Welcome to CIMS India (August 2010) by Dr.John (

<http://medical.fundazone.com>)

This is a medical drugs reference for India.

But note that medical drugs details are updated atleast monthly by organisations like MIMS and so this book

is already very outdated by the time you read this. Kindly refer to an up-to-date and current drug information book for any important decisions.

This eBook includes details of about 865 generic drugs available in India.

Details include Indications & dosage, Administration, Contraindications, Special Precautions, Adverse Drug Reactions,

Mechanism of action, CIMS class of drug, Pregnancy category, Brands available, etc

This is for demonstration purposes only and is not intended for application in life threatening or serious medical situations.

There might be errors in this eBook for which the author, distributor and CIMS will not take any responsibility.

By using this eBook, you agree to accept all liability arising out of any error in this book or caused directly or indirectly

by this book, including but not limited to illness, disease, toxicity, adverse effects,

death, damage caused to computers, mobiles or electronic devices, loss of electronic data, lost marks in exams and so on.

Consult a registered medical practitioner for advice about medical drugs and DO NOT self-medicate at any cost.

If you are a registered medical practitioner or pharmacist, kindly note that this is just a handy reference and might be error prone, so refer to an approved medical drugs reference guide for any prescription.

If you are a medical/pharmacy student, you may use this as a quick reference, but refer to textbooks for clarifications.

Click on the appropriate letters to browse the generic drugs.

abacavir

CIMS Class : (Antivirals)
abacavir

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related abacavir information

Indication & Dosage	<i>Oral</i> HIV infection Adult: Combined with other antiretrovirals: 300 mg bid or 600 mg once daily. Child: Combined with other antiretrovirals: >3 mth: 8 mg/kg bid. Max: 600 mg daily. Renal impairment: Avoid in end stage renal disease. Hepatic impairment: Child pugh category A: 200 mg bid. Avoid in moderate-severe impairment.
Administration	May be taken with or without food.
Contraindications	Moderate to severe renal and hepatic impairment; end stage renal disease; history of hypersensitivity reactions. Pregnancy and lactation.
Special Precautions	Renal or mild liver impairment; risk for liver impairment. Discontinued when hepatomegaly and unexplained metabolic acidosis develops, or liver function deteriorates. May impair ability to drive or engage in tasks requiring alertness. Discontinue treatment as soon as hypersensitivity is suspected.
Adverse Drug Reactions	Anorexia, headache, nausea, vomiting, diarrhoea, rash, fever, cough, dyspnoea, fatigue, malaise, lethargy, abdominal pain. Pancreatitis and elevated blood glucose and TG concentrations. Potentially Fatal: Severe hypersensitivity reactions.
Drug Interactions	Alcohol may cause decreased elimination of abacavir. Lactic acidosis with nucleoside analogues concomitantly. Decreased serum concentrations of methadone.
Pregnancy	Category C: Either studies in animals have revealed

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 20-25°C.
Mechanism of Action	Abacavir is converted to the active form carbovir triphosphate intracellularly. It competitively inhibits the reverse transcriptase of retroviruses interfering with HIV viral RNA-dependent DNA polymerase resulting in inhibition of viral replication. Absorption: Rapidly absorbed after oral administration with an oral bioavailability of about 80%. Distribution: 50% bound to plasma proteins. Crosses the blood brain barrier. Metabolism: Undergoes intracellular metabolism to carbovir triphosphate which is the active metabolite. Excretion: Elimination half-life: About 1.5 hr after a single oral dose. Elimination by hepatic metabolism mainly by alcohol dehydrogenase and glucuronidation. The metabolites are excreted mainly in the urine.
CIMS Class	Antivirals
ATC Classification	J05AF06 - abacavir; Belongs to the class of nucleoside and nucleotide reverse transcriptase inhibitors. Used in the systemic treatment of viral infections.

***abacavir information:**

Note that there are some more drugs interacting with abacavir

abacavir

abacavir brands available in India

Always prescribe with Generic Name : abacavir, formulation, and dose (along with brand name if required)

acarbose

CIMS Class : (Antidiabetic Agents)
acarbose

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related acarbose information

Indication & Dosage	<i>Oral</i> Type 2 diabetes mellitus Adult: Initially, 25 mg daily. May adjust dose at 4-8 wkly intervals based on tolerance and 1-hr post-prandial blood glucose levels. Maintenance dose: 50-100 mg tid. Max: =60 kg: 50 mg tid; >60 kg: 100 mg tid.	
	CrCl (ml/min)	Dosage Recommendation
	<25	Contra-indicated.
Administration	Should be taken with food. (Take w/ 1st bite of each main meal.)	
Overdosage	Symptoms: Transient increases in flatulence, diarrhoea and abdominal discomfort. Management: Patient should not be given drinks or meals containing carbohydrates for the next 4-6 hr.	
Contraindications	Patients <18 yr; diabetic ketoacidosis or cirrhosis; malabsorption; inflammatory bowel disease; with or pre-disposed to intestinal obstruction; intestinal diseases that affect digestion or absorption; conditions that worsen as a result of increased gas formation e.g. hernias; colonic ulcers; hepatic impairment; CrCl< 25 ml/min/1.73m ² . Pregnancy, lactation.	
Special Precautions	Monitor LFT every 3 mth for 1st yr and periodically thereafter especially for doses >50 mg tid. Reduce dose or withdraw therapy if transaminases elevations persist. If hypoglycaemia occurs, give glucose orally as a 1st aid measure. Adhere strictly to the prescribed diabetic diet to avoid intensification of GI symptoms.	
Adverse Drug	Flatulence, abdominal pain, distension, diarrhoea, nausea,	

Adverse Drug Reactions	Flatulence, abdominal pain, distension, diarrhoea, nausea, vomiting. Elevation of transaminases, hepatitis, jaundice. Rarely, skin reactions. Potentially Fatal: Hepatotoxicity.
Drug Interactions	Drugs that may increase blood glucose levels e.g. thiazides, steroids, chlorpromazine, atypical antipsychotics, may antagonise the action of acarbose. GI adsorbents and digestive enzyme preparations may reduce acarbose effects; avoid concomitant admin. Cholestyramine may enhance effects of acarbose. Effects of other hypoglycaemics may be potentiated by acarbose. Neomycin may enhance reduction of postprandial blood-glucose and intensify GI symptoms. Acarbose may reduce digoxin bioavailability. May interact with warfarin and affect INR. Increased risk of hypoglycaemia with disopyramide.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store below 25°C.
Mechanism of Action	Acarbose competitively and reversibly inhibits pancreatic α -amylase and intestinal brush border α -glucosidases, resulting in retardation of glucose absorption from hydrolysed complex carbohydrates and reduction of blood-glucose concentrations. Absorption: 35% absorbed from the GI tract (oral). Metabolism: Intestines by microbial flora and intestinal enzymes. Excretion: Via urine and faeces.
CIMS Class	Antidiabetic Agents
ATC Classification	A10BF01 - acarbose; Belongs to the class of α glucosidase inhibitors. Used in the treatment of diabetes.

aceclofenac

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
aceclofenac

P - Contraindicated in pregnancy

related aceclofenac information

Indication & Dosage	<i>Oral</i> Ankylosing spondylitis, Rheumatoid arthritis, Osteoarthritis Adult: 100 mg bid. Hepatic impairment: Reduce initial dose to 100 mg daily .
Administration	Should be taken with food. (Take w/ or immediately after meals.)
Overdosage	Management: Gastric lavage and treatment with activated charcoal. Treatment is supportive and symptomatic. Dialysis, haemoperfusion unlikely to be useful.
Contraindications	Hypersensitivity to aspirin or NSAIDs; moderate to severe renal impairment; pregnancy (3rd trimester); history of peptic ulceration or GI bleed; patients with infections.
Special Precautions	Cautiously administer to patients with GI disease, ulcerative colitis, Crohn's disease, haematological abnormalities, hepatic porphyria; history of bronchial asthma; history of heart failure or hypertension; mild renal, hepatic or cardiac impairment. May impair ability to drive or operate machinery. Elderly.
Adverse Drug Reactions	Diarrhoea, nausea, dyspepsia, abdominal pain, dizziness, rashes; increased LFTs. Potentially Fatal: Severe GI bleeding; nephrotoxicity; blood dyscrasias.
Drug Interactions	May increase plasma concentrations of lithium and digoxin. Increased nephrotoxicity when used with diuretics or ciclosporin. Monitor serum potassium when used with potassium-sparing diuretics and ACE inhibitors. May enhance activity of anticoagulants. May increase risk of methotrexate toxicity when administered within 24 hr of methotrexate admin. Increased risk of GI bleed with other

	or ciclosporin. Monitor serum potassium when used with potassium-sparing diuretics and ACE inhibitors. May enhance activity of anticoagulants. May increase risk of methotrexate toxicity when administered within 24 hr of methotrexate admin. Increased risk of GI bleed with other NSAIDs. Increased risk of convulsion with quinolones.
Storage	Oral: Store below 30°C.
Mechanism of Action	Aceclofenac, a phenylacetic acid derivative, has antiinflammatory and analgesic properties. It is a potent inhibitor of cyclo-oxygenase which is involved in the production of prostaglandins. Absorption: Well absorbed from the GI tract (oral); peak plasma concentrations after 1-3 hr. Distribution: Protein-binding: 99%. Excretion: Urine (as hydroxymetabolites); 4 hr (elimination half-life).
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AB16 - aceclofenac; Belongs to the class of acetic acid derivatives and related substances of non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism. M02AA25 - aceclofenac;

aceclofenac + paracetamol

CIMS Class : (Analgesics (Non-Opioid) & Antipyretics) , (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
aceclofenac + paracetamol

P - Contraindicated in pregnancy

Lab - Lab interference

related aceclofenac + paracetamol information

Indication & Dosage	<i>Oral</i> Pain and inflammation Adult: Each tablet contains aceclofenac 100 mg and paracetamol 500 mg: 1 tablet in the morning and 1 tablet in the evening. Max: 2 tablets/day.
Overdosage	Empty stomach promptly by gastric lavage or induction of emesis. Administer standard supportive measures.
Contraindications	Hypersensitivity. Moderate to severe renal or hepatic impairment; severe heart failure; pregnancy (third trimester).
Special Precautions	GI disease; renal or hepatic impairment; alcohol-dependent patients; asthma or allergic disorders; haemorrhagic disorders; hypertension; cardiac impairment. Elderly. Caution when driving or operating machinery. Monitor renal and hepatic function and blood counts during long term treatment. Persistently elevated hepatic enzyme levels may require drug withdrawal. Pregnancy, lactation.
Adverse Drug Reactions	Paracetamol: Nausea, allergic reactions, skin rashes, acute renal tubular necrosis. Aceclofenac: Diarrhoea, headache, vertigo, dizziness, nervousness, tinnitus, depression, drowsiness, insomnia; fever, angioedema, bronchospasm, rashes; blood dyscrasias. Potentially Fatal: Paracetamol: Very rare, blood dyscrasias (eg, thrombocytopaenia, leucopaenia, neutropaenia, agranulocytosis); liver damage. Aceclofenac: Severe GI bleeding; nephrotoxicity.
Drug Interactions	Paracetamol: Reduced absorption of cholestyramine within 1 hr of administration. Accelerated absorption with metoclopramide. Aceclofenac: May increase the plasma

	Paracetamol: Reduced absorption of cholestyramine within 1 hr of administration. Accelerated absorption with metoclopramide. Aceclofenac: May increase the plasma concentrations of lithium and digoxin. Increased nephrotoxicity with diuretics. Serum-potassium should be monitored when used with potassium-sparing diuretics. May enhance activity of anticoagulants. May increase plasma methotrexate levels leading to toxicity if administered within 2-4 hr of methotrexate admin. Risk of convulsions with quinolones. Potentially Fatal: Paracetamol: Increased risk of liver damage in chronic alcoholics. Increased risk of toxicity with high doses or long term admin of barbiturates, carbamazepine, hydantoins, isoniazid, rifampin and sulfinpyrazone.
Lab Interference	Aceclofenac interferes with thyroid function tests.
Mechanism of Action	Aceclofenac is a phenylacetic acid derivative that inhibits synthesis of the inflammatory cytokines interleukin-1b and tumour necrosis factor, and inhibits prostaglandin E2 production. It increases glycosaminoglycans (GAG) synthesis, the principal macromolecule of the extracellular matrix, which aids in repair and regeneration of articular cartilage. Thus, aceclofenac has +ve effects on cartilage anabolism combined with modulating effect of matrix catabolism. Paracetamol has analgesic and antipyretic action with weak anti-inflammatory activity. It produces analgesia by increasing pain threshold and antipyresis by acting on the hypothalamic heat-regulating centre. Absorption: Aceclofenac: Rapidly absorbed; almost 100% bioavailability; peak plasma levels reached about 1.25-3 hr after oral admin. Distribution: Aceclofenac: >99.7% bound to plasma proteins; distributes into synovial fluid. Paracetamol: Distributes throughout most fluids of the body. Metabolism: Aceclofenac: Probably metabolised by CYP2C9; average plasma elimination half-life: 4-4.3 hr. Paracetamol: Mainly metabolised hepatically; plasma elimination half-life: 1-4 hr. Excretion: Aceclofenac: About two-thirds of the administered dose is removed in the urine, mainly as conjugated hydroxymetabolites. Paracetamol: Most metabolites are removed in the urine within 24 hr.
CIMS Class	Analgesics (Non-Opioid) & Antipyretics / Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AB16 - aceclofenac; Belongs to the class of acetic acid derivatives and related substances of non-steroidal antiinflammatory and antirheumatic products. Used in the

M01AB16 - aceclofenac; Belongs to the class of acetic acid derivatives and related substances of non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism.

M02AA25 - aceclofenac;

N02BE01 - paracetamol; Belongs to the class of anilide preparations. Used to relieve pain and fever.

acenocoumarol

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
acenocoumarol

P - Contraindicated in pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related acenocoumarol information

Indication & Dosage	<i>Oral</i> Thromboembolic disorders Adult: 4-12 mg on the 1st day and 4-8 mg on the 2nd day. Maintenance: 1-8 mg daily given in a single dose at the same time everyday.
Contraindications	Active haemorrhage or risk of serious haemorrhage; severe hypertension; pregnancy.
Special Precautions	Bleeding disorders; peptic ulcers; severe wounds; cerebrovascular disorders, bacterial endocarditis; renal or hepatic impairment; lactation. Avoid alcohol.
Adverse Drug Reactions	Alopecia; fever, nausea, vomiting, diarrhoea; skin rash; cholestatic liver damage. Potentially Fatal: Haemorrhage.
Drug Interactions	Potentiates hypoglycaemic agents. Bismuth carbonate and Mg reduce absorption. Cimetidine, allopurinol, diuretics and other oral anticoagulants enhance effect. vit K reverses effect. Potentially Fatal: Potentiated by NSAIDs, amiodarone, antibacterial agents eg, co-trimoxazole, cephalosporins, erythromycin, quinolone antibiotics, chloramphenicol, doxycycline, INH and neomycin. Rifampicin, barbiturates and griseofulvin diminish effect.
Food Interaction	Renal excretion of metabolites is decreased when administered with grapefruit juice.
Storage	Oral: Store at 20-25°C.
	Acenocoumarol inhibits synthesis of vitamin K-dependent

Mechanism of Action	Acenocoumarol inhibits synthesis of vitamin K-dependent coagulation factors VII, IX, X and II including anticoagulant protein C and its cofactor proteins. Absorption: Readily absorbed from the GI tract. Distribution: Extensively bound to plasma proteins. Excretion: Largely in the urine mainly as metabolites. Elimination half-life: 8-11 hr.
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC Classification	B01AA07 - acenocoumarol; Belongs to the class of vitamin K antagonists. Used in the treatment of thrombosis.

acetazolamide

CIMS Class : (Diuretics) , (Anticonvulsants) , (Antiglaucoma Preparations)
acetazolamide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab $\square$ - Lab interference

related acetazolamide information

Indication & Dosage

Oral

Diuresis

Adult: 250-375 mg once daily or on alternate days.

Intermittent treatment is needed for continued efficacy.

Oral

Preoperative management of angle-closure glaucoma

Adult: 250-1000 mg daily in divided doses.

Child: 1 mth-12 yr: 10-20 mg/kg daily. Max: 750 mg daily, in 2-4 divided doses.

Oral

Adjunct in open-angle glaucoma

Adult: 250-1000 mg daily in divided doses.

Child: 1 mth-12 yr: 10-20 mg/kg daily. Max: 750 mg daily, in 2-4 divided doses.

Oral

Epilepsy

Adult: Either alone or with other antiepileptics: 250-1000 mg daily in divided doses.

Child: Neonates and up to 12 yr: Initially, 2.5 mg/kg bid-tid; maintenance: 5-7 mg/kg bid-tid. Max: 750 mg daily.

Oral

Prophylaxis of high-altitude disorders

Adult: 500-1000 mg daily in divided doses. Prompt descent is still advised if severe symptoms such as cerebral or pulmonary oedema occur.

