabolites); 8-11 hrs (elimination half-life).
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AH03 - valdecoxib; Belongs to the class of non-steroidal antiinflammatory and antirheumatic products, coxibs. Used in the treatment of inflammation and rheumatism.

valethamate

CIMS Class : (Antispasmodics)
valethamate

P - Caution when used during pregnancy

related valethamate information

Indication & Dosage

Oral

Gastrointestinal tract spasm

Adult: Each tablet contains 10 mg valethamate bromide and 325 mg paracetamol. 1 tablet tid.

Oral

Postoperative pain

Adult: Each tablet contains 10 mg valethamate bromide and 325 mg paracetamol. 1 tablet tid.

Oral

Visceral spasms

Adult: Each tablet contains 10 mg valethamate bromide and 325 mg paracetamol. 1 tablet tid.

Oral

Tenesmus

Adult: Each tablet contains 10 mg valethamate bromide and 325 mg paracetamol. 1 tablet tid.

Oral

Urinary tract and bile stone colic

Adult: Each tablet contains 10 mg valethamate bromide and 325 mg paracetamol. 1 tablet tid.

	<i>Oral</i> Urinary tract and bile stone colic Adult: Each tablet contains 10 mg valethamate bromide and 325 mg paracetamol. 1 tablet tid. <i>Oral</i> Dysmenorrhoea Adult: Each tablet contains 10 mg valethamate bromide and 325 mg paracetamol. 1 tablet tid. <i>Parenteral</i> Dysmenorrhoea Adult: 8-16 mg daily, via IM or IV inj. <i>Parenteral</i> Urinary tract and bile stone colic Adult: 8-16 mg daily, via IM or IV inj. <i>Parenteral</i> Visceral spasms Adult: 8-16 mg daily, via IM or IV inj. <i>Parenteral</i> Gastrointestinal tract spasm Adult: 8-16 mg daily, via IM or IV inj.
	Contraindications Narrow angle glaucoma, benign prostatic hyperplasia, paralytic ileus, pyloric stenosis, ulcerative colitis, megacolon, tachyarrhythmia. Severe hepatic and renal impairment.
	Special Precautions May impair ability to drive or operate machinery at high doses.
	Adverse Drug Reactions Dry mouth, blurring of vision, difficulty in swallowing and talking, constipation, urinary retention, mydriasis, arrhythmias.
	Drug Interactions Increased antimuscarinic side effects with drugs with antimuscarinic properties e.g. amantadine, antihistamines, phenothiazide antipsychotics, TCAs. Antagonise GI effects of domperidone, metoclopramide. Delayed gastric emptying

	antimuscarinic properties e.g. amantadine, antihistamines, phenothiazide antipsychotics, TCAs. Antagonise GI effects of domperidone, metoclopramide. Delayed gastric emptying reduces absorption of other drugs.
Storage	Oral: Store below 25°C. Parenteral: Store below 25°C.
Mechanism of Action	A quaternary ammonium anticholinergic with peripheral actions close to those of atropine.
CIMS Class	Antispasmodics

valproic acid

CIMS Class : (Anticonvulsants) , (Antimigraine Preparations) , (Antipsychotics)
valproic acid

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related valproic acid information

Indication & Dosage

Oral

Prophylaxis of migraine

Adult: As valproate semisodium: Initially, 250 mg bid. Max: 1 g daily.

Elderly: Initiate at lower dose and increase slowly.

Renal impairment: Dose adjustments may be needed.

Hepatic impairment: Avoid.

Oral

Acute manic episodes of bipolar disorder

Adult: As valproate semisodium: Initially, 750 mg daily in divided doses, increase as fast as possible to achieve optimal response or desired range of trough plasma concentrations between 50-125 mcg/ml. Max: 60 mg/kg daily.

Elderly: Initiate at lower dose and increase slowly.

Renal impairment: Dose adjustments may be needed.

Hepatic impairment: Avoid.

Oral

Renal impairment: Dose adjustments may be needed.

Hepatic impairment: Avoid.

Oral

Complex partial seizures

Adult: As monotherapy, conversion to monotherapy or adjunctive therapy: Given as valproic acid or valproate semisodium, initially 10-15 mg/kg/day in 2-4 divided doses, increased by 5-10 mg/kg/wk. Max: 30mg/kg/day. Given as sodium valproate, 600 mg daily in 2 divided doses, increased by 200 mg every 3 days. Usual range: 1-2 g daily (20 - 30 mg/kg daily). Max: 2.5 g daily.

Child: As monotherapy, conversion to monotherapy or adjunctive therapy: Given as sodium valproate: >20kg: 400 mg/day in 2 divided doses, increased gradually until control achieved. Usual range: 20-30 mg/kg/day. Max: 35mg/kg/day. <20kg: 20mg/kg daily in 2 divided doses, increased to 40mg/kg daily in severe cases, with serum valproic acid monitoring. Monitor clinical chemistry and haematological parameters if doses >40mg/kg daily used. Given as valproic acid or valproate semisodium for =10 yr: initially, 10-15 mg/kg/day in 2-4 divided doses, increased by 5-10 mg/kg/wk. Max: 30mg/kg/day.

Elderly: Initiate at lower dose and increase slowly.

Renal impairment: Dose adjustments may be needed.

Hepatic impairment: Avoid.

Oral

Simple and complex absence seizures

Adult: As monotherapy, conversion to monotherapy or adjunctive therapy: Given as valproic acid or valproate semisodium, initially 15 mg/kg/day in 2-4 divided doses, increased by 5-10 mg/kg/wk. Max: 30 mg/kg/day.

Child: As monotherapy, conversion to monotherapy or adjunctive therapy: Given as sodium valproate: >20kg: 400 mg/day in 2 divided doses, increased gradually until control

increased by 5-10 mg/kg/wk. Max: 30 mg/kg/day.

Child: As monotherapy, conversion to monotherapy or adjunctive therapy: Given as sodium valproate: >20kg: 400 mg/day in 2 divided doses, increased gradually until control achieved. Usual range: 20-30 mg/kg/day. Max: 35mg/kg/day. <20kg: 20mg/kg daily in 2 divided doses, increased to 40mg/kg daily with serum valproic acid monitoring in severe cases. Monitor clinical chemistry and haematological parameters if > 40mg/kg daily. Given as valproic acid or valproate semisodium =10 yr: Initially 15 mg/kg/day in 2-4 divided doses, increased by 5-10 mg/kg/wk. Max: 30mg/kg/day.

Elderly: Initiate at lower dose and increase slowly.

Renal impairment: Dose adjustments may be needed.

Hepatic impairment: Avoid.

Oral

Bipolar disorder

Adult: As valpromide: 900-1800 mg daily in 2 divided doses. Usual dose: 1200 mg daily. Initiate at required dose or dosage may be increased every 2-3 days to reach optimal dose in 2 wk with simultaneous and progressive dose reduction of concurrent psychotropic drugs.

Intravenous

Simple and complex absence seizures

Adult: Given as sodium valproate: Initially 400-800 mg daily increasing by 150-300 mg every 3 days until control is achieved. Usual dose: 20-30 mg/kg/day. Daily doses to be given in 3-4 divided doses. Each dose to be given as slow IV Inj over 3-5 minutes or by infusion in 0.9% saline or 5% dextrose over 60 minutes (Max rate: 20 mg/minute). Max: 2.5 g daily.

Child: Given as sodium valproate: Initially 300mg/day increased until control is achieved. Usual range: 20-30 mg/kg/day. Max: 40 mg/kg/day with plasma valproic acid levels monitoring.

Elderly: Initiate at lower dose and increase slowly.

	until control is achieved. Usual range: 20-30 mg/kg/day. Max: 40 mg/kg/day with plasma valproic acid levels monitoring. Elderly: Initiate at lower dose and increase slowly. Renal impairment: Dose adjustments may be needed. Hepatic impairment: Avoid. <i>Intravenous</i> Complex partial seizures Adult: Given as sodium valproate: Initially 400-800 mg daily increasing by 150-300 mg every 3 days until control is achieved. Usual dose: 20-30 mg/kg/day. Daily doses to be given in 3-4 divided doses. Each dose to be given as slow IV Inj over 3-5 minutes or by infusion in 0.9% saline or 5% dextrose over 60 minutes (Max rate: 20 mg/minute). Max: 2.5 g daily. Child: Given as sodium valproate: Initially 300mg/day increased until control is achieved. Usual range: 20-30 mg/kg/day. Max: 40 mg/kg/day with plasma valproic acid levels monitoring. Elderly: Initiate at lower dose and increase slowly. Renal impairment: Dose adjustments may be needed. Hepatic impairment: Avoid.
Overdosage	Symptoms: Somnolence, heart block, deep coma, death. Management: Gastric lavage or emesis may be useful in reducing drug absorption but effectiveness depends on time since ingestion. Due to saturable protein binding, haemodialysis may be useful in removing unbound drug. Treatment is supportive and it is important to maintain adequate urinary output. Naloxone may be useful in reversing the CNS depressant effects of valproate overdose but it should be used with caution in patients with epilepsy as it may reverse the antiepileptic effects of valproate.
Contraindications	Preexisting or family history of hepatic dysfunction, active liver disease, porphyria, urea cycle disorders. Pregnancy.
Special	Increased risk of hepatotoxicity in children <2 yr, congenital

Special Precautions	Increased risk of hepatotoxicity in children <2 yr, congenital metabolic disorders, organic brain disease or severe seizure disorders. HIV or cytomegalovirus (CMV) infection; renal impairment; SLE; lactation. Monitor LFT before and during the 1st 6 mth of therapy. Monitor blood cell count (including platelet count), bleeding time and coagulation tests before the start of therapy or before surgery, and in cases of spontaneous bruising or bleeding. Watch out for signs of pancreatitis (e.g. abdominal pain, nausea, vomiting and anorexia), blood and liver toxicity and seek prompt medical advice. Decrease dose or discontinue in patients with excessive somnolence, decreased food or fluid intake. Gradual withdrawal or transition to and from another type of antiepileptic therapy. Suspect hyperammonemic encephalopathy and measure ammonia levels in patients who develop unexplained lethargy, vomiting or changes in mental status. Decrease GI side effects by taking with meals, starting with low dose or taking the enteric coated formulations.
Adverse Drug Reactions	Anorexia, nausea, vomiting, diarrhoea, increased appetite, wt gain, nystagmus, ataxia, somnolence, dizziness, fatigue, hyperammonaemia, hallucinations. Thrombocytopenia (dose related), tremours, elevations of LFT. Potentially Fatal: Fatal hepatotoxicity esp in children <2 yr, multi-organ hypersensitivity reactions, pancreatitis, blood dyscrasias.
Drug Interactions	Increased risk of hepatotoxicity and carbamazepine toxicity with a decrease in valproic acid levels with concurrent carbamazepine. Decreased valproic acid and increased ethosuximide serum levels with ethosuximide. Decreased valproic acid levels with carbapenems, rifampicin, phenytoin, phenobarbital (or primidone) and

	carbamazepine. Decreased valproic acid and increased ethosuximide serum levels with ethosuximide. Decreased valproic acid levels with carbapenems, rifampicin, phenytoin, phenobarbital (or primidone) and antineoplastic drug regimens. Increased valproic acid levels with felbamate and aspirin. Increased risk of hepatotoxicity with olanzepine. Concurrent use increased phenobarbital, nimodipine, nifedipine, lamotrigine, zidovudine, amitriptyline, nortriptyline and benzodiazepines levels. Concurrent use decreased tigabine and clozapine levels. Increased risk of absence status with clonazepam. Increased risk of hyperammonaemia with topiramate. Increased free valproic acid concentrations with highly protein bound drugs. Potentially Fatal: Increased risk of convulsions with mefloquine. Increased risk of carnitine deficiency with pivmecillinam and pivampicillin. Increased risk of toxicity with bupropion.
Food Interaction	Avoid co-admin of St John's Wort and valpromide.
Lab Interference	False positive for urinary ketones. May alter thyroid function test.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store between 15-30 °C (59-86°F). Oral: Store below 30°C (86°F) .
Mechanism of Action	Valproate is a generic term used to describe valproic acid, its salts and esters. It is available in various forms including the sodium salts (valproate semisodium and sodium valproate), the amide derivative (valpromide), or as valproic acid. Valproate is an antiepileptic which dissociates to the valproate ion in the GI tract. It has been suggested that its antiepileptic activity is related to increased brain levels of gamma-aminobutyric acid

	amide derivative (valpromide), or as valproic acid. valproate is an antiepileptic which dissociates to the valproate ion in the GI tract. It has been suggested that its antiepileptic activity is related to increased brain levels of gamma-aminobutyric acid (GABA). Absorption: The sodium salts of valproate are rapidly converted to valproic acid in the GI tract. Valproic acid is rapidly and completely absorbed from the GI tract while valpromide is absorbed slower than valproic acid. Rate, but not the extent, of absorption of valproic acid is delayed when given with or after food. Distribution: Crosses the placenta; enters breast milk. Protein-binding: Extensive, saturable and concentration dependent. Metabolism: Valpromide is rapidly and almost completely metabolised in the liver to valproic acid. Valproic acid is extensively metabolised by liver, mainly by glucuronidation. Excretion: Urine (mainly as metabolites), small amounts in faeces and expired air; 5-20 hr (elimination half-life).
CIMS Class	Anticonvulsants / Antimigraine Preparations / Antipsychotics
ATC Classification	N03AG01 - valproic acid; Belongs to the class of fatty acid derivatives antiepileptic. Used in the management of epilepsy.

valsartan

CIMS Class : (Angiotensin II Antagonists)
valsartan

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related valsartan information

Indication & Dosage

Oral

Hypertension

Adult: Initially, 80 mg once daily, increased to 160 mg once daily. Max: 320 mg daily.

Elderly: > 75 yr: Initially, 40 mg once daily.

CrCl (ml/min)	Dosage Recommendation
<20	Initiate at 40 mg once daily.

Hepatic impairment: Mild to moderate impairment: Initial dose 40 mg once daily; max: 80 mg once daily. Severe hepatic impairment, cirrhosis, or biliary obstruction: contra-indicated.

Oral

Heart failure

Adult: 40 mg bid, may be increased to 160 mg bid if tolerated.

Renal impairment: Use with caution.

Hepatic impairment: Severe hepatic impairment, cirrhosis, or biliary obstruction: contra-indicated.

Oral

	Hepatic impairment: Severe hepatic impairment, cirrhosis, or biliary obstruction: contra-indicated. <i>Oral</i> Post myocardial infarction Adult: Start as early as 12 hr after MI in stable patients, at an initial dose of 20 mg bid, increased over a few wk up to 160 mg bid if tolerated. Renal impairment: Use with caution. Hepatic impairment: Mild to moderate: max: 80 mg bid. Patients with severe hepatic impairment, cirrhosis or biliary obstruction: Avoid.	
Administration	May be taken with or without food.	
Overdosage	Symptoms: Hypotension, tachycardia or bradycardia, depressed level of consciousness, circulatory collapse and shock. Management: Treatment is mainly supportive. Haemodialysis is not likely to be useful.	
Contraindications	Hypersensitivity; severe hepatic impairment, cirrhosis or biliary obstruction; primary hyperaldosteronism. Pregnancy (2nd and 3rd trimesters) and lactation.	
Special Precautions	Volume depletion; renal artery stenosis; monitor serum potassium concentrations; severe CHF; renal impairment; mild to moderate hepatic impairment. Elderly.	
Adverse Drug Reactions	Dizziness; headache; dose-related orthostatic hypotension; rash; angioedema; hyperkalaemia; myalgia; resp tract disorders; back pain; GI disturbances; fatigue; increase in BUN and serum creatinine; abdominal pain; dry cough; LFT elevations.	
	Potentially Fatal: Blood dyscrasias (e.g. neutropenia).	
Drug Interactions	Increased risk of renal impairment and hyperkalaemia with NSAIDs and ciclosporin. Increased risk of hypotension with general anaesthetics, clozapine, dopamine agonists and	

	Increased risk of renal impairment and hyperkalaemia with NSAIDs and ciclosporin. Increased risk of hypotension with general anaesthetics, clozapine, dopamine agonists and other antihypertensives. Increased risk of lithium toxicity. Increased risk of hyperkalaemia with potassium-sparing diuretics, potassium supplements, ACE inhibitors, heparin.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store between 15-30°C (59 - 86°F).
Mechanism of Action	Valsartan, an angiotensin II receptor antagonist, produces its BP lowering effects by antagonizing angiotensin II-induced vasoconstriction, aldosterone release and renal reabsorption of sodium. Onset: 2 hr. Duration: >24 hr. Absorption: Rapidly absorbed with oral bioavailability 23%. Peak plasma concentrations: 2-4 hr. Food may decrease the rate and extent. Distribution: Protein binding: 94-97% to serum albumin. Volume of distribution after IV admin: 17 L. Metabolism: Not significantly metabolised.

	Distribution: Protein binding: 94-97% to serum albumin. Volume of distribution after IV admin: 17 L. Metabolism: Not significantly metabolised. Excretion: Excreted via bile in faeces (about 83% of dose) and urine (about 13% of dose), mainly as unchanged drug and some as metabolites (20% of dose). Terminal elimination half life: 5-9 hr.
CIMS Class	Angiotensin II Antagonists
ATC Classification	C09CA03 - valsartan; Belongs to the class of angiotensin II antagonists. Used in the treatment of cardiovascular disease.

vancomycin

CIMS Class : (Other Antibiotics)
vancomycin

P - Caution when used during pregnancy

L - Caution when used during lactation

related vancomycin information

Indication & Dosage

Oral

Antibiotic-associated colitis

Adult: 0.5-2 g daily in 3-4 divided doses for 7-10 days. Use the lower dose unless ileus is impending or in severe infections.

Child: 40 mg/kg daily, given in 3-4 divided doses for 7-10 days. Not to exceed 2 g daily.

Renal impairment: Dose adjustment may be needed.

Oral

Staphylococcal enterocolitis

Adult: 0.5-2 g daily in 3-4 divided doses for 7-10 days. Use the lower dose unless ileus is impending or in severe infections.

Child: 40 mg/kg daily, given in 3-4 divided doses for 7-10 days. Not to exceed 2 g daily.

Renal impairment: Dose adjustment may be needed.

Intravenous

Severe staphylococcal or other Gram-positive infections

Adult: 500 mg every 6 hr infused over at least 60 minutes or

Renal impairment: Dose adjustment may be needed.

Intravenous

Severe staphylococcal or other Gram-positive infections

Adult: 500 mg every 6 hr infused over at least 60 minutes or 1 g every 12 hr infused over 100 minutes.

Child: Various dosing regimens available. By IV infusion over at least 60 minutes: Neonates: <29 wk postmenstrual age: 15 mg/kg every 24 hr; 29-35 wk postmenstrual age: 15 mg/kg every 12 hr; >35 wk postmenstrual age: 15 mg/kg every 8 hr. 1 mth-18 yr: 15 mg/kg every 8 hr (max: 2 g daily), adjusted according to plasma concentrations.

Renal impairment: Various nomograms available. Initial IV dose of 15 mg/kg with subsequent dosage based on renal function and serum concentrations of the drug.

Intravenous

Osteomyelitis

Adult: 500 mg every 6 hr infused over at least 60 minutes or 1 g every 12 hr infused over 100 minutes.

Child: Various dosing regimens available. By IV infusion over at least 60 minutes: Neonates: <29 wk postmenstrual age: 15 mg/kg every 24 hr; 29-35 wk postmenstrual age: 15 mg/kg every 12 hr; >35 wk postmenstrual age: 15 mg/kg every 8 hr. 1 mth-18 yr: 15 mg/kg every 8 hr (max: 2 g daily), adjusted according to plasma concentrations.

Renal impairment: Various nomograms available. Initial IV dose of 15 mg/kg with subsequent dosage based on renal function and serum concentrations of the drug.

Intravenous

Soft tissue infections

Adult: 500 mg every 6 hr infused over at least 60 minutes or 1 g every 12 hr infused over 100 minutes.

Child: Various dosing regimens available. By IV infusion over at least 60 minutes: Neonates: <29 wk postmenstrual

1 g every 12 hr infused over 100 minutes.

Child: Various dosing regimens available. By IV infusion over at least 60 minutes: Neonates: <29 wk postmenstrual age: 15 mg/kg every 24 hr; 29-35 wk postmenstrual age: 15 mg/kg every 12 hr; >35 wk postmenstrual age: 15 mg/kg every 8 hr. 1 mth-18 yr: 15 mg/kg every 8 hr (max: 2 g daily), adjusted according to plasma concentrations.

Renal impairment: Various nomograms available. Initial IV dose of 15 mg/kg with subsequent dosage based on renal function and serum concentrations of the drug.

Intravenous

Septicaemia

Adult: 500 mg every 6 hr infused over at least 60 minutes or 1 g every 12 hr infused over 100 minutes.

Child: Various dosing regimens available. By IV infusion over at least 60 minutes: Neonates: <29 wk postmenstrual age: 15 mg/kg every 24 hr; 29-35 wk postmenstrual age: 15 mg/kg every 12 hr; >35 wk postmenstrual age: 15 mg/kg every 8 hr. 1 mth-18 yr: 15 mg/kg every 8 hr (max: 2 g daily), adjusted according to plasma concentrations.

Renal impairment: Various nomograms available. Initial IV dose of 15 mg/kg with subsequent dosage based on renal function and serum concentrations of the drug.

Intravenous

Prophylaxis of endocarditis

Adult: For patients undergoing dental, oral or upper respiratory tract surgery: 1 g 1 hr before surgery. For patients undergoing GI or genitourinary procedure: 1 g w/ 1.5 mg/kg gentamicin 1 hr before surgery. Routine prophylaxis is not recommended; recommended only for patients undergoing invasive procedures and in patients w/ underlying cardiac conditions that may put them at higher risk of adverse effects should infection occur.

recommended, recommended only for patients undergoing invasive procedures and in patients w/ underlying cardiac conditions that may put them at higher risk of adverse effects should infection occur.

Child: For patients undergoing dental, oral or upper respiratory tract surgery: 20 mg/kg 1 hr before surgery. For patients undergoing GI or genitourinary procedure: 20 mg/kg w/ 2 mg/kg gentamicin 1 hr before surgery. Routine prophylaxis is not recommended; recommended only for patients undergoing invasive procedures and in patients w/ underlying cardiac conditions that may put them at higher risk of adverse effects should infection occur.

Renal impairment: Dose adjustment may be needed.

Reconstitution: Add 10 or 20 ml of sterile water for Inj to a 500 mg or 1 g of vancomycin vial, respectively, to yield a concentration of 50 mg/ml. For intermittent IV infusion, the reconstituted solutions containing 500 mg or 1 g may be further diluted with at least 100 ml or at least 200 ml respectively and infused over a period of at least 1 hr. Suitable diluents include 5% dextrose Inj or sodium chloride 0.9%. If intermittent infusion is not feasible, continuous IV infusion may be used with the required daily dose of reconstituted vancomycin added to a sufficient volume of diluents and infused over 24 hr.

Incompatibility: Incompatible with alkaline preparations or drugs unstable at low pH. Y-site incompatibility: Albumin, amphotericin B cholesteryl sulfate complex, omeprazole, cefepime, gatifloxacin, heparin, idarubicin. Syringe incompatibility: Heparin. Admixture incompatibility: Amobarbital, chloramphenicol, pentobarbital, phenobarbital, phenytoin, chlorothiazide, dexamethasone sodium phosphate, penicillin G potassium.

	Amobarbital, chloramphenicol, pentobarbital, phenobarbital, phenytoin, chlorothiazide, dexamethasone sodium phosphate, penicillin G potassium.
Administration	May be taken with or without food.
Contraindications	Hypersensitivity to the drug; history of impaired hearing; IM administration.
Special Precautions	Renal impairment; neonates, elderly, pregnancy and lactation. Administer by slow IV only. Decrease thrombophlebitis by giving vancomycin slowly as a dilute solution (2.5-5 mg/ml) and rotate infusion sites frequently. Keep rate of infusion ≤ 10 mg/min. Serum trough vancomycin levels to be kept at 5-20 mcg/ml depending on severity of infections and sites of infection. Monitor renal function, blood counts and auditory functions regularly. Discontinue if tinnitus develops.
Adverse Drug Reactions	Ototoxicity, nephrotoxicity, eosinophilia, "red-man" syndrome (e.g. flushing, hypotension, erythema), urticaria, thrombophlebitis, hypersensitivity reactions. Potentially Fatal: Stevens-Johnson syndrome; toxic epidermal necrolysis, blood dyscrasias such as neutropenia or thrombocytopenia.
Drug Interactions	Risk of increased nephrotoxicity with concomitant aminoglycosides, cisplatin, NSAIDs, amphotericin B, polymyxin B, colistin or other nephrotoxic agents. Increased neuromuscular blockade with concomitant use of suxamethonium or vecuronium. Increased risk of ototoxicity with other aminoglycoside antibiotics, loop diuretics and ethacrynic acid. Increased risk of toxicity with methotrexate. Decreased vancomycin levels with dopamine, dobutamine. Increased risk of neutropenia with zidovudine.
Pregnancy Category (US)	

Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 15-30°C. Oral: Store at 15-30°C.
Mechanism of Action	Vancomycin, a glycopeptide antibiotic, is used in the treatment of severe staphylococcal or other gram positive infections where other drugs cannot be used due to resistance or intolerance. It prevents the transfer and addition of muramylpentapeptide building blocks that make up the peptidoglycan molecule thus inhibiting formation of peptidoglycan polymers of the bacterial cell wall. It is active against Staphylococci eg, <i>S. aureus</i>, <i>S. epidermidis</i>, <i>S. pneumoniae</i>, <i>Str. pyrogenes</i> and some strains of Group B streptococci, <i>Clostridium difficile</i>, <i>Actinomyces</i> species, <i>Bacillus anthracis</i>, <i>Corynebacterium</i> species, some lactobacilli and <i>Listeria</i> species. Vancomycin demonstrates concentration-independent or time dependent killing. Absorption: Poorly absorbed from the GI tract; may be increased if GI tract is inflamed. 60% of intraperitoneal dose

	concentration-independent or time dependent killing. Absorption: Poorly absorbed from the GI tract; may be increased if GI tract is inflamed. 60% of intraperitoneal dose absorbed through the peritoneal cavity in 6 hr. Distribution: Extracellular fluids eg, pleural, ascitic, synovial, pericardial fluids; bile (small amounts), CSF (little diffusion); crosses the placenta and enters breast milk. Protein-binding: 55%. Metabolism: Minimal or no metabolism. Excretion: Via the kidneys by glomerular filtration (80-90% as unchanged); 4-6 hr (elimination half-life), prolonged in renal impairment (7.5 days in anephric).
CIMS Class	Other Antibiotics
ATC Classification	A07AA09 - vancomycin; Belongs to the class of antibiotics. Used for the treatment of intestinal infections. J01XA01 - vancomycin; Belongs to the class of glycopeptide antibacterials. Used in the treatment of systemic infections.

varenicline

CIMS Class : (Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence)
varenicline

P - Caution when used during pregnancy

L - Caution when used during lactation

related varenicline information

Indication & Dosage

Oral

As a smoking cessation aid

Adult: 500 mcg once daily for the 1st 3 days, followed by 500 mcg bid for the next 4 days. Maintenance (wk 2-12): 1 mg bid. Initiate dose 1-2 wk prior to target quit date; may temporarily reduce dose to 500 mcg bid if adverse effects are not tolerable. Usual treatment duration: 12 wk. May continue for another 12 wk to reduce relapse in patients who have successfully quit after the initial treatment course.

Renal impairment: Haemodialysis: Max: 500 mcg once daily.

CrCl (ml/min)	Dosage Recommendation
<30	Max: 500 mcg bid.

Administration

Should be taken with food. (Take after eating & w/ a full glass of water.)

Overdosage

General supportive measures should be instituted.

Special Precautions

Monitor for signs of suicidal ideation or behaviour, or changes in behaviour. May affect performance of skilled tasks. Not recommended for use in children <18 yr. Pregnancy, lactation.