Intravenous

Chronic open-angle glaucoma

Adult: As an adjunct, 0.25-1 g every 24 hr, usually in divided doses. Adjust dose according to symptomatology and

	or pulmonary oedema occur. <i>Intravenous</i> Chronic open-angle glaucoma Adult: As an adjunct, 0.25-1 g every 24 hr, usually in divided doses. Adjust dose according to symptomatology and ocular tension. <i>Intravenous</i> Acute closed angle glaucoma Adult: 250-500 mg. may repeat 2-4 hr later if needed. Max: 1 g daily. <i>Intravenous</i> Epilepsy Adult: 8-30 mg/kg daily in divided doses. Optimum dose: 375-1000 mg daily. When used with other anticonvulsants, initiate at 250 mg once daily in addition to existing medications and adjust accordingly. Reconstitution: Reconstitute with at least 5 ml of sterile water for inj to produce a solution containing = 100 mg/ml. Further dilute with 5% dextrose solution or normal saline for IV infusion. Incompatibility: Admixture incompatibility: Multivitamins.
Administration	Should be taken with food.
Overdosage	Symptoms may include electrolyte imbalance, acidotic state and central nervous effects. Monitor serum electrolyte levels (particularly potassium) and blood pH levels. Supportive measures are required to restore electrolyte and pH balance. Acidotic state can usually be corrected by the admin of bicarbonate.
Contraindications	Hypersensitivity to sulphonamides; sodium or potassium depletion, hepatic insufficiency; hepatic cirrhosis; hyperchloraemic acidosis; severe renal impairment; severe pulmonary obstruction; chronic noncongestive angle-closure glaucoma; adrenocortical insufficiency. Pregnancy, lactation.
Special Precautions	Potassium supplements may be required. Impaired hepatic or renal function; diabetes. Monitor plasma electrolytes and blood count regularly. IM route is not recommended. Caution when driving or operating machinery. Elderly.
Adverse Drug Reactions	Drowsiness, paraesthesia, ataxia, dizziness, thirst, anorexia, headache; confusion, malaise, depression; GI distress, metabolic acidosis, polyuria, hyperuricaemia, renal calculi, nephrotoxicity, hepatic dysfunction. Potentially Fatal: Rarely, skin reactions or blood dyscrasias.
Drug Interactions	Aids penetration of weakly acidic substances like sulphonamides across blood and CSF barrier. May inhibit renal excretion of basic drugs (e.g. quinidine, ephedrine, amphetamines) and promotes excretion of acidic drugs. May increase salicylate toxicity (acidosis). Hypokalaemia with corticosteroids and potassium-wasting diuretics. May

	renal excretion of basic drugs (e.g. quinidine, ephedrine, amphetamines) and promotes excretion of acidic drugs. May increase salicylate toxicity (acidosis). Hypokalaemia with corticosteroids and potassium-wasting diuretics. May increase excretion of lithium and primidone. May cause osteomalacia with anticonvulsants. Potentially Fatal: May potentiate effect of folic acid antagonists, oral hypoglycaemic agents, oral anticoagulants and severe reactions to sulphonamides.
Lab Interference	May cause false positive results for urinary protein. Interferes with HPLC theophylline assay and serum uric acid levels.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store between 15-30°C (59-86°F). Reconstituted solution may be stored at for 3 days at 2-8°C (36-46°C) or 12 hr at 15-30°C (59-86°F). Oral: Store at 15-30°C.
Mechanism of Action	Acetazolamide specifically inhibits the enzyme carbonic anhydrase which catalyses the reversible reaction involving the hydration of CO₂ and dehydration of carbonic acid. It increases the excretion of HCO₃ ions and as well as Na and K leading to alkaline diuresis. Carbonic anhydrase is also inhibited in the CNS to retard abnormal and excessive discharge from neurons. Onset: 60-90 minutes (oral); 2 minutes (IV). Duration: 8-12 hr (oral); 4-5 hr (IV). Absorption: Moderately rapid absorption from the GI tract; peak plasma concentrations after 2 hr (oral). Distribution: Concentrates in the red blood cells and renal cortex; enters the breast milk. Protein-binding: High. Excretion: Urine (as unchanged drug); 3-6 hr (elimination half-life).
CIMS Class	Diuretics / Anticonvulsants / Antiglaucoma Preparations
ATC Classification	S01EC01 - acetazolamide; Belongs to the class of carbonic anhydrase inhibitors used in the treatment of glaucoma and miosis.

acetylcysteine

CIMS Class : (Cough & Cold Preparations) , (Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence) , (Other Eye Preparations)
acetylcysteine

P - Caution when used during pregnancy

L - Caution when used during lactation

related acetylcysteine information

Indication & Dosage

Oral

Mucolytic

Adult: As lozenges/ effervescent granules or tablets: 200 mg tid.

Child: As lozenges/ effervescent granules or tablets: 2-7 yr: 200 mg bid; <2 yr: 200 mg daily.

Oral

Paracetamol poisoning

Adult: After gastric lavage or induction of emesis with ipecac syrup, admin loading dose of 140 mg/kg, followed by maintenance doses of 70 mg/kg every 4 hr for a total of 17 doses. 1st maintenance dose to be given 4 hr after the loading dose. Repeat dose if the patient vomits within 1 hr of admin. Continue therapy until paracetamol levels are not detectable and there is no evidence of hepatotoxicity.

Child: After gastric lavage or induction of emesis with ipecac syrup, admin loading dose of 140 mg/kg, followed by maintenance doses of 70 mg/kg every 4 hr for a total of 17 doses. 1st maintenance dose to be given 4 hr after the loading dose. Repeat dose if the patient vomits within 1 hr of admin. Continue therapy until paracetamol levels are not detectable and there is no evidence of hepatotoxicity.

Intravenous

Paracetamol poisoning

Adult: Initially, 150 mg/kg in 200 ml of infusion fluid given over 15 minutes, followed by 50 mg/kg in 500 ml of infusion given over the next 4 hr, then 100 mg/kg in 1 L of infusion fluid over the next 16 hr.

Child: Child =20 kg: Initially, 150 mg/kg in 100 ml of infusion fluid given over 15 min, followed by 50 mg/kg in 250 ml of

over the next 4 hr, then 100 mg/kg in 1 L of infusion fluid over the next 16 hr.

Child: Child ≥ 20 kg: Initially, 150 mg/kg in 100 ml of infusion fluid given over 15 min, followed by 50 mg/kg in 250 ml of infusion given over the next 4 hr, then 100 mg/kg in 500 mL of infusion fluid over the next 16 hr. Child < 20 kg: Doses as per adult dose but adjust volume of based on child age and wt to avoid fluid overload.

Inhalation

Mucolytic

Adult: 3-5 ml of a 20% solution or 6-10 ml of a 10% solution 3-4 times daily by nebulising through a face mask, mouth piece or tracheostomy. May increase to 1-10 ml of a 20% solution or 2-20 ml of a 10% solution every 2-6 hr if needed.

Child: 3-5 ml of a 20% solution or 6-10 ml of a 10% solution 3-4 times daily by nebulising through a face mask, mouth piece or tracheostomy. May increase to 1-10 ml of a 20% solution or 2-20 ml of a 10% solution every 2-6 hr if needed.

Endotracheal

Mucolytic

Adult: Instill 1-2 ml of a 10-20% solution as often as every hrly.

Child: Instill 1-2 ml of a 10-20% solution as often as every hrly.

Ophthalmic

Dry eye associated with abnormal mucus production

Adult: Instill 1-2 drops of a 5% solution into the affected eye 3-4 times daily.

Reconstitution: To be diluted for IV infusion with 5% dextrose, 0.9% sodium chloride, 0.3% potassium chloride with 5% glucose, 0.3% potassium chloride with 0.9% sodium chloride.

Incompatibility: Incompatible with metals (e.g. iron, copper, nickel), rubber, oxygen, oxidising substances (e.g. hydrogen peroxide), and some antibiotics (e.g. tetracycline HCl, oxytetracycline HCl, erythromycin lactobionate, ampicillin sodium, amphotericin B). A change in colour of solution to light purple may be observed and does not indicate significant change in safety or efficacy.

Special
Precautions

Asthmatic patients, history of bronchospasm, peptic ulceration. Pregnancy, lactation.

Adverse Drug
Reactions

Flushing, fever, stomatitis, nausea, vomiting, rhinorrhoea, bronchospasm, anaphylactoid reactions, rashes. Rarely, blurred vision, bradycardia, syncope, thrombocytopenia, convulsions.
Potentially Fatal: Rarely, respiratory or cardiac arrest.

Pregnancy
Category (US
FDA)

Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the

	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Endotracheal: Store between 59-86°F (15-30°C). Undiluted solution may be kept refrigerated for 96 hr. Inhalation: Store between 59-86°F (15-30°C). Undiluted solution may be kept refrigerated for 96 hr. Diluted solution to be used within 1 hr. Intravenous: Store below 25°C. Ophthalmic: Store below 25°C. Oral: Store below 25°C.
Mechanism of Action	Acetylcysteine may decrease the viscosity of secretions by splitting of disulphide bonds in mucoproteins. It also promotes the detoxification of an intermediate paracetamol metabolite which is used in the management of paracetamol overdose. Absorption: Rapidly absorbed from the GI tract (oral); peak plasma concentrations after 0.5-1 hr. Distribution: Protein-binding: 50%. Metabolism: Extensively hepatic. Excretion: Urine; elimination half-life: 6.25 hr (oral); 5.58 (IV).
CIMS Class	Cough & Cold Preparations / Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence / Other Eye Preparations
ATC Classification	R05CB01 - acetylcysteine; Belongs to the class of mucolytics. Used in the treatment of wet cough. S01XA08 - acetylcysteine; Belongs to the class of other agents used as ophthalmologicals. V03AB23 - acetylcysteine; Belongs to the class of antidotes. Used to neutralize paracetamol overdose.

aciclovir

CIMS Class : (Antivirals) , (Eye Anti-infectives & Antiseptics) , (Topical Antivirals)
aciclovir

P - Caution when used during pregnancy

L - Caution when used during lactation

related aciclovir information

Indication & Dosage

Oral

Primary herpes simplex infections

Adult: 200 mg 5 times daily every 4 hr for 5-10 days; for severely immunocompromised patients and those with impaired absorption: 400 mg 5 times daily for 5 days.

CrCl (ml/min)	Dosage Recommendation
<10	200 mg every 12 hr.

Oral

Suppression of recurrent herpes simplex

Adult: 800 mg daily in 2-4 divided doses. May reduce to 400-600 mg daily if necessary. Reassess the condition every 6-12 mth. For mild or infrequent recurrences: Episodic treatment may be used: 200 mg 5 times daily for 5 days, preferably begun during the prodromal period.

CrCl (ml/min)	Dosage Recommendation
<10	200 mg every 12 hr.

Oral

Prophylaxis of herpes simplex in immunocompromised patients

Adult: 200-400 mg 4 times daily.

Child: =2 yr: 200-400 mg 4 times daily; <2 yr: 100-200 mg 4 times daily.

CrCl (ml/min)	Dosage Recommendation
<10	200 mg every 12 hr.

Oral

Oral

Varicella zoster

Adult: >40 kg: 800 mg 4 times daily for 5 days.

Child: =2 yr and =40 kg: 20 mg/kg (up to 800 mg) 4 times daily for 5 days.

CrCl (ml/min)	Dosage Recommendation
10-25	800 mg tid.
<10	800 mg every 12 hr.

Oral

Herpes zoster (shingles)

Adult: 800 mg 5 times daily for 7-10 days.

Child: =6 yr: 800 mg 4 times daily; 2-5 yr: 400 mg 4 times daily; <2 yr: 200 mg 4 times daily.

CrCl (ml/min)	Dosage Recommendation
<10	800 mg every 12 hr.
10-25	800 mg tid.

Intravenous

Mucocutaneous herpes simplex in immunocompromised patients

Adult: 5 mg/kg every 8 hr for 7 days. Dose to be given as IV infusion over 1 hr.

Child: 10 mg/kg every 8 hr for 7 days.

Renal impairment: Peritoneal dialysis: Half the usual dose once daily. Haemodialysis: Half the usual dose every 24 hr and an additional half-dose after haemodialysis.

CrCl (ml/min)	Dosage Recommendation
25-50	Increase dose interval to 12 hr.
10-25	Increase dose interval to 24 hr.

Intravenous

Herpes simplex encephalitis

Adult: 10 mg/kg every 8 hr for 10 days.

Child: =3 mth: 20 mg/kg every 8 hr for 10 days.

Renal impairment: Peritoneal dialysis: Half the usual dose once daily. Haemodialysis: Half the usual dose every 24 hr and an additional half-dose after haemodialysis.

CrCl (ml/min)	Dosage Recommendation
25-50	Increase dose interval to 12 hr.
10-25	Increase dose interval to 24 hr.

Intravenous

Genital herpes

Adult: 5 mg/kg every 8 hr for 5-7 days.

Intravenous

Genital herpes

Adult: 5 mg/kg every 8 hr for 5-7 days.

Renal impairment: Peritoneal dialysis: Half the usual dose once daily. Haemodialysis: Half the usual dose every 24 hr and an additional half-dose after haemodialysis.

CrCl (ml/min)	Dosage Recommendation
25-50	Increase dose interval to 12 hr.
10-25	Increase dose interval to 24 hr.

Intravenous

Neonatal herpes simplex virus infections

Child: Birth - 3 mth: 10 mg/kg every 8 hr for 10 days.

Renal impairment: Peritoneal dialysis: Half the usual dose once daily. Haemodialysis: Half the usual dose every 24 hr and an additional half-dose after haemodialysis.

CrCl (ml/min)	Dosage Recommendation
25-50	Increase dose interval to 12 hr.
10-25	Increase dose interval to 24 hr.

Intravenous

Herpes zoster in immunocompromised patients

Adult: ≥12 yr: 10 mg/kg every 8 hr for 7 days.

Child: 20 mg/kg every 8 hr for 7 days.

Renal impairment: Peritoneal dialysis: Half the usual dose once daily. Haemodialysis: Half the usual dose every 24 hr and an additional half-dose after haemodialysis.

CrCl (ml/min)	Dosage Recommendation
25-50	Increase dose interval to 12 hr.
10-25	Increase dose interval to 24 hr.

Ophthalmic

Herpes simplex keratitis

Adult: Apply a 3% ointment 5 times daily until the 3rd day of complete healing.

Topical/Cutaneous

Herpes simplex infections of skin

Adult: Apply a 5% ointment/cream 5-6 times daily every 3-4 hr for 5-10 days.

Reconstitution: Remove the calculated dose and add it to any appropriate IV solution at a volume selected for admin during each 1-hr infusion. Recommended infusion concentrations: About 7 mg/mL or lower. Higher concentrations (e.g. 10 mg/mL) may cause phlebitis or inflammation at the inj site if there is extravasation. Standard, commercially available electrolyte and glucose solutions are suitable for IV admin; biologic or colloidal fluids (e.g. blood

	concentrations: About 7 mg/mL or lower. Higher concentrations (e.g. 10 mg/mL) may cause phlebitis or inflammation at the inj site if there is extravasation. Standard, commercially available electrolyte and glucose solutions are suitable for IV admin; biologic or colloidal fluids (e.g. blood products, protein solutions) are not recommended. Incompatibility: Y-site incompatibility: Ondansetron, piperacillin/tazobactam, sargramostim, tacrolimus, vinorelbine, amifostine, amsacrine, aztreonam, cefepime, dobutamine, dopamine, fludarabine, foscarnet, gemcitabine, idarubicin, levofloxacin. Syringe incompatibility: Pantoprazole, caffeine citrate. Admixture incompatibility: Dobutamine, dopamine.
Administration	May be taken with or without food. (May be taken w/ meals to reduce GI discomfort.)
Contraindications	Hypersensitivity.
Special Precautions	Renal impairment. Pregnancy, lactation. Neurological abnormalities with significant hypoxia, serious hepatic or electrolyte abnormalities. Maintain adequate hydration.
Adverse Drug Reactions	Nausea, vomiting, headache, diarrhoea, rash, haematological changes (occasional), increase in liver enzymes, burning, itching or erythema (topical use). Eye application may produce stinging, superficial punctate keratopathy, blepharitis or conjunctivitis. IV administration: Local reaction, pain, inflammation, phlebitis, extravasation leads to ulceration. Increase in BUN and/or creatinine. Rarely, renal failure. Potentially Fatal: Occasionally neurotoxicity after IV use: Lethargy, confusion, agitation, tremors, seizures, coma.
Drug Interactions	Probenecid decreases urinary excretion and increases half-life. Risk of renal impairment increased by other nephrotoxic drugs.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Vial: Store between 15-25°C. Once diluted for administration, solution should be used within 24 hr. Ophthalmic: Store at 15-25°C. Oral: Store at 15-25°C. Topical/Cutaneous: Store at 15-25°C.
Mechanism of Action	Activity against HSV types I and II and varicella-zoster virus is due to intracellular conversion of aciclovir to the monophosphate by viral thymidine kinase with subsequent conversion to the diphosphate and active triphosphate by

	Activity against HSV types I and II and varicella-zoster virus is due to intracellular conversion of aciclovir to the monophosphate by viral thymidine kinase with subsequent conversion to the diphosphate and active triphosphate by cellular enzymes. This active form inhibits viral DNA synthesis and replication by interfering with viral DNA polymerase enzyme and being incorporated into viral DNA. Absorption: 15-30% is absorbed from the GI tract (oral), slightly absorbed from the skin (topical), absorbed from the eye (ophthalmic). Distribution: CSF (50% of conc is similar to those in plasma); crosses the placenta and enters breast milk (concentrations 3 times higher than in maternal serum). Protein-binding: 9-33%. Excretion: Via kidney by glomerular filtration and tubular secretion (14% as unchanged), via faeces (2%); elimination half-life: 2-3 hr (normal renal function), 19.5% (anuric patients), 5-7% (haemodialysis patients).
CIMS Class	Antivirals / Eye Anti-infectives & Antiseptics / Topical Antivirals
ATC Classification	D06BB03 - aciclovir; Belongs to the class of topical antivirals used in the treatment of dermatological diseases. J05AB01 - aciclovir; Belongs to the class of nucleosides and nucleotides excluding reverse transcriptase inhibitors. Used in the systemic treatment of viral infections. S01AD03 - aciclovir; Belongs to the class of anti-infectives, antivirals. Used in the treatment of eye infections.

acitretin

CIMS Class : (Psoriasis, Seborrhea & Ichthyosis Preparations)
acitretin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ✖ - Lab interference

Food ✖ - Food interaction

related acitretin information

Indication & Dosage	<i>Oral</i> Darier's disease Adult: Initially, 10 mg daily for 2-4 wk. Max: 50 mg/day. Child: 500 mcg/kg/day. Max dose: 35 mg/day. <i>Oral</i> Congenital ichthyosis Adult: Initially, 25-30 mg daily for 2-4 wk before dose adjustments are done. Usual range: 25-50 mg daily for further 6-8 wk. Max: 75 mg daily for short periods. Child: 500 mcg/kg/day. Max: 35 mg daily. <i>Oral</i> Severe lichen planus Adult: Initially, 25-30 mg daily for 2-4 wk before dose adjustments are done. Usual range: 25-50 mg daily for further 6-8 wk. Max: 75 mg daily for short periods. Child: 500 mcg/kg/day. Max: 35 mg daily. <i>Oral</i> Severe psoriasis Adult: Initially, 25-30 mg daily for 2-4 wk before dose adjustments are done. Usual range: 25-50 mg daily for further 6-8 wk. Max: 75 mg daily for short periods. Child: 500 mcg/kg/day. Max: 35 mg daily.
Administration	Should be taken with food. (Take w/ main meals or w/ a glass of milk.)
Overdosage	Symptoms are identical to acute hypervitaminosis A, ie, headache and vertigo.
Contraindications	Pregnancy (before the start, during and at least 2-3 yr after