	Monitor for signs of suicidal ideation or behaviour, or changes in behaviour. May affect performance of skilled tasks. Not recommended for use in children <18 yr. Pregnancy, lactation.
Adverse Drug Reactions	Nausea, headache, dizziness, somnolence, fatigue, sleep disturbances, increased appetite and GI disturbances including vomiting, constipation and flatulence.
Drug Interactions	Cimetidine may increase the plasma levels of varenicline.
Storage	Oral: Store between 15-30°C.
Mechanism of Action	Varenicline is a partial neuronal $\alpha_4 \beta_2$ nicotinic receptor agonist. It works as a smoking cessation aid by preventing nicotine stimulation of mesolimbic dopamine system. It also stimulates dopamine activity but to a much lesser extent than nicotine does, resulting in reduced craving and withdrawal symptoms. Absorption: Well absorbed from the GI tract; plasma concentrations peak 3-4 hr after admin. Metabolism: Minimal metabolism. Excretion: About 92% of a dose is excreted unchanged in the urine. Elimination half-life: About 24 hr.
CIMS Class	Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence
ATC Classification	N07BA03 - varenicline;

varicella-zoster immunoglobulins

CIMS Class : (Vaccines, Antisera & Immunologicals)
varicella-zoster immunoglobulins

P - Caution when used during pregnancy

L - Caution when used during lactation

related varicella-zoster immunoglobulins information

Indication & Dosage	<i>Intramuscular</i> Passive immunisation against varicella infections Adult: Dosing is based on patient's weight. =10 kg: 125 units; 10.1-20 kg: 250 units; 20.1-30 kg: 375 units; 30.1-40 kg: 500 units; >40 kg: 625 units. To be given as a single deep IM inj; if the volume to be injected is >5 ml, dose should be divided and administered at different sites. May repeat dose at 3-wk intervals if patient is re-exposed or continuously exposed to varicella until the risk of exposure is no longer present. Dose should preferably be given within 48 hr after exposure but no later than 96 hr after exposure. Child: Dosing is based on patient's weight. =10 kg: 125 units; 10.1-20 kg: 250 units; 20.1-30 kg: 375 units; 30.1-40 kg: 500 units; >40 kg: 625 units. To be given as a single deep IM inj; if the volume to be injected is >5 ml, dose should be divided and administered at different sites. May repeat dose at 3-wk intervals if patient is re-exposed or continuously exposed to varicella until the risk of exposure is no longer present. Dose should preferably be given within 48 hr after

	be divided and administered at different sites. May repeat dose at 3-wk intervals if patient is re-exposed or continuously exposed to varicella until the risk of exposure is no longer present. Dose should preferably be given within 48 hr after exposure but no later than 96 hr after exposure
Contraindications	History of hypersensitivity to immune globulins. IM administration should not be used in patients with severe thrombocytopenia or coagulation disorders.
Special Precautions	Caution when used in patients with a specific IgA deficiency due to possible presence of antibodies to IgA. Risk of transmitting infectious agents thus vaccination should be considered where appropriate. Caution when used in pregnant and lactating women.
Adverse Drug Reactions	Inj site reactions e.g. local erythema, redness and pain. GI symptoms, malaise, headache, rash and respiratory symptoms. Chest pain, dyspnoea, tremor, dizziness, glossitis, buccal ulceration, facial oedema, arthralgia.
Drug Interactions	Concurrent use may interfere with the immune response to certain live vaccines.
Storage	Intramuscular: Store at 2-8°C.
Mechanism of Action	Varicella-zoster immunoglobulins are used for passive immunisation against varicella. It is recommended for use in susceptible persons who are at high risk of developing varicella-associated complications after exposure to varicella or herpes zoster (shingles).
CIMS Class	Vaccines, Antisera & Immunologicals

vasopressin

CIMS Class : (Antidiuretics) , (Haemostatics)
vasopressin

P - Caution when used during pregnancy

L - Caution when used during lactation

related vasopressin information

Indication & Dosage	<i>Parenteral</i> Cranial diabetes insipidus Adult: As argipressin: 5-20 units SC/IM every 4 hr. <i>Intravenous</i> Initial control of variceal bleeding Adult: As argipressin: 20 units in 100 ml of glucose 5% infused over 15 min.
Contraindications	Hypersensitivity. Vascular disease especially coronary artery disease; chronic nephritis (until reasonable blood-nitrogen conc attained).
Special Precautions	Heart failure; migraine; epilepsy; asthma or other conditions which might be exacerbated by fluid retention; renal impairment; hypertension or other conditions that may worsen with BP increase. Adjust fluid intake to avoid fluid overload. Lactation, pregnancy (especially 3rd trimester as it may have oxytocic effect).
Adverse Drug Reactions	Pallor, vomiting, nausea, belching, abdominal cramps, tremour, pounding headache, vertigo, fluid retention,

	Pallor, vomiting, nausea, belching, abdominal cramps, tremour, pounding headache, vertigo, fluid retention, hyponatraemia, hypersensitivity reaction, sweating, urticaria, gangrene, desire to defecate, arrhythmias, bradycardia, angina, MI and bronchoconstriction. Potentially Fatal: Anaphylaxis; cardiac arrest or shock.
Drug Interactions	Carbamazepine, chlorpropamide, clofibrate, urea, fludrocortisone and tricyclic antidepressants may potentiate the antidiuretic action of vasopressin. Demeclocycline, noradrenaline, lithium, heparin and alcohol may decrease antidiuretic action of vasopressin. Ganglionic blockers may increase sensitivity to the pressor effect of vasopressin. Increased risk of QT prolongation with dolasetron.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Store between 15-25°C (59-77°F). Parenteral: Store between 15-25°C (59-77°F).
Mechanism of Action	Vasopressin is a posterior pituitary hormone which may be synthetically prepared or extracted from animals. It exerts direct antidiuretic action on the kidneys by increasing tubular reabsorption of water. Vasopressin also acts by constricting the peripheral blood vessels and causes the smooth muscle of the intestine, gall bladder and urinary bladder to contract. Vasopressin is given parenterally or intranasally in the form of argipressin or lyspressin. Argipressin is a synthetic type of vasopressin derived from most mammals (including man but

	Vasopressin is given parenterally or intranasally in the form of argipressin or lypressin. Argipressin is a synthetic type of vasopressin derived from most mammals (including man but excluding pig) while lypressin is vasopressin from pig.
CIMS Class	Antidiuretics / Haemostatics
ATC Classification	H01BA01 - vasopressin; Belongs to the class of vasopressin and analogues. Used in posterior pituitary lobe hormone preparations.

vecuronium bromide

CIMS Class : (Muscle Relaxants)
vecuronium bromide

P - Caution when used during pregnancy

L - Caution when used during lactation

related vecuronium bromide information

Indication & Dosage	<i>Intravenous</i> Muscle relaxant in general anaesthesia, Facilitate endotracheal intubation Adult: Initially, 80-100 mcg/kg given as inj (reduced doses at 30-50 mcg/kg have been suggested after use of suxamethonium; not to exceed 100 mcg/kg in caesarean and neonatal surgery). Maintenance in prolonged procedure: 20-30 mcg/kg, adjust according to response. Alternatively, as continuous infusion: 0.8-1.4 mcg/kg/minute after initial IV dose of 40-100 mcg/kg. Child: < 5 mth: Initially, 10-20 mcg/kg, increased if necessary according to response. > 5 mth: initially, 80-100 mcg/kg given as inj; alternatively, 30-50 mcg/kg after clinical recovery from neuromuscular blockade of suxamethonium. Max in caesarean and neonatal surgery: 100 mcg/kg. Maintenance in prolonged procedure: 10-15 mcg/kg. Elderly: Dose reduction may be needed. Renal impairment: Dose adjustments may be needed. Hepatic impairment: Dose adjustments may be needed.

	in prolonged procedure: 10-15 mcg/kg. Elderly: Dose reduction may be needed. Renal impairment: Dose adjustments may be needed. Hepatic impairment: Dose adjustments may be needed. Incompatibility: Incompatible with furosemide, alkaline solution e.g. thiopental sodium.
Overdosage	Symptoms: Mainly extensions of the usual pharmacologic effects of the drug. Skeletal muscle weakness, decreased respiratory reserve, low tidal volume, or apnea. A peripheral nerve stimulator may be used to monitor recovery from blockade and to differentiate between prolonged neuromuscular blockade from other causes of diminished respiratory reserve. Management: Treatment is supportive and symptomatic. Maintain an adequate, patent airway using assisted or controlled respiration. Neuromuscular blockade may be reversed by admin of a cholinesterase inhibitor such as neostigmine, pyridostigmine or edrophonium.
Contraindications	Hypersensitivity to vecuronium or bromide.
Special Precautions	Pregnancy, lactation, elderly. Renal and hepatic impairment. Increase in onset time in conditions associated with prolonged circulation time (e.g. CV disease, oedema). Neuromuscular disease e.g. myasthenia gravis, Eaton-Lambert syndrome or after poliomyelitis. Hypothermia, burns patients. Decrease dose in obese patients, taking into account lean body-mass. Correct severe electrolyte disturbances, altered blood pH, dehydration where possible before vecuronium admin. Do not use potentially dangerous machinery or drive a car within 24 hr after full recovery from the neuromuscular blocking action of vecuronium. Do not admin vecuronium unless facilities for intubation, artificial respiration, oxygen therapy and agents for neuromuscular reversal are immediately available.

	the neuromuscular blocking action of vecuronium. Do not admin vecuronium unless facilities for intubation, artificial respiration, oxygen therapy and agents for neuromuscular reversal are immediately available.
Adverse Drug Reactions	Muscle weakness, paralysis, muscle atrophy (after long term use), hypersensitivity reactions e.g urticaria and erythema. Potentially Fatal: Anaphylaxis, respiratory failure, apnoea.
Drug Interactions	Increases neuromuscular blockade with volatile anaesthetic agents (halothane, ether, enflurane, isoflurane, methoxyflurane, propofol and cyclopropane), fentanyl, other non-depolarising muscle relaxants, prior admin of succinylcholine, tetracyclines, polymyxins, diuretics, thiamine, MAOIs, bacitracin, colistin, sodium colistimethate, acylaminopenicillins, aminoglycoside antibiotics, high dose metronidazole, protamine, β -adrenergic blocking agents, calcium antagonists e.g. verapamil, and Mg. Decreased neuromuscular blockade with anticholinesterases, prior chronic admin of corticosteroids, phenytoin, carbamazepine, noradrenaline, azathioprine, theophylline, calcium chloride.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Vecuronium bromide inhibits depolarisation by blocking acetylcholine from binding to receptors on motor endplate. Onset: 1.5-2 min. Duration: 20-30 min. Metabolism: Hepatic; yielding metabolites also possessing neuromuscular blocking activity.

	Duration: 20-30 min. Metabolism: Hepatic; yielding metabolites also possessing neuromuscular blocking activity. Excretion: Via bile (as unchanged drug and metabolites), via urine (trace amounts); 30-80 min (elimination half-life).
CIMS Class	Muscle Relaxants

venlafaxine hydrochloride

CIMS Class : (Antidepressants) , (Anxiolytics)
venlafaxine hydrochloride

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food $\square$ - Food interaction

related venlafaxine hydrochloride information

Indication & Dosage

Oral

Depression

Adult: As conventional tablets: Initially, 75 mg daily in 2 or 3 divided doses, increased to 150 mg daily after several wk if necessary, further increase may be made in increments of up to 75 mg, every 2-4 days. Max: 375 mg daily.

CrCl (ml/min)	Dosage Recommendation
10-30	Reduce dose by 50% and give once daily.
<10	No data available.

Hepatic impairment: Moderate: Reduce dose by 50% and give once daily. Severe: no data available.

Oral

Anxiety

Adult: As modified-release preparation: Initially, 75 mg once daily, adjusted in increments of up to 75 mg , at intervals of at least 4 days. Max 225 mg daily. Withdraw gradually if no response after 8 wk.

CrCl (ml/min)	Dosage Recommendation
10-30	Reduce dose by 50% and give once daily.

	at least 4 days. Max 225 mg daily. Withdraw gradually if no response after 8 wk.	
	10-30	Reduce dose by 50% and give once daily.
	<10	No data available.
	Hepatic impairment: Moderate: Reduce dose by 50%. Severe: no data available.	
	<i>Oral</i>	
	Social anxiety disorder	
	Adult: As modified-release preparation: Initially, 75 mg once daily, adjusted in increments of up to 75 mg , at intervals of at least 4 days. Max 225 mg daily. Withdraw gradually if no response after 8 wk.	
	CrCl (ml/min)	Dosage Recommendation
	10-30	Reduce dose by 50% and give once daily.
	<10	No data available.
	Hepatic impairment: Moderate: Reduce dose by 50%. Severe: no data available.	
	<i>Oral</i>	
	Panic disorder	
	Adult: 37.5 mg once daily for first 7 days, then increased to 75 mg daily; increase by up to 75 mg at intervals of at least 7 days as needed. Max: 225 mg daily.	
	CrCl (ml/min)	Dosage Recommendation
	10-30	Reduce dose by 50% and give once daily.
	<10	No data available.
	Hepatic impairment: Moderate: Reduce dose by 50% and give once daily. Severe: no data available.	
Administration	Should be taken with food.	
Overdosage	Symptoms: Sweating, dizziness, somnolence, ECG changes, cardiac arrhythmias and seizures. Management: Treatment is symptomatic and supportive. Activated charcoal may reduce absorption if > 12.5 mg/kg has been ingested and presented within 1 hr of ingestion. Dialysis, haemoperfusion, exchange perfusion and increase in urine production unlikely	

	is symptomatic and supportive treatment should be initiated. Activated charcoal may reduce absorption if > 12.5 mg/kg has been ingested and presented within 1 hr of ingestion. Dialysis, haemoperfusion, exchange perfusion and increase in urine production unlikely useful.
Contraindications	<18 yr. Lactation. Uncontrolled hypertension; high risk of serious ventricular arrhythmia.
Special Precautions	Moderate to severe renal or hepatic impairment. Conditions which may be worsened by increase in heart rate. History of MI, bleeding disorder, epilepsy, hypomania or mania. Raised Intraocular pressure or risk at angle-closure glaucoma. May impair performance of skilled tasks, driving or machinery operation. Monitor BP and serum cholesterol regularly. Monitor closely during early therapy until depression improves due to increased risk of suicide. Avoid abrupt withdrawal. Withdraw gradually over at least 1-2 wk and monitor for withdrawal symptoms e.g. fatigue, headache, nausea, vomiting, palpitations. Discontinue if seizure develops or increase in seizure frequency. Elderly, pregnancy.
Adverse Drug Reactions	Nausea, vomiting, anorexia, dry mouth, constipation, orthostatic hypotension, tremour, sweating, rash, anxiety, dizziness, fatigue, headache, syncope, insomnia, somnolence, constipation, hyponatraemia, sexual dysfunction, dyspepsia, visual disturbances, mydriasis, increased cholesterol concentrations, increased LFT. Aggressive behaviour (especially at the start and when stopping therapy). Potentially Fatal: Blood dyscrasias, Stevens-Johnson syndrome, hepatitis.
Drug Interactions	Risk of serotonin syndrome with triptans, linezolid, lithium, tramadol. Increased risk of

	Risk of serotonin syndrome with triptans, linezolid, lithium, tramadol. Increased risk of anticholinergic side effects and serotonin syndrome with TCA, SSRI. Decreased indinavir concentration with concurrent use. Increased INR with warfarin. Possible risk of serotonin syndrome with metoclopramide, and amoxicillin with clavulanate combinations. Potentially Fatal: Increased risk of serotonin syndrome with MAOI, do not use within at least 14 days of discontinuing MAOI treatment and start MAOI at least 7 days after stopping venlafaxine. Increased risk of serotonin syndrome with sibutramine.
Food Interaction	Increase risk of serotonin syndrome with St John's Wort and jujube (suanzaoren, <i>Ziziphus jujuba</i>).
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store below 30°C.
Mechanism of Action	Venlafaxine selectively inhibits the neuronal re-uptake of serotonin, norepinephrine and to a lesser extent dopamine. It has minimal affinity for muscarinic, histamine or α_1-adrenergic receptors. It appears to be as effective as standard antidepressants with a lower incidence of the anticholinergic side effects. Absorption: Readily absorbed from the GI tract; peak plasma concentrations: 2 hr (venlafaxine); 4 hr (O-desmethylvenlafaxine). Distribution: Protein-binding: 27% (venlafaxine); 30% (O-desmethylvenlafaxine). Passes into placenta and into

	(O-desmethylvenlafaxine). Distribution: Protein-binding: 27% (venlafaxine); 30% (O-desmethylvenlafaxine). Passes into placenta and into breast milk. Metabolism: Extensively hepatic; converted mainly to O-desmethylvenlafaxine by cytochrome P450 isoenzyme CYP2D6. Isoenzyme CYP3A4 also involved in metabolism to other metabolites. Excretion: Urine (as free or conjugated metabolites), faeces (2%). Mean elimination half-life: 5 hr (venlafaxine), 11 hr (O-desmethylvenlafaxine).
CIMS Class	Antidepressants / Anxiolytics

verapamil

CIMS Class : (Calcium Antagonists) , (Anti-Anginal Drugs)
verapamil

P - Caution when used during pregnancy

L - Caution when used during lactation

Food α - Food interaction

related verapamil information

Indication & Dosage

Oral

Supraventricular arrhythmias

Adult: As hydrochloride: 120-480 mg daily in 3-4 divided doses according to severity of the condition and patient's response.

Child: As hydrochloride: <2 yr: 20 mg bid/tid; ≥2 yr: 40-120 mg bid/tid, according to response.

Renal impairment: Use with caution.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose.

Oral

Angina pectoris

Adult: As hydrochloride: 120 mg tid or 80 mg tid in patients with angina or As modified-release: Up to 480 mg daily.

Renal impairment: Use with caution.

Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose.

Oral

Hypertension

Adult: As hydrochloride: 240 mg daily in 2-3 divided doses. Max: 480 mg

Child: As hydrochloride: 10 mg/kg daily in divided doses.

	Hypertension Adult: As hydrochloride: 240 mg daily in 2-3 divided doses. Max: 480 mg Child: As hydrochloride: 10 mg/kg daily in divided doses. Renal impairment: Use with caution. Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose. <i>Intravenous</i> Supraventricular arrhythmias Adult: As hydrochloride: 5-10 mg injected over 2-3 min, 10 mg may be injected 30 min after the 1st dose, if needed. Child: As hydrochloride: <1 yr: 100-200 mcg/kg over =2 min, repeated after 30 min, if needed; 1-15 yr: 100-300 mcg/kg (max: 5 mg) over =2 min, repeat 30 min, if necessary. Doses to be given under continuous ECG monitoring Elderly: As hydrochloride: 5-10 mg injected over =3 min, 10 mg may be injected 30 min after the 1st dose, if needed. Renal impairment: Use with caution. Hepatic impairment: Severe: $\frac{1}{3}$ of usual dose. Incompatibility: Incompatible with human albumin, amphotericin B, hydrocortisone, hydrochloride, co-trimoxazole, aminophylline, nafcillin sodium, sodium bicarbonate and alkaline solutions. Avoid diluting drug in ($\frac{1}{6}$)M sodium lactate inj in PVC containers.
Administration	Should be taken with food.
Overdosage	Symptoms: Hypotension, bradycardia, conduction abnormalities, metabolic acidosis, hyperglycaemia, hyperkalaemia, renal dysfunction, seizures, impaired conduction, ECG arrhythmias, changes in mental status, shock and cardiac arrest Management: Patients to be observed for at least 48 hr (especially if extended-release preparations were ingested) as verapamil may decrease gastrointestinal transit time. Treatment is symptomatic and supportive. Place the patient in Trendelenburg's position and admin IV fluids. Hypotension may be treated with calcium or vasopressor agent. Haemodialysis is unlikely to be useful. If symptoms last for an unusually long time, consider endoscopy.
Contraindications	Cardiogenic shock, severe bradycardia, severe left ventricular dysfunction

Contraindications	Cardiogenic shock, severe bradycardia, severe left ventricular dysfunction uncompensated heart failure, hypotension (systolic pressure <90 mm Hg) porphyria. Patients with atrial flutter or atrial fibrillation and an accessory tract (e.g., Wolff-Parkinson-White, Lown-Ganong-Levine syndromes). 2nd degree AV block (unless pacemaker is fitted).
Special Precautions	1st degree AV block. Hypertrophic cardiomyopathy, patients with decreased neuromuscular transmission. Bradycardia or conduction disturbances. Heart renal impairment. For IV admin, verapamil to be given slowly under continuous ECG and BP monitoring. Conventional tablets, extended-release capsules, extended-release core tablets, and controlled extended-release capsules admin without regard to food while extended-release tablets to be admin with food. Slower infusion rates (over >3 min) in elderly. Periodic monitoring of LFT (creatinine) on long-term therapy. Avoid sudden withdrawal. Infants and neonates, elderly. Pregnancy and lactation.
Adverse Drug Reactions	Bradycardia, CHF, MI, AV block, worsening heart failure, transient asystole, hypotension, pulmonary and peripheral oedema, nausea. Constipation, fatigue, hypotension, dizziness, headache, palpitation, flushing, nausea, rashes, and hyperprolactinaemia, increased LFT and arthralgia. Potentially Fatal: Heart block and cardiac failure in patients with preexisting cardiac disease. Hepatotoxicity.
Drug Interactions	Increased cardiac depressant effects with β-blockers and flecainide. Increased risk of additive bradycardia, conduction disturbances and digoxin toxicity with digoxin. Increased risk of bradycardia and hypotension with remifentanyl and sufentanil. Increased levels of both everolimus and verapamil on concurrent use. May increase levels of doxorubicin, buspirone, carbamazepine, ciclosporin, epirubicin, etoposide, quinidine, statins, sirolimus, tacrolimus, quinupristin/dalfopristin levels. May increase blood alcohol levels. Unpredictable interactions with lithium. Decrease verapamil concentrations with phenobarbital, sulfinpyrazone, rifampicin, rifabutin and rifapentine. Increase

	increase blood alcohol levels. Unpredictable interactions with lithium. Decreased verapamil concentrations with phenobarbital, sulfinpyrazone, rifampicin, rifabutin and rifapentine. Increased verapamil concentrations with protease inhibitors and cimetidine. Potentially Fatal: Increased cardiac depressant effects with amiodarone. Increased risk of QT prolongation with dofetilide, ranolazine, sotalolol. Atrial bradycardia with ivabradine. Increased risk of heart block with clonidine. Increased risk of acute hyperkalaemia and CV collapse with dantrolene.
Food Interaction	Grapefruit juice increases serum concentration of verapamil by 40%. St John's wort reduces the bioavailability of verapamil.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Verapamil inhibits entry of calcium ions into arterial smooth muscle cells and the myocytes and conducting tissue. These actions lead to reversal and prevention of coronary artery spasm, reduction in afterload through peripheral vasodilatation and reduction in ventricular rate in patients with chronic atrial or fibrillation and reduction in the occurrence of paroxysmal supraventricular tachycardia. Verapamil reduces BP, relieves angina and slows AV conduction. Onset: 5 min (IV); 1-2 hr (oral). Duration: Absorption: 90% absorbed from GI tract. Bioavailability: 20% (due to extensive first-pass metabolism). Peak plasma concentration: 1-2 hr. Distribution: Protein-binding: 90%. Crosses placenta and distributed into milk. Metabolism: Extensively metabolised in liver to >12 metabolites. Terminal half-life: 2-8 hr (after single dose); increased to 4.5-12 hr (after repeated doses). Excretion: Excreted by kidney (70% of dose) as metabolites and via bile and faeces (16%). <4% excreted unchanged.
CIMS Class	Calcium Antagonists / Anti-Anginal Drugs
ATC	C08DA01 - verapamil; Belongs to the class of selective phenylalkylamine

ATC
Classification

C08DA01 - verapamil; Belongs to the class of selective phenylalkylamine derivative calcium-channel blockers with direct cardiac effects. Used in the treatment of cardiovascular diseases.

vinblastine

CIMS Class : (Cytotoxic Chemotherapy)
vinblastine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related vinblastine information

Indication & Dosage

Intravenous

Lymphocytic lymphoma, Histiocytic lymphoma, Kaposi's sarcoma, Letterer-Siwe disease, Testicular cancer, Hodgkin's disease, Mycosis fungoides

Adult: Initially, 3.7 mg/m^2 , increase dose wkly based on WBC counts in increments of about 1.8 mg/m^2 until leukocyte count decreases to about $3000/\text{mm}^3$, or max wkly dose of 18.5 mg/m^2 reached. Do not increase dose if leukocyte count is reduced to approximately 3000 cells/mm^3 ; administer the max dose that does not cause leucopenia for maintenance. Do not increase subsequent doses if onolytic activity occurs before leucopenic effect. Usual dose: $5.5\text{-}7.4 \text{ mg/m}^2$ per wk. Do not admin next dose, even though 7 days have lapsed unless the leukocyte count has returned to at least $4000/\text{mm}^3$.

Child: Initial 2.5 mg/m^2 of BSA, increased dose at wkly intervals in increments of about 1.25 mg/m^2 until leukocyte count decreases to about $3000/\text{mm}^3$, or max wkly dose of 12.5 mg/m^2 reached. Do not increase dose once leukocyte

	intervals in increments of about 1.25 mg/m² until leukocyte count decreases to about 3000/ mm³, or max wkly dose of 12.5 mg/m² reached. Do not increase dose once leukocyte count reaches approximately 3000 cells/mm³, instead, a dose of 1 increment smaller to be admin at wkly intervals for maintenance i.e. patient receives the max dose that does not cause leucopenia. If onolytic activity is encountered before leucopenic effect, then there is no need to increase subsequent doses. Do not admin next dose, even though 7 days have lapsed unless the leukocyte count has returned to at least 4000/mm³. Duration of maintenance therapy depends on disease state and the antineoplastic agent combination. Hepatic impairment: Serum bilirubin >3 mg/100ml: Reduce dose by 50%. Incompatibility: Incompatible with furosemide.
Overdosage	Symptoms: Severe bone marrow suppression and extensions of its usual side effects. Management: Treatment is supportive. Restrict fluid and use of loop diuretics to counteract the effects of syndrome of inappropriate secretion of antidiuretic hormone. Monitor the patient's CV system and daily blood counts for transfusion requirement.
Contraindications	Severe bone marrow suppression; presence of bacterial infection; maglignant cell infiltration of bone marrow; Inj into extremity with poor circulation; porphyria; granulocytopenia. Elderly with cachexia or extreme skin ulcerations. Pregnancy; lactation. Intrathecal use may result in death.
Special Precautions	Hepatic impairment; neurotoxicity; ischemic heart disease; preexisting pulmonary dysfunction; extravasation may cause tissue damage and pain. Discontinue immediately if extravasation occurs, with local Inj of hyaluronidase and local

	Hepatic impairment; neurotoxicity; ischemic heart disease; preexisting pulmonary dysfunction; extravasation may cause tissue damage and pain. Discontinue immediately if extravasation occurs, with local Inj of hyaluronidase and local heat application to decrease discomfort and risk of cellulitis; remaining Inj to be injected into another vein. Routine prophylaxis against constipation recommended especially in high doses. Nadir in leukocyte count occur 4-10 days after vinblastine admin; recovery observed 7-14 days after treatment.
Adverse Drug Reactions	Alopecia, constipation, malaise, stomatitis, dose-limiting bone marrow suppression (e.g. granulocytopenia, thrombocytopenia, anaemia), hypertension, central and peripheral neurotoxicity, 8th cranial nerve damage resulting in vestibular and auditory toxicity, ischaemic cardiac toxicity, breathlessness, bone, tumour or jaw pain. Nausea, vomiting, GI bleed, syndrome of inappropriate antidiuretic hormone. Necrosis, cellulitis if extravasation occurs.
Drug Interactions	Possible increase in vinblastine levels with aprepitant. Reduced vinblastine metabolism with miconazole. Variable interactions with phenytoin, monitor serum phenytoin levels. Reduced immune response with vaccines. Additive myelotoxicity with zidovudine. Concurrent admin of vinblastine with CYP3A inhibitors may cause an earlier onset and/or an increased severity of side effects. Potentially Fatal: Increased toxicity of vinblastine with erythromycin. Increased neurotoxicity and myelotoxicity with azole antifungals e.g. itraconazole and posaconazole. Increased risk of severe neutropenia with ritonavir. Increased risk of acute pulmonary toxicity with mitomycin. Increased toxicity when ganciclovir is given with, immediately before or after vinblastine.

	risk of acute pulmonary toxicity with mitomycin. Increased toxicity when ganciclovir is given with, immediately before or after vinblastine.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 2-8°C.
Mechanism of Action	Vinblastine is M phase specific. It binds to microtubular proteins and arrests mitosis at the metaphase by disrupting mitotic spindle formation. It blocks glutamic acid utilization, thus inhibiting purine synthesis, the citric acid cycle, and the formation of urea. It may also interfere with nucleic acid and protein synthesis. Absorption: Not absorbed reliably from GI tract. Distribution: Protein binding: Extensive. Concentrated in blood platelets. Does not cross blood-brain barrier significantly. Metabolism: Metabolised by CYP3A, to active metabolite desacetylvinblastine. Excretion: Excreted in urine and via bile into faeces (some as unchanged drug). Terminal half life: 25 hr.
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01CA01 - vinblastine; Belongs to the class of plant alkaloids and other natural products, vinca alkaloids and analogues. Used in the treatment of cancer.

vincristine sulfate

CIMS Class : (Cytotoxic Chemotherapy)
vincristine sulfate

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related vincristine sulfate information

Indication & Dosage	<i>Intravenous</i> Acute lymphoblastic leukaemia, Brain tumours, Wilm's tumour, Neuroblastoma, Small cell lung cancer, Acute myeloid leukaemia, Non-Hodgkin's lymphoma, Hodgkin's disease, AIDS-related Kaposi's sarcoma Adult: Usual recommended dosage: 1.4-1.5 mg/m² once wkly. Max: 2 mg wkly. Subsequent doses may be modified based on clinical and haematological responses and tolerance of the patient. May be used in combination with other drugs. Prescribers should consult published protocols for the dosage, method and sequence of admin. Child: Usual recommended dosage: 1.5-2 mg/m² once wkly; for patients $\geq$10 kg: Initiate at 0.05 mg/kg once wkly. Subsequent doses may be modified based on clinical and haematological responses and tolerance of the patient. May be used in combination with other drugs. Prescribers should consult published protocols for the dosage, method and sequence of admin. Hepatic impairment: Dose adjustment may be needed. Serum

	combination with other drugs. Prescribers should consult published protocols for the dosage, method and sequence of admin. Hepatic impairment: Dose adjustment may be needed. Serum bilirubin >3 mg/100ml: Reduce dose by 50%. Incompatibility: Any solution that may change pH of the solution beyond 3.5-5.5.
Overdosage	Symptoms: mainly extensions of its common adverse effects. Management: Treatment is supportive and includes prevention of side effects from syndrome of inappropriate antidiuretic hormone secretion (SIADH) (e.g. fluid restriction and admin of loop diuretic); admin of anticonvulsants and use of enemas (to prevent ileus). Closely monitor the CV system and determine the blood counts daily to guide transfusion requirements. Folinic acid 100 mg admin IV every 3 hr for 24 hr and then every 6 hr for at least 48 h may be admin. Haemodialysis unlikely to be useful.
Contraindications	Patients with demyelinating form of Charcot-Marie-Tooth syndrome. Pregnancy and lactation. Intrathecal admin (may be fatal). Patients receiving radiation therapy through ports which include liver.
Special Precautions	Elderly. Preexisting pulmonary dysfunction or neuromuscular disease; leucopenia or a complicating infection; impaired liver function; obstructive jaundice. Routine prophylactic laxative needed to ensure regular bowel movement. Discontinue immediately if extravasation occurs, and inj any remaining drug into another vein, followed by local Inj of hyaluronidase and topical heat application to the affected area to aid in drug removal and reduce discomfort. Discontinue in patients who develop progressive dyspnea. CBC to be checked before each dose admin. Frequent monitoring of uric acid during first 3-4 wk of treatment and watch out for uric acid nephropathy.

	progressive dyspnea. CBC to be checked before each dose admin. Frequent monitoring of uric acid during first 3-4 wk of treatment and watch out for uric acid nephropathy.
Adverse Drug Reactions	Dose limiting neurotoxicity (e.g. motor function impairment, gait abnormalities), hyperuricaemia, bronchospasm, azospermia, amenorrhoea, alopecia, leucopenia, urinary dysfunction, abdominal cramps, vomiting, diarrhoea, severe constipation, paralytic ileus, convulsions, hypertension, orthostatic hypotension, ptosis, hoarseness, optic neuropathies, hallucinations, blindness, neurological deafness, difficulty in walking, syndrome of inappropriate ADH secretion. Potentially Fatal: Myelosuppression.
Drug Interactions	Decreased digoxin (tablets) and verapamil absorption with antineoplastic regimens. Increased etoposide serum levels with vincristine. Increased toxicity when ganciclovir given with, immediately before or after vincristine. Reduced vincristine metabolism with miconazole. Increased neurotoxicity with isoniazid, itraconazole, voriconazole, posaconazole and nifedipine. Decreased immune response when used concurrently with vaccines. Increased myelotoxicity with zidovudine. Increased risk of thromboembolic complications with tamoxifen. Increased risk of ototoxicity with ototoxic drugs (e.g. platinum-containing antineoplastic agents). Possible risk of earlier onset and/or increased severity of adverse effects with macrolides. Possible increase in vincristine levels with aprepitant. Possible decrease in antiepileptic levels with vincristine, monitor serum antiepileptic levels and effectiveness of chemotherapy. Potentially Fatal: Increased risk of bronchospasm with mitomycin C. Reduced vincristine clearance and increased toxicity with asparaginase, minimise toxicity by giving vincristine 12-24 hr before L-asparaginase admin.
Pregnancy Category (US)	

Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 2-8°C. Protect from light.
Mechanism of Action	Vincristine arrests cell division at the metaphase stage by inhibiting microtubule formation in the mitotic spindle. Absorption: Poorly absorbed from the GI tract. Distribution: Does not cross the blood-brain barrier in significant amounts. Protein-binding: Extensive. Metabolism: Metabolised in liver. Excretion: Excreted mainly via bile into faeces (as unchanged drug and metabolites, 70-80%), urine; 85 hrs (elimination half-life).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01CA02 - vincristine; Belongs to the class of plant alkaloids and other natural products, vinca alkaloids and analogues. Used in the treatment of cancer.

vinorelbine tartrate

CIMS Class : (Cytotoxic Chemotherapy)
vinorelbine tartrate

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related vinorelbine tartrate information

Indication & Dosage	<i>Oral</i> Non-small cell lung cancer Adult: 60 mg/m² once wkly for 3 wk, may increase subsequently to 80 mg/m² once wkly. If neutrophil count is < 500 cells/mm³ or between 500-1000 cells/mm³ on 2 separate occasions, keep dose at 60 mg/m² for next 3 doses. Hepatic impairment: Massive liver metastases(>75% of liver volume replaced by the tumour): Decrease dose by ¹/₃. Bilirubin 2.1-3 mg/100 ml: Reduce IV dose by 50%. Bilirubin >3 mg/100 ml: Reduce IV dose by 75%. <i>Intravenous</i> Non-small cell lung cancer Adult: As single agent: 30 mg/m² wkly as infusion over 20-30 minutes (after diluting in 125 ml normal saline or glucose 5%) or as slow bolus over 5-10 minutes (after diluting in 20-50 ml normal saline or glucose 5%). Delay subsequent doses if neutrophil count is <2000 cells/mm³ until recovery. As combination therapy with

	glucose 5%) or as slow bolus over 5-10 minutes (after diluting in 20-50 ml normal saline or glucose 5%). Delay subsequent doses if neutrophil count is <2000 cells/mm³ until recovery. As combination therapy with cisplatin: 25-30 mg/m² every 7 days. Hepatic impairment: Massive liver metastases(>75% of liver volume replaced by the tumour): Decrease dose by $\frac{1}{3}$. Bilirubin 2.1-3 mg/100 ml: Reduce IV dose by 50%. Bilirubin >3 mg/100 ml: Reduce IV dose by 75%. <i>Intravenous</i> Cervical cancer Adult: 30 mg/m²/dose days 1 and 8 of a 21-day treatment cycle. Hepatic impairment: Dose adjustments may be needed. <i>Intravenous</i> Breast cancer Adult: 25 mg/m²/dose every 7 days. Hepatic impairment: Dose adjustments may be needed. <i>Intravenous</i> Ovarian cancer Adult: 25 mg/m²/dose every 7 days. Hepatic impairment: Dose adjustments may be needed.
Contraindications	Hypersensitivity to vinorelbine or other vinca alkaloids; severe current or recent infection (within last 2 wk); neutropenia; thrombocytopenia; severe hepatic impairment. Intrathecal admin. Do not give concomitantly with radiotherapy if liver is in treatment field. Pregnancy, lactation.
Special Precautions	Hepatic impairment. Compromised bone marrow reserve due to prior irradiation or chemotherapy; recovering marrow function from the effects of previous chemotherapy. Prior radiation therapy; past history or pre-existing neuropathy. CBC with differentials to be monitored prior to admin of subsequent doses. Delay subsequent doses, if neutrophil

	function from the effects of previous chemotherapy. Prior radiation therapy; past history or pre-existing neuropathy. CBC with differentials to be monitored prior to admin of subsequent doses. Delay subsequent doses, if neutrophil count < 2000 cells/mm³. Each admin to be followed by at least 250 ml of normal saline to flush the vein. Avoid extravasation. If extravasation occurs, stop infusion immediately, and flush the vein with normal saline solution; admin the remaining solution in another vein. Do not father a child during and up to six mth after treatment and females of childbearing potential to use effective method of contraception during treatment and three mth thereafter. When admin orally, capsules must be swallowed whole with water and not chewed or sucked.
Adverse Drug Reactions	Neurotoxicity, peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, severe constipation, diarrhoea, alopecia, severe local irritation. Dose limiting granulocytopenia, leukopenia and anaemia. Intestinal obstruction, paralytic ileus, nausea, vomitinh, increased in LFT, chest pain, fatigue. Local pain and thrombophlebitis with repeated Inj.
Drug Interactions	Increased risk of granulocytopenia with cisplatin. Increased risk of neurotoxicity with paclitaxel, itraconazole,ketoconazole. Increased radiosensitising effects with prior or concomitant radiation therapy. Increased pulmonary toxicity with mitomycin. Increased myelotoxicity with zidovudine. Earlier onset and/or an increased severity of side effects with CYP3A inhibitors. Possible increase in vincristine levels with aprepitant. Possible infection with live vaccines.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal

	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 2-8°C. Protect from light. Oral: Store at 2-8°C.
Mechanism of Action	Vinorelbine, a semisynthetic vinblastine derivative, binds to tubulin and inhibits microtubule formation. This disrupts the formation of the mitotic spindle thereby arresting the cell at metaphase. Absorption: Rapidly absorbed. Oral bioavailability: 40%. Peak plasma concentration: 1.5-3 hr (oral). Distribution: Widely distributed. Binding: 13.5% (plasma protein), 78% (platelets), 4.8% (lymphocytes). Metabolism: Metabolised in liver by cytochrome P450 3A4 to active metabolite. Excretion: Excreted mainly in faeces via bile and urine as metabolites and unchanged drug.
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01CA04 - vinorelbine; Belongs to the class of plant alkaloids and other natural products, vinca alkaloids and analogues. Used in the treatment of cancer.

vinpocetine

CIMS Class : (Nootropics & Neurotonics)
vinpocetine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related vinpocetine information

Indication & Dosage	<i>Oral</i> Dementia, Cerebrovascular disorders Adult: 15-30 mg daily in 3 divided doses.
Administration	Should be taken with food. (Take after meals.)
Contraindications	Pregnancy; lactation.
Special Precautions	Hypertension or cardiac dysfunction.
Adverse Drug Reactions	Transient hypotension, tachycardia.
Drug Interactions	Possible decrease in anticoagulation effect with warfarin.
Mechanism of Action	Vinpocetine is derived from vincamine. It increases cerebral circulation and utilisation of oxygen and is used in a variety of cerebral disorders.
CIMS Class	Nootropics & Neurotonics
ATC Classification	N06BX18 - vinpocetine; Belongs to the class of other agents used as CNS stimulant.

vitamin e

CIMS Class : (Vitamins A, D & E)
vitamin e

related vitamin e information

Indication & Dosage

Oral

Vitamin E deficiency

Adult: 40-50 mg of d-a tocopherol daily.

Child: Neonate: 10 mg/kg once daily; 1 mth–18 yr: 2–10 mg/kg/day, up to 20 mg/kg.

Oral

Supplementation in cystic fibrosis

Adult: 100-200 mg daily of dl-a-tocopheril acetate or 67-135 mg daily of d-a-tocopherol.

Child: As a- tocopheryl acetate: 1 mth–1 yr 50 mg once daily; 1–12 yr 100 mg once daily; 12–18 yr 200 mg once daily. Dose to be adjusted as needed.

Oral

Abetalipoproteinaemia

Adult: 50-100 mg/kg daily of dl-a-tocopheril acetate or about 33-67 mg/kg daily of d-a-tocopherol.

Child: Neonate: 100 mg/kg once daily; 1 mth–18 yr: 50–100 mg/kg once daily.

Administration

Should be taken with food.

Adverse Drug

Hypertension; myopathy; thrombophlebitis; fatigue, weakness,

Adverse Drug Reactions	Hypertension; myopathy; thrombophlebitis; fatigue, weakness, nausea, headache, dizziness, blurred vision, flatulence, diarrhoea, abdominal pain. Topical: Contact dermatitis.
Drug Interactions	Colestyramine, colestipol, and orlistat may interfere with vitamin E absorption. High doses of vitamin E potentiates the anticoagulant action of warfarin. Large doses of vitamin E may impair response to iron supplementation.
Mechanism of Action	Vitamin E is a general term used to refer to a large number of natural or synthetic compounds. Tocopherols are the most common compounds, of which alpha tocopherols are the most active and widely distributed in nature. Alpha tocopherols occur naturally in the d optical isomer form and is more active than the synthetic racemic dlform. d-α-tocopheryl acetate is the acetate ester of natural source d-α-tocopherol. Other naturally occurring tocopherols e.g. beta, gamma, and delta tocopherols are not used clinically. Tocotrienols are another group of compounds with vitamin E activity. Vitamin E, a fat soluble vitamin, reacts with free radicals and protects RBCs against haemolysis and polysaturated fatty acids in membranes against free radical attack. Absorption: 20-80% (oral). Absorption depends on the presence of bile and on normal pancreatic function; decrease with increasing dose. Distribution: Enters blood via the chylomicrons in the lymph; bound to β-lipoproteins. Widely distributed to all tissues. Stored in adipose tissue. Enters breast milk but crosses the placenta poorly. Metabolism: Hepatic; converted to glucuronides of tocopheronic acid and its γ-lactone. Excretion: Excreted mainly via bile into faeces and some into

voglibose

CIMS Class : (Antidiabetic Agents)
voglibose

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related voglibose information

Indication & Dosage	<i>Oral</i> Diabetes mellitus Adult: 200-300 mcg tid. Elderly: Initiate at lower doses.
Administration	Should be taken with food. (Take just before meals.)
Contraindications	Inflammatory bowel disease; GI obstruction or patients predisposed to it; conditions which may deteriorate as a result of increased gas formation eg, hernia; severe ketosis; diabetic coma or pre-coma; severe infection; hypersensitivity; pregnancy; lactation. Not to be used as monotherapy in IDDM.
Special Precautions	History of laparotomy or ileus. Roemheld's syndrome, stenosis, severe hepatic or renal impairment. Child <18 yr; elderly. Monitor LFT. Treat hypoglycaemic episodes with glucose (not with sucrose).
Adverse Drug Reactions	Flatulence; abdominal distension; diarrhoea; pain; skin reactions; hypoglycemia; increased LFT. Potentially Fatal: Hepatotoxicity.

	Flatulence; abdominal distension; diarrhoea; pain; skin reactions; hypoglycemia; increased LFT. Potentially Fatal: Hepatotoxicity.
Drug Interactions	May enhance effects of other antidiabetics including insulin.
Storage	Oral: Store below 30°C.
Mechanism of Action	Voglibose has general properties similar to acarbose and selectively inhibits α -glucosidase in the enteric canal, delaying the digestion and absorption of carbohydrate, thereby suppressing sharp increase in post-prandial plasma glucose.
CIMS Class	Antidiabetic Agents
ATC Classification	A10BF03 - voglibose; Belongs to the class of α glucosidase inhibitors. Used in the treatment of diabetes.

CrCl (ml/min)	Dosage Recommendation
<50	Use oral voriconazole and avoid IV.

Hepatic impairment: Child-Pugh category A and B: Standard loading doses but halved the maintenance doses. Child-Pugh category C: no studies done.

Intravenous

Invasive aspergillosis

Adult: Loading dose: 6 mg/kg every 12 hr for the 1st 24 hr.

Maintenance: 4 mg/kg every 12 hr (3-4 mg/kg every 12 hr for candidaemia in non-neutropenic patients or patients intolerant of high doses). Max duration: 6 mth. Max infusion rate: 3 mg/kg/hr over 1-2 hr. May switch to oral therapy once patient is able to tolerate oral admin.

Child: 2-<12 yr: 7mg/kg every 12 hr (4mg/kg every 12 hr if intolerant of high doses).

CrCl (ml/min)	Dosage Recommendation
<50	Use oral voriconazole and avoid IV.

Hepatic impairment: Child-Pugh category A and B: Standard loading doses but halved the maintenance doses. Child-Pugh category C: no studies done.

Intravenous

Deep tissue *Candida* infections

Adult: Loading dose: 6 mg/kg every 12 hr for the 1st 24 hr.

Maintenance: 4 mg/kg every 12 hr (3-4 mg/kg every 12 hr for candidaemia in non-neutropenic patients or patients intolerant of high doses). Max duration: 6 mth. Max infusion rate: 3 mg/kg/hr over 1-2 hr. May switch to oral therapy once patient

	maintenance. 4 mg/kg every 12 hr (3-4 mg/kg every 12 hr for candidaemia in non-neutropenic patients or patients intolerant of high doses). Max duration: 6 mth. Max infusion rate: 3 mg/kg/hr over 1-2 hr. May switch to oral therapy once patient is able to tolerate oral admin. Child: 2-<12 yr: 7mg/kg every 12 hr (4mg/kg every 12 hr if intolerant of high doses).	
	CrCl (ml/min)	Dosage Recommendation
	<50	Use oral voriconazole and avoid IV.
	Hepatic impairment: Child-Pugh category A and B: Standard loading doses but halved the maintenance doses. Child-Pugh category C: no studies done.	
	Reconstitution: IV: Reconstitute the vial with 19 ml of Water For Inj in order to get a concentration of 10 mg/ml of voriconazole. The required volume is then further diluted with a suitable diluent (e.g. 5% dextrose; 0.9% sodium chloride). Incompatibility: Do not infuse into the same line or cannula concomitantly with other drug infusions and parenteral nutrition. Do not infuse blood products simultaneously. Incompatible with 4.2% sodium bicarbonate infusion.	
Administration	Susp: Should be taken on an empty stomach. (Take at least 1 hr before or 2 hr after meals.) Tab: Should be taken on an empty stomach. (Take at least 1 hr before or after meals.)	
Contraindications	Hypersensitivity. Lactation.	
Special Precautions	Monitor renal and hepatic function before and during treatment. Monitor visual function if used >28 days. Monitor pancreatic function in patients at risk of acute pancreatitis. Haematological malignancy; patients with proarrhythmic conditions; hepatic and renal impairment. Use in pregnancy not recommended, ensure effective contraception during treatment. Avoid exposure to sunlight. Correct electrolyte	

	conditions; hepatic and renal impairment. Use in pregnancy not recommended, ensure effective contraception during treatment. Avoid exposure to sunlight. Correct electrolyte abnormalities before treatment initiation. May affect ability to drive or operate machinery and do not drive at night.
Adverse Drug Reactions	Transient and reversible visual disturbances; fever; headache; abdominal pain; chills; asthenia; back pains; chest pain; face oedema; flu-like syndrome; hypotension; thrombophlebitis; phlebitis; GI disturbances (eg, nausea, vomiting, diarrhoea); jaundice; cheilitis; cholestatic jaundice; gastroenteritis; blood dyscrasias; purpura; peripheral oedema; facial oedema; hypokalaemia; hypoglycaemia; dizziness; hallucinations; confusion; depression; anxiety; tremor; agitation; paraesthesia; respiratory distress syndrome; sinusitis; rash; pruritus; photosensitivity; alopecia; exfoliative dermatitis; acute kidney failure; haematuria; infusion-related reactions. Increased LFT and serum creatinine; prolongation of QT interval. Potentially Fatal: Stevens-Johnson Syndrome, toxic epidermal necrolysis.
Drug Interactions	Increased INR with acenocoumarol and warfarin. Increased alfentanil, erlotinib, bosentan, sulphonylureas, ciclosporin, tacrolimus, benzodiazepines, and omeprazole levels. Increased risk of rhabdomyolysis with statins. Increased both delavirdine and voriconazole levels with concurrent use. Increased both HIV protease inhibitors and voriconazole levels with concurrent use. Decreased voriconazole levels and increased efavirenz levels with concurrent use. Increased risk of methadone toxicity with voriconazole. Reduced both phenytoin and voriconazole levels with concurrent use. Increased risk of neurotoxicity with vinca alkaloids. Decreased voriconazole and

	voriconazole. Reduced both phenytoin and voriconazole levels with concurrent use. Increased risk of neurotoxicity with vinca alkaloids. Decreased voriconazole and increased rifabutin levels with concurrent use. Avoid concurrent use with clopidogrel. Potentially Fatal: Increased risk of torsade de pointes with cisapride, astemizole, pimozide, quinidine and terfenadine. Reduced voriconazole levels with carbamazepine, rifampicin, ritonavir and phenobarbital. Increased risk of ergotism with ergot alkaloids. Increased sirolimus levels with voriconazole.
Food Interaction	Decreased voriconazole levels with St John's Wort.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Unreconstituted vials: Store at 15- 30°C (59-86°F); reconstituted concentrate: Store at 2-8°C for up to 24 hr (in a refrigerator). Oral: Tablets: Store at 15-30°C (59-86°F). Powder for oral suspension: Store at 2-8°C (in a refrigerator) before constitution; constituted suspension: Store at 15-30°C (do not refrigerate or freeze) for up to 14 days.
Mechanism of Action	Voriconazole is a triazole antifungal agent which inhibits cytochrome P450-dependent enzymes thereby inhibiting ergosterol synthesis in fungal cell membranes. It has a broad spectrum of activity against all Candida species (including strains resistant to fluconazole), Aspergillus spp., Scedosporium spp., and Fusarium spp. Absorption: Rapidly and completely absorbed from GI tract. Bioavailability: 96% (oral). Peak plasma concentration: 1-2 hr. Food decreases oral absorption.

	Absorption: Rapidly and completely absorbed from GI tract. Bioavailability: 96% (oral). Peak plasma concentration: 1-2 hr. Food decreases oral absorption. Distribution: Protein binding: 58%; diffuses into CSF. Metabolism: Saturable metabolism. Metabolised by P450 isoenzyme CYP2C19, CYP2C9 and CYP3A4 to inactive metabolites. Excretion: Excreted in urine (80%).
CIMS Class	Antifungals
ATC Classification	J02AC03 - voriconazole; Belongs to the class of systemic triazole derivative antimycotics. Used in the treatment of mycotic infections.

warfarin

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
warfarin

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related warfarin information

Indication & Dosage

Oral

Treatment and prophylaxis of venous thromboembolism

Adult: Initially, 5 mg daily. Rapid anti-coagulation: Initially, 10 mg daily for 2 days. Adjust subsequent doses based on PT/INR. Usual maintenance dose: 2-10 mg daily.

Elderly: Lower initial dose.

Renal impairment: Severe: Avoid.

Hepatic impairment: Severe: Avoid.

Intravenous

Treatment and prophylaxis of venous thromboembolism

Adult: Given as slow bolus Inj over 1-2 min into peripheral vein. Initially, 5 mg daily. Rapid anti-coagulation: Initially, 10 mg daily for 2 days. Adjust subsequent doses based on PT/INR. Usual maintenance dose: 2-10 mg daily.

Elderly: Lower initial dose.

Renal impairment: Severe: Avoid.

Hepatic impairment: Severe: Avoid.

	Elderly: Lower initial dose. Renal impairment: Severe: Avoid. Hepatic impairment: Severe: Avoid.
Administration	May be taken with or without food.
Overdosage	Symptoms: Haemorrhage. Management: Approach depends on severity of haemorrhage, the urgency to restore normal haemostasis, and whether the anticoagulant is to be maintained. Minor haemorrhage or INR < 5 will usually respond to dose reduction or withholding of one or more doses of the drug. In patients with INR < 9 with no appreciable bleeding, phytonadione (1-2.5 mg) may be admin after omitting the next dose of warfarin. For fast reversal of anticoagulation, phytonadione (not exceeding 5 mg orally) can be admin and a reduction in the INR should occur in 24 hr. If the INR remains high after 24 hr, additional phytonadione (1-2 mg orally) may be admin. In patients with INR >9 with no appreciable bleeding, withhold warfarin and admin a higher dose of phytonadione (5-10 mg orally), INR should be reduced in 24-48 hr. In patients with severe bleeding, withhold warfarin and admin phytonadione (10 mg by slow IV infusion every 12 hr as needed). As the effects of phytonadione may take several hr, fresh plasma or prothrombin complex concentrate may be admin concomitantly with phytonadione if the need arises. Phytonadione if given excessively, may make the patient unresponsive to warfarin therapy for several days or wk. It should therefore be avoided in patients with minor bleeding in whom the warfarin must be continued.
Contraindications	Hypersensitivity; haemorrhagic tendencies or blood dyscrasia; recent surgery; peptic ulcer; severe hypertension; bacterial endocarditis; cerebrovascular disorders; psychosis; senility; aneurysms; pericarditis; pericardial effusion;

	dyscrasia; recent surgery; peptic ulcer; severe hypertension; bacterial endocarditis; cerebrovascular disorders; psychosis; senility; aneurysms; pericarditis; pericardial effusion; eclampsia; pre-eclampsia; threatened abortion; alcoholism; severe renal and hepatic impairment; pregnancy.
Special Precautions	Heparin induced thrombocytopenia, DVT, infectious disease, disturbances of intestinal flora, surgery or trauma, indwelling catheters, hypertension, Vit C, Vit K, protein C or S deficiency. Elderly, lactation, alcoholics. Purple toes syndrome (due to cholesterol microembolisation) may occur between 3-10 wk after start of therapy. Discontinue therapy if necrosis develops. Periodic determination of PT/INR. Patient to report any signs of bleeding, symptoms of blood clot and avoid activities or sports that can cause injuries. An INR <2 generally represents insufficient anticoagulation while INR>4 represents higher risk of bleeding.
Adverse Drug Reactions	Hypersensitivity, rash, alopecia, diarrhoea, drop in haematocrit, purple toes syndrome, skin necrosis, jaundice, nausea, vomiting, hepatic dysfunction, pancreatitis, increased LFT. Potentially Fatal: Haemorrhage (narrow therapeutic index).
Food Interaction	Avoid major changes in dietary intake of Vit K (green vegetables eg broccoli, spinach). Increased anticoagulant effects with chamomile, cranberry, ginkgo biloba, alfalfa, dong quai, black cohosh, celery, capsicum, clove, omega 3 triglycerides, fenugreek, ginger. Reduced anticoagulant effect with St John's wort, Panax ginseng, coenzyme Q10, mistletoe.
Lab Interference	May cause false decrease in serum theophylline concentrations with the Schack and Waxler ultraviolet method.

	May cause false decrease in serum theophylline concentrations with the Schack and Waxler ultraviolet method.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Intravenous: Store at 15-30°C (59-80°F). Protect from light. Oral: Store at 15-30°C (59-80°F). Protect from light.
Mechanism of Action	Warfarin inhibits synthesis of vit K-dependent coagulation factors VII, IX, X and II and anticoagulant protein C and its cofactor protein S. No effects on established thrombus but further extension of the clot can be prevented. Secondary embolic phenomena are avoided. Onset: 24 hr Duration: 2-5 days. Absorption: Absorbed readily from the GI tract (oral); used as racemic isomers, S-isomers more potent. Peak plasma concentration: within first 4 hr. Distribution: Protein binding: Extensive (99%) to albumin. Crosses placenta. Metabolism: Hepatic; mainly by the cytochrome P450 isoenzyme CYP2C9, which shows genetic polymorphism. Other enzymes involved include CYP2C19, CYP2C8, CYP2C18, CYP1A2, and CYP3A4. S-isomer is metabolised more rapidly than R-isomer. Excretion: Via urine (as metabolites after reabsorption from the bile); 37 hr (elimination half-life).
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC Classification	B01AA03 - warfarin; Belongs to the class of vitamin K antagonists. Used in the treatment of thrombosis.

xantinol nicotinate

CIMS Class : (Peripheral Vasodilators & Cerebral Activators)
xantinol nicotinate

P - Contraindicated in pregnancy

related xantinol nicotinate information

Indication & Dosage	<i>Oral</i> Cerebrovascular disorders, Peripheral vascular disease Adult: 3 g daily.
Contraindications	Severe haemorrhage, pregnancy, recent MI, recent cerebrovascular accidents, severely compromised cardiac function, hypersensitivity.
Special Precautions	Mitral stenosis.
Adverse Drug Reactions	Flushing, generalised itching, rash, abdominal pain, hypoglycemia, hypotension.
Mechanism of Action	Xantinol nicotinate, a ester of theophylline and nicotinic acid acts as a peripheral vasodilator.
CIMS Class	Peripheral Vasodilators & Cerebral Activators
ATC Classification	C04AD02 - xantinol nicotinate; Belongs to the class of purine derivative agents used as peripheral vasodilators.

xipamide

CIMS Class : (Diuretics)
xipamide

P - Caution when used during pregnancy
L - Contraindicated in lactation

related xipamide information

Indication & Dosage

Oral

Oedema

Adult: Initially, 40 mg daily in the morning, reduced to 20 mg daily according to response. Max: 80 mg daily.

Renal impairment: Severe: Avoid.

Hepatic impairment: Use with caution.

Oral

Hypertension

Adult: 20 mg daily as a single dose in the morning.

Renal impairment: Severe: Avoid.

Hepatic impairment: Use with caution.

Overdosage

Symptoms: Hypotension, electrolyte and metabolic disturbances. Management: Reduce further absorption by gastric lavage or induced emesis. Treatment is supportive with BP maintenance and correction of electrolyte imbalances.

Contraindications

Hypersensitivity to sulphonamide. Untreated Addison's disease. Severe renal failure; severe electrolyte deficiency;

	Hypersensitivity to sulphonamide. Untreated Addison's disease. Severe renal failure; severe electrolyte deficiency; precomatose states associated with cirrhosis; lactation.
Special Precautions	Pregnancy; elderly. Prostatic hypertrophy; renal or hepatic impairment; hypovolaemia; DM; hyperuricaemia; severe coronary or cerebral arteriosclerosis.
Adverse Drug Reactions	GI disturbances; hypokalaemia; hyperuricaemia; nocturia, dizziness; impaired glucose metabolism.
Drug Interactions	Antihypertensives enhance BP-lowering effects of xipamide. Increased risk of hypokalaemia with amphotericinB, carbenoxolone. Potentially Fatal: Propensity to cause hypokalaemia can increase risk of digitalis toxicity.
Mechanism of Action	Xipamide is structurally related to indapamide and exerts its diuretic effect at the distal section of the nephron. Onset: 1-2 hr Duration: 12 hr Absorption: Rapid and well absorbed from GI tract. Peak plasma concentration: 1-2 hr. Distribution: Protein binding: 99%. Excretion: Excreted in urine as unchanged and glucuronide metabolite. Plasma half life: 5-8 hr.
CIMS Class	Diuretics
ATC Classification	C03BA10 - xipamide; Belongs to the class of low-ceiling sulfonamide diuretics. Used to promote excretion of urine.

xylometazoline hydrochloride

CIMS Class : (Nasal Decongestants & Other Nasal Preparations) , (Ophthalmic Decongestants, Anesthetics, Anti-inflammatories)
xylometazoline hydrochloride

P - Caution when used during pregnancy

L - Caution when used during lactation

related xylometazoline hydrochloride information

Indication & Dosage	<i>Nasal</i> Nasal congestion Adult: As 0.1% solution: Instill into each nostril bid-tid. Max duration: 7 days. Child: As 0.05% solution: 3 mth-12 yr: 1-2 drops into each nostril once or bid. Max duration: 7 days. <i>Ophthalmic</i> Conjunctival decongestant Adult: As 0.05-0.1% solution: Instil into the eye.
Contraindications	Angle closure glaucoma; dry rhinitis; post trans-sphenoidal hypophysectomy, trans-nasal, trans-oral surgery where dura mater is exposed.
Special Precautions	Young children, pregnancy and lactation. Hypertension, CV abnormalities, DM, hyperthyroidism, history of excessive reaction to sympathomimetics, difficulty in urination secondary to prostate enlargement. Rebound congestion may occur after prolonged regular use.