Contraindications	Pregnancy (before the start, during and at least 2-3 yr after cessation of therapy), lactation. Hepatic and renal impairment. Hyperlipidaemia.
Special Precautions	Female patients to avoid alcohol during and 2 mth after treatment. Avoid blood donation during therapy or at least 1-3 yr after stopping therapy. Children. Radiographic treatment for prolonged therapy. Therapy should not last >6 mth. Monitor plasma lipid and glucose levels (especially diabetics) regularly. Monitor LFTs.
Adverse Drug Reactions	Dryness of mucous membranes and skin; conjunctivitis, dry sore mouth; ophth disturbances; raised lipid level, pancreatitis; sticky skin, dermatitis. Severe headache; GI disturbances; dermatologic reactions, oedema, paronychia, granulomatous lesions, bullous eruptions; reversible hair thinning and alopecia; CNS disturbances; sweating; taste disturbance, gingivitis; benign intracranial hypertension; photosensitivity; skeletal hyperostosis; extraosseous calcification; premature epiphyseal closure in child. Potentially Fatal: Phototoxicity, jaundice, hepatitis and hepatotoxicity.
Drug Interactions	Concomitant use with keratolytics or high dose vitamin A. Reduces anticoagulant effect of coumarins e.g. warfarin. Concomitant use of microdised progestin oral contraceptives. Concomitant use of methotrexate can potentiate hepatotoxicity. Concomitant use with tetracycline.
Food Interaction	Co-administration with food may increase oral bioavailability.
Lab Interference	Elevation of liver enzymes, lipids, triglycerides and cholesterol level in blood.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Oral: Store below 25°C.
Mechanism of Action	Acitretin is an active metabolite of etretinate but its mechanism of action is unknown.
CIMS Class	Psoriasis, Seborrhea & Ichthyosis Preparations
ATC Classification	D05BB02 - acitretin; Belongs to the class of systemic retinoids used in the treatment of psoriasis.

aclarubicin

CIMS Class : (Cytotoxic Chemotherapy)
aclarubicin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related aclarubicin information

Indication & Dosage	<i>Intravenous</i> Malignant blood disorders Adult: Initially: 175-300 mg/m ² given in divided doses over 3-7 consecutive days via IV infusion over 30-60 minutes. Maintenance: 25-100 mg/m ² in a single infusion every 3-4 wk.
Contraindications	Pregnancy, lactation; CV disease.
Special Precautions	Myocardial irradiation and use of radiotherapy. Hepatic or renal impairment. Elderly.
Adverse Drug Reactions	Nausea, vomiting, mucositis, irritant to tissue, sore mouth, bone-marrow suppression, hyperuricaemia. Alopecia (rare). Potentially Fatal: Cardiotoxicity (rare), myelosuppression in patients who received mitomycin or a nitrosourea, leucopenia.
Drug Interactions	Other cardiotoxic drugs e.g. daunorubicin or cyclophosphamide, live vaccines; decreases effects of digoxin, oral anticoagulants, phenytoin and suxamethonium.
Lab Interference	Elevated bilirubin level.
Mechanism of Action	Aclarubicin is an anthracycline, a cytotoxic antibiotic, and inhibits RNA synthesis through intercalation. Distribution: Rapidly distributed into tissues after IV admin. Metabolism: Extensively metabolised. Excretion: Triphasic clearance. Terminal elimination half-life: About 3 hr. Excreted in urine mainly as metabolites.
CIMS Class	Cytotoxic Chemotherapy

CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01DB04 - aclarubicin; Belongs to the class of cytotoxic antibiotics, anthracyclines and related substances. Used in the treatment of cancer.

adapalene

CIMS Class : (Acne Treatment Preparations)

adapalene

P - Caution when used during pregnancy

L - Caution when used during lactation

related adapalene information

Indication & Dosage	<i>Topical/Cutaneous</i> Acne Adult: As 0.1% solution/cream/gel: Apply thinly onto affected areas once daily at night after cleansing.
Contraindications	Hypersensitivity.
Special Precautions	Patients with sunburn, eczema. Pregnancy, lactation. Avoid excessive exposure to sunlight or UV irradiation. Keep away from the eyes, lips, nostrils and mucous membranes. Do not apply to cuts, abrasions, scaly or flaky skin, or patches of sunburned skin. Use with caution with preparations containing sulfur, resorcinol, or salicylic acid.
Adverse Drug Reactions	Mild skin irritation, scaling, erythema, cutaneous dryness, sensations of stinging and burning, pruritus.
Drug Interactions	Increased irritation may occur with medicated or abrasive soaps, products with a pronounced drying effect and those containing alcohol or astringents.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Topical/Cutaneous: Store below 25°C.
Mechanism of Action	Adapalene binds to specific retinoic acid nuclear receptors which normalises the differentiation of follicular epithelial cells resulting in decreased microcomedone formation.

	Adapalene binds to specific retinoic acid nuclear receptors which normalises the differentiation of follicular epithelial cells resulting in decreased microcomedone formation. Absorption: Minimal (topical). Excretion: Bile.
CIMS Class	Acne Treatment Preparations
ATC Classification	D10AD03 - adapalene; Belongs to the class of topical retinoid preparations used in the treatment of acne.

adefovir dipivoxil

CIMS Class : (Antivirals)

adefovir dipivoxil

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food $\nrightarrow$ Food interaction

related adefovir dipivoxil information

Indication & Dosage	<i>Oral</i> Chronic hepatitis B Adult: >18 yr: 10 mg once daily. Renal impairment: Haemodialysis patients: 10 mg every 7 days after dialysis. <table border="1"><thead><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr></thead><tbody><tr><td>20-49</td><td>10 mg every 48 hr.</td></tr><tr><td>10-19</td><td>10 mg every 72 hr.</td></tr></tbody></table>	CrCl (ml/min)	Dosage Recommendation	20-49	10 mg every 48 hr.	10-19	10 mg every 72 hr.
CrCl (ml/min)	Dosage Recommendation						
20-49	10 mg every 48 hr.						
10-19	10 mg every 72 hr.						
Administration	May be taken with or without food.						
Overdosage	Monitor for signs of toxicity, apply supportive treatment when necessary.						
Contraindications	Lactation.						
Special Precautions	Pregnancy; elderly; child; renal or hepatic impairment. HIV antibody testing to be performed before initiation due to possible resistance development in untreated HIV infection. Increased risk of hepatotoxicity in females, obese patients and with prolonged treatment. Monitor renal function every 3 mth; hepatitis B biochemical, viral and serological markers every 6 mth and LFTs. Discontinue therapy if liver function worsens, severe hepatomegaly, steatosis or unexplained metabolic or lactic acidosis. Monitor hepatic function for several mth in patients whose antihepatitis therapy is discontinued as acute exacerbations of hepatitis may occur.						
Adverse Drug Reactions	Nausea, dyspepsia, abdominal pain, flatulence, diarrhoea, asthenia, headache. Pruritus, skin rashes, and respiratory effects e.g. cough, pharyngitis and sinusitis. Potentially Fatal: Lactic acidosis, severe hepatomegaly with						

	Nausea, dyspepsia, abdominal pain, flatulence, diarrhoea, asthenia, headache. Pruritus, skin rashes, and respiratory effects e.g. cough, pharyngitis and sinusitis. Potentially Fatal: Lactic acidosis, severe hepatomegaly with steatosis, hepatotoxicity, nephrotoxicity.
Drug Interactions	Increased risk of nephrotoxicity with nephrotoxic drugs e.g. aminoglycosides, ciclosporin, NSAIDs, vancomycin, tacrolimus. Ibuprofen increases bioavailability of adefovir.
Food Interaction	Increased risk of hepatotoxicity with alcohol in hepatitis B infection.
Storage	Oral: Store between 15-30°C (59-86°F).
Mechanism of Action	Adefovir dipivoxil is an acyclic nucleoside reverse transcriptase inhibitor. The diester function is hydrolyzed and subsequently phosphorylated to the active adefovir diphosphate. The active metabolite inhibits HBV DNA polymerase (reverse transcriptase) and hence inhibits viral replication. It can be used in patients with lamivudine-resistant hepatitis B. Absorption: Rapidly converted to adefovir after oral admin. Bioavailability 59%. Plasma concentration peaks after 0.6-4 hr. Distribution: Widely distributed to body tissues. Protein binding: >4%. Excretion: Renal. Terminal elimination half-life: 7 hr.
CIMS Class	Antivirals
ATC Classification	J05AF08 - adefovir dipivoxil; Belongs to the class of nucleoside and nucleotide reverse transcriptase inhibitors. Used in the systemic treatment of viral infections.

adenosine

CIMS Class : (Cardiac Drugs)
adenosine

P - Caution when used during pregnancy

related adenosine information

Indication & Dosage	<i>Intravenous</i> Differential diagnosis of supraventricular tachycardias Adult: Initially, 3 mg by rapid IV inj into a central or large peripheral vein over 2 sec with cardiac monitoring; 6 mg may be given after 1-2 minutes if necessary, then 12 mg after a further 1-2 minutes. Avoid increments if high level AV block occurs at any particular dose. Child: Initially, 50-100 mcg/kg; if necessary, may increase dose by 50-100 mcg/kg increments at 1-2 minute intervals or until arrhythmia is controlled. Max dose: 300 mcg/kg. Max Dosage: <i>Intravenous</i> Paroxysmal supraventricular tachycardia Adult: Initially, 3 mg by rapid IV inj into a central or large peripheral vein over 2 sec with cardiac monitoring; 6 mg may be given after 1-2 minutes if necessary, then 12 mg after a further 1-2 minutes. Avoid increments if high level AV block occurs at any particular dose. Child: Initially, 50-100 mcg/kg; if necessary, may increase dose by 50-100 mcg/kg increments at 1-2 minute intervals or until arrhythmia is controlled. Max dose: 300 mcg/kg. Max Dosage: <i>Intravenous</i> Myocardial imaging Adult: 140 mcg/kg/minute by infusion for 6 minutes. Inject radionuclide 3 minute after infusion.
Contraindications	2nd or 3rd degree AV block and sick sinus syndrome (unless pacemaker fitted), asthma, hypersensitivity.
Special Precautions	Pregnancy; heart transplant patients; patients on dipyridamole (lower initial dose of adenosine 0.5-1 mg); atrial fibrillation or flutter with accessory pathway (conduction

	Pregnancy; heart transplant patients; patients on dipyridamole (lower initial dose of adenosine 0.5-1 mg); atrial fibrillation or flutter with accessory pathway (conduction along anomalous pathway may increase).
Adverse Drug Reactions	Facial flushing, palpitations, chest pain, bradycardia, sweating, hypotension, dyspnoea, choking sensation, headache, lightheadedness, tingling, numbness, neck and back pain, nausea, metallic taste. ECG changes suggestive of rhythm disturbances.
Drug Interactions	Adenosine effects antagonised by methylxanthines like caffeine, theophylline, etc. Concomitant carbamazepine may increase the risk of heart block. Potentially Fatal: Adenosine effects are potentiated by dipyridamole.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Adenosine acts rapidly to slow down conduction through the AV node via the A1 receptors. It also mediates peripheral and coronary vasodilatation by stimulating the A2 receptors. Extremely short plasma half-life (<10 sec) permits dosage titration during IV use every 1-2 min and causes no concern of cumulative effect through repeated dosing. Absorption: Rapidly taken up into the erythrocytes and vascular endothelial cells. Metabolism: Metabolised to adenosine monophosphate and inosine. Excretion: Plasma half-life: <10 sec.
CIMS Class	Cardiac Drugs
ATC Classification	C01EB10 - adenosine; Belongs to the class of other preparations used in cardiac therapy.

albendazole

CIMS Class : (Anthelmintics)
albendazole

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related albendazole information

related albendazole information	
Indication & Dosage	<i>Oral</i> Echinococcosis Adult: >60 kg: 400 mg bid for 28 days; <60 kg: 15 mg/kg daily in 2 divided doses. Max dose: 800 mg daily. For cystic echinococcosis, up to 3 treatment cycles of 28 days each may be given with 14 treatment-free days in between cycles. For alveolar echinococcosis, treatment cycles of 28 days each with 14 treatment-free days in between. Treatment cycles may need to be continued for mth or yr until complete eradication of parasites. <i>Oral</i> Neurocysticercosis Adult: >60 kg: 400 mg bid; <60 kg: 15 mg/kg daily in 2 divided doses for 8-30 days. Max Dosage: Adult <60 kg: 800 mg daily. <i>Oral</i> Ascariasis Adult: 400 mg as a single dose. Child: =2 yr: 400 mg as a single dose; 1-2 yr: 200 mg as a single dose for enterobiasis. <i>Oral</i> Hookworm infections Adult: 400 mg as a single dose. Child: =2 yr: 400 mg as a single dose; 1-2 yr: 200 mg as a single dose for enterobiasis. <i>Oral</i> Enterobiasis Adult: 400 mg as a single dose. Child: =2 yr: 400 mg as a single dose; 1-2 yr: 200 mg as a single dose for enterobiasis.

	Enterobiasis Adult: 400 mg as a single dose. Child: =2 yr: 400 mg as a single dose; 1-2 yr: 200 mg as a single dose for enterobiasis. <i>Oral</i> Strongyloidiasis Adult: 400 mg once daily or bid for 3 consecutive days, repeated after 3 wk if necessary. <i>Oral</i> Giardiasis Adult: 400 mg daily for 5 days. Child: 400 mg daily for 5 days.
Administration	Should be taken with food.
Overdosage	Symptomatic and supportive measures are advised.
Contraindications	Pregnancy and lactation. Neonates. Hypersensitivity, liver impairment.
Special Precautions	Monitor blood counts and liver function. Administer within 7 days of start of normal menstruation in women of childbearing age. Adequate nonhormonal contraceptive measures must be taken during and for 1 mth after therapy. Perform liver function tests and blood counts before and every 2 wk during high dose therapy of hydatid disease.
Adverse Drug Reactions	GI discomfort, headache, nausea, dizziness, allergic reactions, pruritus, raised liver enzymes, alopecia and dry mouth. Potentially Fatal: Bone marrow depression.
Drug Interactions	Cimetidine increases albendazole metabolism. Serum levels are increased if taken with dexamethasone and praziquantel agent.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 20-25°C.
Mechanism of Action	Albendazole exhibits a broad-spectrum anthelmintic activity showing vermicial, ovicidal and larvicidal actions. It inhibits tubulin polymerization in the parasite and blocks glucose uptake; energy levels are reduced resulting to death of the parasite. Susceptible parasites include hookworm, roundworm, threadworm, whipworm, tapeworm, strongyloides, opisthorchis and hydatid disease (Echinococcus). Absorption: Poorly absorbed from the GI tract (oral).

	roundworm, threadworm, whipworm, tapeworm, strongyloides, opisthorchis and hydatid disease (Echinococcus). Absorption: Poorly absorbed from the GI tract (oral). Distribution: Widely distributed; bile, CSF. Protein-binding: 70% Metabolism: Extensive hepatic first-pass metabolism; converted to albendazole sulfoxide. Excretion: Via bile; via urine (small amounts). 8.5 hr (elimination half-life).
CIMS Class	Anthelmintics
ATC Classification	P02CA03 - albendazole; Belongs to the class of benzimidazole derivative agents used as antinematodal.

alendronic acid

CIMS Class : (Agents Affecting Bone Metabolism)
alendronic acid

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related alendronic acid information

Indication & Dosage

Oral

Osteopetrosis

Adult: 10 mg daily or 70 mg once wkly.

CrCl (ml/min)	Dosage Recommendation
<35	Not recommended.

Oral

Paget's disease of bone

Adult: 40 mg daily for 6 mth; may be repeated if necessary after 6-mth post-treatment evaluation period.

Oral

Prophylaxis of postmenopausal osteoporosis

Adult: 5 mg once daily or 35 mg once wkly.

CrCl (ml/min)	Dosage Recommendation
<35	Not recommended.

Oral

Corticosteroid-induced osteoporosis

Adult: Treatment and prevention: 5 mg daily; may increase to 10 mg daily in women who do not receive HRT.

Administration

Should be taken on an empty stomach. (Take w/ a full glass of plain water at least ½ hr before the 1st food/drink/medication of the day & remain in sitting/upright position for at least ½ hr. Swallow whole, do not chew/crush.)