Adverse Drug Reactions	Headache, insomnia, tachycardia, hypertension, nervousness, nausea, dizziness, palpitation, arrhythmia. Nasal drops: Local stinging or burning, sneezing, dryness of mouth and throat, nausea. Eye drops: Dryness of eye.
Drug Interactions	Increased heart rate or BP with sibutramine. Potentially Fatal: Hypertensive crisis with MAOIs.
Storage	Nasal: Store below 30°C. Ophthalmic: Store below 30°C.
Mechanism of Action	Xylometazoline is a direct-acting sympathomimetic which has a vasoconstrictor effect by reducing swelling and congestion when applied to mucous membranes. Onset: 5-10 min. Duration: 10 hr.
CIMS Class	Nasal Decongestants & Other Nasal Preparations / Ophthalmic Decongestants, Anesthetics, Anti-inflammatories
ATC Classification	R01AA07 - xylometazoline; Belongs to the class of topical sympathomimetic agents used as nasal decongestants. R01AB06 - xylometazoline; Belongs to the class of topical sympathomimetic combination preparations, excluding corticosteroids. Used as nasal decongestants. S01GA03 - xylometazoline; Belongs to the class of sympathomimetics used as ophthalmologic decongestants.

zaleplon

CIMS Class : (Hypnotics & Sedatives)
zaleplon

P - Caution when used during pregnancy

L - Contraindicated in lactation

related zaleplon information

Indication & Dosage	<i>Oral</i> Insomnia Adult: 10 mg before bedtime. Max: 20 mg daily. Elderly: >65 yr: 5 mg before bedtime. Max: 10 mg daily. Renal impairment: Severe: No studies done. Hepatic impairment: Mild to moderate: 5 mg at bedtime. Severe: Contra-indicated. Special Populations: Patients on cimetidine should receive initial dose of 5 mg at bedtime.
Administration	May be taken with or without food. (Do not take w/ or immediately after a heavy or high fat meal.)
Overdosage	Symptoms: Drowsiness, mental confusion, lethargy, ataxia, hypotonia, hypotension, respiratory depression, coma, and very rarely death. Management: Treatment is symptomatic and supportive. Gastric lavage may be performed to reduce absorption and IV fluids admin as needed.
Contraindications	Hypersensitivity. Severe hepatic impairment. Lactation.

Contraindications	Hypersensitivity. Severe hepatic impairment. Lactation.
Special Precautions	May precipitate new psychiatric abnormalities. Depression; hepatic impairment. History of drug or alcohol dependence or abuse, elderly and debilitated patients. Childn <18 yr. Pregnancy. May impair ability to drive or operate machinery. Do not take zaleplon if there is <4 hr of sleep. Dose reduction or withdrawal of drug should be done gradually.
Adverse Drug Reactions	Headache, light headedness, asthenia, dizziness, nausea, somnolence, rash, myalgia, back pain, chest pain, taste perversion, fever, migraine, constipation, dry mouth, dyspepsia, arthralgia, anxiety, depression, difficulty concentrating, amnesia, confusion, hallucinations. Transient impairment of memory and psychomotor function. Decreased inhibition, behavioural changes (e.g. bizarre behaviour, depersonalisation), complex sleep related behaviour (e.g. sleep driving).
Drug Interactions	Additive CNS effects may occur with CNS depressants e.g. TCA, alcohol, antihistamines, narcotic analgesics, thioridazine and diphenhydramine. Cytochrome P450 CYP3A4 inducers e.g. rifampicin, phenytoin, carbamazepine and phenobarbital decrease zaleplon concentrations. Increased zaleplon concentration with cimetidine and CYP 3A4 inhibitors e.g. erythromycin, ketoconazole.
Storage	Oral: Store at 20-25°C (68-77°F).
Mechanism of Action	Zaleplon, a pyrazolopyrimidine, is a sedative and hypnotic agent structurally unrelated to the benzodiazepines and other sedative-hypnotic agents. It is shown to interact with GABA subtype A complex by binding selectively to benzodiazepine type 1 receptor. It reduces sleep latency

	other sedative-hypnotic agents. It is shown to interact with GABA subtype A complex by binding selectively to benzodiazepine type 1 receptor. It reduces sleep latency without affecting sleep duration. Absorption: Rapidly and completely absorbed. Peak plasma concentrations: 1 hr. Absorption reduced by heavy meal or high-fat diet. Bioavailability: 30%. Distribution: Distributed into breast milk. Metabolism: Undergo significant first-pass hepatic metabolism. Metabolised mainly by aldehyde oxidase and some by the cytochrome P450 isoenzyme CYP3A4. Plasma-elimination half-life: 1 hour. Excretion: Excreted mainly in urine as inactive metabolites or their glucuronides (70%); <1% excreted unchanged. 17% of a dose excreted in the faeces, mainly as metabolites.
CIMS Class	Hypnotics & Sedatives
ATC Classification	N05CF03 - zaleplon; Belongs to the class of benzodiazepine related agents used as hypnotics and sedatives.

zidovudine

CIMS Class : (Antivirals)
zidovudine

P - Caution when used during pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related zidovudine information

Indication & Dosage

Oral

HIV infection

Adult: 600 mg daily in divided doses, in combination with other antiretroviral agents.

Child: 6 wk - 12 yr: 160 mg/m² every 8 hr. Max: 200 mg every 8 hr. May be used in combination with other anti-retrovirals.

Renal impairment: Haemodialysis or peritoneal dialysis: 100 mg every 6-8 hr.

CrCl (ml/min)	Dosage Recommendation
<10	100 mg every 6-8 hr.

Hepatic impairment: Dose reduction may be needed.

Oral

Prophylaxis of maternal-foetal HIV transmission

Adult: 100 mg 5 times daily or 200 mg tid or 300 mg bid. Start treatment after 14th wk of gestation until the start of labour.

Renal impairment: Haemodialysis or peritoneal dialysis: 100

Start treatment after 14th wk of gestation until the start of labour.

Renal impairment: Haemodialysis or peritoneal dialysis: 100 mg every 6-8 hr.

CrCl (ml/min)	Dosage Recommendation
<10	100 mg every 6-8 hr.

Hepatic impairment: Dose reduction may be needed.

Oral

Prophylaxis of HIV infection in neonates

Child: Neonates: 2 mg/kg every 6 hr for 1st 6 wk of life, starting within 12 hr after birth.

Renal impairment: Dose adjustment may be needed.

Hepatic impairment: Dose adjustment may be needed.

Intravenous

HIV infection

Adult: 1-2 mg/kg every 4 hr, given as 2-4 mg/ml infusion over 1 hr.

Child: As continuous infusion: 20 mg/m²/hr. Alternatively, as intermittent infusion: 120 mg/m² every 6 hr.

Renal impairment: Haemodialysis or peritoneal dialysis: 1 mg/kg every 6-8 hr.

CrCl (ml/min)	Dosage Recommendation
<10	1 mg/kg every 6-8 hr.

Hepatic impairment: Dose reduction may be needed.

Intravenous

Prophylaxis of HIV infection in neonates

Child: Neonates: 1.5 mg/kg every 6 hr. Start treatment within 12 hr after birth and continue for 1st 6 wk of life. Dose to be given via IV infusion over 30 minutes.

Renal impairment: Dose adjustment may be needed.

Hepatic impairment: Dose adjustment may be needed.

Intravenous

Prophylaxis of maternal-foetal HIV transmission during labour and delivery

	Hepatic impairment: Dose adjustment may be needed. Intravenous Prophylaxis of maternal-foetal HIV transmission during labour and delivery Adult: Loading dose: 2 mg/kg, followed by continuous infusion of 1 mg/kg/hr until umbilical cord is clamped. If caesarean section is planned, start the IV infusion 4 hr before the operation. Renal impairment: Dose reduction may be needed. Hepatic impairment: Dose reduction may be needed. Reconstitution: Required dose to be removed from vial and added to 5% dextrose Inj solution to achieve a concentration <4 mg/ml. Incompatibility: May not be compatible with meropenem and total parenteral nutrition.	
Administration	May be taken with or without food.	
Contraindications	Lactation.	
Special Precautions	Anaemia or myelosuppression, renal and hepatic impairment, elderly, pregnancy. Monitor patients with risk factors for liver disease. Blood tests should be carried out regularly, reduce dose if neutrophil or haemoglobin count is low. Monitor serum CK concentration every 3 mth in patients who have received >6 mth of treatment. Patients to contact doctor if they experience muscle weakness, shortness of breath, symptoms of hepatitis or pancreatitis.	
Adverse Drug Reactions	Nausea, severe headache, myalgia, insomnia, vomiting, anorexia, diarrhoea, asthenia, dizziness, taste perversion, convulsions, myopathy, nail, skin and oral mucosa pigmentation, raised LFT, pancreatitis, fat redistribution. Potentially Fatal: Lactic acidosis, severe hepatomegaly with steatosis, hepatotoxicity. Blood dyscrasias, e.g. serious	

	pigmentation, raised LFT, pancreatitis, fat redistribution. Potentially Fatal: Lactic acidosis, severe hepatomegaly with steatosis, hepatotoxicity. Blood dyscrasias, e.g. serious anaemia (may require transfusion), neutropenia, leucopenia.
Drug Interactions	Decreased zidovudine concentration with tipranavir. Increased risk of peripheral neuropathy with bortezomib. Increased haematological toxicity with IV pentamidine, lamivudine, dapsone, vancomycin flucytosine, amphotericin, ganciclovir, interferon alfa, cyclophosphamide and other bone marrow suppressive or cytotoxic agents Increased risk of zidovudine toxicity with atovaquone, chloramphenicol, fluconazole, valproate. Decreased absorption with clarithromycin, minimise interactions by admin at least 2 hours apart. Increased zidovudine concentration and increased potential for hypersensitivity reactions with probenecid. Increased zidovudine clearance and haematological toxicity with rifampicin. Increased bioavailability of zidovudine with nimodipine. Increased incidences of headache with benzodiazepines. Possible increase in zidovudine concentration with methadone. Potentially Fatal: Avoid stavudine (due to inhibition of activation of stavudine), didanosine, ribavirin (antagonize effect of zidovudine), zalcitabine (inferior virological activity and a higher rate of side effects) with zidovudine. Increased risk of toxicity (e.g. hepatic decompensation, neutropenia) in patients with interferon alfa with or without ribavirin.
Lab Interference	Maternal zidovudine treatment may cause wrong results in screening tests for inborn errors of metabolism due to high urinary thymine concentrations in neonates.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 15-25°C (59-77°F). Oral: Store at 15-25°C (59-77°F).
Mechanism of Action	Zidovudine is a thymidine analogue. It is phosphorylated in the body to its active form zidovudine triphosphate which interferes in DNA synthesis of retroviruses by inhibiting DNA replication. Zidovudine inhibits the key enzyme reverse transcriptase. Human DNA polymerase is inhibited only at a conc 100 times more than that required to inhibit viral reverse transcriptase. Absorption: Rapidly absorbed from the GI tract, delayed if taken with food (oral). Peak plasma concentrations: 1 hr. Bioavailability: 60-70%. Distribution: Crosses the placenta and blood-brain barrier; enters breast milk and semen. Protein-binding: 34-38% Metabolism: Intracellular; converted to the active antiviral triphosphate. Hepatic; converted to the inactive glucuronide. Excretion: Urine (as unchanged drug and metabolites); 1 hr (elimination half-life).
CIMS Class	Antivirals
ATC Classification	J05AF01 - zidovudine; Belongs to the class of nucleoside and nucleotide reverse transcriptase inhibitors. Used in the systemic treatment of viral infections.

zinc oxide

CIMS Class : (Emollients & Skin Protectives)
zinc oxide

related zinc oxide information

Indication & Dosage	<i>Topical/Cutaneous</i> Eczema Adult: As cream/ointment: Use as required. <i>Topical/Cutaneous</i> Haemorrhoids Adult: As cream/ointment: Use as required. <i>Topical/Cutaneous</i> Nappy rash Child: To apply as often as needed with each diaper change, especially at bedtime. Incompatibility: In the presence of light, black discoloration occurs when zinc oxide and glycerol are in contact.
Drug Interactions	Zinc oxide reduce therapeutic efficacy of hydroxyquinoline.
Mechanism of Action	Zinc oxide has astringent, soothing and protective properties and is used in topical preparations for eczema, slight excoriations, wounds and haemorrhoids. It also reflects ultraviolet radiation and can be used as a physical sunscreen.
CIMS Class	Emollients & Skin Protectives

zinc sulfate

CIMS Class : (Electrolytes) , (Other Eye Preparations)
zinc sulfate

Food ⚠ - Food interaction

related zinc sulfate information

Indication & Dosage	<i>Oral</i> Zinc deficiency Adult: 50 mg of elemental zinc tid. <i>Intravenous</i> Zinc deficiency Adult: 6.5 mg elemental zinc (100 micromoles) daily. <i>Ophthalmic</i> Minor eye irritation Adult: In combination with a vasoconstrictor, 1-2 drops are instilled into the eye 2–4 times daily. Incompatibility: Mixing sodium borate, glycerin and methylcellulose with zinc sulfate may cause precipitation.
Special Precautions	Oral/IV: Monitor CBC and serum cholesterol to detect early signs of copper deficiency, especially if prolonged high dose use of zinc. Topical: Consult medical advice if relief not seen within 3 days.
Adverse Drug Reactions	Abdominal pain, dyspepsia, nausea, vomiting, diarrhoea, gastric irritation, gastritis. Prolonged use may cause copper deficiency (e.g. sideroblastic anaemia, neutropenia)

	Abdominal pain, dyspepsia, nausea, vomiting, diarrhoea, gastric irritation, gastritis. Prolonged use may cause copper deficiency (e.g. sideroblastic anaemia, neutropenia)
Drug Interactions	Reduced absorption of both zinc and oral iron supplements, penicillamine and tetracyclines when admin concomitantly. Phosphorus-containing preparations reduce zinc absorption. Zn sulfate reduces absorption of copper and flouroquinolones e.g. ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin. Reduced zinc absorption with calcium co-admin. Reduced bisphosphonates absorption with concurrent zinc admin.
Food Interaction	Absorption of Zn sulfate is reduced by milk, phytates (present in cereals, rice, corn, legumes) and some minerals (e.g. iron, calcium).
Storage	Ophthalmic: Store below 40°C.
Mechanism of Action	As an ophthalmic preparation, zinc sulfate precipitates protein and this is responsible for the astringent and weak antiseptic activity of Zn sulfate. It also produces mild vasodilation. Zinc sulfate can also be used orally or systemically as a zinc supplement. 220 mg of zinc sulfate (heptahydrate) contains 50 mg of elemental zinc. Absorption: Following oral administration, 20-30% of dietary Zn is absorbed. Distribution: Widely distributed but concentrated within the muscle, bone, skin and prostatic fluids. Excretion: Primarily via faeces at approx 90%; small amounts via urine at approx 2% and via perspiration.
CIMS Class	Electrolytes / Other Eye Preparations
ATC Classification	A12CB01 - zinc sulfate; Belongs to the class of zinc-containing preparations used as dietary supplements.

ziprasidone

CIMS Class : (Antipsychotics)
ziprasidone

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food $\nrightarrow$ - Food interaction

related ziprasidone information

Indication & Dosage

Oral

Schizophrenia

Adult: As hydrochloride: $\geq$ 18 yr: Initially 20 mg bid, increase if necessary at intervals of not < 2 days, up to 80 mg bid.

Maintenance: 20 mg bid.

Elderly: Lower initial dose with slow titration and close monitoring.

Hepatic impairment: Dose reductions may be needed.

Oral

Mania

Adult: Initially, 40 mg bid, increased to 60-80 mg bid on the 2nd day. Adjust subsequent doses according to patient's response and tolerance level.

Elderly: Lower initial dose with slow titration and close monitoring.

Hepatic impairment: Dose reductions may be needed.

Intramuscular

Acute agitation in patients with schizophrenia

	Hepatic impairment: Dose reductions may be needed. <i>Intramuscular</i> Acute agitation in patients with schizophrenia Adult: As mesilate: ≥18 yr: 10-20 mg as needed; doses of 10 mg may be repeated every 2 hr and doses of 20 mg may be repeated every 4 hr. Max: 40 mg daily for 3 consecutive days. Switch to oral therapy as soon as possible. Elderly: Lower initial dose with slow titration and close monitoring. Renal impairment: Use with caution due to cyclodextrin excipient. Hepatic impairment: Dose reductions may be needed. Reconstitution: Add 1.2 ml of sterile water to the vial to obtain a solution containing 20 mg/ml.
Administration	Should be taken with food.
Contraindications	Concomitant use of oral and IM ziprasidone. Recent acute MI, decompensated heart failure, cardiac arrhythmias, conditions that may increase QT interval eg, QT-interval prolongation or history of QT prolongation; prolactin dependent tumours. Lactation. Not for treatment of behavioural disorders in elderly with dementia.
Special Precautions	Patients predisposed to significant electrolyte disturbances, esp hypokalaemia, should have a baseline serum potassium and magnesium screening performed and corrected before treatment. CNS depression; cerebrovascular disease and significant CV illness; history of seizures; conditions that decrease seizure threshold; predisposition to hypotension; patients at risk of aspiration pneumonia; Parkinson's disease; renal impairment (IM); hepatic impairment; pregnancy. Discontinue if persistent QTc measurements >500 msec. May impair ability to drive or operate machinery. Monitor

	patients at risk of aspiration pneumonia, Parkinson's disease, renal impairment (IM); hepatic impairment; pregnancy. Discontinue if persistent QTc measurements >500 msec. May impair ability to drive or operate machinery. Monitor ECG in patients who shows symptoms of torsades de pointes (e.g. syncope, dizziness, palpitations). Monitor serum electrolytes if on concurrent diuretic therapy. Monitor glucose levels in DM or patient at risk of developing DM.
Adverse Drug Reactions	Somnolence, respiratory tract infections, akathisia, extrapyramidal syndrome, tardive dyskinesia, hyperglycaemia, dizziness, dystonia, headache, GI disturbances, asthenia, agitation, rash, urticaria, visual disturbances, prolonged QT interval, orthostatic hypotension, increased prolactin levels, weight gain, sexual dysfunction, hyperlipidaemia, seizures. Potentially Fatal: Blood dyscrasias, neuroleptic malignant syndrome.
Drug Interactions	Antagonistic effect with levodopa and dopamine antagonists. Additive hypotensive effect with antihypertensives. Additive sedative effects with other CNS agents, alcohol. Potentially Fatal: Increased risk of torsades de pointes with drugs that prolong QT interval e.g. dofetilide, quinidine, sotalol, and other Class Ia and III antiarrhythmics, moxifloxacin, pimozide, sparfloxacin, thioridazine.
Food Interaction	Grapefruit juice may increase serum concentration. Increased CNS depression with kava kava, chamomile. Possible decrease of ziprasidone concentration with St John's Wort.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or

	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intramuscular: Store at 15-30°C (59-86°F). Once reconstituted, store at 15-30°C for up to 24 hr or 2-8°C (36-46°F) for up to 7 days. Protect from light. Oral: Store at 15-30°C (59-86°F).
Mechanism of Action	Ziprasidone, an atypical antipsychotic, produces antischizophrenic effect through a combination of dopamine D₂ and serotonin 5H₂ receptor antagonism. Absorption: Well absorbed from the GI tract. Peak plasma concentrations: 6-8 hr (oral); 1 hr (IM). Bioavailability: 100% (IM). Food increases absorption. Distribution: Protein-binding: 99%. Metabolism: Extensively hepatic by aldehyde oxidase (66% of a dose) and by the cytochrome P450 isoenzyme CYP3A4. Excretion: Excreted mainly as metabolites via faeces (66%) and urine (20%); <5% as unchanged drug. Mean terminal elimination half-life: 7 hr (oral); 2-5 hr (IM).
CIMS Class	Antipsychotics
ATC Classification	N05AE04 - ziprasidone; Belongs to the class of indole derivatives antipsychotics. Used in the management of psychosis.

***ziprasidone information:**

zoledronic acid

CIMS Class : (Agents Affecting Bone Metabolism)
zoledronic acid

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related zoledronic acid information

Indication & Dosage

Intravenous

Hypercalcaemia of malignancy

Adult: 4 mg as a single dose by infusion over at least 15 minutes. Retreatment in patients who relapse or who are refractory to initial treatment: 4 mg as an infusion over at least 15 minutes, after at least 1 wk from initial dose.

Renal impairment: Serum creatinine >400 micromol/L: Avoid.

Intravenous

Bone metastases associated with solid tumours

Adult: 4 mg infusion over at least 15 minutes every 3-4 wk, in conjunction with 500 mg calcium and 400 IU vitamin D oral supplement.

CrCl (ml/min)	Dosage Recommendation
50-60	3.5 mg every 3-4 wk
40-49	3.3 mg every 3-4 wk
30-39	3 mg every 3-4 wk
<30	Not recommended.

Intravenous

Intravenous

Osteolytic lesions associated with multiple myeloma

Adult: 4 mg infusion over at least 15 minutes every 3-4 wk, in conjunction with 500 mg calcium and 400 IU vitamin D oral supplement.

CrCl (ml/min)	Dosage Recommendation
50-60	3.5 mg every 3-4 wk
40-49	3.3 mg every 3-4 wk
30-39	3 mg every 3-4 wk
<30	Not recommended.

Intravenous

Paget's disease of bone

Adult: Single 5 mg IV infusion over 15 minutes, in conjunction with 1500 mg elemental calcium daily in divided doses and 800 IU vitamin D daily, especially in the 2 wk following zoledronic acid admin.

CrCl (ml/min)	Dosage Recommendation
<40	Not recommended.

Intravenous

Osteoporosis in postmenopausal women

Adult: Single 5 mg IV infusion over at least 15 minutes, once a year.

CrCl (ml/min)	Dosage Recommendation
<40	Not recommended.

Reconstitution: Dilute the required amount in 100 ml of 0.9% sodium chloride or 5% dextrose.

Incompatibility: Incompatible with calcium containing solutions (e.g. lactated Ringer's solution) and other divalent cation containing solutions.

	0.9% sodium chloride or 5% dextrose. Incompatibility: Incompatible with calcium containing solutions (e.g. lactated Ringer's solution) and other divalent cation containing solutions.	
Contraindications	Pregnancy; lactation; children.	
Special Precautions	Cardiac disease (avoid fluid overload). Renal impairment. Monitor serum electrolytes, calcium, phosphate and magnesium. Assess renal function before each dose. Withhold treatment if there is worsening of renal function (increase of 44 micromoles/l in patients with normal baseline creatinine or increase in 88 micromoles/l in those with abnormal baseline creatinine); restart treatment at previous dose when creatinine return to within 10% of baseline. Ensure adequate hydration throughout therapy and maintain urinary output of 2 L/day. Increased risk of renal impairment with small infusion volume and rapid infusion. Increased risk of bronchoconstriction in aspirin-sensitive patients. Consider dental examination with appropriate corrective action before initiating treatment in patients at risk of osteomyelitis and osteonecrosis of the jaws (e.g. infection, anaemia, pre-existing viral disease, trauma, coagulation disorders). Hard and soft tissue oral assessment to be carried out every 3-4 mth and avoid invasive dental procedures while on treatment.	
Adverse Drug Reactions	Electrolyte disturbances (e.g. hypocalcaemia); GI disturbances; dizziness; hypersensitivity reactions; blood disorders e.g. anaemia; weight loss; dyspnoea; iritis; uveitis; conjunctivitis; influenza-like symptoms; myalgia; arthralgia; fever; rigors; renal impairment; taste disturbance; dry mouth; stomatitis; chest pain; cough; CNS effects; pruritus; rash; sweating; asthenia; peripheral oedema; hypertension; bradycardia.	

	stomatitis; chest pain; cough; CNS effects; pruritus; rash; sweating; asthenia; peripheral oedema; hypertension; bradycardia.
Drug Interactions	Increased risk of hypocalcaemia with aminoglycosides and loop diuretics. Increased risk renal dysfunction with nephrotoxic agents.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 15-30°C(59-86°F).
Mechanism of Action	Zoledronic acid, an aminobiphosphonate, is a potent inhibitor of bone resorption. It inhibits osteoclastic activity and skeletal calcium release caused by tumours. Distribution: Protein binding: Low (22-56%) Metabolism: Not metabolised. Excretion: Excreted unchanged in urine (23-55%), the rest sequestered to bone and eliminated very slowly.
CIMS Class	Agents Affecting Bone Metabolism
ATC Classification	M05BA08 - zoledronic acid; Belongs to the class of bisphosphonates. Used in the treatment of bone diseases.

zolpidem

CIMS Class : (Hypnotics & Sedatives)
zolpidem

P - Caution when used during pregnancy
L - Caution when used during lactation

related zolpidem information

Indication & Dosage	<i>Oral</i> Short-term management of insomnia Adult: As conventional release tab: 10 mg immediately before bedtime; max: 10 mg/day. As controlled release tab: 12.5 mg immediately before bedtime. Elderly: As conventional tab: Initiate with a 5-mg dose before bedtime. As controlled release tab: 6.25 mg immediately before bedtime. Hepatic impairment: As conventional tab: Initiate with 5 mg before bedtime. Severe: contra-indicated.
Administration	May be taken with or without food.
Overdosage	Symptoms: impairment of consciousness from somnolence to coma, compromised CV and respiratory function. Management: Treatment is largely symptomatic and supportive. Activated charcoal may be given if presented within one hour of ingestion of >100 mg zolpidem in adults and >5 mg in children. Gastric lavage may be considered if presented within 1 hr of ingestion of >100 mg zolpidem.

	within one hour of ingestion of >100 mg zolpidem in adults and >5 mg in children. Gastric lavage may be considered if presented within 1 hr of ingestion of >100 mg zolpidem. Flumazenil may be used if there is severe CNS depression, but generally not needed. Haemodialysis unlikely to be useful.
Contraindications	Severe hepatic insufficiency.
Special Precautions	Obstructive sleep apnoea, myasthenia gravis, compromised respiratory function, hepatic impairment. Caution in patients exhibiting symptoms of depression. Patients should be warned from doing any work involving mental alertness or motor coordination after ingestion of the drug. Pregnancy and lactation. Re-evaluate if insomnia fail to remit after 7-10 days. Max duration of treatment: 4 wk including tapering.
Adverse Drug Reactions	Amnesia, drowsiness, dizziness, diarrhoea, nausea, vomiting, abnormal thinking and behaviour, drugged feelings, back pain, ataxia, hiccups, confusion, euphoria, insomnia, vertigo, diplopia, abnormal vision. Potentially Fatal: Hepatitis, anaphylactic reactions, sleep-driving (driving while not fully awake after drug ingestion, with no recollection of the event).
Drug Interactions	Increased sedation and incoordination with TCA. Increased sedation with haloperidol and alcohol. Small increase in zolpidem concentration with ketoconazole. Reduced effect of hypnotic effects with rifampicin. Potentially Fatal: Increased risk of prolonged sedation and respiratory depression with ritonavir.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in

	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 20-25°C (68-77°F).
Mechanism of Action	Zolpidem acts by binding to the benzodiazepine (BZD) receptors of the GABA receptor complex. It has a selective affinity to BZD receptors prevalent in the cerebellum (omega-1 receptors). It has strong sedative actions but only minor anxiolytic properties. It has also less effects on skeletal muscle and seizure threshold. Zolpidem has a rapid onset but short duration of hypnotic action. Absorption: Rapidly absorbed from GI tract. Peak plasma concentration: 3 hr. Absolute bioavailability: 70%. Food reduce both the rate and extent of GI absorption. Distribution: Protein binding: 92%. Distributed into breast milk. Metabolism: Undergoes first pass metabolism, metabolised primarily by the cytochrome P450 isoenzyme CYP3A4. Elimination half life: 2.5 hr. Excretion: Excreted in urine and faeces as inactive metabolites.
CIMS Class	Hypnotics & Sedatives
ATC Classification	N05CF02 - zolpidem; Belongs to the class of benzodiazepine related agents used as hypnotics and sedatives.

zonisamide

CIMS Class : (Anticonvulsants)
zonisamide

P - Caution when used during pregnancy
L - Contraindicated in lactation

related zonisamide information

Indication & Dosage	<i>Oral</i> Partial seizures Adult: Initially, 50 mg daily in 2 divided doses, may increase to 100 mg daily after 1 wk. Thereafter, may further increase dose at wkly intervals in steps of up to 100 mg. Usual dose: 300-500 mg daily, although some patients may respond to lower doses. Renal impairment: Dose reduction and slower titration may be needed. Hepatic impairment: Mild to moderate: Slower titration may be needed. Severe: Not recommended.
Administration	May be taken with or without food.
Overdosage	Symptoms: Bradycardia, hypotension, and respiratory depression. Management: Treatment is symptomatic and supportive. Induce emesis or perform gastric lavage to reduce drug absorption. Haemodialysis unlikely to be useful.
Contraindications	Known hypersensitivity to sulfonamide. Lactation.
Special	Pregnancy. Child. Renal or hepatic impairment. Patient at

Special Precautions	Pregnancy. Child. Renal or hepatic impairment. Patient at risk of nephrolithiasis; ensure adequate hydration to prevent renal stones. Discontinue use if unexplained rash develops; otherwise, frequent observation is necessary. Withdraw gradually and reduce dosage slowly. Avoid driving and operating machinery. Monitor serum creatine phosphokinase and aldolase levels if patient develops severe muscle pain or weakness; withdraw if levels are raised. Monitor pancreatic lipase and amylase levels in patients who develop pancreatitis and withdraw zonisamide if needed. Consider drug withdrawal in patients with severe weight loss. Monitor renal function periodically.
Adverse Drug Reactions	Abdominal pain, anorexia, diarrhoea, nausea, headache, dizziness, ataxia, nystagmus, paraesthesia, confusion, difficulty concentrating, impaired memory, mental slowing, speech abnormalities, difficulty in verbal expression, agitation and/or irritability, depression, insomnia, schizophrenic behaviour, somnolence, fatigue, ecchymosis, weight loss, rash, diplopia, decreased sweating, renal stones, pancreatitis, rhabdomyolysis. Potentially Fatal: Stevens-Johnson syndrome, toxic epidermal necrolysis, blood dyscrasias.
Drug Interactions	Small decrease in zonisamide levels with phenytoin, phenobarbital, carbamazepine. Zonisamide has variable effects on carbamazepine levels. Increased zonisamide levels with lamotrigine.
Storage	Oral: Store below 30°C.
Mechanism of Action	Zonisamide is a benzisoxazole derivative anticonvulsant containing sulfonamide. It may act on voltage sensitive

	Zonisamide is a benzisoxazole derivative anticonvulsant containing sulfonamide. It may act on voltage sensitive sodium and calcium channels, thereby affecting neuronal firing and therefore reducing the spread of seizure discharges. It may modulate GABA mediated neuronal inhibition. Absorption: Absorbed from GI tract; peak plasma concentration: 2-6 hr. Bioavailability: High. Food delays time to peak concentration. Distribution: Widely distributed. Crosses placenta and distributed into breast milk. Protein binding: 40-50%; extensively bound to erythrocytes. Metabolism: Undergoes hepatic metabolism via cytochrome P450 isoenzyme CYP3A4 to metabolites. Excretion: Excreted mainly via urine as metabolites and unchanged drug (15-30%). Plasma elimination half life: 63 hr.
CIMS Class	Anticonvulsants
ATC Classification	N03AX15 - zonisamide; Belongs to the class of other antiepileptics. Used in the management of epilepsy.

zopiclone

CIMS Class : (Hypnotics & Sedatives)
zopiclone

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ∇ - Food interaction

related zopiclone information

Indication & Dosage

Oral

Short-term management of insomnia

Adult: 7.5 mg at bedtime.

Elderly: Initially, 3.75 mg at bedtime.

Renal impairment: Initiate at 3.75 mg at bedtime.

Hepatic impairment: Mild to moderate: Initially 3.75 mg at bedtime.

Severe: Contraindicated.

Administration

May be taken with or without food.

Overdosage

Symptoms: CNS depression ranging from drowsiness to coma depending on ingested amount. In mild cases, there may be drowsiness, confusion, and lethargy while in more serious cases, there may be ataxia, hypotonia, hypotension, respiratory depression and coma. Management: Treatment is symptomatic and supportive with close monitoring of the respiratory and CV functions. Gastric lavage is only of value if performed within 1 hr after ingestion. Haemodialysis is unlikely to be useful. Flumazenil may be a useful antidote in severe CNS depression.

	lavage is only of value if performed within 1 hr after ingestion. Haemodialysis is unlikely to be useful. Flumazenil may be a useful antidote in severe CNS depression.
Contraindications	Myasthenia gravis; respiratory failure; severe sleep apnoea syndrome; severe hepatic impairment; pregnancy, lactation.
Special Precautions	Hepatic and renal insufficiency; elderly; psychiatric disorders; history of drug abuse. May impair ability to drive or operate machinery. Limit treatment duration to <4 wk to minimise risk of dependence and tolerance. Avoid abrupt discontinuation of therapy.
Adverse Drug Reactions	Metallic or bitter aftertaste; irritability, confusion, depressed mood, aggressiveness, incoordination, anterograde amnesia, mild increase in LFTs, drowsiness, lightheadedness, nausea, vomiting, urticaria, rashes.
Drug Interactions	Reduced hypnotic effect with phenytoin and carbamazepine. Increased drowsiness and incoordination with TCAs. Increased CNS depressant effect with alcohol and other CNS depressants. Decreased zopiclone concentration with rifampicin. Possible increase in zopiclone concentration with CYP3A4 inhibitors e.g. erythromycin, clarithromycin, ketoconazole, itraconazole, ritonavir.
Food Interaction	Possible decrease in zopiclone levels with St John's Wort.
Storage	Oral: Store in a dry place below 30°C. Protect from light.
Mechanism of Action	Zopiclone is a cyclopyrrolone derivative with hypnotic and sedative actions, anticonvulsant and muscle relaxant properties similar to benzodiazepines. It binds to a site in the GABA-A-benzodiazepine-chloride channel macromolecular-receptor complex which is different from that of the benzodiazepine binding site. Absorption: Rapidly absorbed from the GI tract (oral). Distribution: Widely distributed. Enters breast milk. Protein-binding: 45-80%. Metabolism: Extensively hepatic; converted to less active N-oxide

	Distribution: Widely distributed. Enters breast milk. Protein-binding: 45-80%. Metabolism: Extensively hepatic; converted to less active N-oxide and inactive N-desmethylzopiclone. Undergoes decarboxylation to inactive metabolites. Excretion: Urine, faeces (as unchanged drug and metabolites), lungs and saliva; 3.5-6.5 hr (elimination half-life).
CIMS Class	Hypnotics & Sedatives
ATC Classification	N05CF01 - zopiclone; Belongs to the class of benzodiazepine related agents used as hypnotics and sedatives.

zuclopenthixol

CIMS Class : (Antipsychotics)
zuclopenthixol

related zuclopenthixol information

related zuclopenthixol information	
Indication & Dosage	<i>Oral</i> Psychoses Adult: Initially, 20-30 mg daily in divided doses. Usual maintenance dose: 20-50 mg daily. Up to 150 mg daily for severe or resistant cases. Renal impairment: Dose reduction may be needed. Hepatic impairment: Dose reduction may be needed. <i>Intramuscular</i> Psychoses Adult: As acetate: 50-150 mg via deep IM inj. May repeat, if needed, after 2-3 days. An additional dose 1-2 days after the 1st dose may be required in some patients. Not >4 inj should be given in a max course of 2 wk and total dose should not exceed 400 mg. Maintenance: May start oral zuclopenthixol HCl 2-3 days after the last acetate inj or begin IM inj of decanoate with the last inj of the acetate. Elderly: As acetate ester: Dose reduction may be needed. Max: 100 mg/dose. Renal impairment: Renal failure: Half of the normal dose. Hepatic impairment: Half of the normal recommended

Oral

Psychoses

Adult: Initially, 20-30 mg daily in divided doses. Usual maintenance dose: 20-50 mg daily. Up to 150 mg daily for severe or resistant cases.

Renal impairment: Dose reduction may be needed.

Hepatic impairment: Dose reduction may be needed.

Intramuscular

Psychoses

Adult: As acetate: 50-150 mg via deep IM inj. May repeat, if needed, after 2-3 days. An additional dose 1-2 days after the 1st dose may be required in some patients. Not >4 inj should be given in a max course of 2 wk and total dose should not exceed 400 mg. Maintenance: May start oral zuclopenthixol HCl 2-3 days after the last acetate inj or begin IM inj of decanoate with the last inj of the acetate.

Elderly: As acetate ester: Dose reduction may be needed. Max: 100 mg/dose.

Renal impairment: Renal failure: Half of the normal dose.

Hepatic impairment: Half of the normal recommended

	Max: 100 mg/dose. Renal impairment: Renal failure: Half of the normal dose. Hepatic impairment: Half of the normal recommended dose. <i>Intramuscular</i> Chronic psychosis Adult: As decanoate ester: Initially, a test dose of 100 mg by deep IM into the upper outer buttock or lateral thigh to assess tolerance, followed after at least 1 wk by 200-500 mg or more, repeated at 1-4 wkly intervals according to response. Max dose: 600 mg wkly. Inj >2 ml to be distributed between 2 inj sites. Elderly: Reduce dose to $\frac{1}{4}$ or $\frac{1}{2}$ of usual initial dose. Renal impairment: Dose reduction may be needed. Hepatic impairment: Dose reduction may be needed.
Administration	May be taken with or without food.
Overdosage	Symptoms: Somnolence, extrapyramidal symptoms, convulsions, hypotension, shock, hyper or hypothermia, ECG changes e.g. QT prolongation, torsade de pointes, cardiac arrest, ventricular arrhythmias and coma. Management: Treatment is symptomatic and supportive with close monitoring of the respiratory and CV systems. Do not use adrenaline (epinephrine) in these patients.
Contraindications	Hypersensitivity. Comatose states e.g. alcohol, barbiturate and opiate intoxications; porphyria. children.
Special Precautions	Hepatic and renal impairment, heart disease, recent acute MI, arrhythmias, significant bradycardia (<50 beats/min), severe respiratory disease, epilepsy (and conditions at risk of epilepsy, e.g. alcohol withdrawal or brain damage), Parkinson's disease, acute angle glaucoma, prostatic hypertrophy, hypothyroidism, hyperthyroidism, myasthenia gravis, pheochromocytoma. Patients at risk of stroke and

	Parkinson's disease, acute angle glaucoma, prostatic hypertrophy, hypothyroidism, hyperthyroidism, myasthenia gravis, phaeochromocytoma. Patients at risk of stroke and QT interval prolongation. Avoid abrupt withdrawal. Ability to drive a car or operate machinery may be impaired.
Adverse Drug Reactions	Drowsiness, blurred vision, tachycardia, nausea, dizziness, headache, excitement, postural hypotension, hyperprolactinaemia, sexual dysfunction, ECG changes (prolongation of QT interval and T wave changes), hyperthermia. Extrapyramidal symptoms may occur, especially during the early phase of treatment; urinary frequency or incontinence; tardive dyskinesia. Potentially Fatal: Neuroleptic malignant syndrome, blood dyscrasias.
Drug Interactions	Zuclopenthixol may enhance the sedative effects of alcohol and the effects of barbiturates and other CNS depressants. Zuclopenthixol reduces the antihypertensive effect of guanethidine. Concomitant use of metoclopramide and piperazine with zuclopenthixol increases the risk of extrapyramidal symptoms. Increased risk of severe neurotoxicity with lithium and sibutramine. Increased anticholinergic side effects with drugs with anticholinergic properties. Potentially Fatal: Antagonises effect of apomorphine, levodopa and other dopamine agonists. Increased risk of blood dyscrasias with clozapine. Increased risk of arrhythmias with drugs that prolong QT interval e.g. class Ia and III antiarrhythmics, erythromycin or cause electrolyte disturbances e.g. thiazide diuretics.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal

	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intramuscular: Store below 25°C. Protect from light. Oral: Store below 25°C. Protect from light.
Mechanism of Action	Zuclopenthixol has high affinity for D₁ and D₂ receptors and α-adrenoreceptors. It also has slight antihistamine properties and blocks serotonergic properties. Duration: 2-3 days (zuclopenthixol acetate IM). Absorption: Well absorbed from the GI tract; peak plasma concentrations: 3-6 hr. Distribution: Protein-binding: 98%. Widely distributed and crosses blood-brain barrier. Crosses the placenta and enters breast milk (small amounts). Metabolism: Hepatic via sulfoxidation, side-chain N-dealkylation, and glucuronic acid conjugation. Acetate and decanoate esters undergoes hydrolysis after IM inj to release zuclopenthixol. Excretion: Excreted in faeces as unchanged drug and N-dealkylated metabolite.
CIMS Class	Antipsychotics
ATC Classification	N05AF05 - zuclopenthixol; Belongs to the class of thioxanthene derivatives antipsychotics. Used in the management of psychosis.

16th WHO Model List of Essential Medicines, March 2010

WHO EDL 2010

The original 1977 WHO definition of "essential medicines" was that they were 'of utmost importance, basic, indispensable, and necessary for the healthcare needs of the population'. The concept was mentioned in one of the ten points of the 1978 Alma Ata Declaration on primary health care.

The difficulty of putting this into practice is reflected in the rather longer and more categorical 2002 definition:

'Essential medicines are those that satisfy the priority health care needs of the population. They are selected with due regard to public health relevance, evidence on efficacy and safety, and comparative cost-effectiveness. Essential medicines are intended to be available within the context of functioning health systems at all times in adequate amounts, in the appropriate dosage forms, with assured quality and adequate information, and at a price the individual and the community can afford. The implementation of the concept of essential medicines is intended to be flexible and adaptable to many different situations; exactly which medicines are regarded as essential remains a national responsibility.'

The WHO Model Lists of Essential Medicines has been updated every two years since 1977. The current version, the 16th list, dates from March 2009, and was updated in March 2010. The number of drugs has nearly doubled, from 186 in 1977 to 320 in 2002.

1. abacavir (ABC)
2. acetazolamide
3. acetic acid
4. acetylcysteine
5. acetylsalicylic acid
6. aciclovir
7. albendazole
8. alcuronium
9. allopurinol
10. aluminium diacetate
11. aluminium hydroxide
12. amidotrizoate

13. amikacin
14. amiloride
15. amiodarone
16. amitriptyline
17. amlodipine
18. amodiaquine
19. amoxicillin
20. amoxicillin + clavulanic acid
21. amphotericin B
22. ampicillin
23. anti-D immunoglobulin (human)
24. antitetanus immunoglobulin (human)
25. antivenom immunoglobulin
26. artemether
27. artemether + lumefantrine
28. artesunate
29. ascorbic acid
30. asparaginase
31. atazanavir
32. atenolol
33. atropine
34. azathioprine
35. azithromycin
36. barium sulfate
37. BCG vaccine
38. beclometasone
39. benzathine benzylpenicillin
40. benznidazole
41. benzoic acid + salicylic acid
42. benzoyl peroxide
43. benzyl benzoate
44. benzylpenicillin
45. betamethasone
46. biperiden
47. bleomycin
48. budesonide
49. bupivacaine
50. caffeine citrate
51. calamine lotion
52. calcium folinate
53. calcium gluconate
54. capreomycin
55. carbamazepine
56. carboplatin
57. cefalexin
58. cefazolin
59. cefixime
60. cefotaxime
61. ceftazidime

62. ceftriaxone
63. charcoal, activated
64. chlorambucil
65. chloramphenicol
66. chlorhexidine
67. chlorine base compound
68. chloroquine
69. chloroxylonol
70. chlorphenamine
71. chlorpromazine
72. cholecalciferol
73. cholera vaccine
74. ciclosporin
75. ciprofloxacin
76. clindamycin
77. clofazimine
78. clomifene
79. clomipramine
80. clotrimazole
81. cloxacillin
82. coal tar
83. codeine
84. condoms
85. copper-containing device
86. cyclophosphamide
87. cycloserine
88. cytarabine
89. dacarbazine
90. dactinomycin
91. dapsone
92. daunorubicin
93. deferoxamine
94. dexamethasone
95. dextran 70
96. diaphragms
97. diazepam
98. didanosine (ddI)
99. diethylcarbamazine
100. digoxin
101. diloxanide
102. dimercaprol
103. diphtheria antitoxin
104. diphtheria vaccine
105. dithranol
106. DL-methionine
107. dopamine
108. doxorubicin
109. doxycycline
110. efavirenz (EFV or EFZ)

111. efavirenz + emtricitabine + tenofovir
112. eflornithine
113. emtricitabine (FTC)
114. emtricitabine + tenofovir
115. enalapril
116. ephedrine
117. epinephrine (adrenaline)
118. ergocalciferol
119. ergometrine
120. erythromycin
121. estradiol cypionate + medroxyprogesterone acetate
122. ethambutol
123. ethambutol + isoniazid
124. ethambutol + isoniazid + pyrazinamide + rifampicin
125. ethambutol + isoniazid + rifampicin
126. ethanol
127. ethinylestradiol
128. ethinylestradiol + levonorgestrel
129. ethinylestradiol + norethisterone
130. ethionamide
131. ethosuximide
132. etoposide
133. factor IX complex (coagulation factors, II, VII, IX, X) concentrate
134. factor VIII concentrate
135. ferrous salt
136. ferrous salt + folic acid
137. fluconazole
138. flucytosine
139. fludrocortisone
140. fluorescein
141. fluorouracil
142. fluoxetine
143. fluphenazine
144. folic acid
145. furosemide
146. gentamicin
147. glibenclamide
148. glucose
149. glucose with sodium chloride
150. glutaral
151. glyceryl trinitrate
152. griseofulvin
153. Haemophilus influenzae type b vaccine
154. haloperidol
155. halothane
156. heparin sodium
157. hepatitis A vaccine
158. hepatitis B vaccine
159. human normal immunoglobulin

160. hydralazine
161. hydrochlorothiazide
162. hydrocortisone
163. hydroxocobalamin
164. hydroxycarbamide
165. ibuprofen
166. ifosfamide
167. imipenem + cilastatin
168. indinavir (IDV)
169. influenza vaccine
170. insulin injection (soluble)
171. intermediate-acting insulin
172. intraperitoneal dialysis solution(of appropriate composition)
173. iodine
174. iohexol
175. ipratropium bromide
176. isoniazid
177. isoniazid + pyrazinamide + rifampicin
178. isoniazid + rifampicin
179. isosorbide dinitrate
180. ivermectin
181. Japanese encephalitis vaccine
182. kanamycin
183. ketamine
184. lamivudine (3TC)
185. lamivudine + nevirapine + stavudine
186. lamivudine + nevirapine + zidovudine
187. lamivudine + zidovudine
188. levamisole
189. levodopa + carbidopa
190. levonorgestrel
191. levonorgestrel-releasing implant
192. levothyroxine
193. lidocaine
194. lidocaine + epinephrine (adrenaline)
195. lithium carbonate
196. lopinavir + ritonavir (LPV/r)
197. lorazepam
198. Lugol's solution
199. magnesium hydroxide
200. magnesium sulfate
201. mannitol
202. measles vaccine
203. mebendazole
204. medroxyprogesterone acetate
205. mefloquine
206. meglumine iotroxate
207. melarsoprol
208. meningococcal meningitis vaccine

209. mercaptopurine
210. mesna
211. metformin
212. methadone
213. methotrexate
214. methyldopa
215. methylrosanilinium chloride (gentian violet)
216. methylthioninium chloride (methylene blue)
217. metoclopramide
218. metronidazole
219. miconazole
220. mifepristone
221. misoprostol
222. morphine
223. mumps vaccine
224. naloxone
225. neomycin sulfate + bacitracin
226. neostigmine
227. nevirapine (NVP)
228. niclosamide
229. nicotinamide
230. nicotine replacement therapy (NRT)
231. nifedipine
232. nifurtimox
233. nitrofurantoin
234. nitrous oxide
235. norethisterone
236. norethisterone enantate
237. nystatin
238. ofloxacin
239. omeprazole
240. ondansetron
241. oral rehydration salts
242. oseltamivir
243. oxamniquine
244. oxygen
245. oxytocin
246. p-aminosalicylic acid
247. pancreatic enzymes
248. paracetamol
249. paromomycin
250. penicillamine
251. pentamidine
252. permethrin
253. pertussis vaccine
254. phenobarbital
255. phenoxymethylpenicillin
256. phenytoin
257. phytomenadione

258. pilocarpine
259. pneumococcal vaccine
260. podophyllum resin
261. poliomyelitis vaccine
262. polyvidone iodine
263. potassium chloride
264. potassium ferric hexacyano-ferrate(II) $\cdot 2\text{H}_2\text{O}$ (Prussian blue)
265. potassium iodide
266. potassium permanganate
267. praziquantel
268. prednisolone
269. primaquine
270. procaine benzylpenicillin
271. procarbazine
272. proguanil
273. promethazine
274. propranolol
275. propylthiouracil
276. prostaglandin E
277. protamine sulfate
278. pyrantel
279. pyrazinamide
280. pyridostigmine
281. pyridoxine
282. pyrimethamine
283. quinine
284. rabies immunoglobulin
285. rabies vaccine
286. ranitidine
287. retinol
288. ribavirin
289. riboflavin
290. rifabutin
291. rifampicin
292. ritonavir
293. rotavirus vaccine
294. rubella vaccine
295. salbutamol
296. salicylic acid
297. saquinavir (SQV)
298. selenium sulfide
299. senna
300. silver sulfadiazine
301. simvastatin
302. sodium calcium edetate
303. sodium chloride
304. sodium fluoride
305. sodium hydrogen carbonate
306. sodium lactate

307. sodium nitrite
308. sodium nitroprusside
309. sodium stibogluconate or meglumine antimoniate
310. sodium thiosulfate
311. spectinomycin
312. spironolactone
313. stavudine (d4T)
314. streptokinase
315. streptomycin
316. sulfadiazine
317. sulfadoxine + pyrimethamine
318. sulfamethoxazole + trimethoprim
319. sulfasalazine
320. suramin sodium
321. surfactant
322. suxamethonium
323. tamoxifen
324. tenofovir disoproxil fumarate
325. testosterone
326. tetanus vaccine
327. tetracaine
328. tetracycline
329. thiamine
330. thiopental
331. timolol
332. triclabendazole
333. trimethoprim
334. tropicamide
335. tuberculin, purified protein derivative (PPD)
336. typhoid vaccine
337. urea
338. valproic acid
339. vancomycin
340. varicella vaccine
341. vecuronium
342. verapamil
343. vinblastine
344. vincristine
345. warfarin
346. water for injection
347. xylometazoline
348. yellow fever vaccine
349. zidovudine (ZDV or AZT)
350. zinc sulfate

For further details and new additions, consult WHO.

Website : www.who.int/entity/medicines/publications/essentialmedicines/en

The WHO has published a model list of essential medicines. Each country is encouraged to prepare their own lists taking into consideration local priorities. At present over 150 countries have published an official essential medicines list.

The WHO List contains a core list and a complementary list.

The core list presents a list of minimum medicine needs for a basic health care system, listing the most efficacious, safe and cost-effective medicines for priority conditions. Priority conditions are selected on the basis of current and estimated future public health relevance, and potential for safe and cost-effective treatment. The complementary list presents essential medicines for priority diseases, for which specialized diagnostic or monitoring facilities are needed. In case of doubt medicines may also be listed as complementary on the basis of consistent higher costs or less attractive cost-effectiveness in a variety of settings. The compilation of an essential medicines list enables health authorities, especially in developing countries, to optimize pharmaceutical resources.

The list is important because:

- it forms the basis of national drugs policy in many countries, both developed and developing (e.g. South Africa, Eritrea).
- governments refer to WHO recommendations when making decisions on health spending.

Drugs Banned In India

LIST OF DRUGS PROHIBITED FOR MANUFACTURE AND SALE THROUGH GAZETTE NOTIFICATIONS UNDER SECTION 26A OF DRUGS & COSMETICS ACT 1940 BY THE MINISTRY OF HEALTH AND FAMILY WELFARE

DRUGS PROHIBITED FROM THE DATE OF NOTIFICATION

- # 1. Amidopyrine.
- # 2. Fixed dose combinations of vitamins with anti-inflammatory agents and tranquilizers.
- # 3. Fixed dose combinations of Atropine in Analgesics and Antipyretics.
- # 4. Fixed dose combinations of Strychnine and Caffeine in tonics.
- # 5. Fixed dose combinations of Yohimbine and Strychnine with Testosterone and Vitamins.
- # 6. Fixed dose combinations of Iron with Strychnine, Arsenic and Yohimbine.
- # 7. Fixed dose combinations of Sodium Bromide/chloral hydrate with other drugs.
- # 8. Phenacetin.
- # 9. Fixed dose combinations of antihistaminic with anti-diarrhoeals.
- #10. Fixed dose combinations of Penicillin with Sulphonamides.
- #11. Fixed dose combinations of Vitamins with Analgesics.
- B#12. Fixed dose combinations of any other Tetracycline with Vitamin C.
- E#13. Fixed dose combinations of Hydroxyquinoline group of drugs with any other drug except for preparations meant for external use.
- ccc#14. Fixed dose combinations of Corticosteroids with any other drug for internal use.
- ccc#15. Fixed dose combinations of Chloramphenicol with any other drug for internal use.
- #16. Fixed dose combinations of crude Ergot preparations except those containing Ergotamine, Caffeine, analgesics, antihistamines for the treatment of migraine, headaches.
- #17. Fixed dose combinations of Vitamins with Anti TB drugs except combination of Isoniazid with Pyridoxine Hydrochloride (Vitamin B6).
- #18. Penicillin skin/eye Ointment.
- #19. Tetracycline Liquid Oral preparations.
- #20. Nialamide.
- #21. Practolol.
- #22. Methapyrilene, its salts.
- c 23. Methaqualone.

& 24. Oxytetracycline Liquid Oral preparations.

& 25. Demeclocycline Liquid Oral preparations.

T 26. Combination of anabolic Steroids with other drugs.

cc 27. Fixed dose combination of Oestrogen and Progestin (other than oral contraceptive) containing per tablet estrogen content of more than 50 mcg (equivalent to Ethinyl Estradiol) and progestin content of more than 3 mg (equivalent to Norethisterone Acetate) and all fixed dose combination injectable preparations containing synthetic Oestrogen and Progesterone. (Subs. By Noti. No. 743 (E) dt 10-08-1989)

* 28. Fixed dose combination of Sedatives/ hypnotics/anxiolytics with analgesics-antipyretics.

J* 29. Fixed dose combination of Rifampicin, isoniazid and Pyrazinamide, except those which provide daily adult dose given below:

Drugs	Minimum	Maximum
Rifampicin	450 mg	600 mg
Isoniazid	300 mg	400 mg
Pyrazinamide	1000 mg	1500 mg

* 30. Fixed dose combination of Histamine H-2 receptor antagonists with antacids except for those combinations approved by Drugs Controller, India.

* 31. The patent and proprietary medicines of fixed dose combinations of essential oils with alcohol having percentage higher than 20% proof except preparations given in the Indian Pharmacopoeia.

* 32. All Pharmaceutical preparations containing Chloroform exceeding 0.5% w/w or v/v

whichever is appropriate.

** 33. Fixed dose combination of Ethambutol with INH other than the following: INH Ethambutol 200 mg. 600 mg. 300 mg. 800 mg.

** 34. Fixed dose combination containing more than one antihistamine.

B** 35. Fixed dose combination of any anthelmintic with cathartic/purgative except for piperazine/Santonim.

J ** 36. Fixed dose combination of Salbutamol or any other drug having primarily bronchodilatory activity with centrally acting anti-tussive and/or antihistamine.

** 37. Fixed dose combination of laxatives and/or anti-spasmodic drugs in enzyme preparations.

G** 38. Fixed dose combination of Metoclopramide with systemically absorbed drugs except fixed dose combination of metoclopramide with aspirin/paracetamol

** 39. Fixed dose combination of centrally acting, antitussive with antihistamine, having high atropine like activity in expectorants.

** 40. Preparations claiming to combat cough associated with asthma containing centrally acting antitussive and/ or an antihistamine.

** 41. Liquid oral tonic preparations containing glycerophosphates and/or other phosphates and / or central nervous system stimulant and such preparations containing alcohol more than 20% proof.

** 42. Fixed dose combination containing Pectin and/or Kaolin with any drug which is systemically absorbed from GI tract except for combinations of Pectin and/or Kaolin with drugs not systemically absorbed.

*** 43. Chloral Hydrate as a drug.

b 44. Dovers Powder I.P.

b 45. Dover's Powder Tablets I.P.

A 46. Antidiarrhoeal formulations containing Kaolin or Pectin or Attapulgit or Activated Charcoal.

A 47. Antidiarrhoeal formulations containing Phthalyl Sulphathiazole or Sulphaguanidine or Succinyl Sulphathiazole.

A 48. Antidiarrhoeal formulations containing Neomycin or Streptomycin or Dihydrostreptomycin including their respective salts or esters.

A 49. Liquid Oral antidiarrhoeals or any other dosage form for pediatric use containing Diphenoxylate Lorloperamide or Atropine or Belladonna including their salts or esters or metabolites Hyoscyamine or their extracts or their alkaloids.

A 50. Liquid Oral antidiarrhoeals or any other dosage form for pediatric use containing halogenated hydroxyquinolines.

A 51. Fixed dose combination of antidiarrhoeals with electrolytes.

C 52. Patent and Proprietary Oral Rehydration Salts other than those conforming to the

D 53. Fixed dose combination of Oxyphenbutazone or Phenylbutazone with any other drug.