Overdosage

Symptoms may include hypocalcaemia, hypophosphataemia and upper GI adverse events, such as upset stomach, heartburn, esophagitis, gastritis or ulcer. Milk or antacids should be given to bind alendronate. Should not induce

	Symptoms may include hypocalcaemia, hypophosphataemia and upper GI adverse events, such as upset stomach, heartburn, esophagitis, gastritis or ulcer. Milk or antacids should be given to bind alendronate. Should not induce vomiting due to the risk of oesophageal irritation. Patient should remain fully upright. Dialysis would not be beneficial.
Contraindications	Hypocalcaemia; oesophageal abnormalities and factors which delay oesophageal emptying; severe renal impairment; hypersensitivity; inability to stand or sit upright for ≥30 min. Pregnancy, lactation.
Special Precautions	Upper GI disorders (discontinue if symptoms worsen); history of ulcers, active GI bleeding. Correct vitamin D and calcium deficiency before starting therapy. To be taken half an hr before breakfast and remain upright for at least 30 minutes after admin. Not recommended for use in patients with CrCl <35 ml/min.
Adverse Drug Reactions	Oesophagitis, oesophageal ulcers and erosions, dysphagia, heartburn, retrosternal pain, abdominal pain, distension, diarrhoea, constipation, flatulence, headache, rash, erythema, musculoskeletal pain, transient decreases in serum phosphate.
Drug Interactions	Concomitant iron, calcium supplements and antacids hinder alendronate absorption. Concomitant aspirin or NSAIDs may increase the incidence of adverse GI effects.
Food Interaction	Food, mineral water, coffee, tea and juice interfere with absorption of alendronate.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Alendronic acid reduces bone resorption by inhibiting the action of osteoclasts. Absorption: Poorly absorbed from the GIT (oral); reduced by food. Distribution: Protein-binding: 78% Excretion: Urine (50%); remainder is sequestered to bone.
CIMS Class	Agents Affecting Bone Metabolism
ATC Classification	M05BA04 - alendronic acid; Belongs to the class of bisphosphonates. Used in the treatment of bone diseases.

alfacalcidol

CIMS Class : (Agents Affecting Bone Metabolism)
alfacalcidol

related alfacalcidol information

Indication & Dosage	<i>Oral</i> Hypocalcaemia, Rickets or osteomalacia, Hypophosphataemia, Renal osteodystrophy, Hypoparathyroidism Adult: Initially, 1 mcg daily. Maintenance: 0.25-1 mcg daily. Child: Premature infants and neonates: 0.05-0.1 mcg/kg daily; <20 kg: 0.05 mcg/kg daily. Elderly: 0.5 mcg daily.
Administration	Should be taken with food.
Overdosage	Symptoms may include anorexia, lassitude, nausea and vomiting, constipation or diarrhoea, polyuria, nocturia, sweating, headache, thirst, somnolence and vertigo and hypercalcaemia. Management: Stop admin of alfacalcidol. Treatment is symptomatic and supportive. Ensure patient is well hydrated by i.v. infusion of saline (force diuresis). Monitor electrolytes, calcium levels, renal function, ECG (especially in patients on digitalis). Consider treatment with glucocorticosteroids, loop diuretics, bisphosphonates, calcitonin and haemodialysis with low calcium content.
Contraindications	Hypercalcaemia, metastatic calcification, hyperphosphataemia (except when occurring with hypoparathyroidism), hypermagnesaemia.
Special Precautions	Pregnancy, lactation, renal impairment, infants, elderly. Monitor serum levels of calcium in patients with renal failure. Caution in hypercalciuria esp in those with history of renal calculi. Avoid in patients with hypersensitivity to inj. containing propylene glycol.
Adverse Drug Reactions	Anorexia, nausea, vomiting, diarrhoea, lassitude, polyuria, sweating, headache, thirst, vertigo, pruritus, rash, urticaria. Hypercalcaemia, hypercalciuria and ectopic calcification. In case of renal impairment, hyperphosphataemia. In hypercalcaemic dialysis patients, possibility of calcium influx from the dialysate

	anorexia, nausea, vomiting, diarrhoea, constipation, polyuria, sweating, headache, thirst, vertigo, pruritus, rash, urticaria. Hypercalcaemia, hypercalciuria and ectopic calcification. In case of renal impairment, hyperphosphataemia. In hypercalcaemic dialysis patients, possibility of calcium influx from the dialysate should be considered.
Drug Interactions	Thiazides may increase the risk of hypercalcaemia. Some antiepileptics e.g. carbamazepine, phenobarbital, phenytoin and primidone may increase vitamin D requirements. Rifampicin, isoniazid and corticosteroids may reduce the efficacy of vitamin D.
Storage	Oral: Capsule: Store below 25°C. Liquid: Refrigerate at 2-8°C.
Mechanism of Action	Alfacalcidol is a precursor of the active calcitriol. It does not require renal hydroxylation but requires 25-hydroxylation in the liver for conversion to calcitriol. Absorption: Adequately absorbed from the GI tract (oral). Distribution: Adipose and muscle tissue; enters breast milk. Protein-binding: Specific to α-globulin. Metabolism: Hepatic; rapidly converted to calcitriol. Excretion: Faeces and urine (small amounts).
CIMS Class	Agents Affecting Bone Metabolism
ATC Classification	A11CC03 - alfacalcidol; Belongs to the class of vitamin D and analogues. Used as dietary supplements.

alfuzosin

CIMS Class : (Drugs for Bladder & Prostate Disorders)
alfuzosin

L - Contraindicated in lactation

related alfuzosin information

Indication & Dosage	<i>Oral</i> Benign prostatic hyperplasia Adult: 2.5 mg tid. Max dose: 10 mg daily. Elderly: Initially, 2.5 mg bid. Renal impairment: Initiate with 2.5 mg bid. Adjust dose according to response. Hepatic impairment: Mild-moderate impairment: Initiate with 2.5 mg daily, may increase to 2.5 mg bid gradually according to response. Modified-release preparations are not recommended.
Administration	Should be taken with food.
Overdosage	May lead to hypotension. Maintain patient in supine position to restore BP. Otherwise, IV fluids and/or vasopressors may be needed. Monitor renal function.
Contraindications	Severe hepatic impairment; history of postural hypotension and micturition syncope; intestinal occlusion; severe renal insufficiency; lactation.
Special Precautions	Elderly; hypertension; coronary insufficiency; angina (discontinue); renal or hepatic impairment. Monitor BP regularly. May affect ability to drive or operate machinery.
Adverse Drug Reactions	Drowsiness, postural hypotension, syncope, asthenia, depression, headache, dry mouth, GI disturbances, edema, blurred vision, rhinitis, erectile disorders, tachycardia, palpitation, hypersensitivity reactions; flushes; chest pain; dizziness; lack of energy.
Drug Interactions	CYP3A4 inhibitors e.g. azole antifungals, clarithromycin, diclofenac, doxycycline, erythromycin, imatinib, isoniazid, nefazodone, nifedipine, propofol, protease inhibitors, quinidine, telithromycin,

	CYP3A4 inhibitors e.g. azole antifungals, clarithromycin, diclofenac, doxycycline, erythromycin, imatinib, isoniazid, nefazodone, nifedipine, propofol, protease inhibitors, quinidine, telithromycin, and verapamil may increase the levels of alfuzosin. Reduced serum levels when used with CYP3A4 inducers e.g. aminoglutethimide, carbamazepine, nafcillin, nevirapine, phenobarbital, phenytoin and rifamycins. Potentially Fatal: Concurrent use with potent CYP3A4 inhibitors (e.g. itraconazole, ketoconazole or ritonavir) is contraindicated.
Storage	Oral: Store between 15-30°C.
Mechanism of Action	Alfuzosin is a quinazoline-derivative which exhibits selectivity for α_1-adrenergic receptors in the lower urinary tract. Blockade of these adrenoreceptors causes relaxation of smooth muscle in the bladder neck and prostate, resulting in improvement in urine flow and a reduction in symptoms of benign prostatic hyperplasia. Absorption: Readily absorbed after oral admin. Bioavailability: about 64%. Distribution: 90% bound to plasma proteins. Metabolism: Extensively metabolised in the liver, mainly by the cytochrome P450 isoenzyme CYP3A4, to inactive metabolites. Excretion: About 11% excreted unchanged in urine. Metabolites are mainly excreted in faeces via bile. Elimination half-life: about 3-5 hr.
CIMS Class	Drugs for Bladder & Prostate Disorders
ATC Classification	G04CA01 - alfuzosin; Belongs to the class of alpha-adrenoreceptor antagonists. Used in the treatment of benign prostatic hypertrophy.

allopurinol

CIMS Class : (Hyperuricemia & Gout Preparations)

allopurinol

P - Caution when used during pregnancy

L - Caution when used during lactation

related allopurinol information

Indication & Dosage

Oral

Hyperuricaemia

Adult: Initially, 100 mg daily increased according to response until the plasma conc of urate is reduced to ≈ 6 mg/100 ml. Maintenance: 100-300 mg daily for mild to moderate gout; up to 600 mg daily for moderately severe tophaceous gout. Max: 800 mg daily. Up to 300 mg may be taken as a single dose; larger doses should be taken in divided doses to minimise gastric irritation.

Renal impairment: Max initial dose: 100 mg daily, increase only if the response is inadequate. Severe impairment: Doses should be <100 mg daily or 100 mg at intervals >1 day. Patients receiving dialysis 2-3 times/wk: 300-400 mg immediately after dialysis only. Adjust dose to maintain plasma-oxipurinol concentrations <15.2 mcg/ml.

Hepatic impairment: Dose reduction may be needed. Monitor liver function regularly.

Oral

Gout

Adult: Initially, 100 mg daily increased according to response until the plasma conc of urate is reduced to ≈ 6 mg/100 ml. Maintenance: 100-300 mg daily for mild to moderate gout; up to 600 mg daily for moderately severe tophaceous gout. Max: 800 mg daily. Up to 300 mg may be taken as a single dose; larger doses should be taken in divided doses to minimise gastric irritation.

Renal impairment: Max initial dose: 100 mg daily, increase only if the response is inadequate. Severe impairment: Doses should be <100 mg daily or 100 mg at intervals >1 day. Patients receiving dialysis 2-3 times/wk: 300-400 mg

Renal impairment: Max initial dose: 100 mg daily, increase only if the response is inadequate. Severe impairment: Doses should be <100 mg daily or 100 mg at intervals >1 day. Patients receiving dialysis 2-3 times/wk: 300-400 mg immediately after dialysis only. Adjust dose to maintain plasma-oxipurinol concentrations <15.2 mcg/ml.

Hepatic impairment: Dose reduction may be needed. Monitor liver function regularly.

Oral

Prophylaxis of uric acid nephropathy associated with cancer therapy

Adult: 600-800 mg/day in 2-3 divided doses for 2-3 days before starting cancer treatment. Ensure adequate fluid intake. Maintenance for patients with hyperuricaemia secondary to cancer or cancer therapy: 100-300 mg daily for mild to moderate gout; up to 600 mg daily for moderately severe tophaceous gout. Max: 800 mg daily. Dose is titrated based on response. Up to 300 mg may be taken as a single dose; larger doses should be taken in divided doses to minimise gastric irritation.

Child: <15 yr: 10-20 mg/kg daily. Max: 400 mg daily.

Renal impairment: Max initial dose: 100 mg daily, increase only if the response is inadequate. Severe impairment: Doses should be <100 mg daily or 100 mg at intervals >1 day. Patients receiving dialysis 2-3 times/wk: 300-400 mg immediately after dialysis only. Adjust dose to maintain plasma-oxipurinol concentrations <15.2 mcg/ml.

Hepatic impairment: Dose reduction may be needed. Monitor liver function regularly.

Oral

Recurrent calcium oxalate stones

Adult: 200-300 mg daily, may be given as a single dose or in divided doses. Dose is adjusted based on subsequent 24-hr urinary urate excretion.

Renal impairment: Max initial dose: 100 mg daily, increase only if the response is inadequate. Severe impairment: Doses should be <100 mg daily or 100 mg at intervals >1 day. Patients receiving dialysis 2-3 times/wk: 300-400 mg immediately after dialysis only. Adjust dose to maintain plasma-oxipurinol concentrations <15.2 mcg/ml.

Hepatic impairment: Dose reduction may be needed. Monitor liver function regularly.

Intravenous

Cancer therapy-induced hyperuricaemia

Adult: 200-400 mg/m² daily given as a single dose or equally divided doses at 6-, 8- or 12-hr intervals; given as an infusion over 15-60 minutes. Max: 600 mg daily. Therapy should be started 24-48 hr before initiating the treatment. Ensure sufficient fluid intake to produce a daily urinary output of at least 2 L and maintenance of a neutral, or slightly alkaline

over 15-60 minutes. Max: 600 mg daily. Therapy should be started 24-48 hr before initiating the treatment. Ensure sufficient fluid intake to produce a daily urinary output of at least 2 L and maintenance of a neutral, or slightly alkaline urine.

Child: =10 yr: Start with 200 mg/m² daily; >10 yr: 200-400 mg/m² daily (max: 600 mg/day). Dose can be given as a single dose or equally divided doses at 6-, 8- or 12-hr intervals; infuse over 15-60 minutes. Therapy should be started 24-48 hr before initiating the chemotherapy treatment.

Renal impairment: Haemodialysis: Administer dose after session or administer 50% supplemental dose.

CrCl (ml/min)	Dosage Recommendation
10-20	200 mg daily.
<3	100 mg daily at extended intervals.
3-10	100 mg daily.

Hepatic impairment: Dose reduction may be needed. Monitor liver function regularly.

Reconstitution: Recommended to further dilute the reconstituted solution to = 6 mg/ml with normal saline or 5% dextrose solution.

Incompatibility: Y-site incompatibility: Amikacin sulfate, amphotericin B, carmustine, cefotaxime sodium, chlormethine hydrochloride, chlorpromazine hydrochloride, cimetidine hydrochloride, clindamycin phosphate, cytarabine, dacarbazine, daunorubicin hydrochloride, diphenhydramine hydrochloride, doxorubicin hydrochloride, doxycycline hyclate, droperidol, floxuridine, gentamicin sulfate, haloperidol lactate, hydroxyzine hydrochloride, idarubicin hydrochloride, imipenem with cilastatin sodium, methylprednisolone sodium succinate, metoclopramide hydrochloride, minocycline hydrochloride, nalbuphine hydrochloride, netilmicin sulfate, ondansetron hydrochloride, pethidine hydrochloride, prochlorperazine edisilate, promethazine hydrochloride, sodium bicarbonate, streptozocin, tobramycin sulfate and vinorelbine tartrate.

Administration	Should be taken with food. (Take immediately after meals.)
Contraindications	Hypersensitivity; acute attack of gout.
Special Precautions	Ensure adequate fluid intake. Prophylactically with an anti-inflammatory or colchicine for at least 1 mth. Withdraw immediately when sensitivity (skin rash, etc) appears. Pregnancy, lactation. Hepatic and renal impairment.
Adverse Drug Reactions	Rash; alopecia; GI disorders, taste disturbances, nausea, vomiting, abdominal pain, diarrhoea; paraesthesia, peripheral neuropathy, vertigo, headache, hepatic necrosis, drowsiness, neuritis, arthralgia; hypertension. Potentially Fatal: Stevens-Johnson and/or Lyell's Syndrome

	rash, dyspepsia, GI disorders, taste disturbances, nausea, vomiting, abdominal pain, diarrhoea; paraesthesia, peripheral neuropathy, vertigo, headache, hepatic necrosis, drowsiness, neuritis, arthralgia; hypertension. Potentially Fatal: Stevens-Johnson and/or Lyell's Syndrome (urticaria, fever, lymphadenopathy, arthralgia). Occasionally, thrombocytopaenia, agranulocytosis and aplastic anaemia.
Drug Interactions	Increased risk of skin rash when used with ampicillin or amoxicillin. May prolong half-life of chlorpropamide and dicumarol. May increase serum levels of ciclosporin. May increase bone marrow depression when used with cyclophosphamide Potentially Fatal: Increased haematological effects of azathioprine and mercaptopurine when co-administered with allopurinol.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Powder for inj: Store at 15-30°C. After reconstitution: Store at 20-25°C. Solution should be used within 10 hr of preparation. Oral: Store below 25°C.
Mechanism of Action	Allopurinol is an inhibitor of the enzyme xanthine oxidase which converts hypoxanthine to xanthine then uric acid. The reduced production of uric acid relieves all symptoms associated with hyperuricaemia and gout. Inhibition of xanthine oxidase leads to accumulation of its substrates hypoxanthine and xanthine but since their renal clearance is more than 10 times that of uric acid, there is no risk of nephrolithiasis. Absorption: 90% of the dose is absorbed from the GI tract (oral); peak plasma concentrations after 1-2 hrs. Distribution: Enters breast milk. Protein-binding: None. Metabolism: Converted to oxipurinol (alloxanthine). Excretion: Urine (as unchanged drug and metabolite), faeces. Elimination half-life: 1-2 hr (allopurinol), 15 hr (oxipurinol).
CIMS Class	Hyperuricemia & Gout Preparations
ATC Classification	M04AA01 - allopurinol; Belongs to the class of preparations inhibiting uric acid production. Used in the treatment of gout.

allylestrenol

CIMS Class : (Oestrogens & Progesterones & Related Synthetic Drugs)

allylestrenol

P - Contraindicated in pregnancy

L - Caution when used during pregnancy

Lab - Lab interference

related allylestrenol information

Indication & Dosage	<i>Oral</i> Threatened miscarriage Adult: 5 mg tid for 5-7 days.
Administration	May be taken with or without food. (May be taken w/ meals if GI upset occurs)
Contraindications	Hypersensitivity; thrombophlebitis; undiagnosed vag bleeding, incomplete abortion, hormone-dependent carcinoma, cerebral apoplexy, as a diagnostic test for pregnancy; severe hepatic impairment; pregnancy.
Special Precautions	Discontinue medications if there is sudden partial or complete loss of vision; proptosis or diplopia; migraine and embolic disorders; epilepsy, migraine, cardiac or renal dysfunction. History of depression, glucose intolerance and diabetes. May impair ability to drive or operate machinery. Sudden withdrawal of allyloestrenol should be avoided as it leads to intermittent breakthrough bleeding and lactation.
Adverse Drug Reactions	GI disturbances, appetite/weight change; fluid retention, oedema; acne, seborrhoea; urticaria; depression, headache, fever, fatigue; breast changes, hirsutism, alopecia; decrease in libido, altered menstrual cycles or irregular menstrual bleeding (rare).
Drug Interactions	Enhanced clearance with enzyme-inducing drugs eg, carbamazepine, griseofulvin, phenobarbital, phenytoin and rifampicin. Fluconazole may increase bioavailability of progesterone. Potentially Fatal: Increased ciclosporin concentration.
Lab Interference	Alterations in lipid profile and liver function tests.
Mechanism of Action	Allylestrenol is similar to that of natural progesterone. It prepares the uterus for receiving the fertilised ovum and suppresses uterine motility.
CIMS Class	Oestrogens & Progesterones & Related Synthetic Drugs
ATC Classification	G03DC01 - allylestrenol; Belongs to the class of estren derivative progestins used in progestogenic hormone preparations.