H.D 54. Fixed dose combination of Analgin with any other drug.

D 55. Fixed dose combination of dextropropoxyphene with any other drug other than anti-spasmodics and/or non-steroidal anti-inflammatory drugs (NSAIDs).

D 56. Fixed dose combination of a drug, standards of which are prescribed in the Second Schedule to the said Act with an Ayurvedic, Siddha or Unani drug.

F 57. Mepacrine Hydrochloride (Quinacrine and its salts) in any dosage form for use for female sterilization or contraception.

F 58. Fenfluramine and Dexfenfluramine.

I 59. Fixed dose combination of Diazepam and Diphenhydramine Hydrochloride .

K 60. Rimonabant.

DRUGS PROHIBITED FOR MANUFACTURE, SALE AND DISTRIBUTION FROM SUBSEQUENT DATE(All dates are past)

No.	Drugs Formulation	Effective date	Notification
1	Cosmetics Licensed as toothpaste/tooth powder containing tobacco	With immediate effect	GSR 444(E) dt.30.4.92
2	Parenteal Preparations fixed dose combination of streptomycin with Pencillin	Jan 1, 1998	GSR 93(E) dt.25.2.97
3	Fixed dose combination of Vitamin B1, Vitamin B6 and Vitamin B12 for human use	Jan 1, 2001	GSR 702(E) dt.14.10.99
4	Fixed dose combination of haemoglobin in any form (natural or synthetic).	Sep 1, 2000	GSR 814(E) dt.16.12.99
5	Fixed dose combination of Pancreatin or Pancrelipase containing amylase, protease and lipase with any other enzyme.	Sep 1, 2000	GSR 814(E) dt.16.12.99
6	Fixed dose combination of Nitrofurantoin and trimethoprim.	Jan 1, 2002	GSR 170(E) dt.12.3.01
7	Fixed dose combination of Phenobarbitone with any anti-asthmatic drugs	Jan 1, 2002	GRS 170(E) dt.12.3.01
8	Fixed dose combination of Phenobarbitone with Hyoscin and/or Hyoscyamine.	Jan 1, 2002	GSR 170(E) dt.12.3.01
9	Fixed dose combination of Phenobarbitone with Ergotamine and/or Belladonna	Jan 1, 2002	GSR 170(E) dt.12.3.01
10	Fixed dose combination of Haloperidol with any anti-cholinergic agent including Propantheline Bromide.	Jan 1, 2002	GSR 170(E) dt.12.3.01

11	Fixed dose combination of Nalidixic Acid with any anti-amoebic including Metronidazole.	Jan 1, 2002	GSR 170(E) dt.12.3.01
12	Fixed dose combination of Loperamide Hydrochloride with Furazolidone	Jan 1, 2002	GSR 170(E) dt.12.3.01
13	Fixed dose combination of Cyproheptadine with Lysine or Peptone.	Jan 1, 2003	GSR 170(E) dt.12.3.01
14	Astemizole	Apr.1, 2003	GSR 191(E) dt.5.3.03
15	Terfinadine	Apr.1, 2003	GSR 191(E) dt.5.3.03
16	Fenformin	Oct.1, 2003	GSR 780(E) dt.1.10.03
17	Rafecoxib	Dec 13, 2004	GSR 810(E) dt. 13.12.04
18	Valdecoxib and its formulation	July 25, 2005	GSR 510(E) dt. 25.07.05
19	Diclofenac and its formulations for animal use	July 4, 2008	GSR 499(E) dt.4.07.08

A few Globally Banned Drugs not Banned In India

Some drugs which are banned/withdrawn/severely restricted/not approved by Governments due to serious side effects as per WHO recommendations. These drugs are a few of those which are not banned in India(as of July 2010)

Analgin
Cisapride
Droperidol
Furazolidone
Human Placenta Extract
Lynestrenol
Nimesulide
Nitrofurazone
Phenolphthalein
Phenylbutazone
Phenylpropanolamine
Piperazine
Quinodochlor
Sibutramine
Tegaserod
Thioridazine

For further details and new additions, consult Central Drugs Standard Control Organization, Dte.GHS, Ministry of Health and Family Welfare, Government of India.

ABBREVIATION INDEX CIMS

This Index lists abbreviations adopted in CIMS for commonly used words, medical terminology and drug regulation symbols.

ACE	Angiotensin Converting Enzyme
Admn.	Administration
ADR	Adverse drug reactions
ADR POT-LT	Adverse drug reactions potential life threatening
Alum.	Aluminium
Ammon.	Ammonium
AMP	Ampoule
AP-CAPS	Applicaps
AQ-GEL	Aqueous Gel
b.i.d	Twice daily
BP	Blood Pressure
BZD	Benzodiazepine
Cal.	Calcium
CAP	Community Acquired Pneumonia
CAPS	Capsule
CrCl	Creatinine Clearance
CCB	Calcium Channel Blocker
Chlor.	Chloride
CHW-TAB	Chewable Tablet
CI	Contraindications
COPD	Chronic Obstructive Pulmonary Disease
Corresp.	Corresponding
CPM	Chlorpheniramine Maleate
CR-CAPS	Controlled Release Capsule
CR-TAB	Controlled Release Tablet
div.	Divided
DPI	Dry Powder Inhaler
DRESS	Dressing
D-Syrup	Dry Syrup
DT-TAB	Dispersible Tablet
DUB	Dysfunctional Uterine Bleeding

E/E-DPS	Ear/Eye Drops
E/E-SOL	Ear/Eye Solution
EAR-DP	Ear Drops
ECG	Electrocardiogram
EC-TAB	Enteric Coated Tablet
EEG	Electroencephalogram
EMU-GEL	Emulsion Gel
ENT	Ear, Nose and Throat
equiv.	equivalent
ER-CAPS	Extended Release Capsule
EYE-DPS	Eye Drops
EYE-OINT	Eye Ointment
F	Forte
FC-TAB	Film Coated Tablet
g	gram
G6PD	Glucose 6-Phosphate Dehydrogenase
GRAN	Granules
HBr	Hydrobromide
HCl	Hydrochloride
HMG CoA	3-Hydroxy 3-Methyl Glutaryl Coenzyme A
Hydrox.	Hydroxide
Hypersens.	Hypersensitivity
Ig	Immunoglobulin
IM	Intramuscular
INF	Infusion
INH	Isoniazid
INJ	Injection
IOP	Intraocular Pressure
ISMN	Isosorbide Mononitrate
INT FOOD	Interaction with food
INT	Interaction
INT POT-HAZ	Interaction potential harardous
IU	International Units
IUCD	Intra Uterine Contraceptive Device
IV	Intravenous
Kcal	Kilocalories
Kg	Kilogram
KID-TAB	Kid Tablet
LAB INT	Laboratory Interference
LDL	Low Density Lipoprotein
LFT	Liver Function Test
Liq.	Liquid
LRTI	Lower Respiratory Tract Infection

Ltr.	Litre
m ²	Square metre
Mag.	Magnesium
Maint.	Maintenance
Mang.	Manganese
MAOI	Mono Amine Oxidase Inhibitors
Max.	Maximum
mcg	microgram
MDI	Metered Dose Inhaler
mEq	milliequivalent
mg	milligram
ml	millilitre
mmol	millimole
MR-TAB	Modified Release Tablet
M-WASH	Mouth Wash
NPH	Neutral Protamine Hagedorn
NSAID	Non Steroidal Anti-Inflammatory Drug
N-SOLN	Nasal Solution
N-SPRAY	Nasal Spray
o.d.	Once daily
OC	Oral Contraceptive
OCD	Obsessive Compulsive Disorder
OHA	Oral Hypoglycaemic Agent
OINT	Ointment
OM	Otitis Media
Ophth	Ophthalmic
OVL-TAB	Oval Tablet
P	Paediatric
PCP	Pneumocystis Carinii
P-DROPS	Paediatric Drops
PE	Pulmonary Embolism
P-ELIX	Paediatric Elixir
PESS	Pessary
PFS	Pre-filled syringe
PFU system	Pre-filled Uniject System
Phos.	Phosphate
PO	Oral route
Pot.	Potassium
PPD	Purified Protein Derivative
PPI	Proton Pump Inhibitor
PPNG	Penicillinase producing Neisseria Gonorrhoea
PSVT	Paroxysmal Supraventricular Tachycardia
Pts.	patients

q.i.d	Four times daily
q.s.	Quantity sufficient
RA	Rheumatoid Arthritis
RESP	Respule
RET-TAB	Retard Tablet
RND-TAB	Round Tablet
ROA	Route of Administration
R-Syp	Rediuse Syrup
RTI	Respiratory Tract Infection
SAC	Sachet
SC	Subcutaneous
SG-CAPS	Soft Gelatin Capsule
SG-PRLS	Soft Gelatin Pearls
SHAMP	Shampoo
SJS	Stevens Johnson Syndrome
SL-TAB	Sub-lingual Tablet
Sod.	Sodium
Soln.	Solution
SP	Special Precautions
SR-CAPS	Sustained Release Capsule
SR-TAB	Sustained Release Tablet
SSRI	Selective Serotonin Reuptake Inhibitor
Sulph.	Sulphate
SUPP	Suppository
SUSP	Suspension
t.i.d	Three times daily
TAB	Tablet
TB	Tuberculosis
TCA	Tricyclic Antidepressant
TOP-SOL	Topical Solution
TR-CAPS	Timed Release Capsule
TR-TAB	Timed Release Tablet
URTI	Upper Respiratory Tract Infection
UTI	Urinary Tract Infection
UV	Ultraviolet
v/v	volume by volume
VG-CAPS	Vaginal Capsule
VG-DOU	Vaginal Douche
VG-GEL	Vaginal Gel
VG-TAB	Vaginal Tablet
Vit.	Vitamin
VLDL	Very Low Density Lipoprotein
VMA	Vannilyl Mandelic Acid

w/v	weight by volume
w/w	weight by weight
WPW	Wolffe Parkinson White(syndrome)
wrt	with respect to
yrs.	Years.

([\[all drugs\]](#))

Definition of various dosage forms

Oral Preparations

Term	Definition
Solid oral dosage form	Refers to tablets or capsules or other solid dosage forms such as 'melts' that are immediate-release preparations. It implies that there is no difference in clinical efficacy or safety between the available dosage forms, and countries should therefore choose the form(s) to be listed depending on quality and availability. The term 'solid oral dosage form' is never intended to allow any type of modified-release tablet.
Tablets	Refers to: • uncoated or coated (film-coated or sugar-coated) tablets that are intended to be swallowed whole; • unscored and scored*; • tablets that are intended to be chewed before being swallowed; • tablets that are intended to be dispersed or dissolved in water or another suitable liquid before being swallowed; • tablets that are intended to be crushed before being swallowed. The term 'tablet' without qualification is never intended to allow any type of modified-release tablet. * Scored tablets may be divided for ease of swallowing, provided dose is a whole number of tablets.

Tablets (qualified)	Refers to a specific type of tablet: • chewable - tablets that are intended to be chewed before being swallowed; • dispersible - tablets that are intended to be dispersed in water or another suitable liquid before being swallowed; • soluble - tablets that are intended to be dissolved in water or another suitable liquid before being swallowed; • crushable - tablets that are intended to be crushed before being swallowed; • scored - tablets bearing a break mark or marks where sub-division is intended in order to provide doses of less than one tablet; • sublingual - tablets that are intended to be placed beneath the tongue. The term 'tablet' is always qualified with an additional term (in parentheses) in entries where one of the following types of tablet is intended: gastro-resistant (such tablets may sometimes be described as enteric-coated or as delayed-release), prolonged-release or another modified-release form.
Capsules	Refers to hard or soft capsules. The term 'capsule' without qualification is never intended to allow any type of modified-release capsule.
Capsules (qualified)	The term 'capsule' with qualification refers to gastro-resistant (such capsules may sometimes be described as enteric-coated or as delayed-release), prolonged-release or another modified-release form.
Granules	Preparations that are issued to patient as granules to be swallowed without further preparation, to be chewed, or to be taken in or with water or another suitable liquid. The term 'granules' without further qualification is never intended to allow any type of modified-release granules.
Oral powder	Preparations that are issued to patient as powder (usually as single-dose) to be taken in or with water or another suitable liquid.

Oral liquid	Liquid preparations intended to be swallowed i.e. oral solutions, suspensions, emulsions and oral drops, including those constituted from powders or granules, but not those preparations intended for oromucosal administration e.g. gargles and mouthwashes. Oral liquids presented as powders or granules may offer benefits in the form of better stability and lower transport costs. If more than one type of oral liquid is available on the same market (e.g. solution, suspension, granules for reconstitution), they may be interchanged and in such cases should be bioequivalent. It is preferable that oral liquids do not contain sugar and that solutions for children do not contain alcohol.
-------------	---

Parenteral Preparations

Term	Definition
Injection	Refers to solutions, suspensions and emulsions including those constituted from powders or concentrated solutions.
Injection (qualified)	Route of administration is indicated in parentheses where relevant.
Injection (oily)	The term injection is qualified by (oily) in relevant entries.
Intravenous infusion	Refers to solutions and emulsions including those constituted from powders or concentrated solutions.

Other dosage forms

Mode of administration	Term to be used
To the eye	Eye drops, eye ointments.
Topical	• For liquids: lotions, paints. • For semi-solids: cream, ointment.
Rectal	Suppositories, gel or solution.
Vaginal	Pessaries or vaginal tablets.
Inhalation	Powder for inhalation, pressurized inhalation, nebulizer.

Latest US-FDA approved drugs Aug 2009-2010

Newly approved drugs by the United States Food and Drug Administration

8/5/2010	Suprep Sodium Sulfate + Potassium Sulfate + Magnesium Sulfate (BRAINTREE)
8/3/2010	Altavera Ethinyl Estradiol + Levonorgestrel (SANDOZ)
7/30/2010	Xeomin Incobotulinumtoxina (MERZ PHARMS)
7/28/2010	Cuvposa Glycopyrrolate (SHIONOGI PHARMA)
7/28/2010	Lastacraft Alcaftadine (VISTAKON PHARMA)
7/23/2010	Tribenzor Olmesartan Medoxomil + Amlodipine + Hydrochlorothiazide (DAIICHI SANKYO)
7/16/2010	Veltin Clindamycin Phosphate + Tretinoin (STIEFEL GSK)
7/2/2010	Zuplenz Ondansetron (PAR PHARM)
6/30/2010	Butrans Buprenorphine (PURDUE PHARMA LP)
6/29/2010	Alsuma Sumatriptan Succinate (KING PHARMS)
6/22/2010	Dulera Mometasone Furoate + Formoterol Fumarate (SCHERING)
6/22/2010	Isopto Carpine Pilocarpine (ALCON RES)
6/21/2010	Namenda Xr Memantine Hydrochloride (FOREST LABS)
6/18/2010	Scanlux-300 Iopamidol (SANOCHEMIA CORP USA)
6/17/2010	Staxyn Vardenafil Hydrochloride (BAYER HEALTHCARE PHARMS)
6/17/2010	Jevtana Cabazitaxel (SANOFI AVENTIS US)
6/14/2010	Jalyn Dutasteride + Tamsulosin Hydrochloride (SMITHKLINE BEECHAM)
6/7/2010	Clenz-lyte Polyethylene Glycol 3350 + Potassium Chloride + Sodium Bicarbonate + Sodium Chloride + Sodium Sulfate (PADDOCK LABS)
6/1/2010	Prolia Denosumab (AMGEN)
5/28/2010	Cysview Hexaminolevulinate Hydrochloride (PHOTOCURE ASA)
5/24/2010	Lumizyme Alglucosidase Alfa (GENZYME)
5/18/2010	Zymaxid Gatifloxacin (ALLERGAN)
5/14/2010	Sprix Ketorolac Tromethamine (ROXRO PHARMA INC)

5/6/2010	Natazia Estradiol Valerate + Estradiol Valerate Dienogest (BAYER HEALTHCARE PHARMS)
4/30/2010	Vimovo Esomeprazole Magnesium + Naproxen (POZEN)
4/23/2010	Heather Norethindrone (GLENMARK GENERICS)
4/20/2010	Zortress Everolimus (NOVARTIS)
4/16/2010	Oravig Miconazole (BIOALLIANCE PHARMA)
4/12/2010	Pancreaze Pancrelipase (ORTHO MCNEIL JANSSEN)
3/30/2010	Asclera Polidocanol (CHEMISCH FBRK KRSSLR)
3/25/2010	Zyclara Imiquimod (GRACEWAY)
3/18/2010	Carbaglu Carglumic Acid (R & R REGISTRATIONS INC)
3/17/2010	Silenor Doxepin Hydrochloride (SOMAXON PHARMA)
3/10/2010	Trelstar Triptorelin Pamoate (WATSON LABS)
3/1/2010	Exalgo Hydromorphone Hci (ALZA)
2/26/2010	Vpriv Velaglucerase Alfa (SHIRE)
2/25/2010	Lax-lyte With Flavor Packs Polyethylene Glycol 3350 + Potassium Chloride + Sodium Bicarbonate + Sodium Chloride (PADDOCK)
2/22/2010	Cayston Aztreonam (GILEAD)
2/19/2010	Mirapex Er Pramipexole Dihydrochloride (BOEHRINGER INGELHEIM)
2/3/2010	Balanced Salt Calcium Chloride + Magnesium Chloride + Potassium Chloride + Sodium Acetate + Sodium Chloride + Sodium Citrate (B BRAUN)
2/2/2010	Xiaflex Collagenase Clostridium Histolyticum (AUXILIUM PHARMS)
2/2/2010	Oleptro Trazodone Hydrochloride (LABOPHARM)
1/25/2010	Victoza Liraglutide (NOVO NORDISK INC)
1/22/2010	Ampyra Dalfampridine (ACORDA)
1/8/2010	Actemra Tocilizumab (GENENTECH)
12/11/2009	Zyprexa Relprevv Olanzapine (ELI LILLY CO)
12/1/2009	Zegerid Otc Omeprazole + Sodium Bicarbonate (SCHERING PLOUGH)
11/27/2009	Kalbitor Ecallantide (DYAX CORP.)
11/25/2009	Nexcede Ketoprofen (NOVARTIS)
11/16/2009	Qutenza Capsaicin (NEUROGESX, INC.)
11/13/2009	Lysteda Tranexamic Acid (XANODYNE PHARMS)
11/6/2009	Nevis Ethinyl Estradiol + Norethindrone Acetate (BARR)
11/5/2009	Istodax Romidepsin (GLOUCESTER PHARMACEUTICALS)
11/4/2009	Pennsaid Diclofenac Sodium (Covidien)
10/26/2009	Arzerra Ofatumumab (GLAXO GRP LTD)
10/19/2009	Votrient Pazopanib Hydrochloride (GLAXOSMITHKLINE)

10/16/2009	Fentanyl-100	Fentanyl (HISAMITSU)
10/16/2009	Twynsta	Telmisartan + Amlodipine (BOEHRINGER INGELHEIM)
9/29/2009	Jenloga	Clonidine Hydrochloride (ADDRENEX PHARMS)
9/25/2009	Stelara	Ustekinumab (CENTOCOR ORTHO BIOTECH INC)
9/24/2009	Folotyn	Pralatrexate (ALLOS THERAPEUTICS, INC)
9/17/2009	Ribavarin	Ribavirin (AUROBINDO PHARMA)
9/16/2009	Valturna	Aliskiren + Valsartan (NOVARTIS PHARMS)
9/15/2009	Zirgan	Ganciclovir (SIRION THERAP)
9/11/2009	Vibativ	Telavancin (THERAVANCE INC)
9/8/2009	Bepreve	Bepotastine Besilate (ISTA PHARMS)
9/4/2009	Metozolv Odt	Metoclopramide Hydrochloride (WILMINGTON PHARMA)
9/2/2009	Intuniv	Guanfacine (SHIRE)
8/27/2009	Zenpep	Pancrelipase (EURAND)

Indian List of Approved drug from January to July 2008

Newly approved Indian drugs in 2008 first half

Newer lists could not be found on a quick search of the Government website.
Latest Indian approved drug lists will be added to later versions of this eBook if I find the list.

<u>List of approved drugs from 01.01.08 to 31.07.08</u>			
S. No.	Drug Name	Indication	Approval Date
1	Me-salicylate 30% + Menthol 10% + camphor 4% Cream	For temporary relief from pain, swelling & inflammation due to musculoskeletal disorder	29.11.07
2	Voglibose 0.2mg/0.3mg tablet (Mouth dissolving)	For improvement of parantial hyperphemia in diabetes mellitus only. When diet and/or exercise or oral, hypoglyceamic drug or insulin preparation in addition to diet and or exercise do not result in adequate glycemic control.	28.12.07
3	Hydroxychloroquine 400mg tablets (Additional Strength)	Same as Approved	31.01.08
4	ISMN 30mg SR + Metoprolol Succinate equivalent to metoprolol tartrate 25mg/50mg tablets (Additional Strength)	Same as Approved	02.01.08
5	Halobetasol 0.05% + Clotrimazole 1.0% cream	For the treatment of steroid responsive fungal infections including eczema and psoriasis	04.01.08

6	Citicholine Syrup 750mg/5ml	For the treatment of disturbance of consciousness resulting from head injuries, brain operation and acute stage of cerebral infarction in adults only	04.01.08
7	Levodopa 200mg + Carbidopa 50mg C.R. tablet	For Parkinson's Disease	08.01.08
8	Nanocrystalline Silver Gel 0.002%	For the treatment of burns and wound infections	04.01.08
9	Cinitapride (as hydrogen tartrate) 1mg tablet	For the treatment of gastroesophageal reflux disease and functional inconveniences of the gastrointestinal motility	04.01.08
10	Tenofovir disoproxil fumarate 300mg + Lamivudine 300mg tablet	For the treatment of adult patients with HIV infection	07.01.08
11	Cefixime 200mg/100mg + Lactic acid bacillus 2.5 billion spores tablet & dispersible tablet	For the treatment of Urinary tract infections, respiratory tract infections, biliary tract infections in adult patients prone to antibiotic associated diarrhoea	07.01.08
12	D-Trans Fentanyl Metrix system (12mcg/hr.) (Additional Strength)	Same as Approved	07.01.08
13	Ceftazidime 500mg + Tobramycin 60mg per vial (Injection)	For the treatment of lower respiratory tract infection caused by pseudomonas aeruginosa	08.01.08
14	Atazanavir 300mg capsules (Additional strength)	Same as approved	08.01.08
15	Ertapenem for injection 1gm/vial (additional indication)	For the prophylaxis of surgical site infections following elective colorectal surgery	15.01.08
16	Vildagliptin Tablets 50mg/100mg	As an adjunct to diet and exercise to improve glycemic control in patients with type-II diabetes mellitus	18.01.08
17	Atorvastatin 10mg + Aspirin 75/150mg Capsules	For the treatment of dyslipidemia associated with atherosclerotic arterial disease with risk of myocardial infarction, stroke or peripheral vascular disease	18.01.08
18	Smatriptan (as succinate) 50mg + Naproxen sodium 550mg tablets	For the treatment of acute migraine	22.01.08

19	Sodium Valproate 666mg + valproic acid 290mg equivalent as sodium valproate 1000mg C.R. tablet (Additional Strength)	Same as Approved	24.01.08
20	Cefepime (as hydrochloride) 2000/1000/500mg + Sulbactam (as sodium) 1000/500/250mg per vial of injection	For serious CRTI, uncomplicated and complicated UTI, Uncomplicated skin & skin structure, infection acute exacerbation of chronic bronchitis & intraabdominal infection.	24.01.08
21	Paclitaxel Nanoparticle Solution for Injection 20mg/ml (Additional indication)	Ovarian cancer, non-small cell lung cancer and AIDS related Kaposi Sarcoma	22.01.08
22	Sorafenib tablets 200mg (Additional Indication)	For hepatocellular Carcinoma	22.01.08
23	Zanamavir inhalation powder 5mg/blister (Additional Indication)	For prophylaxes and treatment of both influenza A & B in adults and children (greater than or equal to 5 years)	22.01.08
24	Mycophenolate Mofetil Capsule 250mg, 500mg & Oral suspension 200mg/ml (Additional Indication)	For the prophylaxis of acute organ rejection in patients receiving allogeneic hepatic transplantation	23.01.08
25	Combikit 4 tablets of Alendronate sodium trihydrate equivalent to Alendronic acid 70mg each + 24 tablets of Calcium carbonate 1250mg (equivalent to 500mg Calcium) + cholecalciferol-250IU	For the treatment of osteoporosis in post-menopausal women	23.01.08
26	Aceclofenac injection 150mg/ml	For short term treatment of pain due to post operative and post traumatic cases	23.01.08
27	Atorvastatin 10mg + Fenofibrate 80mg tablet (Additional Indication)	For the treatment of uncomplicated and complicated UTI, uncomplicated skin and skin structure infections, and complicated intra-abdominal infections	25.01.08
28	Sodium Valproate 499.5mg + Valproic acid 217.5mg equivalent as sodium valproate- 750mg CR tablet (Additional Strength)	Same as Approved	24.01.08

29	Diclofenac 50mg + Serratiopeptidase 10mg enteric coated tablet	For the treatment of acute pain in adults	24.01.08
30	Gabapentin 100mg + methylcobalamin 500mcg tablets (Additional Strength)	Same as Approved	24.01.08
31	Cefpirome (as sulphate) 500/1000mg/2000mg + Sulbactam (as sodium) 250mg/500mg/1000mg powder for injection	For the treatment of infection caused by sensitive organisms viz. lower RTI, complicated UTI, Septicemia, bacteremia	24.01.08
32	Metformin HCl ER 500mg + Fenofibrate 80mg/160mg tablet	For the treatment of Type-II diabetes associated with mixed dyslipidemia	25.01.08
33	Salicylic acid 10mg/20mg (Foaming facewash solution)	For the treatment of acne vulgaris	28.01.08
34	Ozagrel Hcl. Tablets 100mg/200mg	For the treatment of bronchial asthma	28.01.08
35	Rivastigmine transdermal patch (each patch of 5m ² , 10m ² , 15m ² & 20m ² contain Rivastigmine base 9/18/27/36mg respectively)	For the treatment of patients with mild to moderately severe dementia of the Alzheimer type and dementia associated with Parkinsons disease	28.01.08
36	Daptomycin powder for concentrate for solution for infusion (350mg/500mg per vial)	For the treatment of complicated skin and skin structure infections and for staphylococcus aureus bloodstream infections (bacteremia)	28.01.08
37	Dextromethorphan Orodispersible strip 5.5mg/11mg	For the relief of persistent dry irritating cough in adult patients only	28.01.08
38	Diclofenac sodium 50mg + Dicyclomine HCl 20mg per ml of injection	For the treatment of acute colicky pain in adults	28.01.08
39	Travoprost 40mcg + Timolol (as Maleate) 5mg per ml of eye drops	For decrease of intraocular pressure in patients with open angle glaucoma or ocular hypertension, who are insufficiently responsive to topical beta blockers or prostaglandin analogues	28.01.08
40	Amoxicillin 250mg/125mg + Cloxacillin 250mg/125mg + Lactic Acid Bacillus 1.7 Billion spores	For RTI, SRS of tissue infection, bone & joint infection, ENT infection in adults prone to antibiotic associated diarrhoea	30.01.08

41	Amoxicillin 250mg + Lacto- Bacillus 1.7 billion Spores	For RTI, SRS of tissue infection, bone & joint infection, ENT infection in adults prone to antibiotic associated diarrhoea	31.01.08
42	Amoxycillin 250mg + Cloxacillin 250mg + Lactobacillus 2 billion spores capsules	For the treatment of lower RTI, skin & soft tissue bone & joint infections, ENT infections in adult patients prone to antibiotic associated diarrhoea	30.01.08
43	Tiotropium (as Tiotropium Bromide Monohydrate) 18mcg + Formoterol Fumarate Dihydro. 12mcg + Ciclesomide 400mcg per capsules	As 3rd line treatment of severe cases of COPD when monotherapy and second line therapy with two drugs do not respond adequately	31.01.08
44	Metoprolol Succinate Equivalent to Metoprolol Tartrate [ER 25/50mg] + Atorvastatin (As calcium) 10mg tablets	For the treatment of patient with both essential hypertension and hypercholesterolemia	28.01.08
45	Levocetirizine Di HCl Dispersible tablet 5mg/10mg (New Dosage form)	For allergic rhinitis & chronic urticaria	28.01.08
46	Oseltamivir 30mg & 45mg Capsules (Additional Strength)	Same as Approved	28.01.08
47	Fondaparinux Sodium injection (Additional Indication)	Treatment of acute coronary syndrome (ACS) with and without ST-segment elevation	28.01.08
48	Camostat Mesylate tablets 100mg	For remission of acute symptoms of chronic pancreatitis and post-operative reflux esophagitis	29.01.08
49	Hyaluronic Acid Salt 25mg + Cross-Linked Hyaluronic acid 25mg per ml in prefilled syringe	For intradermal implantation and facial soft tissue augmentation	30.01.08
50	Ursodeoxycholic acid tablets 600mg	For the treatment of patients with chronic cholestatic liver disease	30.01.08
51	Dalteparin Sodium Injection (Additional Indication)	For the extended treatment of symptomatic venous thromboembolism (VTE) proximal deep thrombosis (DVT) and/or pulmonary embolism (PE), to reduce the recurrence of VTE in patients with cancer	30.01.08

52	Beclomethasone Dipropionate 0.25mg + Econazole 10mg + Neomycin 5mg per gm of Cream	For the topical treatment of bacterial and fungal infections	30.01.08
53	Exenatide injection (Each 2ml vial contains- Exenatide 5mcg/10mcg per 0.2ml) (Additional Strength)	For adjunctive therapy to improve glycemic control in patients with type-II diabetes mellitus, who have not achieved adequate glycemic control with metformin, a sulfonylurea or a combination of metformin and a sulfonylureas	30.01.08
54	Diclofenac Sodium 50mg + Paracetamol 500mg tablets	For the symptomatic treatment of acute pain and inflammation in patients with osteoarthritis, rheumatoid arthritis and ankylosing spondylitis	30.01.08
55	Gabapentin SR 600mg tablets	As adjunctive therapy in the treatment of partial seizures of epilepsy	30.01.08
56	Memantine 5mg /10mg + Donepezil 5mg Tablets	For moderate to severe Alzheimer's disease	31.01.08
57	Doxifluridine Capsules 100mg/200mg	For carcinoma of the stomach, colon, rectum, breast, uterine, cervix and bladder	31.01.08
58	Haemodialysis Powder/Liquid Form containing citrate	For use for patients being treated by hemodialysis	31.01.08
59	Carmustine (polifeprosan 20 with carmustine Implant (Wafer)	1:- In newly diagnosed high-grade malignant glioma patients as an adjunct to surgery and radiation. 2:- In recurrent glioblastoma multiforme patients as an adjunct to surgery	31.01.08
60	Cimetropium Bromide tablet 50mg	For the treatment of irritable bowel syndrome	31.01.08
61	CyclobenzaprineHcl. Tablets 5mg/10mg	As adjunct to rest and physical therapy for relief of muscle spasm associated with acute painful musculoskeletal conditions	31.01.08
62	Sertaconazole Nitrate Cream 2%,	For the topical treatment of the superficial mycosis like dermatophytosis	31.01.08
63	Cefpodoxime 50mg + Clavulanic acid 31.25mg dispersible tablet & dry syrup (Additional strength)	Same as Approved	31.01.08

64	Darifenacin (as hydrobromide) 7.5mg/15mg ER tablets	For the treatment of overactive bladder with symptoms of urge urinary incontinence, urgency and frequency	31.01.08
65	Amoxycillin 125mg/250mg/500mg + Lactobacillus 1.66 billion Spores (Capsules)	For the treatment of respiratory tract infection, skin and soft tissue infections & antibiotics associated diarrhoea in adult patients	31.01.08
66	Halobetasol 0.5mg + Miconazole 20mg per gram Cream	For steroid responsive dermatoses associated with superficial fungal infection of skin	31.01.08
67	Montelukast 10mg + Levocetirizine 5mg film coated tablets	For the treatment of allergic rhinitis in adults only	31.01.08
68	Hydroquinone 2% + Tretinoin 0.025% (w/w) Mometasone 0.10% Gel	For short term intermittent treatment of moderate to severe melasma of the face in the presence of measures for sun avoidance including use of sun screen	31.01.08
69	Phenylephrine 5mg + Chlorpheniramine maleate 0.5mg + Paracetamol 125mg + sodium citrate 60mg + Menthol 1mg (per 5ml) Syrup	For the treatment of common cold and cough associated with fever	31.01.08
70	Diclofenac Sodium 100mg (SR Pellets) + Rabeprazole Sodium 20mg (E.C Pellets) Capsules	For treatment of painful inflammatory conditions associated with gastroduodenal ulcers	31.01.08
71	Ciclesonide 160mcg/320mcg/Formoterol 12mcg + Tiotropium 18mcg Dry powder inhaler	As third line treatment of severe cases of COPD, when monotherapy and second line therapy with two drugs do not respond adequately	31.01.08
72	VSL # (Combination of lactic acid bacteria (VSL # 3)	For the treatment of irritable bowel syndrome	31.01.08
73	Clostimethate Sodium of 1,00,000IU Injection	For the treatment of serious infection caused Gram-Ve bacteria including LRTI, UTI, where commonly used anti bacterial agent may be infective because of bacterial resistance	31.01.08
74	Ramipril 5mg + HCTZ 12.5mg tablets (Additional Strength)	Same as Approved	20.02.08

75	Metronidazole CR tablet 600mg	For the treatment of amoebiasis, urogenital trichomoniasis & giardiasis	21.02.08
76	Quetiapine fumarate SR tablets	for the additional indication "acute manic episode associated with bipolar disorder	21.02.08
77	Atorvastatin Calcium 80mg tablets (Additional Strength)	additional Strength (it should not be used routinely because of increased risk of adverse events. It should be reserved for patients who are considered to be at higher risk after careful risk assessment	25.02.08
78	Euphorbia Prostrata Dry Extract (ethanolic 80% (v/v) (35-70) :100mg tablet	For the treatment of haemorrhoid	29.02.08
79	Amtolmetin Guacil tablets 600mg	For the treatment of osteoarthritis & rheumatoid arthritis	07.03.08
80	Brimonidine Tartrate Ophthalmic solution 0.1% (with purite as preservation 0.0005%) (additional strength)	For lowering of IOP in patients with open angle glaucoma ocular hypertension	07.03.08
81	Methoxsalen USP-20mg Tablet	1:- For repigmentation of idiopathic vitiligo alongwith phototherapy. 2:- For symptomatic control of severe, recalcitrant, disabling psoriasis in conjunction with phototherapy	07.03.08
82	Cefditoren pivoxil 400mg tablets (Additional Strength)	Same as Approved	11.03.08
83	Doxofylline ER tablets 400mg/800mg (addl. Strength)	For the treatment of bronchial asthma & COPD in adults	12.03.08
84	Betamethasone 0.05% +Miconazole 2% Cream	For the treatment of steroid responsive dermatoses associated with superficial fungal infections of the skin	12.03.08
85	Premetrxed disodium injection 100mg/vial (Additional Strength)	Same as Approved	12.03.08
86	Omeprazole 20mg/40mg + Sodium bicarbonate 1680mg per sachet powder for oral suspension	For gastric ulcer, duodenal ulcer, and GERD	12.03.08
87	ISMN 30mg SR + Atenolol 50mg tablets (Additional Strength)	Same as Approved	19.03.08

88	Temozolamide capsules 140mg/180mg (Addl. Strength)	Same as Approved	31.03.08
89	Amisulpiride 300mg tablets (Additional Strength)	Same as Approved	20.03.08
90	Nifedipine SR Tablets 10mg/20mg	For the treatment of essential hypertension	24.03.08
91	Ambroxol HCl. 15mg + Guiphenesin 50mg + Terbutalin sulphate 1.25mg + Menthol 2.5mg per 5 ml of syrup	For symptomatic relief of bronchospasm in bronchial asthma and chronic bronchitis	26.03.08
92	Ambroxol HCl 30mg + Guaiphenesin 100mg + Terbutaline sulphate 2.5mg per 10ml Syrup	For the symptomatic relief of bronchospasm in bronchial asthma & chronic bronchitis	26.03.08
93	Boswellia Serrata 0.05gm/gm of Cream	For the treatment of mild to moderate psoriasis	28.03.08
94	Etoricoxib injection 90mg/ml	For short term use in acute painful condition in adults only	28.03.08
95	Drospirenone 3mg + Ethinyl estradiol 0.02mg tablets (Additional Strength)	Oral contraceptive in women	28.03.08
96	Nimesulide 100mg ER + Levocetirizine HCl 5mg Tablets	For symptomatic treatment of acute rhinosinusitis	28.03.08
97	Dexketoprofen (as Trometamol) tablets 12.5mg/25mg	For the treatment of mild to moderate pain, such as dental pain, dysmenorrhoea & musculoskeletal pain	28.03.08
98	Nepafenac Ophthalmic suspension (1mg/ml)	For the treatment of pain and inflammation associated with cataract surgery	31.03.08
99	Hylan GF 20 Injection (Synvisc) (Additional Indication)	For pain management in patients suffering with osteoarthritis of the knee, hip, shoulder and ankle	31.03.08
100	Docetaxel injection conc.	For additional indication "advanced gastric adenocarcinoma, locally advanced squamous cell carcinoma of head & neck, Hormone refractory metastatic prostate cancer, locally advanced or metastatic breast cancer	31.03.08
101	Methylcobalamin 1000mcg + Pyridoxine Hcl IP 100mg + Nicotinamide IP 100mg + D-Panthenol IP 50mg per 2 ml of injection	For peripheral neuropathy	31.03.08

102	Lamivudine 20mg + Stavudine 5mg dispersible tablets (Additional Sgtrrength)	Same as Approved	01.04.08
103	Nicardipine Hcl. Injection 2.5mg/ml	For short-term treatment of hypertension when oral therapy is not feasible or not desirable	07.04.08
104	Diclofenac Potassium 50mg + Serratiopeptidase (as enteric coated pellets) 15mg capsules (Additional Strength)	For the treatment of acute pain in adults	08.04.08
105	Diacerin 50mg + Aceclofenac 100mg tablets	For the treatment of adult patients with osteoarthritis of knee and or hip joints	11.04.08
106	Rabeprazole sodium Enteric coated pellets 15.4% w/w (20mg/129.83mg)	Same as Approved	16.04.08
107	Live freeze-dried lactic acid bacteria and bifidobacteria capsules	For the treatment of irritable bowel syndrome	10.04.08
108	Miltefosin Capsule 10mg/50mg (Additional Indication)	Treatment of cutaneous leishmaniasis	16.04.08
109	Silver Wound Dressing	As an antimicrobial barrier for management of partial thickness burns, incisions, skin grafts, donor sites, lacerations, abrasions and Stage I-IV dermal ulcers (vascular, venous, pressure and diabetic)	16.04.08
110	Diacerin 50mg + Glucosamine sulphate 500mg tablets.	For the treatment of adult patients with osteoarthritis of knee and hip joints	21.04.08
111	Clostridium Botulinum type-A toxin haemagglutinin complex (Additional Indication)	For focal spasticity, including the treatment of arm symptoms associated with focal spasticity in conjunction with physiotherapy	22.04.08
112	Fluconazole Dispersible tablets 50mg	For the treatment of systemic candidiasis, mucosal candidiasis, prevention of fungal infections in patients with malignancy	22.04.08
113	Lenalidomide Capsule 5mg/10mg/15mg/25mg (Additional Indication)	In combination with dexamethasone for the treatment of multiple myeloma patients who have received at least one prior therapy	22.04.08

114	Sitagliptin (As Phosphate) 50mg + Metformin Hcl. 500mg/1000mg Film coated tablets	As an adjunct to diet & exercise to improve glycemic control in patients with type-two diabetes mellitus	28.04.08
115	Lansoprazole for injection 30mg/vial	For short term treatment of erosive esophagitis when patients are unable to take the oral formulation	28.04.08
116	Naproxen Suspension 125mg/5ml	For the treatment of RA in children 5 years of age and above	28.04.08
117	Sevelamer Carbonate 400mg/800mg tablets & sachet 400mg/800mg	For control of serum phosphorus in patients with chronic kidney disease on dialysis	28.04.08
118	Rabeprazole Sodium (With Sodium bicarbonate as buffer) 10mg/20mg tablets	For the treatment of gastric ulcer, duodenal ulcer, Zollinger Ellison Syndrome and GERD	28.04.08
119	Pantoprazole Sodium (With Sodium bicarbonate as buffer) 20mg/40mg tablets	For the treatment of gastric ulcer, duodenal ulcer, Zollinger Ellison Syndrome and GERD	28.04.08
120	Cefdinir 250mg dispersible tablets & oral suspension 250mg/5ml	For the treatment of community acquired pneumonia, acute exacerbation of chronic bronchitis, uncomplicated skin and skin structure infection, Pharyngitis/tonsillitis	29.04.08
121	Pregabalin capsules (Addl. Indication)	management of fibromyalgia syndrome	29.04.08
122	Pregabalin 75mg/150mg + Methylcobalamin 750mcg capsules (Additional Strength)	Same as Approved	08.05.08
123	Aliskiren 150/150/300/300mg + HCTZ 12.5/25/12.5/25mg tablets	For the treatment of essential hypertension in adult patients whose blood pressure is not adequately controlled on monotherapy .	08.05.08
124	Desmopressin lyophilisate Oral tablets 60mcg/120mcg/240mcg per tablets	For diabetes insipidus and nocturnal enuresis	08.05.08
125	Losartan Potassium 25mcg + Amlodipine (as besylate) 5mg tablets. (Additional Strength)	Same as Approved	14.05.08
126	Lecithin Liquid (each 5 ml contains lecithin 500mg equivalent to essential phospholipids 250mg	For alcoholic liver disease, drug induced hepatitis	14.05.08

127	Halobetasol 0.05% + Salicylic acid 6% Ointment (additional Strength)	For the treatment of plaque psoriasis	14.05.08
128	Benzoyl Peroxide Medicated Solution (each textured pad contains 4.5%/6.5%/8.5% of solution)	For the topical treatment of acne vulgaris	14.05.08
129	Deflazocort 24mg tablets (Additional strength)	Same as Approved	14.05.08
130	Sodium Chondroitin sulfate 40mg + sodium Hyaluronate 30mg per ml Intraocular Injection (additional strength)	For use as a surgical aid in anterior segments procedure including cataract extraction & intra-ocular lens implantation	14.05.08
131	Esomeprazole (with Sodium bicarbonate as buffer) 20mg/40mg tablets	For the treatment of GERD, gastric and duodenal ulcer, Zollinger-Ellison syndrome	14.05.08
132	Telmisartan 40 mg + Atorvastatin (as calcium) 10 mg Tablets	For coexisting essential hypertension & hyperlipidemia	22.05.08
133	Milnacipran Hcl. 25mg/50mg equivalent to Milnacipran free base 21.77 or 43.55 mg. tablet.	For the treatment of adult patients with major depressive disorder	22.05.08
134	Metolazone 2.5mg + Losartan Potassium 25mg/50mg tablets	For hypertension in patients whose blood pressure is not adequately controlled in monotherapy	28.05.08
135	Metolazone 2.5mg + Ramipril 2.5mg/5mg	For essential hypertension in adult patients whose blood pressure is not adequately controlled on monotherapy	28.05.08
136	Doxercalciferol 0.5mcg/2.5mcg Soft Gelatin capsules	For the treatment of secondary hyperthyroidism in patients with chronic kidney disease on dialysis	29.05.08
137	Acebrophylline capsules 100mg	For the treatment of adult patients with chronic obstructive pulmonary disease and bronchial asthma	29.05.08
138	Sofalcone Capsule (100mg/50mg)	For the treatment of gastric ulcer and management of gastric mucosal lesions (erosion, hemorrhage, redness or edema) associated with acute gastritis or acute exacerbation of chronic gastritis	02.06.08

139	S(+) Etodolac ER tablets 200mg/300mg	For the relief of pain and inflammation in patients with rheumatoid arthritis and osteoarthritis	02.06.08
140	Diclofenac Sodium 50mg + Codeine Phosphate 50mg tablets	For the treatment of adult patients with signs & symptoms of acute painful conditions	02.06.08
141	Sodium Hyaluronate injectable gel (each 0.6ml. 1ml pre filled syringe contains, sodium Hyaluronate 20mg/ml, 22.5mg/ml	For intradermal implantation and facial soft tissue augmentation	03.06.08
142	Amphotericin B Lipid suspension injection (25mg/vial) with lipid suspension	For invasive fungal infection in patients who are refractory to or intolerant of conventional amphotericin B therapy	03.06.08
143	Dexrabeprazole 10mg (EC) + Domperidone 30mg SR Capsules	For the treatment of Gastroesophageal Reflux Disease (GERD) in patients not responding to dexrabeprazole alone	09.06.08
144	Thiocolchicoside 4mg/8mg + Ketoprofen 50mg/100mg tablets	For acute low back pain & other musculoskeletal painful and inflammatory condition in adults	11.06.08
145	Cefotaxime sodium + Sulbactam sodium for injection (Additional Indication)	For the treatment of lower respiratory tract infection in children	24.06.08
146	Artemether 40mg/80mg + Lumefantrine 240mg/480mg tablets (additional Strength)	Same as Approved	24.06.08
147	Ivabradine (Hcl.) 5mg/7.5mg Tablets	For the treatment of chronic stable angina pectoris in patients with normal sinus rhythm who have a contraindication or intolerance for Beta-blockers	03.07.08
148	Amino Acid, Glucose Parenteral Solution (Solution for intravenous infusion)	Indicated to meet daily requirement of nitrogen (amino acids), energy (glucose) for patients needing parenteral Nutrition	08.07.08
149	Temoporfin 1mg/ml Injection (Additional Strength)	Same as Approved	08.07.08
150	Pazufloxacin Mesylate i.v. infusion 300mg/100ml & 500mg/100ml	For the treatment of RTI, UTI and abdominal infections in adults	09.07.08

151	Metoprolol ER + Amlodipine tablets (Additional Indication)	For coronary artery disease/ischaemic heart disease	16.07.08
152	Fenofibril Disoproxil fumarate 300mg + Lamivudine 300mg + Efavirenz 600mg tablets		18.07.08
153	Vildagliptin 50mg/50mg/50mg + Metformin Hcl 500mg +850mg +1000mg tablets	For the treatment of type II diabetes mellitus when single drug therapy alongwith diet, exercise do not result in adequate glycemic control	21.07.08
154	Testosterone Undecanoate 250mg/ml Injection	For Testosterone replacement therapy of male hypogonadism when testosterone deficiency has been confirmed by clinical feature or biochemical tests	22.07.08
155	Abatacept powder for injection 250mg/vial	For adult patients with severe active rheumatoid arthritis who had an inadequate response to one more DMARDs such as methotrexate or TNF antagonists	22.07.08
156	Actarit 100mg Tablets	For the treatment of rheumatoid arthritis patients	22.07.08
157	Tenofovir Fumarate 300mg + Lamivudine 300mg + Efavirenz 600mg Tablets	For the treatment of HIV infection in adults	23.07.08
158	Bacillus Clausii Spores (2 Billion) Capsules (additional dosage form)	Same as Approved	23.07.08
159	Gatifloxacin 0.3% + Ketorolac Tromethamine 0.4% eye Drop	For reduction of post operative inflammatory condition of eyes	24.07.08
160	Ketorolac Tromethamine 4mg + Gatifloxacin 3mg Eye Drops	For the reduction of post operative inflammatory conditions of the eye	24.07.08
161	Cefadroxyl (as monohydrate) 125mg + Clavulanic acid (as potassium) 31.25 per 5ml Syrup (Additional strength)	Same as Approved	25.07.08

ABBREVIATION INDEX MIMS

This Index lists abbreviations adopted in MIMS for commonly used words, medical terminology and drug regulation symbols.

/.....	per
+ve	positive
-ve	negative
<	less than/below/under
>	greater than/above
¼.....	quarter
½.....	half
α.....	alpha
β.....	beta
γ.....	gamma
1st	first
2nd/3rd, etc ..	second/third, etc
A.....	Administration
Ab.....	antibody
ACE.....	angiotensin converting enzyme
ACTH.....	adrenocorticotrophic hormone
ADHD	Attention-Deficit Hyperactivity Disorder
AIDS.....	acquired immune deficiency syndrome
Ang II	angiotensin II antagonist
Al	aluminium/aluminum
AML.....	acute myeloid leukaemia
ammon.....	ammonium
amp	ampoule(s)
ANA.....	antinuclear antibodies
anesth	anesthesia/tic
approx.....	approximately
aq	aqueous
AR	Adverse Reactions
ATP	adenosine triphosphate
AV.....	atrio-ventricular
ave.....	average
BCG.....	Bacille Calmette-Guerin
bd/bid.....	twice daily
BMI.....	body mass index
BP.....	blood pressure
Br.....	bromide
BUN.....	blood urea nitrogen

C..... Contents
 Ca..... calcium
 cap capsule(s)
 CHD..... coronary heart disease
 CHF congestive heart failure
 childn children
 CI Contraindications
 Cl chloride
 CNS..... central nervous system
 CO₂ carbon dioxide
 compd..... compound(s)
 conc concentration
 COPD chronic obstructive pulmonary disease
 CPR..... cardiopulmonary resuscitation
 CrCl creatinine clearance
 CSF cerebrospinal fluid
 CT..... computed tomography
 CV..... cardiovascular
 CVA..... cerebrovascular accident
 CVS cardiovascular system
 D..... Dosage
 d- dextro
 DI Drug Interactions
 diHCl dihydrochloride
 DM..... diabetes mellitus
 DPT diphtheria pertussis tetanus
 drag..... dragee(s)
 DVT deep vein thrombosis
 E coli Escherichia coli
 ECG..... electrocardiogram
 EEG..... electroencephalogram
 eg for example
 ELISA..... enzyme-linked immunosorbent assay
 ENT ear, nose & throat
 equiv equivalent
 esp especially
 ESR erythrocyte sedimentation rate
 exam examination
 extr extract
 FBC full blood count
 Fe iron
 flu influenza
 FSH follicle-stimulating hormone
 g gram(s)
 G6PD..... glucose-6-phosphate dehydrogenase
 gal gallon
 GERD gastro-oesophageal reflux disease
 GFR..... glomerular filtration rate
 GI..... gastrointestinal

GIT..... gastrointestinal tract
 gm+ve gram-positive
 gm-ve..... gram-negative
 GRH..... growth hormone releasing hormone
 GUT..... genito-urinary tract
 H-influenza Haemophilus influenza
 HAV..... hepatitis A virus
 Hb..... haemoglobin
 HBr..... hydrobromide
 HBsAg..... hepatitis B surface antigen
 HBV..... hepatitis B virus
 HCG..... human chorionic gonadotrophin
 HCl hydrochloride
 HCV..... hepatitis C virus
 HDL high-density lipoprotein
 Hg..... mercury
 HGH..... human growth hormone
 Hib Haemophilus influenza type B
 HIV..... human immunodeficiency virus
 h/hr/hrly hour(s)/hourly
 HSV herpes simplex virus
 HTN hypertension
 HZV herpes zoster virus
 I..... Indications
 IA intra-articular
 IB intrabursal
 ICU intensive care unit
 IDDM insulin-dependent diabetes mellitus
 Ig immunoglobulin
 IgA..... immunoglobulin A
 IM..... intramuscular
 INH isoniazid (isonicotine hydrazine)
 INR international normalised ratio
 inj inject/injection
 IP intra-peritoneal
 ipecac ipecacuanha
 IS intrasynovial
 iu international unit(s)
 IUD intrauterine contraceptive device
 IV intravenous
 K..... potassium
 kCal kilocalorie
 kg kilogram
 L litre
 l- laevo
 LDL..... low-density lipoprotein
 LH..... luteinising hormone/luteinizing hormone
 Liqd/liq..... liquid
 lit literature

LMWH low molecular weight heparin
 loz..... lozenge(s)
 m- meso
 MAOI(s)..... monoamine oxidase inhibitor(s)
 max maximum
 mcg microgram
 MDI..... metered dose inhaler
 Mg magnesium
 mg milligram
 MI..... myocardial infarction
 min minimum/minute(s)
 MIU..... million international units
 mixt mixture
 mL millilitre
 mmol..... millimole
 monoHCl..... monohydrochloride
 MRI..... magnetic resonance imaging
 MRSA..... methicillin-resistant *Staphylococcus aureus*
 mth/mthly month(s)/monthly
 MU..... million units
 Na..... sodium
 NIDDM..... non-insulindependent diabetes mellitus
 NSAID(s) nonsteroidal anti-inflammatory drug(s)
 O & G obstetrics & gynaecology
 O2 oxygen
 obstet..... obstetrics
 OC oral contraceptives/oral contraception
 OH hydroxide
 oint ointment
 ophth..... ophthalmic
 P plasmodium/Phosphorous
 p- para
 P/P..... Presentation & Packing
 PABA para-aminobenzoic acid
 paed/ped..... paediatric/pediatric
 phenobarb.... phenobarbitone
 PMT..... premenstrual tension
 PO oral administration
 post-op post-operative
 powd powder
 PPNG penicillinaseproducing *Neisseria gonorrhoea*
 premed..... premedication
 pre-op pre-operative
 prep..... preparation(s)
 PUVA..... psoralen + ultraviolet A
 qds/qid..... four times daily
 RA rheumatoid arthritis
 RBC..... red blood cells
 resp respiratory

S/Staph Staphylococcus
 SA..... sino-atrial
 SC..... subcutaneous
 SGOT serum glutamic oxaloacetic transaminase,
 or AST aspartate aminotransferase
 SGPT serum glutamic pyruvic transaminase,
 or ALT..... alanine aminotransferase
 SLE..... systemic lupus erythematosus
 soln solution
 SP..... Special Precautions
 spp species
 SR..... slow release/sustained-release
 STD sexually transmitted disease(s)
 Strep Streptococcus
 supp..... suppository
 susp suspension
 syr syrup
 tab tablet(s)
 TB..... tuberculosis
 tbsp (15 mL) tablespoonful
 tds/tid..... three times daily
 temp..... temperature
 tinct tincture
 TPN total parenteral nutrition
 TSH thyroid-stimulating hormone
 tsp (5 mL)teaspoonful
 TTS..... transdermal therapeutic system
 u unit(s)
 UTI..... urinary tract infection
 UV..... ultraviolet
 vag vaginal
 VD..... venereal disease
 vit vitamin(s)
 VLDL very low-density lipoprotein
 vol volume
 VTE..... venous thromboembolism
 w/..... with
 w/draw withdraw
 w/in..... within
 w/o..... without
 w/v..... weight in volume
 w/w..... weight in weight
 WBC..... white blood cells
 wk/wkly week(s)/weekly
 wt..... weight
 yr/yrly..... year(s)/yearly
 Zn zinc

National Essential Drugs List, India

Indian National EDL 2003

In the 2003 Essential Drug List of India, there were 354 essential drugs. In an attempt to keep the price of essential medicines under check, the Centre, in 2003, added 75 new medicines to the essential drugs list after reviewing the Pharmaceutical Policy-2002. The updated 2007 Essential Drugs List will be added in a later release of this eBook (as I was unable to find it on the WHO India website).