ATC

alpha-lipoic acid

CIMS Class : (Supplements & Adjuvant Therapy)
alpha-lipoic acid

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related alpha-lipoic acid information

Indication & Dosage	<i>Oral</i> Diabetic neuropathy Adult: As a racemic mixture: 300-600 mg daily.
Administration	Should be taken on an empty stomach. (Take 30 mins before meals. Swallow whole, do not chew/ crush.)
Special Precautions	Pregnancy and lactation. May lower blood glucose. Monitor blood glucose levels regularly.
Mechanism of Action	Alpha-lipoic acid has antioxidant activity and activity in enhancing biological energy production. It is also known as thioctic acid.
CIMS Class	Supplements & Adjuvant Therapy

([all drugs])

alprazolam

CIMS Class : (Anxiolytics)

alprazolam

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related alprazolam information

Indication & Dosage	<i>Oral</i> Short-term management of anxiety Adult: 0.25-0.5 mg tid, increased to 3-4 mg daily if necessary. Elderly: Initially, 0.25 mg bid/tid. Hepatic impairment: Avoid in severe impairment. <i>Oral</i> Panic attacks Adult: Up to 10 mg daily.
Administration	May be taken with or without food. (Side effects such as sleepiness/ drowsiness may be reduced if taken immediately after meals.)
Overdosage	Symptoms: Somnolence, confusion, impaired coordination, diminished reflexes and coma. Monitor respiration, pulse rate and BP. General supportive measures and immediate gastric lavage may be recommended. If hypotension occurs, it may be combated by the use of vasopressors. Dialysis is of limited value. Flumazenil may be used for complete or partial reversal of the sedative effects of benzodiazepines and may be used when an overdose with a benzodiazepine is known or suspected.
Contraindications	Acute narrow-angle glaucoma, preexisting CNS depression or coma, resp depression, acute pulmonary insufficiency or sleep apnoea; severe hepatic impairment; pregnancy, lactation.
Special Precautions	Dosage reduction or gradual withdrawal. Dependence. Geriatric or debilitated patients. Muscle weakness, impaired hepatic or renal function; arteriosclerosis; obesity; depression particularly suicidal tendency; chronic pulmonary

	Dosage reduction or gradual withdrawal. Dependence. Geriatric or debilitated patients. Muscle weakness, impaired hepatic or renal function; arteriosclerosis; obesity; depression particularly suicidal tendency; chronic pulmonary insufficiency. May impair ability to drive or operate machinery. Children <18 yr.
Adverse Drug Reactions	Psychological and physical dependence, withdrawal syndrome; drowsiness, sedation, vertigo, headache, visual disturbances, GI disturbances, jaundice; fatigue, muscle weakness, ataxia, dizziness, confusion and depression. Potentially Fatal: Blood dyscrasias.
Drug Interactions	Potentiates action of alcohol and CNS depressants. Reduced conc with cigarette smoking by 50%. Potentially Fatal: Cimetidine and fluoxetine reduce the clearance of alprazolam. Alprazolam enhances activity of imipramine and desipramine.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store below 25°C.
Mechanism of Action	Alprazolam has anxiolytic, muscle-relaxant, anticonvulsant, antidepressant and sleep-modifying effects. It binds to the γ -aminobutyric acid (GABA)-specific sites throughout the CNS, leading to an increase in the inhibitory effect of GABA on neuronal excitability. Increased neuronal permeability to chloride ions thus results in hyperpolarisation and stabilisation. Absorption: Well absorbed from the GIT (oral); peak plasma concentrations after 1-2 hrs. Distribution: Protein-binding: 70-80% Metabolism: Hepatic; converted to α -hydroxyalprazolam and benzophenone. Excretion: Urine (as unchanged drug and metabolites); 11-15 hrs (elimination half-life).
CIMS Class	Anxiolytics
ATC Classification	N05BA12 - alprazolam; Belongs to the class of benzodiazepine derivatives anxiolytics. Used in the management of anxiety, agitation or tension.

alprostadil

CIMS Class : (Drugs for Erectile Dysfunction) , (Other Cardiovascular Drugs)
alprostadil

P - Contraindicated in pregnancy

Food ⚠ - Food interaction

related alprostadil information

Indication & Dosage

Intravenous

Maintenance of patency of ductus arteriosus in neonates with congenital heart disease

Child: 0.05-0.1 mcg/kg/minute by continuous IV infusion, may increase to 0.4 mg/kg/minute. To be injected into a large vein, or alternatively through an umbilical artery catheter placed at the ductal opening. Reduce to the lowest dose necessary to maintain response as soon as possible.

Intracavernosal

Erectile dysfunction

Adult: Initially, 2.5 mcg, then 5 mcg, further increments may be made in steps of 5-10 mcg depending on erectile response. Once the optimal dose is determined, it should not be given >1 time/day or 3 times/wk. Usual maintenance: 5-20 mcg/day. Max: 60 mcg/day. For neurogenic origin (e.g. spinal cord injury): Initially, 1.25 mcg, may increase to 2.5 mcg, then 5 mcg (if needed).

Intracavernosal

Diagnosis of erectile dysfunction

Adult: 5-20 mcg. A dose of 500 mcg may also be administered trans-urethrally.

Urethral

Erectile dysfunction

Adult: Initially 250 mcg, may increase to 500 or 1000 mcg or reduce to 125 mcg depending on erectile response. The optimal dose should not be given >2 times/day or 7 times/wk.

Contraindications

Hypersensitivity, hyaline membrane disease. Pregnancy.

Special Precautions

Neonates receiving PGE₁ for more than 120 hr should be

Special Precautions	Neonates receiving PGE ₁ for more than 120 hr should be closely monitored for antral hyperplasia and gastric outlet obstruction; history of haemorrhage; monitor BP, blood oxygenation and blood pH continually. Caution in COPD.
Adverse Drug Reactions	Flushing, bradycardia, hypotension, tachycardia, oedema, diarrhoea, fever, convulsions, DIC, cortical proliferation of long bones, hypokalaemia, weakening of the wall of ductus arteriosus and pulmonary artery may follow prolonged use; gastric outlet obstruction reported. Potentially Fatal: Cardiac arrest, apnoea (in infants <2 kg).
Food Interaction	Avoid ethanol.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Alprostadil causes vasodilation and prevents platelet aggregation. It has direct effect on the vascular and ductus arteriosus smooth muscle. When injected along the penile shaft, alprostadil relaxes the trabecular smooth muscle by dilation of the cavernosal arteries. This allows blood flow to the lacunar spaces of the penis. Metabolism: Rapidly metabolised by oxidation during passage through the pulmonary circulation. Excretion: Excreted in urine as metabolites within 24 hr.
CIMS Class	Drugs for Erectile Dysfunction / Other Cardiovascular Drugs
ATC Classification	C01EA01 - alprostadil; Belongs to the class of prostaglandins used in cardiac therapy. G04BE01 - alprostadil; Belongs to the class of drugs used in erectile dysfunction.

alteplase

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
alteplase

P - Caution when used during pregnancy

Lab - Lab interference

related alteplase information

Indication & Dosage

Intravenous

Acute myocardial infarction

Adult: A total dose of 100 mg should be given as soon as possible after the onset of symptoms; total dose should be =1.5 mg/kg in patients weighing <65 kg. For admin within 6 hr of MI: 15 mg as bolus, then 0.75 mg/kg (up to a max of 50 mg) to be infused over 30 minutes, followed by the remainder dose to be infused over subsequent 60 minutes. For admin >6 hr after MI: 10 mg as bolus, then 50 mg to be infused over 60 minutes, followed by remainder dose to be infused over subsequent 2 hr.

Intravenous

Acute massive pulmonary embolism

Adult: Total dose: 100 mg but not >1.5 mg/kg for patients weighing <65 kg. First 10 mg as bolus, followed by infusion of the remainder dose over 2 hr.

Intravenous

Acute ischaemic stroke

Adult: To be given within 3 hr of the onset of symptoms: Infuse 0.9 mg/kg (up to a max total dose of 90 mg) over 60 minutes with 10% of the dose given as a bolus over the first minute.

Injection

Clearance of central venous lines

Adult: Using solution at a concentration of 1 mg/mL. Usual dose: 2 mg, may repeat after 2 hr if needed. Not to exceed a total dose of 4 mg. Patients weighing <30 kg: Dose is 110% of the internal lumen volume of the catheter (not >2 mg), may repeat after 2 hr if needed.

	total dose of 4 mg. Patients weighing <30 kg: Dose is 110% of the internal lumen volume of the catheter (not >2 mg), may repeat after 2 hr if needed. Reconstitution: Reconstitute by adding 50 ml of sterile water for inj without preservatives to a vial containing 50 mg of drug using a large-bore (e.g. 18-gauge) needle and directing the stream of diluent into the lyophilized plug of powder; diluents other than sterile water for inj without preservatives should not be used for reconstitution. Final concentration: 1 mg/ml. Incompatibility: Y-site incompatibility: Dopamine, nitroglycerin, heparin and dobutamine. Admixture incompatibility: Dopamine, dobutamine, heparin.
Contraindications	Recent surgery or trauma, susceptibility to internal bleeding, history of cerebrovascular accident, uncontrolled hypertension, esophageal varices, heavy vaginal bleeding, coagulation defects, aneurysm and poor glycaemic control.
Special Precautions	Children, elderly. Pregnancy. Monitor intracranial haemorrhage and BP in acute stroke. Renal impairment.
Adverse Drug Reactions	Vomiting, bleeding from puncture sites, gingival tissues and urinary tract. Potentially Fatal: Haemorrhage esp with previous trauma or unsuspected underlying cause of bleeding, intracerebral bleeding.
Drug Interactions	Heparin reduces risk of coronary reocclusion. Prostacyclin and nitrates increase plasma alteplase clearance. Potentially Fatal: Increased risk of GI bleeding with NSAIDs. Increased risk of hemorrhage with warfarin.
Lab Interference	May interfere with estimation of plasma fibrinogen and other coagulation tests.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Injection: For Activase®: Lyophilised product: May store at room temperature (<30°C) or under refrigeration. Reconstituted solution: Use within 8 hr. Intravenous: For Activase®: Lyophilised product: May store at room temperature (<30°C) or under refrigeration. Reconstituted solution: Use within 8 hr.
Mechanism of Action	Alteplase initiates local fibrinolysis and dissolution of clots by binding to fibrin in a thrombus and the fibrin-bound plasminogen is converted to plasmin.

	Alteplase initiates local fibrinolysis and dissolution of clots by binding to fibrin in a thrombus and the fibrin-bound plasminogen is converted to plasmin. Excretion: Cleared rapidly from the plasma mainly by hepatic metabolism. Half-life: 4-5 minutes (initial); about 40 minutes (terminal).
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC Classification	B01AD02 - alteplase; Belongs to the class of enzymes. Used in the treatment of thrombosis. S01XA13 - alteplase; Belongs to the class of other agents used as ophthalmologicals.

aluminium hydroxide

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants)

aluminium hydroxide

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ∇ - Food interaction

related aluminium hydroxide information

Indication & Dosage	<i>Oral</i> Antacid Adult: Up to 1 g daily. <i>Oral</i> Hyperphosphataemia in patients with chronic renal failure Adult: Dose is adjusted to the individual patient's requirement. Up to 10 g/day may be given in divided doses with meals. Max Dosage: 10 g daily in divided doses.
Administration	May be taken with or without food.
Contraindications	Hypersensitivity to aluminium salts.
Special Precautions	Chronic renal impairment; CHF; oedema; cirrhosis and low Na diets; patients with recent GI haemorrhage. Administer 2-3 hrs before/after another medication to minimise drug interactions. Pregnancy and lactation.
Adverse Drug Reactions	Constipation; intestinal obstruction (with large doses); phosphate depletion may occur with prolonged admin or large doses.
Drug Interactions	Enhanced absorption with citrates or ascorbic acid. Decreases absorption of allopurinol, tetracyclines, quinolones, cephalosporins, biphosphonate derivatives, corticosteroids, cyclosporin, delavirdine, Fe salts, imidazole antifungals, isoniazid, mycophenolate, penicillamine, phosphate supplements, phenytoin, phenothiazines, trientine.
Food Interaction	Food decreases gastric emptying time.
Mechanism of Action	Alumunium hydroxide acts on the HCl in the stomach by neutralization, forming aluminium chloride salt and water. Absorption: Alumunium hydroxide reacts with hydrochloric acid

	Alumunium hydroxide acts on the HCl in the stomach by neutralization, forming aluminium chloride salt and water. Absorption: Alumunium hydroxide reacts with hydrochloric acid in the stomach to form soluble aluminium chloride, which is absorbed from the GI tract. Excretion: Absorbed aluminium is excreted via the urine. Insoluble aluminium salts formed in the intestines, eg, hydroxides, carbonates, phosphates and fatty acid derivatives, are excreted in the faeces.
CIMS Class	Antacids, Antireflux Agents & Antiulcerants
ATC Classification	A02AB01 - aluminium hydroxide; Belongs to the class of aluminium-containing antacids. Used for the treatment of acid-related disorders.

amantadine

CIMS Class : (Antiparkinsonian Drugs) , (Antivirals)
amantadine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related amantadine information

Indication & Dosage

Oral

Influenza A

Adult: 100 mg daily for 5 days.

Elderly: >65 yr: Daily dose of <100 mg or 100 mg given at intervals >1 day.

CrCl (ml/min)	Dosage Recommendation
>35	100 mg daily.
15-35	100 mg every 2-3 days.
<15	Not recommended.

Oral

Prophylaxis of influenza A

Adult: 100 mg daily for up to 6 wk; when used with influenza vaccination: only up to 3 wk after vaccination.

Child: 10-15 yr: 100 mg daily.

CrCl (ml/min)	Dosage Recommendation
>35	100 mg daily.
15-35	100 mg every 2-3 days.
<15	Not recommended.

Oral

Herpes zoster in immunocompromised patients

Adult: 100 mg bid for 14 days, continued for another 14 days if pain persists.

CrCl (ml/min)	Dosage Recommendation
>35	100 mg daily.
15-35	100 mg every 2-3 days.
<15	Not recommended.

	<15	Not recommended.
	<i>Oral</i> Parkinson's disease Adult: Initially, 100 mg/day, increased to 100 mg bid after a wk or more. Max dose: 400 mg daily. Elderly: >65 yr: Lowest effective dose.	
Administration	Should be taken with food.	
Overdosage	Cardiac arrest may occur.	
Contraindications	Hypersensitivity. Pregnancy and lactation. Epilepsy or other seizure disorders, severe renal impairment and gastric ulceration.	
Special Precautions	Patients with CV or liver disease, impaired renal function, recurrent eczema. Elderly. Withdrawal of the drug should be gradual.	
Adverse Drug Reactions	Seizures, psychosis, hallucinations, confusion, ataxia, heart failure, depression, orthostatic hypotension, blood dyscrasias, urinary retention, irritability, GI disturbances, anorexia, livedo reticularis, ankle oedema. Potentially Fatal: Congestive heart failure, convulsions.	
Drug Interactions	Enhances the adverse effects of antimuscarinics and levodopa. CNS stimulants, drugs that raise urinary pH.	
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.	
Storage	Oral: Store at 20-25°C.	
Mechanism of Action	Amantadine is a weak dopamine agonist possessing antimuscarinic properties. It alters dopamine release and re-uptake. It also noncompetitively antagonises N-methyl-D-aspartate. As an antiviral drug, it inhibits replication of influenza type A virus. Absorption: Readily absorbed from the GIT (oral); peak concentrations after 4 hrs. Distribution: Crosses the placenta and the blood-brain barrier; enters breast milk. Protein binding: 67%. Excretion: Mainly via urine by glomerular filtration and tubular secretion (as unchanged and small amounts of an acetylated metabolite); 11-15 hrs (elimination half-life), significantly prolonged in the elderly and renal impairment;	

	Excretion: Mainly via urine by glomerular filtration and tubular secretion (as unchanged and small amounts of an acetylated metabolite); 11-15 hrs (elimination half-life), significantly prolonged in the elderly and renal impairment; may be increased by acidification of the urine.
CIMS Class	Antiparkinsonian Drugs / Antivirals
ATC Classification	N04BB01 - amantadine; Belongs to the class of adamantane derivative dopaminergic agents. Used in the management of parkinson's disease.

ambroxol

CIMS Class : (Cough & Cold Preparations)
ambroxol

related ambroxol information

Indication & Dosage	<i>Oral</i> Mucolytic Adult: 60-120 mg daily, in 2-3 divided doses. Child: <2 yr: 7.5 mg bid; 2-5 yr: 7.5 mg bid/tid; 6-12 yr: 15 mg bid/tid.
Administration	Should be taken with food.
Adverse Drug Reactions	Mild GI effects and allergic reactions.
Mechanism of Action	Ambroxol is a metabolite of bromhexine and is used similarly as a mucolytic.
CIMS Class	Cough & Cold Preparations
ATC Classification	R05CB06 - ambroxol; Belongs to the class of mucolytics. Used in the treatment of wet cough.

amifostine

CIMS Class : (Supportive Care Therapy)
amifostine

P - Caution when used during pregnancy

L - Caution when used during lactation

related amifostine information

Indication & Dosage	<i>Intravenous</i> As a cytoprotective agent in chemotherapy Adult: Initially, 910 mg/m² BSA once daily, as an infusion given over 15 minutes, 30 minutes before start of chemotherapy. May reduce to 740 mg/m² if patient is unable to tolerate the full dose. For patients receiving cisplatin doses <100 mg/m², a dose of 740 mg/m² may be given to reduce renal toxicity. <i>Intravenous</i> Prophylaxis of xerostomia in patients undergoing radiotherapy for head and neck cancer Adult: 200 mg/m² BSA once daily, as an infusion given over 3 minutes, beginning 15-30 minutes before radiotherapy. Reconstitution: Each single-use vial contains 500 mg of anhydrous amifostine. Reconstitute with 9.7 mL of sterile 0.9% sodium chloride Inj and dilute with 0.9% sodium chloride to a final concentration of 5-40 mg/mL. Visual inspection for particulate matter and discoloration prior to admin is recommended. Do not use if cloudiness or precipitate is observed. Incompatibility: Y-site incompatibility: Acyclovir, amphotericin B, chlorpromazine, cisplatin, ganciclovir, hydroxyzine HCl, prochlorperazine edisylate.
Overdosage	May cause hypotension which can be managed by supportive care and normal saline infusion.
Contraindications	Hypersensitivity, patients with low BP, dehydration, patients with renal or hepatic impairment, children and elderly >70 yr.
Special	Pregnancy and lactation. Patients should be well-hydrated

Special Precautions	Pregnancy and lactation. Patients should be well-hydrated and kept supine during infusion. Prolonged infusion causes greater side effects: Stop antihypertensive drugs 24 hr before infusion. Monitor BP regularly, at least before and immediately after infusion. Admin antiemetics before infusion especially when emetogenic drugs are used.
Adverse Drug Reactions	Hypotension during infusion. Systolic fall is greater. Transient and reversible loss of consciousness rarely. Nausea, vomiting, flushing, feeling of warmth, chills, dizziness, sneezing, cough and drowsiness, mild skin rashes. Potentially Fatal: Severe skin reactions, including Stevens-Johnson syndrome.
Drug Interactions	Concurrent use with antihypertensives may cause severe hypotension.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Vials containing lyophilized powder: Store at 20-25°C. Reconstituted solution (500 mg/10 mL): Chemically stable for up to 5 hr at room temperature (about 25°C) or up to 24 hr under refrigeration (2-8°C).
Mechanism of Action	Amifostine is a prodrug that is converted to a pharmacologically active metabolite (free thiol), which selectively protects non-cancer cells from the toxic effects of antineoplastics (eg, cisplatin) and radiation. Distribution: Volume of distribution: 3.5L. Metabolism: Dephosphorylated by alkaline phosphatase to an active metabolite, a free thiol compound. Excretion: About 6% or less is excreted in the urine. Elimination half life after 15-minute IV infusion: <10 minutes.
CIMS Class	Supportive Care Therapy
ATC Classification	V03AF05 - amifostine; Belongs to the class of detoxifying agents used in antineoplastic treatment.

amikacin

CIMS Class : (Aminoglycosides)
amikacin

P - Contraindicated in pregnancy

L - Caution when used during lactation

related amikacin information

related amikacin information	
Indication & Dosage	<i>Parenteral</i> Uncomplicated urinary tract infections Adult: 250 mg bid, given via IM, IV inj over 2-3 minutes or as IV infusion. Max Dosage: Renal impairment: Dosage adjustments may be made by (a) normal doses at increased dosing intervals or (b) reduced doses at the usual intervals. For (a), dosing interval (in hr) can be calculated by multiplying the patient's serum creatinine (mg/100ml) by 9. For (b), initiate at normal dose. Maintenance doses can be calculated by dividing the normal dose by the patient's serum creatinine. <i>Parenteral</i> Severe Gram-negative infections resistant to gentamicin and tobramycin Adult: 15 mg/kg daily in equally divided doses injected every 8 or 12 hr for 7-10 days. Max: Up to 500 mg every 8 hr in life-threatening infections. Max cumulative dose: 15 g. Doses may be given via IM, slow IV inj over 2-3 minutes or IV infusion. Child: 15 mg/kg daily in equally divided doses injected every 8 or 12 hr for 7-10 days. Neonates: 10 mg/kg daily in 2 divided doses. Renal impairment: Dosage adjustments may be made by (a) normal doses at increased dosing intervals or (b) reduced doses at the usual intervals. For (a), dosing interval (in hr) can be calculated by multiplying the patient's serum creatinine (mg/100ml) by 9. For (b), initiate at normal dose. Maintenance doses can be calculated by dividing the normal dose by the patient's serum creatinine.

	(in hr) can be calculated by multiplying the patient's serum creatinine (mg/100ml) by 9. For (b), initiate at normal dose. Maintenance doses can be calculated by dividing the normal dose by the patient's serum creatinine.
Overdosage	Peritoneal dialysis or haemodialysis may be used in case of overdosage.
Contraindications	Pregnancy, perforated ear drum, myasthenia gravis, hypersensitivity.
Special Precautions	Renal impairment; vertigo, tinnitus. Discontinue if signs of ototoxicity, neurotoxicity or hypersensitivity occurs; lactation. Safety has not been established for treatment period >14 days. Monitor renal function before and during treatment.
Adverse Drug Reactions	Tinnitus, vertigo; ataxia and overt deafness. Potentially Fatal: Ototoxicity, nephrotoxicity, neuromuscular blockade.
Drug Interactions	Amphotericin B may lead to increased nephrotoxicity and reduced clearance of amikacin when used together. Potentially Fatal: Increased ototoxic or nephrotoxic effects with other nephrotoxic or ototoxic drugs. Enhanced neuromuscular blockade with neuromuscular blocking drugs. Increased risk of ototoxicity with potent diuretics.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Parenteral: Store at 15-30°C.
Mechanism of Action	Amikacin binds to 30S ribosomal subunits of susceptible bacteria, thus inhibiting its protein synthesis. Distribution: Detected in body tissues and fluids after inj; crosses the placenta but does not readily penetrate the CSF. Significant amounts penetrate the blood-brain barrier in children with meningitis. Excretion: Via the urine by glomerular filtration (within 24 hr); 2-3 hr (elimination half-life).
CIMS Class	Aminoglycosides
ATC Classification	D06AX12 - amikacin; Belongs to the class of other topical antibiotics used in the treatment of dermatological diseases. J01GB06 - amikacin; Belongs to the class of other aminoglycosides. Used in the treatment of systemic infections. S01AA21 - amikacin; Belongs to the class of antibiotics. Used in the treatment of eye infections.

amiloride + hydrochlorothiazide

CIMS Class : (Diuretics)
amiloride + hydrochlorothiazide

related amiloride + hydrochlorothiazide information

Indication & Dosage	<i>Oral</i> Mild to moderate hypertension Adult: Each tab contains amiloride 5 mg and hydrochlorothiazide 50 mg, 1-2 tabs daily, preferably in the morning.
Administration	Should be taken with food.
Contraindications	Hyperkalemia, renal impairment, hypersensitivity, pregnancy, lactation
Special Precautions	Oliguria, elderly, neonatal jaundice, oliguria, renal disease, hepatic disease, diabetic nephropathy, systemic lupus erythematosus, acute pancreatitis, hyponatremia, hypercalcemia, gout, hypercholesterolemia, IDDM, NIDDM sympathectomy, acidosis, hyponatremia.
Adverse Drug Reactions	Electrolyte imbalance, hyperkalemia, hypochloremic alkalosis, hypokalemia, hyponatremia, anorexia, constipation, diarrhea, dizziness, GI irritation, headache, muscle cramps, orthostatic hypotension, photosensitivity, sexual function impairment, agranulocytosis, allergic dermatitis, allergic reaction, anaphylaxis, cholecystitis, gout, hepatic function impairment, hives, hyperuricemia, itching, jaundice, pancreatitis, shortness of breath, skin rash, thrombocytopenia.
Drug Interactions	Concomitant use of amiloride with ACE inhibitors may increase the risk of hyperkalemia. Thiazide diuretics co-administered with alcohol, barbiturates, or narcotics can potentiate orthostatic hypotension. Hydrochlorothiazide can reduce the effect of antidiabetic drugs. Co-administration of thiazide with other antihypertensive drugs provides an additive effect or potentiation. Cholestyramine and colestipol resins reduce the absorption of hydrochlorothiazide.
Pregnancy	

Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Amiloride HCl is a potassium-conserving drug that possesses weak (compared with thiazide diuretics) natriuretic, diuretic and antihypertensive activity. These effects have been partially additive to the effects of thiazide diuretics. Amiloride HCl exerts its potassium-sparing effect through the inhibition of Na reabsorption at the distal convoluted tubule, cortical collecting tubule and collecting duct; this decreases the net -ve potential of the tubular lumen and reduces both K and hydrogen secretion and their subsequent excretion. Hydrochlorothiazide is a diuretic and antihypertensive. It affects the distal renal tubular mechanism of electrolyte reabsorption. Hydrochlorothiazide increases excretion of Na and chloride in approx equiv amounts. Natriuresis may be accompanied by some loss of K and bicarbonate.
CIMS Class	Diuretics
ATC Classification	C03AA03 - hydrochlorothiazide; Belongs to the class of low-ceiling thiazide diuretics. Used to promote excretion of urine. C03DB01 - amiloride; Belongs to the class of other potassium-sparing agents. Used as diuretics.

aminobenzoic acid

CIMS Class : (Other Dermatologicals)
aminobenzoic acid

related aminobenzoic acid information

Indication & Dosage	<i>Topical/Cutaneous</i> Sunscreen Adult: Apply as instructed by product information.
Contraindications	Hypersensitivity to PABA or sulphonamides, thiazide diuretics, benzocaine.
Adverse Drug Reactions	Skin reactions, contact and photocontact allergic dermatitis.
Drug Interactions	Combination with benzophenones gives added protection against photosensitive disorders. Immersion in water causes serious loss of protection.
Mechanism of Action	Aminobenzoic acid is used topically as a sunscreen. It is used to prevent sunburn, but unlikely to prevent drug-related or other photosensitivity reactions associated with UVA light.
CIMS Class	Other Dermatologicals
ATC Classification	D02BA01 - aminobenzoic acid; Belongs to the class of topical protectives used in the protection against UV-radiation.

aminocaproic acid

CIMS Class : (Haemostatics)
aminocaproic acid

P - Caution when used during pregnancy

L - Caution when used during lactation

related aminocaproic acid information

Indication & Dosage	<i>Oral</i> Treatment and prophylaxis of haemorrhage Adult: Initially, 4-5 g, followed by 1-1.25 g every hr for about 8 hr or until bleeding has been controlled. Max: 24 g in 24 hr. Renal impairment: Dosage reduction may be required. <i>Oral</i> Patients with haemophilia undergoing dental extraction Adult: Initially, 6 g immediately after the procedure, followed by 6 g every 6 hr for up to 10 days. <i>Intravenous</i> Treatment and prophylaxis of haemorrhage Adult: Initially, 4-5 g as a 2% solution over 1 hr followed by a 1 g/hr infusion continued for up to 8 hr or until bleeding has been controlled. Max: 24 g in 24 hr. Renal impairment: Dosage reduction may be required.
Administration	May be taken with or without food. (May be taken w/ meals to prevent GI upset.)
Overdosage	Symptoms may range from no reaction to transient hypotension or severe acute renal failure resulting in death.
Contraindications	Bleeding due to disseminated intravascular coagulation. Rapid IV administration.
Special Precautions	Renal or cardiac disorders. Urinary tract bleeding, haematuria of upper urinary tract origin; veno-occlusive hepatic disease, skeletal myopathy, neonates. Monitor creatinine phosphokinase. Avoid admin with factor IX complex concentrates. Pregnancy and lactation.
Adverse Drug Reactions	Oedema, headache, malaise, allergic and anaphylactic reactions, anaphylaxis, bradycardia, hypotension, peripheral ischaemia, thrombosis, abdominal pain, diarrhoea, nausea,

	Oedema, headache, malaise, allergic and anaphylactic reactions, anaphylaxis, bradycardia, hypotension, peripheral ischaemia, thrombosis, abdominal pain, diarrhoea, nausea, vomiting, agranulocytosis, coagulation disorder, leukopaenia, thrombocytopaenia, increased CPK, muscle damage, myalgia, myopathy, myositis, rhabdomyolysis, confusion, convulsions, delirium, dizziness, hallucinations, intracranial hypertension, stroke, syncope, dyspnoea, nasal congestion, pulmonary embolism, pruritus, rash, tinnitus, decreased vision, watery eyes, increased BUN, dry ejaculation. Potentially Fatal: Cardiac and hepatic damage.
Drug Interactions	Increased risk of hypercoagulability with OC and oestrogens.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 15-30°C.
Mechanism of Action	Aminocaproic acid inhibits the action of plasminogen activators and, to a lesser extent, it also has some antiplasmin activity. Absorption: Absorbed readily from the GI tract (oral); peak plasma concentrations after 2 hr. Distribution: Distributed widely. Excretion: Via urine (as unchanged); 2 hr (elimination half-life).
CIMS Class	Haemostatics
ATC Classification	B02AA01 - aminocaproic acid; Belongs to the class of amino acid antifibrinolytics. Used in the treatment of hemorrhage.

aminophylline

CIMS Class : (Antiasthmatic & COPD Preparations)
aminophylline

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related aminophylline information

Indication & Dosage	<i>Oral</i> Chronic bronchospasm Adult: As hydrate: Initially, 225-450 mg bid, increased if necessary. Child: >3 yr: As modified-release hydrate: 12 mg/kg daily increased to 24 mg/kg daily in 2 divided doses after 1 wk. Elderly: Dose reduction may be necessary. Hepatic impairment: Dose reduction may be necessary. <i>Intravenous</i> Acute severe bronchospasm Adult: Loading dose: 5 mg/kg (ideal body weight) or 250-500 mg (25 mg/ml) by slow inj or infusion over 20-30 min. Maintenance infusion dose: 0.5 mg/kg/hr. Max rate: 25 mg/min. Child: Loading dose: same as adult dose. Maintenance dose: 6 mth-9 yr: 1 mg/kg/hr and 10-16 yr: 0.8 mg/kg/hr. Elderly: Dose reduction may be necessary. Hepatic impairment: Dose reduction may be necessary. Special Populations: Reduce maintenance dose in patients with cor pulmonale or heart failure. Increase maintenance dose for smokers. Incompatibility: Incompatible with metals.
Administration	Should be taken on an empty stomach. (Take on an empty stomach at least 1 hr before or 2 hr after meals.)
Overdosage	Symptoms may include agitated maniacal behavior, frequent vomiting, extreme thirst, slight fever, tinnitus, palpitation and

	Symptoms may include agitated maniacal behavior, frequent vomiting, extreme thirst, slight fever, tinnitus, palpitation and arrhythmias. Treatment is usually supportive and withdrawal of the drug. Restoration of fluid and electrolyte balance is necessary.
Contraindications	Hypersensitivity.
Special Precautions	Neonates, elderly, lactation, pregnancy, cardiac/hepatic diseases, peptic ulceration, hyperthyroidism, hypertension, epilepsy, heart failure, chronic alcoholism, acute febrile illness.
Adverse Drug Reactions	Nausea, vomiting, abdominal pain, diarrhoea, headache, insomnia, dizziness, anxiety, restlessness; tremor, palpitations. Potentially Fatal: Convulsions, cardiac arrhythmias, hypotension and sudden death after too rapid IV injection.
Drug Interactions	Other xanthines. Clearance reduced by allopurinol, some antiarrhythmics, cimetidine, disulfiram, fluvoxamine, interferon- α , macrolide antibiotics, quinolones, oral contraceptives, thiabendazole and viloxazine. Clearance increased by phenytoin, anticonvulsants, ritonavir, rifampicin, sulfipyrazone, cigarette smoking. Corticosteroids, diuretics, β_2 -agonists. Potentially Fatal: Increased risk of cardiac arrhythmias with sympathomimetics and halothane. Tachycardia with pancuronium. β -blockers inhibit metabolism. Increased risk of convulsion with quinolones, ketamine.
Food Interaction	Rate of absorption reduced but not extent.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store below 25°C.
Mechanism of Action	Aminophylline is a combination of theophylline and ethylenediamine. Ethylenediamine is inactive; it increases the solubility of theophylline in water. Theophylline relaxes bronchial smooth muscle. Suggested mechanisms are an increase in intracellular cAMP through inhibition of phosphodiesterase; adenosine receptor antagonism, prostaglandin antagonism and effects on intracellular calcium. Absorption: Rate of absorption delayed by food. Distribution: Crosses the placenta and enters breast milk.

	phosphodiesterase; adenosine receptor antagonism, prostaglandin antagonism and effects on intracellular calcium. Absorption: Rate of absorption delayed by food. Distribution: Crosses the placenta and enters breast milk. Metabolism: Undergoes hepatic metabolism. Excretion: Via urine.
CIMS Class	Antiasthmatic & COPD Preparations
ATC Classification	R03DA05 - aminophylline; Belongs to the class of other systemic drugs used in the treatment of obstructive airway diseases, xanthines.

*aminophylline information:

Note that there are some more drugs interacting with aminophylline

amiodarone

CIMS Class : (Cardiac Drugs)
amiodarone

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food $\nrightarrow$ - Food interaction

related amiodarone information

Indication & Dosage

Oral

Ventricular arrhythmias

Adult: 800-1,600 mg/day in 1-2 divided doses for 1-3 wk until initial therapeutic response is achieved, then reduce dose to 600-800 mg/day in 1-2 divided doses for 1 mth. Maintenance: 400 mg/day; lower doses may be used for supraventricular arrhythmias. Daily doses may be divided. Close monitoring of the patient is recommended. Use the minimum effective dose.

Hepatic impairment: Dosage reduction may be necessary.