A

1. Acenocoumarol
2. Acetazolamide
3. Acetyl Salicylic Acid
4. Acriflavin+Glycerin
5. Actinomycin D
6. Activated Charcoal
7. Acyclovir
8. Adenosine
9. Adrenaline Bitartrate
10. Albendazole
11. Albumin
12. Allopurinol
13. Alpha Interferon
14. Alprazolam
15. Aluminium Hydroxide + Magnesium Hydroxide
16. Amikacin
17. Aminophylline
18. Amiodarone
19. Amitriptyline
20. Amlodipine
21. Amoxicillin
22. Amphotericin B
23. Ampicillin
24. Antisnake Venom
25. Anti-D Immunoglobulin (Human)
26. Antitetanus Human Immunoglobulin
27. Artesunate

- 28. Ascorbic Acid
- 29. Atenolol
- 30. Atracurium Besylate
- 31. Atropine Sulphate
- 32. Azathioprine
- 33. Azithromycin

B

- 34. B.C.G Vaccine
- 35. Barium Sulphate
- 36. Beclomethasone Dipropionate
- 37. Benzathine Benzylpenicillin
- 38. Benzoic Acid + Salicylic Acid
- 39. Benzoin Compound
- 40. Benzyl Benzoate
- 41. Benzylpenicillin
- 42. Betamethasone Dipropionate
- 43. Betaxolol Hydrochloride
- 44. Bisacodyl
- 45. Bleaching Powder
- 46. Bleomycin
- 47. Bretylium Tosylate
- 48. Bromocriptine Mesylate
- 49. Bupivacaine Hydrochloride
- 50. Busulphan

C

- 51. Calamine
- 52. Calcium Gluconate
- 53. Calcium Iodate
- 54. Calcium salts
- 55. Carbamazepine
- 56. Carbimazole
- 57. Cefotaxime
- 58. Ceftazidime
- 59. Ceftriaxone
- 60. Cefuroxime
- 61. Centchroman
- 62. Cephalexin
- 63. Cetrимide
- 64. Chloramphenicol
- 65. Chlorhexidine
- 66. Chloroquine Phosphate
- 67. Chlorpheniramine Maleate
- 68. Chlorpromazine Hydrochloride
- 69. Clorthalidone
- 70. Ciprofloxacin Hydrochloride
- 71. Cisplatin
- 72. Clarithromycin

- 73. Clofazimine
- 74. Clomiphene Citrate
- 75. Clomipramine Hydrochloride
- 76. Clonidine Hydrochloride
- 77. Clotrimazole
- 78. Cloxacillin
- 79. Coal Tar
- 80. Codeine Phosphate
- 81. Colchicine
- 82. Condoms
- 83. Co-Trimoxazole (Trimethoprim + Sulphamethoxazole)
- 84. Cryoprecipitate
- 85. Cyanocobalamin
- 86. Cyclophosphamide
- 87. Cyclosporine
- 88. Cytosine Arabinoside

D

- 89. D.P.T Vaccine
- 90. Danazol
- 91. Dapsone
- 92. Desferrioxamine Mesylate
- 93. Dexamethasone
- 94. Dexchlorpheniramine Maleate
- 95. Dextran-40
- 96. Dextran-70
- 97. Dextromethorphan
- 98. Diazepam
- 99. Diclofenac
- 100. Dicyclomine Hydrochloride
- 101. Didanosine
- 102. Diethylcarbamazine Citrate
- 103. Digoxin
- 104. Dihydroergotamine
- 105. Diloxanide Furoate
- 106. Diltiazem
- 107. Dimercaprol
- 108. Diphtheria Antitoxin
- 109. Dithranol
- 110. Dobutamine
- 111. Domperidone
- 112. Dopamine Hydrochloride
- 113. Doxapram
- 114. Doxorubicin
- 115. Doxycycline

E

- 116. Efavirenz
- 117. Enalapril Maleate

- 118. Erythromycin Estolate
- 119. Esmolol
- 120. Ethambutol
- 121. Ether, Anaesthetic
- 122. Ethinylestradiol + Levonorgesterol
- 123. Ethinylestradiol + Norethisterone
- 124. Ethinylestradiol
- 125. Ethyl Alcohol 70%
- 126. Ethyl Chloride
- 127. Etoposide

F

- 128. 5-Fluorouracil
- 129. Factor IX Complex (Coagulation Factors II, VII, IX, X)*
- 130. Factor VIII Concentrate
- 131. Ferrous Salt
- 132. Fluconazole
- 133. Flucytosine
- 134. Flumazenil
- 135. Fluorescein
- 136. Fluoxetine Hydrochloride
- 137. Flutamide
- 138. Folic Acid
- 139. Folinic Acid
- 140. Formaldehyde IP
- 141. Framycetin Sulphate
- 142. Fresh Frozen Plasma
- 143. Furazolidone
- 144. Furosemide

G

- 145. Gamma Benzene Hexachloride
- 146. Gemcitabine Hydrochloride
- 147. Gentamicin
- 148. Gentian Violet
- 149. Glibenclamide
- 150. Glucagon
- 151. Glucose with Sodium Chloride
- 152. Glucose
- 153. Glutaraldehyde
- 154. Glycerin
- 155. Glyceryl Trinitrate
- 156. Griseofulvin

H

- 157. Haloperidol
- 158. Halothane
- 159. Heparin Sodium
- 160. Hepatitis B Vaccine

- 161. Homatropine
- 162. Hormone Releasing IUD
- 163. Hydrochlorothiazide
- 164. Hydrocortisone Sodium Succinate
- 165. Hydrogen Peroxide
- 166. Hydroxyethyl Starch (Hetastarch)
- 167. Hyoscine Butyl Bromide

I

- 168. Ibuprofen
- 169. Imipramine
- 170. Indinavir
- 171. Insulin Injection (Soluble)
- 172. Intermediate Acting Insulin (Lente/NPH Insulin)
- 173. Intraperitoneal Dialysis Solution
(of approximate composition)
- 174. Iodine
- 175. Iopanoic Acid
- 176. Iron Dextran
- 177. Isoflurane
- 178. Isoniazid
- 179. Isoprenaline Hydrochloride
- 180. Isosorbide 5 Mononitrate/Dinitrate
- 181. Isoxsuprine Hydrochloride
- 182. Isphaghula
- 183. IUD containing Copper

K

- 184. Ketamine Hydrochloride
- 185. Ketoconazole

L

- 186. L- Asparaginase
- 187. Lamivudine + Zidovudine
- 188. Lamivudine +Nevirapine + Stavudine
- 189. Lamivudine
- 190. Levodopa+ Carbidopa
- 191. Levothyroxine
- 192. Lignocaine Hydrochloride + Adrenaline
- 193. Lignocaine Hydrochloride
- 194. Lignocaine
- 195. Lithium Carbonate
- 196. Local Anaesthetic, Astringent and Antiinflammatory Medicines
- 197. Loperamide (Contraindicated for paediatric use)
- 198. Losartan Potassium

M

- 199. Magnesium Sulphate
- 200. Mannitol

201. Measles Vaccine
202. Mebendazole
203. Medroxy Progesterone Acetate
204. Meglumine Iothalamate
205. Meglumine Iotroxate
206. Melphalan
207. Menadione Sodium Sulphite
208. Mercaptopurine
209. Metformin
210. Methotrexate
211. Methyl Cellulose
212. Methyl Ergometrine
213. Methyldopa
214. Methylprednisolone
215. Methylrosanilinium Chloride (Gentian Violet)
216. Methylthioninium Chloride (Methylene blue)
217. Metoclopramide
218. Metoprolol
219. Metronidazole
220. Mexiletine Hydrochloride
221. Miconazole
222. Midazolam
223. Mifepristone
224. Mitomycin-C
225. Morphine Sulphate
226. Multivitamins

N

227. N/2 Saline
228. N/5 Saline
229. Nalidixic Acid
230. Naloxone
231. Nelfinavir
232. Neomycin + Bacitracin
233. Neostigmine
234. Nevirapine
235. Niclosamide
236. Nicotinamide
237. Nifedipine
238. Nitrazepam
239. Nitrofurantoin
240. Nitrous Oxide
241. Norethisterone
242. Norfloxacin
243. Normal Saline
244. Nystatin

O

245. Ofloxacin

- 246. Omeprazole
- 247. Ondansetron
- 248. Oral Poliomyelitis Vaccine (Live Attenuated)
- 249. Oral Rehydration Salts
- 250. Oxygen
- 251. Oxytocin

P

- 252. Paclitaxel
- 253. Pancuronium Bromide
- 254. Paracetamol
- 255. Penicillamine
- 256. Pentamidine Isothionate
- 257. Pentazocine
- 258. Pethidine Hydrochloride
- 259. Pheniramine Maleate
- 260. Phenobarbitone
- 261. Phenylephrine
- 262. Phenytoin Sodium
- 263. Physostigmine Salicylate
- 264. Phytomenadione
- 265. Pilocarpine
- 266. Platelet Rich Plasma
- 267. Polygeline
- 268. Potassium Chloride
- 269. Potassium Permanganate
- 270. Povidone Iodine
- 271. Pralidoxime Chloride (2-PAM)
- 272. Praziquantel
- 273. Prednisolone
- 274. Prednisolone Acetate
- 275. Prednisolone Sodium Phosphate
- 276. Primaquine
- 277. Procainamide Hydrochloride
- 278. Procaine Benzylpenicillin
- 279. Procarbazine
- 280. Prochlorperazine
- 281. Promethazine
- 282. Propranolol Hydrochloride
- 283. Propranolol
- 284. Propylidone
- 285. Protamine Sulphate
- 286. Pyrantel Pamoate
- 287. Pyrazinamide
- 288. Pyridostigmine Bromide
- 289. Pyridoxine
- 290. Pyrimethamine

Q

- 291. Quinidine
- 292. Quinine Sulphate

R

- 293. Rabies Immunoglobulin
- 294. Rabies Vaccine
- 295. Raloxifene
- 296. Ranitidine Hydrochloride
- 297. Riboflavin
- 298. Rifampicin
- 299. Ringer Lactate
- 300. Ritonavir
- 301. Roxithromycin

S

- 302. Salbutamol Sulphate
- 303. Salicylic Acid
- 304. Saquinavir
- 305. Silver Nitrate
- 306. Silver Sulphadiazine
- 307. Sodium Meglumine Diatrizoate
- 308. Sodium Bicarbonate
- 309. Sodium Iothalamate
- 310. Sodium Nitrite
- 311. Sodium Nitroprusside*
- 312. Sodium Stibogluconate
- 313. Sodium Thiosulphate
- 314. Sodium Valproate
- 315. Spironolactone
- 316. Stavudine
- 317. Streptokinase
- 318. Streptomycin Sulphate
- 319. Succinyl Choline Chloride
- 320. Sulfadoxine +Pyrimethamine
- 321. Sulfasalazine
- 322. Sulphacetamide Sodium
- 323. Sulphadiazine

T

- 324. Tamoxifen Citrate
- 325. Terazosin
- 326. Terbutaline Sulphate
- 327. Testosterone
- 328. Tetanus Toxoid
- 329. Tetracaine Hydrochloride
- 330. Tetracycline Hydrochloride
- 331. Tetracycline
- 332. Theophylline Compounds
- 333. Thiacetazone + Isoniazid

- 334. Thiamine
- 335. Thiopentone Sodium
- 336. Timolol Maleate
- 337. Tinidazole
- 338. Trifluoperazine
- 339. Trihexyphenidyl Hydrochloride
- 340. Trimethoprim
- 341. Tropicamide
- 342. Tuberculin, Purified Protein Derivative

U

- 343. Urokinase

V

- 344. Vancomycin Hydrochloride
- 345. Verapamil
- 346. Vinblastine Sulphate
- 347. Vincristine
- 348. Vitamin A
- 349. Vitamin D3 (Ergocalciferol)

W

- 350. Warfarin Sodium
- 351. Water for Injection

X

- 352. Xylometazoline

Z

- 353. Zidovudine
- 354. Zinc Oxide

For further details and new additions, consult WHO India.

Website : whoindia.org/en/section2/section5/section68.htm

Note: WHO releases new Essential Drugs List every 2 years. Individual countries update their list whenever required. WHO India website lists the 2003 list as the latest Indian List as of August 2010.

([\[all drugs\]](#))

- 1. Gastrointestinal & hepatobiliary system
 - 1a. Antacids, Antireflux Agents & Antiulcerants
 - 1b. GIT Regulators, Antiflatulents & Anti-Inflammatories
 - 1c. Antispasmodics
 - 1d. Antidiarrheals
 - 1e. Laxatives, Purgatives
 - 1f. Digestives
 - 1g. Cholagogues, Cholelitholytics & Hepatic Protectors
 - 1h. Anorectal Preparations
 - 1i. Antiemetics
 - 1j. Other Gastrointestinal Drugs
- 2. Cardiovascular & hematopoietic system
 - 2a. Cardiac Drugs
 - 2b. Anti-Anginal Drugs
 - 2c. ACE Inhibitors
 - 2d. Beta-Blockers
 - 2e. Calcium Antagonists
 - 2f. Angiotensin II Antagonists
 - 2g. Other Antihypertensives
 - 2h. Diuretics
 - 2i. Antidiuretics
 - 2j. Peripheral Vasodilators & Cerebral Activators
 - 2k. Vasoconstrictors
 - 2l. Dyslipidaemic Agents
 - 2m. Haemostatics
 - 2n. Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
 - 2p. Phlebitis & Varicose Preparations
 - 2q. Haemorrheologicals
 - 2r. Haematopoietic Agents
 - 2s. Other Cardiovascular Drugs
- 3. Respiratory system
 - 3a. Respiratory Stimulants
 - 3b. Antiasthmatic & COPD Preparations
 - 3c. Cough & Cold Preparations
 - 3d. Nasal Decongestants & Other Nasal Preparations
 - 3e. Other Drugs Acting on the Respiratory System
- 4. Central Nervous System
 - 4a. Anxiolytics
 - 4b. Hypnotics & Sedatives

- 4c. Antidepressants
- 4d. Antipsychotics
- 4e. Anticonvulsants
- 4f. Other CNS Drugs & Agents for ADHD
- 4g. Neurodegenerative Disease Drugs
- 4h. Antiparkinsonian Drugs
- 4i. Antivertigo Drugs
- 4j. Analgesics (Opioid)
- 4k. Analgesics (Non-Opioid) & Antipyretics
- 4l. Nonsteroidal Anti-Inflammatory Drugs (NSAIDs)
- 4m. Drugs For Neuropathic Pain
- 4n. Antimigraine Preparations
- 4p. Nootropics & Neurotonics
- 5. Musculo-Skeletal System
 - 5a. Disease-Modifying Anti-Rheumatic Drugs (DMARDs)
 - 5b. Hyperuricemia & Gout Preparations
 - 5c. Muscle Relaxants
 - 5d. Anti-Inflammatory Enzymes
 - 5e. Neuromuscular Disorder Drugs
 - 5f. Other Drugs Acting on Musculo-Skeletal System
- 6. Hormones
 - 6a. Androgens & Related Synthetic Drugs
 - 6b. Oestrogens & Progestones & Related Synthetic Drugs
 - 6c. Combined Sex Hormones
 - 6d. Corticosteroid Hormones
 - 6e. Trophic Hormones & Related Synthetic Drugs
 - 6f. Anabolic Agents
 - 6g. Other Drugs Affecting Hormonal Regulation
- 7. Contraceptive agents
 - 7a. Oral Contraceptives
 - 7b. Depot Contraceptives
 - 7c. Other Contraceptives
- 8. Anti-Infectives (Systemic)
 - 8a. Aminoglycosides
 - 8b. Cephalosporins
 - 8c. Penicillins
 - 8d. Other Beta-Lactams
 - 8e. Chloramphenicols
 - 8f. Macrolides
 - 8g. Quinolones
 - 8h. Tetracyclines
 - 8i. Sulphonamides
 - 8j. Antibacterial Combinations
 - 8k. Other Antibiotics
 - 8l. Anti-TB Agents
 - 8m. Antileprotics
 - 8n. Antifungals
 - 8p. Antivirals
 - 8q. Anthelmintics

- 8r. Antimalarials
- 8s. Antiamoebics
- 8t. Other Antiprotozoal Agents
- 9. Oncology
 - 9a. Cytotoxic Chemotherapy
 - 9b. Hormonal Chemotherapy
 - 9c. Immunological Chemotherapy
 - 9d. Targeted Cancer Therapy
 - 9e. Supportive Care Therapy
- 10. Genito-urinary system
 - 10a. Preparations for Vaginal Conditions
 - 10b. Urinary Antiseptics
 - 10c. Drugs Acting on the Uterus
 - 10d. Drugs for Erectile Dysfunction
 - 10e. Drugs for Bladder & Prostate Disorders
 - 10f. Other Drugs Acting on the Genito-Urinary System
- 11. Endocrine & metabolic system
 - 11a. Insulin Preparations
 - 11b. Antidiabetic Agents
 - 11c. Thyroid Hormones
 - 11d. Antithyroid Agents
 - 11e. Anti-Obesity Agents
 - 11f. Agents Affecting Bone Metabolism
 - 11g. Other Agents Affecting Metabolism
- 12. Vitamins & minerals
 - 12a. Vitamins A, D & E
 - 12b. Vitamin B-Complex / with C
 - 12c. Vitamin C
 - 12d. Calcium/with Vitamins
 - 12e. Vitamins &/or Minerals
 - 12f. Vitamins & Minerals (Geriatric)
 - 12g. Vitamins & Minerals (Paediatric)
 - 12h. Vitamins & Minerals (Pre & Post Natal) / Antianemics
- 13. Nutrition
 - 13a. Infant Nutritional Products
 - 13b. Enteral/Nutritional Products
 - 13c. Parenteral Nutritional Products
 - 13d. Electrolytes
 - 13e. Appetite Enhancers
 - 13f. Supplements & Adjuvant Therapy
- 14. Eye
 - 14a. Eye Anti-Infectives & Antiseptics
 - 14b. Eye Antiseptics with Corticosteroids
 - 14c. Eye Corticosteroids
 - 14d. Mydriatic Drugs
 - 14e. Miotic Drugs
 - 14f. Antiglaucoma Preparations
 - 14g. Ophthalmic Decongestants, Anesthetics, Anti-Inflammatories
 - 14h. Ophthalmic Lubricants

- 14i. Other Eye Preparations
- 15. Ear & Mouth / Throat
 - 15a. Ear Anti-Infectives & Antiseptics
 - 15b. Ear Antiseptics with Corticosteroids
 - 15c. Ear Corticosteroids
 - 15d. Other Ear Preparations
 - 15e. Mouth/Throat Preparations
- 16. Dermatologicals
 - 16a. Topical Antibiotics
 - 16b. Topical Antifungals & Antiparasites
 - 16c. Topical Antivirals
 - 16d. Topical Anti-Infectives with Corticosteroids
 - 16e. Topical Corticosteroids
 - 16f. Acne Treatment Preparations
 - 16g. Topical Antihistamines/Antipruritics
 - 16h. Psoriasis, Seborrhea & Ichthyosis Preparations
 - 16i. Keratolytics
 - 16j. Emollients & Skin Protectives
 - 16k. Skin Antiseptics & Disinfectants
 - 16l. Medicated Surgical Dressings
 - 16m. Other Dermatologicals
- 17. Anaesthetics- local & general
- 18. Allergy & immune system
 - 18a. Antihistamines & Antiallergics
 - 18b. Vaccines, Antisera & Immunologicals
 - 18c. Immunosuppressants
- 19. Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence
- 20. Intravenous & other sterile solutions
- 21. Miscellaneous

Alphabetical Listing of all generic drugs

(A)

[abacavir](#)
[acarbose](#)
[aceclofenac](#)
[aceclofenac + paracetamol](#)
[acenocoumarol](#)
[acetazolamide](#)
[acetylcysteine](#)
[aciclovir](#)
[acitretin](#)
[aclarubicin](#)
[adapalene](#)
[adefovir dipivoxil](#)
[adenosine](#)
[albendazole](#)
[alendronic acid](#)
[alfacalcidol](#)
[alfuzosin](#)
[allopurinol](#)
[allylestrenol](#)
[alpha-lipoic acid](#)
[alprazolam](#)
[alprostadiol](#)
[alteplase](#)
[aluminium hydroxide](#)
[amantadine](#)
[ambroxol](#)
[amifostine](#)
[amikacin](#)
[amiloride + hydrochlorothiazide](#)
[aminobenzoic acid](#)
[aminocaproic acid](#)
[aminophylline](#)
[amiodarone](#)
[amisulpride](#)
[amitriptyline](#)
[amlodipine](#)
[amlodipine + atenolol](#)
[amlodipine + atorvastatin](#)
[amlodipine + benazepril](#)

[amlodipine + enalapril](#)
[amlodipine + lisinopril](#)
[amlodipine + losartan](#)
[amoxapine](#)
[amoxicillin](#)
[amoxicillin + bromhexine](#)
[amoxicillin + carbocisteine](#)
[amoxicillin + clavulanic acid](#)
[amoxicillin + cloxacillin](#)
[amphotericin b](#)
[ampicillin](#)
[ampicillin + cloxacillin](#)
[ampicillin + sulbactam](#)
[amrinone](#)
[anastrozole](#)
[aprotinin](#)
[aripiprazole](#)
[arteether](#)
[artemether](#)
[artesanate](#)
[ascorbic acid](#)
[asparaginase](#)
[aspirin](#)
[aspirin + clopidogrel](#)
[aspirin + dipyridamole](#)
[aspirin + ticlopidine](#)
[astemizole](#)
[atenolol](#)
[atenolol + chlortalidone](#)
[atenolol + nifedipine](#)
[atomoxetine](#)
[atorvastatin](#)
[atorvastatin + ezetimibe](#)
[atorvastatin + fenofibrate](#)
[atracurium besilate](#)
[atropine](#)
[azathioprine](#)
[azelaic acid](#)
[azelastine](#)
[azithromycin](#)
[aztreonam](#)

(A)

(B)

[baclofen](#)
[balsalazide](#)
[bambuterol hydrochloride](#)
[basiliximab](#)
[beclometasone](#)
[benazepril](#)

[benfotiamine](#)
[benzocaine](#)
[benzoyl peroxide](#)
[benzylamine](#)
[betahistine](#)
[betamethasone](#)
[betamethasone + neomycin](#)
[betamethasone dipropionate + clotrimazole](#)
[betamethasone dipropionate + salicylic acid](#)
[betaxolol](#)
[bethanechol chloride](#)
[bezafibrate](#)
[bicalutamide](#)
[bisacodyl](#)
[bisoprolol](#)
[bivalirudin](#)
[bleomycin](#)
[bortezomib](#)
[brimonidine](#)
[bromhexine](#)
[bromocriptine](#)
[budesonide](#)
[bupivacaine](#)
[buprenorphine](#)
[bupropion hydrochloride](#)
[buspirone](#)
[busulfan](#)
[butenafine](#)

(B)

(C)

[cabergoline](#)
[calamine](#)
[calcitonin, salmon](#)
[calcitriol](#)
[calcium carbonate](#)
[calcium carbonate + vitamin d3](#)
[calcium citrate + vitamin d3](#)
[calcium dobesilate](#)
[calcium folinate](#)
[camylofin](#)
[candesartan](#)
[capecitabine](#)
[capreomycin](#)
[captopril](#)
[captopril + hydrochlorothiazide](#)
[carbamazepine](#)
[carbidopa + levodopa](#)
[carbimazole](#)
[carboplatin](#)

[carboprost](#)
[carisoprodol](#)
[carvedilol](#)
[cefaclor](#)
[cefadroxil](#)
[cefalexin](#)
[cefazolin](#)
[cefdinir](#)
[cefepime](#)
[cefetamet](#)
[cefixime](#)
[cefoperazone](#)
[cefoperazone + sulbactam](#)
[cefotaxime](#)
[cefotaxime + sulbactam](#)
[cefpirone](#)
[cefpodoxime](#)
[cefprozil](#)
[ceftazidime](#)
[ceftizoxime](#)
[ceftriaxone](#)
[ceftriaxone + tazobactam](#)
[cefuroxime](#)
[celecoxib](#)
[cetirizine + pseudoephedrine](#)
[cetirizine hydrochloride](#)
[cetrimide](#)
[chlorambucil](#)
[chloramphenicol](#)
[chlordiazepoxide](#)
[chlordiazepoxide + clidinium bromide](#)
[chlorhexidine](#)
[chloroquine](#)
[chlorphenamine](#)
[chlorpromazine](#)
[chlortalidone](#)
[chlorzoxazone](#)
[cholecalciferol](#)
[choline salicylate](#)
[chorionic gonadotrophin](#)
[chymotrypsin](#)
[ciclopirox](#)
[ciclosporin](#)
[cilostazol](#)
[cimetidine](#)
[cinnarizine](#)
[cinnarizine + domperidone](#)
[ciprofloxacin](#)
[ciprofloxacin + tinidazole](#)

[cisapride](#)
[cisplatin](#)
[citalopram](#)
[citicoline](#)
[clarithromycin](#)
[clemastine](#)
[clindamycin](#)
[clioquinol](#)
[clobazam](#)
[clobetasol](#)
[clobetasone](#)
[clofazimine](#)
[clomifene](#)
[clomipramine](#)
[clonazepam](#)
[clonidine](#)
[clopamide](#)
[clopidogrel](#)
[clotrimazole](#)
[cloxacillin](#)
[clozapine](#)
[coal tar](#)
[codeine](#)
[co-dergocrine mesylate](#)
[colchicine](#)
[colistin sulfate](#)
[crotamiton](#)
[cyclandelate](#)
[cyclopentolate](#)
[cyclophosphamide](#)
[cycloserine](#)
[cyproheptadine](#)
[cytarabine](#)

(C)

(D)

[dacarbazine](#)
[daclizumab](#)
[dactinomycin](#)
[dalteparin sodium](#)
[danazol](#)
[dapsone](#)
[daunorubicin](#)
[deferiprone](#)
[deferoxamine](#)
[deflazacort](#)
[demeclocycline](#)
[dequalinium](#)
[desloratadine](#)
[desmopressin](#)

[dexamethasone](#)
[dexchlorpheniramine](#)
[dexibuprofen](#)
[dextromethorphan](#)
[dextropropoxyphene](#)
[dextrose](#)
[diacerein](#)
[diazepam](#)
[diclofenac](#)
[diclofenac + paracetamol](#)
[dicycloverine hydrochloride](#)
[didanosine](#)
[diethylcarbamazine](#)
[digoxin](#)
[diltiazem hydrochloride](#)
[dimenhydrinate](#)
[dimercaprol](#)
[dimeticone](#)
[dinoprostone](#)
[diphenhydramine](#)
[dipyridamole](#)
[dipyrrone](#)
[disopyramide](#)
[disulfiram](#)
[divalproex sodium](#)
[dobutamine](#)
[docetaxel](#)
[docusates](#)
[domperidone](#)
[domperidone + paracetamol](#)
[donepezil](#)
[dopamine](#)
[dorzolamide](#)
[dosulepin](#)
[doxapram](#)
[doxazosin](#)
[doxepin](#)
[doxofylline](#)
[doxorubicin](#)
[doxycycline](#)
[doxylamine + pyridoxine](#)
[droperidol](#)
[drotaverine](#)
[duloxetine](#)
[dutasteride](#)
[dydrogesterone](#)

(D)

(E)

[ebastine](#)

[efavirenz](#)
[enalapril](#)
[enalapril + hydrochlorothiazide](#)
[enoxaparin](#)
[eperisone](#)
[ephedrine](#)
[epinephrine](#)
[epirubicin](#)
[eptifibatide](#)
[erdosteine](#)
[ergometrine](#)
[ergotamine](#)
[erythromycin](#)
[erythropoietin](#)
[escitalopram](#)
[esmolol](#)
[esomeprazole](#)
[estradiol](#)
[estrogens](#)
[etamsylate](#)
[ethacridine lactate](#)
[ethambutol](#)
[ethinylestradiol](#)
[ethionamide](#)
[etidronate](#)
[etodolac](#)
[etoposide](#)
[etoricoxib](#)
[exemestane](#)
[ezetimibe](#)

(E)

(F)

[famciclovir](#)
[famotidine](#)
[felodipine](#)
[fenofibrate](#)
[fenoverine](#)
[fentanyl](#)
[ferrous fumarate](#)
[ferrous fumarate + folic acid](#)
[fexofenadine](#)
[filgrastim](#)
[finasteride](#)
[finasteride + tamsulosin](#)
[flavoxate](#)
[fluconazole](#)
[fludarabine phosphate](#)
[fludrocortisone](#)
[flunarizine](#)

[fluocinolone](#)
[fluorometholone](#)
[fluorouracil](#)
[fluoxetine](#)
[flupentixol](#)
[flupentixol + melitracen](#)
[fluphenazine](#)
[flurazepam](#)
[flurbiprofen](#)
[flutamide](#)
[fluticasone](#)
[fluvoxamine](#)
[folic acid](#)
[formoterol](#)
[fosfestrol](#)
[fosinopril](#)
[fosphenytoin](#)
[framycetin](#)
[furazolidone](#)
[furosemide](#)
[furosemide + amiloride](#)
[furosemide + spironolactone](#)
[fusidic acid](#)
(F)

(G)
[gabapentin](#)
[ganciclovir](#)
[gatifloxacin](#)
[gefitinib](#)
[gemcitabine](#)
[gemfibrozil](#)
[gemifloxacin](#)
[gentamicin](#)
[ginkgo biloba](#)
[glibenclamide](#)
[glibenclamide + metformin](#)
[gliclazide](#)
[glimepiride](#)
[glimepiride + metformin](#)
[glipizide](#)
[glipizide + metformin](#)
[glucaagon](#)
[glucosamine](#)
[glyceryl trinitrate](#)
[glycopyrronium bromide](#)
[goserelin](#)
[granisetron](#)
[griseofulvin](#)
[quaifenesin](#)

[guar gum](#)

(G)

(H)

[halcinonide](#)

[haloperidol](#)

[halothane](#)

[heparin](#)

[human albumin](#)

[human menopausal gonadotrophins](#)

[human normal immunoglobulin](#)

[hyaluronidase](#)

[hydrochlorothiazide](#)

[hydrocortisone](#)

[hydroquinone](#)

[hydrotalcite](#)

[hydroxyapatite compound](#)

[hydroxycarbamide](#)

[hydroxychloroquine](#)

[hydroxyprogesterone caproate](#)

[hydroxyzine](#)

[hyoscine](#)

(H)

(I)

[ibuprofen](#)

[ibuprofen + paracetamol](#)

[idoxuridine](#)

[ifosfamide](#)

[imatinib](#)

[imidapril](#)

[imipenem + cilastatin](#)

[imipramine](#)

[indapamide](#)

[indinavir](#)

[indometacin](#)

[infliximab](#)

[insulin](#)

[insulin aspart](#)

[insulin detemir](#)

[interferon alfa-2a](#)

[interferon alfa-2b](#)

[iohexol](#)

[iopromide](#)

[ipratropium bromide](#)

[irbesartan](#)

[irinotecan](#)

[iron polymaltose](#)

[isoniazid](#)

[isoprenaline](#)

[isosorbide dinitrate](#)
[isosorbide mononitrate](#)
[isosorbide mononitrate + aspirin](#)
[isotretinoin](#)
[isoxsuprine](#)
[itopride](#)
[itraconazole](#)
[ivermectin](#)
[ivermectin + albendazole](#)

(I)

(J)

No generic drugs with "J" were found.

(J)

(K)

[kanamycin](#)
[ketamine](#)
[ketoconazole](#)
[ketoprofen](#)
[ketorolac](#)
[ketotifen](#)

(K)

(L)

[labetalol](#)
[lacidipine](#)
[lactulose](#)
[lamivudine](#)
[lamivudine + zidovudine](#)
[lamotrigine](#)
[lansoprazole](#)
[lanthanum carbonate](#)
[latanoprost](#)
[latanoprost + timolol](#)
[leflunomide](#)
[lercanidipine](#)
[letrozole](#)
[leuprorelin](#)
[levamisole](#)
[levetiracetam](#)
[levobunolol](#)
[levocetirizine](#)
[levodopa](#)
[levofloxacin](#)
[levonorgestrel](#)
[levonorgestrel + ethinylestradiol](#)
[levosulpiride](#)
[levothyroxine sodium](#)
[lidocaine](#)
[lidocaine + epinephrine](#)

[lincomycin](#)
[lindane](#)
[linezolid](#)
[lisinopril](#)
[lisinopril + hydrochlorothiazide](#)
[lithium](#)
[lomefloxacin](#)
[lomustine](#)
[loperamide](#)
[lopinavir + ritonavir](#)
[loratadine](#)
[lorazepam](#)
[lornoxicam](#)
[losartan](#)
[losartan + hydrochlorothiazide](#)
[losartan + ramipril](#)
[loteprednol](#)
[lovastatin](#)
[loxapine](#)
(L)

(M)
[magnesium hydroxide](#)
[mannitol](#)