Intravenous

Life-threatening ventricular arrhythmias

Adult: Recommended starting dose: About 1 g over 1st 24 hr. Dose is given in a 3-phase sequence. Initial rapid loading dose: Infuse 150 mg at a rate of 15 mg/minute (initial infusion rate should not exceed 30 mg/minute); followed by the slow loading phase: Infuse 360 mg at a rate of 1 mg/minute; followed by the first maintenance phase: Infuse 540 mg at a rate of 0.5 mg/minute. After the 1st 24 hr, maintain infusion rate at 0.5 mg/minute (i.e. 720 mg over 24 hr); rate may be increased to achieve effective suppression of arrhythmia. For breakthrough episodes, supplemental doses of 150 mg may be given at 15 mg/minute; may repeat supplemental doses up to a max IV dose of 2.2 g/24 hr. Maintenance infusion at up to 0.5 mg/minute may be continued for up to 2-3 wk with caution. Concentrate for inj should be diluted prior to admin. Conversion to oral therapy will depend on the administered dose of the IV therapy and the bioavailability of the oral drug. **Hepatic impairment:** Dosage reduction may be necessary.

	up to 60 mg/minute may be continued for up to 2-3 hr with caution. Concentrate for inj should be diluted prior to admin. Conversion to oral therapy will depend on the administered dose of the IV therapy and the bioavailability of the oral drug. Hepatic impairment: Dosage reduction may be necessary. <i>Intravenous</i> Pulseless ventricular fibrillation or ventricular tachycardia Adult: Initial: 300 mg (diluted in 20-30 ml dextrose 5% or normal saline) if VF or VT recurs, to be given as a single dose by rapid IV inj. Supplemental dose: 150 mg followed by an infusion of 1 mg/minute for 6 hr, then 0.5 mg/minute. Max: 2.1 g daily. Hepatic impairment: Dosage reduction may be necessary. Reconstitution: To make solution for 1st rapid loading infusion or supplemental infusion: Add 3 ml of amiodarone HCl concentrate (50 mg/ml) to 100 ml of dextrose 5% to give a final conc of 1.5 g/ml; for slow infusion: Add 18 ml of amiodarone HCl concentrate (50 mg/ml) to 500 ml of dextrose 5% to give a final conc of 1.8 mg/ml; for subsequent maintenance infusions, diluted solutions with conc ranging from 1-6 mg/ml may be used. Solutions with conc = 2 mg/ml should be administered via a central venous catheter. Incompatibility: Y-site incompatibility: Cefamandole, sodium bicarbonate, heparin, aminophylline. Syringe incompatibility: Heparin. Admixture incompatibility (amiodarone conc: 4 mg/ml): Cefazolin sodium, cefamandole, mezlocillin sodium, sodium bicarbonate, heparin sodium, aminophylline.
Administration	May be taken with or without food. (Take consistently w/ or without meals. Take w/ meals if high dose or to reduce GI discomfort.)
Overdosage	Symptoms include hypotension, cardiogenic shock, bradycardia, AV block and hepatotoxicity. Hypotension and cardiogenic shock should be treated by slowing the infusion rate or with vasopressor drugs, positive inotropic agents and volume expansion. Bradycardia and AV block may require temporary pacing. Monitor hepatic enzyme concentrations. Amiodarone is not dialyzable.
Contraindications	Hypersensitivity to amiodarone or iodine. Severe sinus node dysfunction, 2nd and 3rd degree heart block (except in patients with a functioning artificial pacemaker), cardiogenic shock, pregnancy.
Special Precautions	Close monitoring is recommended as amiodarone may worsen arrhythmia especially when used concurrently with other anti-arrhythmic drugs or drugs that prolong QT interval. May cause hypotension and bradycardia. May increase risk of liver toxicity. May cause visual disturbance/impairment; corneal refractive laser surgery is not recommended in patients on amiodarone treatment. May cause lung damage;

	other antiarrhythmic drugs or drugs that prolong QT interval. May cause hypotension and bradycardia. May increase risk of liver toxicity. May cause visual disturbance/impairment; corneal refractive laser surgery is not recommended in patients on amiodarone treatment. May cause lung damage; monitor for pulmonary toxicity e.g. acute respiratory distress syndrome. Monitor liver functions regularly. May affect defibrillation or pacing thresholds of cardiac devices. Correct electrolyte imbalance before starting treatment. Caution when used in patients undergoing surgery. Avoid excessive sunlight exposure due to increased risk of photosensitivity. Hepatic impairment, thyroid disease, elderly. Lactation.
Adverse Drug Reactions	Blue-grey discolouration of skin, photosensitivity, peripheral neuropathy, paraesthesia, myopathy, ataxia, tremor, nausea, vomiting, metallic taste, hypothyroidism, hyperthyroidism, alopecia, sleep disturbances, corneal microdeposits, hot flushes, sweating. Heart block, bradycardia, sinus arrest, hepatotoxicity, heart failure. Potentially Fatal: Pulmonary toxicity including pulmonary fibrosis and interstitial pneumonitis, hepatotoxicity, thyrotoxicity. Ventricular arrhythmias, pulmonary alveolitis, exacerbation of arrhythmias and rare serious liver injury. Generally in patients with high doses and having preexisting abnormalities of diffusion capacity.
Drug Interactions	Potentialiation of antiarrhythmic drugs. Possible increased risk of adverse effects when used with anaesthetic agents. Monitor plasma levels of amiodarone when used with HIV protease inhibitors. Cimetidine may increase serum levels of amiodarone. Concurrent use may increase serum levels of ciclosporin. May increase risk of myopathy or rhabdomyolysis when used with HMG-CoA reductase inhibitors. Rifampin may reduce the serum levels of amiodarone. Potentially Fatal: Potentiates the effect of warfarin and other anticoagulants hence dose of warfarin generally needs to be reduced approx half. Raised plasma concentrations of digoxin, phenytoin and quinidine. Additive effect with beta-blockers and calcium-channel blockers (e.g. verapamil and diltiazem).
Food Interaction	St John's wort may reduce serum levels of amiodarone. Grapefruit juice may increase serum levels of amiodarone.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 15-25°C. Oral: Store at 20-25°C.

Storage	Intravenous: Store at 15-25°C. Oral: Store at 20-25°C.
Mechanism of Action	Amiodarone is a class III antiarrhythmic agent which inhibits stimulation, prolongs action potential and refractory period in myocardial tissues. It also decreases AV conduction and sinus node function. Sinus rate is reduced by 15-20%, PR and QT intervals are increased. Amiodarone can cause marked sinus bradycardia or sinus arrest and heart block. In acute IV doses, amiodarone may exert a mild negative inotropic effect. Onset: IV: 1-30 minutes. Duration: IV: 1-3 hr. Absorption: Oral admin: Variable and erratically absorbed from the GI tract; average bioavailability is about 50%. Distribution: Extensively distributed to body tissues; accumulates in muscles and fats. Crosses the placenta and enters breast milk. Protein-binding: 96% Metabolism: Yields desethylamiodarone (also has antiarrhythmic properties); may undergo enterohepatic recycling. Excretion: Mainly in the faeces via bile; via urine (small amounts of amiodarone and its metabolites). Terminal elimination half-life: About 50 days; may range from 20-100 days due to extensive tissue distribution.
CIMS Class	Cardiac Drugs
ATC Classification	C01BD01 - amiodarone; Belongs to class III antiarrhythmics used in the treatment of arrhythmia.

amisulpride

CIMS Class : (Antipsychotics)
amisulpride

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related amisulpride information

Indication & Dosage

Oral

Acute psychosis

Adult: =15 yr: 400-800 mg daily in 2 divided doses. Max: 1.2 g daily. For patients with predominantly negative symptoms: 50-300 mg daily.

CrCl (ml/min)	Dosage Recommendation
30-60	Half the usual dose.
10-30	One-third of the usual dose.

Intramuscular

Acute psychosis

Adult: 400 mg daily.

CrCl (ml/min)	Dosage Recommendation
30-60	Half the usual dose.
10-30	One-third of the usual dose.

Administration

Should be taken on an empty stomach. (Preferably taken before meals.)

Overdosage

Symptoms include generalised convulsions, coma, motor restlessness, tachycardia and slight prolongation of the QT interval.

Contraindications

Pregnancy and lactation, pheochromocytoma, prolactin-dependent tumors. Children <15 yr.

Special Precautions

Renal impairment, Parkinson's disease, CV disease, history of epilepsy, elderly. May affect performance of skilled tasks. withdraw gradually and closely monitored to avoid relapse. Elderly.

Adverse Drug

Weight gain, dizziness, postural hypotension, extrapyramidal

Adverse Drug Reactions	Weight gain, dizziness, postural hypotension, extrapyramidal symptoms, neuroleptic malignant syndrome. GI disorders and dry mouth. CNS effects. Hyperprolactinaemia (with galactorrhoea, amenorrhoea, gynecomastia, breast pain, sexual dysfunction).
Drug Interactions	Guanethidine and other adrenergic neuron blockers, antiarrhythmics, antihistamines, antimalarials and cisapride, diuretics, general anaesthetics, hypnotics, anxiolytics and opioids. Metoclopramide may increase the risk of antipsychotic-induced extrapyramidal effects. Avoid alcohol.
Mechanism of Action	Amisulpride is a substituted benzamide atypical antipsychotic with general properties similar to those of sulpiride and is reported to have a high affinity for dopamine D ₂ and D ₃ receptors. Absorption: Bioavailability: about 48%. Distribution: Protein binding: about 16%. Metabolism: Limited metabolism. Excretion: Terminal half-life: 12 hr. Mainly excreted unchanged in urine.
CIMS Class	Antipsychotics
ATC Classification	N05AL05 - amisulpride; Belongs to the class of benzamides antipsychotics. Used in the management of psychosis.

***amisulpride information:**

Food ⚠ - Food interaction

related amitriptyline information

Indication & Dosage	<i>Oral</i> Depression Adult: Initially, 50-75 mg daily in divided doses or as a single dose at night. May increase dose gradually to 150 mg daily, if needed. Up to 300 mg daily may be used in severe cases. Child: Adolescents(>16yr): 30-75 mg daily or in divided doses, preferably at bedtime. Elderly: 30-75 mg daily or in divided doses, preferably at bedtime. <i>Oral</i> Nocturnal enuresis Child: >11 yr: 25-50 mg at bedtime; 6-10 yr: 10-20 mg at bedtime. Treatment should not continue >3 mth. <i>Oral</i> Neuropathic pain Adult: Initially, 10-25 mg daily at night, may increase to 75 mg daily if needed. Higher doses require specialist attention. <i>Oral</i> Prophylaxis of migraine Adult: Initially, 10 mg at night. Maintenance: 50–75 mg at night.
Administration	May be taken with or without food.
Overdosage	Symptoms: Excitement and restlessness with marked antimuscarinic effects, including dryness of the mouth, hot dry skin, dilated pupils, tachycardia, urinary retention and intestinal stasis. Severe symptoms include unconsciousness, convulsions and myoclonus, hyperreflexia, hypothermia, hypotension, metabolic acidosis, and respiratory and cardiac

	skin, dilated pupils, tachycardia, urinary retention and intestinal stasis. Severe symptoms include unconsciousness, convulsions and myoclonus, hyperreflexia, hypothermia, hypotension, metabolic acidosis, and respiratory and cardiac depression, with life-threatening cardiac arrhythmias that may recur some days after apparent recovery.
Contraindications	Hypersensitivity, use of MAO inhibitors within the last 14 days; acute recovery phase post-MI. Concurrent usage with cisapride.
Special Precautions	Bipolar illness, pregnancy, lactation elderly, CVS disease, renal or liver impairment, epilepsy, thyroid dysfunction, DM. Avoid abrupt withdrawal; urinary retention, prostatic hyperplasia; chronic constipation; angle-closure glaucoma; phaeochromocytoma. Monitor for signs of clinical worsening, suicidality or behavioural changes. May increase risks associated with electro-convulsive therapy. May affect ability to drive or operate machinery.
Adverse Drug Reactions	Postural hypotension, tachycardia, conduction disturbances. Dry mouth, wt gain, sour or metallic taste, stomatitis, constipation; blurring of vision, urinary retention, fatigue, dizziness, weakness, tremors, headache, confusion and delirium in elderly, sexual disturbances; peripheral neuropathy; urticaria, angioedema, sweating. Potentially Fatal: Cardiac arrhythmias.
Drug Interactions	Reduced effect of antihypertensives. Potentiates hypertensive effects of sympathomimetics. Concurrent use with altretamine may cause orthostatic hypotension. May increase adverse CV effects when used with amphetamines. May increase serum levels of carbamazepine. Increased risk of cardiac arrhythmias when used with β -agonists. Absorption may be reduced when used with cholestyramine, colestipol or sucralfate. Additive sedative effects when used with CNS depressants. Concurrent use with CYP2D6 inhibitors (e.g. chlorpromazine, delavirdine, fluoxetine, miconazole, paroxetine) may increase serum levels of amitriptyline. May increase antidiabetic effect of tolazamide, chlorpropamide or insulin. May reduce absorption of levodopa. Increased risk of neurotoxicity when used with lithium. Increased risk of seizures when used with tramadol. May increase anticoagulant effect of warfarin. May cause QT prolongation and fatal arrhythmias when used with drugs that prolong QT interval. Potentially Fatal: Increased risk of QT prolongation and arrhythmias when used with cisapride. Serious adverse effects e.g. hyperpyrexia, hypertension, tachycardia, confusion, seizures and deaths may occur when used with MAO inhibitors.
Food Interaction	Alcohol may enhance adverse effects.

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 20-25°C.
Mechanism of Action	Amitriptyline is a TCA that exerts its action by blocking neuronal re-uptake of noradrenaline and serotonin thus increasing synaptic concentration of serotonin and/or norepinephrine in the CNS. Absorption: Readily absorbed from the GI tract (oral). Distribution: Widely distributed; crosses the placenta; enters breast milk. Protein-binding: Extensive. Metabolism: Extensively 1st-pass effect; demethylated hepatically to nortriptyline (active metabolite). Excretion: Urine (as metabolites in free or conjugated form); 9-25 hr (elimination half-life).
CIMS Class	Antidiuretics / Antidepressants
ATC Classification	N06AA09 - amitriptyline; Belongs to the class of non-selective monoamine reuptake inhibitors. Used in the management of depression.

***amitriptyline information:**

amlodipine

CIMS Class : (Calcium Antagonists) , (Anti-Anginal Drugs)
amlodipine

P - Contraindicated in pregnancy

L - Caution when used during lactation

related amlodipine information

Indication & Dosage	<i>Oral</i> Hypertension, Stable angina, Prinzmetal's angina Adult: Initially, 5 mg once daily increased to 10 mg once daily if necessary. Elderly: Initial dose: 2.5 mg once daily. Hepatic impairment: Initial dose: 2.5 mg once daily.
Administration	May be taken with or without food.
Overdosage	Overdosage may cause marked peripheral vasodilation and hypotension.
Contraindications	Known hypersensitivity to dihydropyridines.
Special Precautions	Impaired liver or renal function, CHF, sick-sinus syndrome, severe ventricular dysfunction, hypertrophic cardiomyopathy, severe aortic stenosis. Caution when used in patients with idiopathic hypertrophic subaortic stenosis. Elderly, children. Pregnancy, lactation.
Adverse Drug Reactions	Headache, peripheral oedema, fatigue, somnolence, nausea, abdominal pain, flushing, dyspepsia, palpitations, dizziness. Rarely pruritus, rash, dyspnoea, asthenia, muscle cramps. Potentially Fatal: Hypotension, bradycardia, conductive system delay and CCF.
Drug Interactions	Increased metabolism with rifampin. Reduced hypotensive effect with calcium. Potentiates effects of thiazide diuretics and ACE inhibitors. Avoid combination with β -blockers in patients with markedly impaired left ventricular function. May increase serum levels of CYP1A2 substrates e.g. aminophylline, fluvoxamine, ropinirole. CYP3A4 inhibitors (e.g. clarithromycin, doxycycline, isoniazid, nifedipine) may increase the effects of amlodipine. Additive BP-lowering

	patients with markedly impaired left ventricular function may increase serum levels of CYP1A2 substrates e.g. aminophylline, fluvoxamine, ropinirole. CYP3A4 inhibitors (e.g. clarithromycin, doxycycline, isoniazid, nifedipine) may increase the effects of amlodipine. Additive BP-lowering effects when used with sildenafil, tadalafil or vardenafil.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Amlodipine relaxes peripheral and coronary vascular smooth muscle. It produces coronary vasodilation by inhibiting the entry of Ca ions into the voltage-sensitive channels of the vascular smooth muscle and myocardium during depolarisation. It also increases myocardial O ₂ delivery in patients with vasospastic angina. Absorption: Well absorbed from the GI tract (oral); peak plasma concentrations after 6-12 hr. Distribution: Protein-binding: 97.5%. Metabolism: Hepatic: Extensive. Excretion: Via urine (mainly as metabolites, 10% as unchanged); 35-50 hr (elimination half-life).
CIMS Class	Calcium Antagonists / Anti-Anginal Drugs
ATC Classification	C08CA01 - amlodipine; Belongs to the class of selective dihydropyridine derivative calcium-channel blockers with mainly vascular effects. Used in the treatment of cardiovascular diseases.

amlodipine + atenolol

CIMS Class : (Calcium Antagonists) , (Beta-Blockers) , (Anti-Anginal Drugs)
amlodipine + atenolol

P - Contraindicated in pregnancy

L - Caution when used during lactation

related amlodipine + atenolol information

Indication & Dosage	<i>Oral</i> Chronic stable angina, Hypertension Adult: Per tablet contains atenolol 25 or 50 mg and amlodipine (as besylate) 5 mg: 1 tab once daily, may increase to 2 tablets daily if needed. Elderly: Per tablet contains atenolol 25 mg and amlodipine (besylate) 5 mg: Initiate with 1 tablet daily. Renal impairment: Per tablet contains atenolol 25 mg and amlodipine (besylate) 5 mg: Initiate with 1 tablet daily.
Overdosage	Overdosage may cause hypotension and less commonly, congestive cardiac failure. Unabsorbed drug may be removed by gastric lavage or use of activated charcoal. Symptomatic treatment may be administered.
Contraindications	Hypotension, sinus bradycardia, 2nd & 3rd degrees of heart block, cardiogenic shock, overt congestive failure, poor LV function, hypersensitivity to either component, pregnancy.
Special Precautions	Excessive fall of BP may occur in elderly patients. Caution in patients with COPD, thyrotoxicosis, congestive failure, vasospastic angina, hepatic & renal impairment. Caution in diabetic patients as beta-blockers may mask tachycardia occurring with hypoglycaemia. Withdrawal should be gradual. Lactation. Safety and efficacy have not been established in children. Not to be used in untreated phaeochromocytoma.
Adverse Drug Reactions	Headache, hypotension, dizziness, breathlessness, fatigue, muscle cramps, bradycardia, palpitations, flushing, oedema, dyspnoea, dyspepsia, cold extremities. Drowsiness, chestpain & impotence rarely. Hypersensitivity reactions.
Drug Interactions	Additive effect when used with catecholamine depleting drugs; monitor for hypotension and/or marked bradycardia. If

	Additive effect when used with catecholamine depleting drugs; monitor for hypotension and/or marked bradycardia. If used with clonidine, clonidine withdrawal should occur a few days after withdrawal of the beta-blocker to prevent rebound hypertension; if replacing clonidine by beta-blocker, beta-blocker should be introduced only after clonidine administration has stopped for several days. Concurrent use with prostaglandin synthase inhibiting drugs (e.g. indomethacin) may reduce the hypotensive effects of beta-blockers.
Mechanism of Action	Atenolol is a cardioselective beta blocker. Amlodipine is a dihydropyridine calcium-channel blocker that blocks the transmembrane influx of calcium ions into vascular smooth muscle and cardiac muscle. Combination of the two drugs results in additive antihypertensive action. Absorption: Amlodipine: Plasma levels peak 6-12 hr after oral admin; absolute bioavailability is estimated to be 64-90%. Atenolol: Absorption is rapid and consistent but incomplete; about 50% of an oral dose is absorbed in the GI tract; plasma levels peak 2-4 hr after oral admin. Distribution: Amlodipine: 93% bound to plasma proteins. Atenolol: 6-16% bound to plasma proteins. Metabolism: Amlodipine: About 90% converted to inactive metabolites hepatically. Atenolol: Little or no hepatic metabolism. Excretion: Amlodipine: 10% of parent compound and 60% of the metabolites are removed in the urine; elimination from the plasma is biphasic with terminal half-life of about 30-50 hr. Atenolol: 50% of the oral dose is removed unchanged in the faeces; absorbed drug is removed mainly via renal elimination; half-life is about 6-7 hr.
CIMS Class	Calcium Antagonists / Beta-Blockers / Anti-Anginal Drugs
ATC Classification	C07AB03 - atenolol; Belongs to the class of selective beta-blocking agents. Used in the treatment of cardiovascular diseases. C08CA01 - amlodipine; Belongs to the class of selective dihydropyridine derivative calcium-channel blockers with mainly vascular effects. Used in the treatment of cardiovascular diseases.

amlodipine + atorvastatin

CIMS Class : (Dyslipidaemic Agents) , (Calcium Antagonists) , (Anti-Anginal Drugs)
amlodipine + atorvastatin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food α - Food interaction

related amlodipine + atorvastatin information

Indication & Dosage

Oral

Hypertension

Adult: In patients with hyperlipidemia or for prevention of cardiovascular disease: As tab containing amlodipine and atorvastatin 2.5/10, 2.5/20, 2.4/40, 5/10, 5/20, 5/40, 5/80, 10/10, 10/20,10/40 and 10/80: Amlodipine component for hypertension: 5 mg once daily. Max: 10 mg once daily. Titrate dose over 7 to 14 days. Atorvastatin component for hyperlipidemias: Initially 10-20 mg daily, Range: 10-80 mg daily. Atorvastatin component for prevention of cardiovascular disease: 10 mg once daily.

Elderly: In patients with hyperlipidemia or for prevention of cardiovascular disease: As tab containing amlodipine and atorvastatin 2.5/10, 2.5/20, 2.4/40, 5/10, 5/20, 5/40, 5/80, 10/10, 10/20,10/40 and 10/80: Amlodipine component: Start on 2.5 mg once daily. Atorvastatin component for hyperlipidemias: Initially 10-20 mg daily, Range: 10-80 mg daily. Atorvastatin component for prevention of cardiovascular disease: 10 mg once daily. Elderly patients are more prone to myopathy, a side effect of atorvastatin.

Hepatic impairment: In patients with hyperlipidemia or for prevention of cardiovascular disease: As tab containing amlodipine and atorvastatin 2.5/10, 2.5/20, 2.4/40, 5/10, 5/20, 5/40, 5/80, 10/10, 10/20,10/40 and 10/80: Amlodipine component for hypertension and angina: Start on 2.5 mg once daily.

Oral

Angina pectoris

	component for hypertension and angina: Start on 2.5 mg once daily. Oral Angina pectoris Adult: In patients with hyperlipidemia or for prevention of cardiovascular disease: As tab containing amlodipine and atorvastatin 2.5/10, 2.5/20, 2.4/40, 5/10, 5/20, 5/40, 5/80, 10/10, 10/20, 10/40 and 10/80: Amlodipine component for angina: 5-10 mg once daily. Max: 10 mg once daily. Atorvastatin component for hyperlipidemias: Initially 10-20 mg daily, Range: 10-80 mg daily. Atorvastatin component for prevention of cardiovascular disease: 10 mg once daily. Elderly: Lower amlodipine dose suggested in the elderly. Amlodipine component for angina: 5 mg once daily. Atorvastatin component for hyperlipidemias: Initially 10-20 mg daily, Range: 10-80 mg daily. Atorvastatin component for prevention of cardiovascular disease: 10 mg once daily. Elderly patients are more prone to myopathy, a side effect of atorvastatin. Hepatic impairment: Amlodipine: Lower dose suggested in the hepatic impairment. Atorvastatin: Do not use in acute liver disease. Decrease dosage in severe disease.
Administration	May be taken with or without food.
Contraindications	Known hypersensitivity to dihydropyridines, HMG-CoA Reductase Inhibitor, amlodipine or atorvastatin. Active liver disease or unexplained persistent elevated serum transaminases. Pregnancy and lactation.
Special Precautions	Severe aortic stenosis, congestive heart failure, renal failure and hepatic impairment and/or ethanol use.
Adverse Drug Reactions	Amlodipine: Headache, dizziness, somnolence, peripheral edema, pulmonary edema, hot flushes, palpitations, nausea and jaundice. Atorvastatin: Headache, constipation, dyspepsia, flatulence, and abdominal pain, diarrhoea, arthritis, chest pain, peripheral edema, nausea, bronchitis, pruritis, rhinitis, UTI, increased transaminases and myalgia.
Drug Interactions	Interactions involving both amlodipine and atorvastatin: Rifamycins increase the metabolism of both amlodipine and atorvastatin. Atorvastatin: There is an increase risk of rhabdomyolysis with use with azoles (eg itraconazole and ketoconazole) and gemfibrozil. Potentially Fatal: Manufacturer of posaconazole and tipranavir contraindicates use with atorvastatin as there may be a risk of rhabdomyolysis. Use of a macrolide, telithromycin is contraindicated with atorvastatin as atorvastatin is metabolised by CYP3A4.
Food Interaction	The metabolism of both amlodipine and atorvastatin may be reduced by grapefruit juice.
Pregnancy	

Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Oral: Store at 15 to 30°C.
Mechanism of Action	Amlodipine relaxes peripheral vascular smooth muscle. Vasodilation is produced via inhibiting the entry of Ca ions into the voltage-sensitive channels of the vascular smooth muscle during depolarisation. It reduces peripheral vascular resistance and hence resulting in a reduction in blood pressure. In vasopastic angina, amlodipine inhibits coronary spasm. Atorvastatin competitively inhibits HMG-CoA reductase, the enzyme that catalyses the conversion of HMG-CoA to mevalonate which is an early rate-limiting step in cholesterol biosynthesis. Absorption: Amlodipine: Peak plasma concentrations after 6-12 hr. Absolute bioavailability: 64% to 90% Atorvastatin: Rapidly absorbed from GI tract (oral). Distribution: Amlodipine: Protein-binding: Abt 93 % Atorvastatin: Protein-binding: =98 % Metabolism: Amlodipine: Extensively (abt 90%) metabolised in the liver. Atorvastatin: Extensively metabolised in the liver. Excretion: Amlodipine: Via urine (60% of metabolites, 10% unchanged); 35-50 hr (elimination half-life). Atorvastatin: Atorvastatin and its metabolites: Removed mainly in the bile. Mean elimination half-life: About 14 hr.
CIMS Class	Dyslipidaemic Agents / Calcium Antagonists / Anti-Anginal Drugs
ATC Classification	C08CA01 - amlodipine; Belongs to the class of selective dihydropyridine derivative calcium-channel blockers with mainly vascular effects. Used in the treatment of cardiovascular diseases. C10AA05 - atorvastatin; Belongs to the class of HMG CoA reductase inhibitors. Used in the treatment of hyperlipidemia.

amlodipine + benazepril

CIMS Class : (ACE Inhibitors) , (Calcium Antagonists)
amlodipine + benazepril

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related amlodipine + benazepril information

Indication & Dosage	Oral Hypertension Adult: As capsules containing amlodipine (mg)/benazepril HCl (mg): 2.5/10, 5/10, 5/20, 5/40, 10/20, 10/40. Amlodipine component: 2.5-10 mg once daily (max: 10 mg/day); benazepril component: 10-40 mg once daily. (Max: 40 mg/day) Elderly: As capsules containing amlodipine (mg)/benazepril HCl (mg): 2.5/10, 5/10, 5/20, 5/40, 10/20, 10/40. Initiate with 2.5 mg amlodipine per day. Renal impairment: Avoid usage in patients with CrCl <30ml/min/1.73m² <table border="1"><thead><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr></thead><tbody><tr><td><30</td><td>Initial dose: 5 mg (benazepril component)</td></tr></tbody></table> Hepatic impairment: As capsules containing amlodipine (mg)/benazepril HCl (mg): 2.5/10, 5/10, 5/20, 5/40, 10/20, 10/40. Initiate with 2.5 mg amlodipine per day.	CrCl (ml/min)	Dosage Recommendation	<30	Initial dose: 5 mg (benazepril component)
CrCl (ml/min)	Dosage Recommendation				
<30	Initial dose: 5 mg (benazepril component)				
Administration	May be taken with or without food.				
Overdosage	Symptoms will likely include vasodilation, resulting in hypotension and tachycardia. Treatment may include the use of pressor agents (e.g. norepinephrine or high-dose dopamine) and/or replenishment of central fluid volume. Benazeprilat is slightly dialyzable ; dialysis may not be useful in removing amlodipine as it is highly-bound to plasma proteins.				
Contraindications	Hypersensitivity, pregnancy, lactation				
Special Precautions	Elderly, impaired renal and hepatic function, CHF, children, low salt diet, aortic stenosis, myocardial ischaemia, angina				

Special Precautions	Elderly, impaired renal and hepatic function, CHF, children, low salt diet, aortic stenosis, myocardial ischaemia, angina pectoris, cholestatic jaundice, allergic angioedema, hyperkalaemia, cerebrovascular insufficiency, coronary insufficiency, bone marrow depression, autoimmune disease, use before, during or immediately after major operation. Discontinue treatment if patients develop jaundice or marked elevations of hepatic enzymes.
Adverse Drug Reactions	Cough, flushing, headache, peripheral oedema, cough, diarrhoea, dizziness, oedema, fainting, fatigue, fever, flushing, hyperkalaemia, hypotension, musculoskeletal pain, loss of taste, nausea, palpitations, skin rash, somnolence, acute renal disease, agranulocytosis, bone marrow suppression, angina pectoris, bradycardia, chest pain, haemolytic anaemia, hepatotoxicity, laryngeal oedema, neutropenia, orthostatic hypotension, pancreatitis, pemphigus, thrombocytopenia. Potentially Fatal: Hypersensitivity, angioedema & Stevens-Johnson syndrome, .
Drug Interactions	NSAIDs decreases effect of ACE inhibitors. Concurrent admin with diuretics may increase the hypotensive effect. Increased risk of hypotension with cytochrome P450 inhibitors such as protease inhibitors, azole antifungals (eg itraconazole). Reduced hypotensive effect if used with cytochrome P450 inducers such as phenobarbital, rifampicin & St John's Wort. Concurrent use with lithium may increase serum levels of lithium and risk of lithium toxicity. Potentially Fatal: Increased risk of hyperkalaemia when used with potassium supplements or potassium-sparing diuretics. Increased risk of leukocytopenia when used with allopurinol or interferons.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 25°C.
Mechanism of Action	Amlodipine is a dihydropyridine calcium antagonist that lowers BP by relaxing the coronary vascular smooth muscles and producing coronary vasodilation; it does this by inhibiting the entry of Ca ions into the 'slow channels' or voltage-sensitive areas of the vascular smooth muscle and myocardium during depolarisation. Benazepril and its active metabolite benazeprilat inhibit ACE, which results in decreased plasma angiotensin II and decreased aldosterone

	the entry of Ca ions into the 'slow channels' or voltage-sensitive areas of the vascular smooth muscle and myocardium during depolarisation. Benazepril and its active metabolite benazeprilat inhibit ACE, which results in decreased plasma angiotensin II and decreased aldosterone secretion. Absorption: Absorption after oral admin: 64-90% (amlodipine) and at least 37% (benazepril). Distribution: Protein binding: 93% (amlodipine). Metabolism: Benazepril: Almost completely metabolised to benazeprilat mainly in the liver. Amlodipine: Largely metabolised in liver. Excretion: Amlodipine: 10% of parent compound and 60% of the metabolites are removed in urine. Benazeprilate: Mainly removed renally. Elimination half life: 10-11 hr (benazeprilat); about 2 days (amlodipine).
CIMS Class	ACE Inhibitors / Calcium Antagonists
ATC Classification	C08CA01 - amlodipine; Belongs to the class of selective dihydropyridine derivative calcium-channel blockers with mainly vascular effects. Used in the treatment of cardiovascular diseases. C09AA07 - benazepril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

amlodipine + enalapril

CIMS Class : (ACE Inhibitors) , (Calcium Antagonists)
amlodipine + enalapril

P - Contraindicated in pregnancy

L - Caution when used during lactation

related amlodipine + enalapril information

Indication & Dosage	<i>Oral</i> Refractory hypertension Adult: Per tablet contains enalapril maleate 5 mg and amlodipine besylate 5 mg: Start with 1 tablet daily. Increase dose gradually according to response. Elderly: 1/2 a tab to start with and built up gradually with caution. Diuretics should be withheld for 2-3 days before starting this combination. Special Populations: Renal impairment: 1/2 a tab to start with and built up gradually with caution. Diuretics should be withheld for 2-3 days before starting this combination.
Contraindications	Hypersensitivity to either component. History of angioedema related to previous exposure to ACE inhibitor. Pregnancy.
Special Precautions	Lactation. Renal and hepatic disease, congestive heart failure; concomitant K supplements & potassium-conserving diuretics, hypovolaemic shock, diuretic therapy; periodic blood count monitoring to preclude neutropaenia or agranulocytosis.
Adverse Drug Reactions	Angioneurotic oedema, nausea, headache, cough, dizziness, fatigue, palpitations, chest pain, flushing, rash; increases in BUN, serum K & creatinine levels may occur; neutropaenia. Potentially Fatal: NA.
Drug Interactions	Indometacin and other NSAIDs may blunt antihypertensive effect. Diuretics enhance antihypertensive effect. Potentially Fatal: Increases lithium levels & may cause lithium toxicity: Hyperkalaemia with K & K sparing diuretics. Risk of bone marrow suppression due to enalapril increased with concomitant use of immunosuppressives.

	effect. Diuretics enhance antihypertensive effect. Potentially Fatal: Increases lithium levels & may cause lithium toxicity: Hyperkalaemia with K & K sparing diuretics. Risk of bone marrow suppression due to enalapril increased with concomitant use of immunosuppressives.
Mechanism of Action	Amlodipine is a 1,4-dihydropyridine-derivative calcium-channel blocker. Enalapril is a pro-drug; following oral administration, it is bioactivated by hydrolysis of the ethyl ester to enalaprilat, which is the active ACE inhibitor.
CIMS Class	ACE Inhibitors / Calcium Antagonists
ATC Classification	C08CA01 - amlodipine; Belongs to the class of selective dihydropyridine derivative calcium-channel blockers with mainly vascular effects. Used in the treatment of cardiovascular diseases. C09AA02 - enalapril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

amlodipine + lisinopril

CIMS Class : (ACE Inhibitors) , (Calcium Antagonists)
amlodipine + lisinopril

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related amlodipine + lisinopril information

Indication & Dosage	<i>Oral</i> Mild to moderate hypertension Adult: Each tablet contains amlodipine 5 mg and lisinopril 5 mg: Usual initial dose 1 tablet daily. May increase to 2 tablets daily, if BP control is still inadequate after 1-2 wk.
Overdosage	Amlodipine: Elevate the extremities if hypotension occurs. Admin vasopressors (such as phenylpehrine) if needed. Lisinopril: Most likely manifestation of overdosage is hypotension; treat with IV infusion of normal saline solution. Can be removed by hemodialysis.
Contraindications	Hypersensitivity to either component, history of angioedema related to ACE inhibitor, patients with hereditary or idiopathic angioedema. Pregnancy & lactation.
Special Precautions	Renal impairment, hepatic impairment and heart failure. Caution when used in patients with severe obstructive coronary artery disease due to risk of increased frequency, duration and/or severity of angina or acute MI. Safety and efficacy have not been established in children.
Adverse Drug Reactions	Nausea, headache, dizziness, cough, diarrhoea, fatigue, rash, oedema, flushing, palpitation, chest pain, asthenia, dry mouth; elevations in BUN, serum creatinine and potassium may occur. Potentially Fatal: Angioneurotic oedema reported with ACE inhibitors.
Drug Interactions	There is an increased risk of hypotension with concurrent use of antihypertensives with alprostadil. Amlodipine: Increased risk of hypotension with concurrent use with alprostadil, non-nucleoside reverse transcriptase inhibitors and cytochrome P450 inhibitors such as protease inhibitors (such

	There is an increased risk of hypotension with concurrent use of antihypertensives with alprostadil. Amlodipine: Increased risk of hypotension with concurrent use with alprostadil, non-nucleoside reverse transcriptase inhibitors and cytochrome P450 inhibitors such as protease inhibitors (such as ritonavir), quinupristin/dalfopristin, azole antifungals (such as itraconazole and ketoconazole). Reduced effect of amlodipine with cytochrome P450 inducers such as phenobarbital, primidone, rifampicin and St John's Wort. Lisinopril: It reduces potassium loss caused by thiazides. Patients on diuretics may experience increased reduction in BP. Hyperkalaemia with concomitant use of potassium-sparing diuretics/potassium supplements may occur. Lisinopril may increase serum lithium levels; monitoring of serum lithium levels is recommended. Concurrent use with NSAIDs may further worsen renal function in patients with renal impairment; may also reduce the antihypertensive effect of lisinopril.
Mechanism of Action	Amlodipine is a dihydropyridine calcium channel blocker that inhibits transmembrane influx of calcium ions into the vascular smooth muscle and cardiac muscle. Lisinopril is an angiotension-converting enzyme inhibitor that reduces BP, mainly by suppressing the renin-angiotensin-aldosterone system. Absorption: Amlodipine: Plasma levels peak between 6-12 hr after oral admin; absolute bioavailability is about 64-90%. Lisinopril: Serum levels peak at approx 7 hr after oral admin. Distribution: Amlodipine: Volume of distribution: 21L/kg; protein-binding: 93 to 98%. Lisinopril: Protein-binding: 25% Metabolism: Amlodipine: About 90% converted to inactive metabolites by the liver. Lisinopril: Does not undergo metabolism. Excretion: Amlodipine: 10% of the parent drug and 60% of the metabolites are removed in the urine; terminal elimination half-life of about 30-50 hr. Lisinopril: Excreted unchanged entirely in the urine; elimination half-life: 11-12 hr.
CIMS Class	ACE Inhibitors / Calcium Antagonists
ATC Classification	C08CA01 - amlodipine; Belongs to the class of selective dihydropyridine derivative calcium-channel blockers with mainly vascular effects. Used in the treatment of cardiovascular diseases. C09AA03 - lisinopril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

amlodipine + losartan

CIMS Class : (Angiotensin II Antagonists) , (Calcium Antagonists)
amlodipine + losartan

P - Contraindicated in pregnancy

L - Caution when used during lactation

related amlodipine + losartan information

Indication & Dosage	<i>Oral</i> Mild to moderate hypertension Adult: Per tablet contains amlodipine 5 mg and losartan potassium 50 mg: Initial: 1 tablet once daily; may increase to 2 tablets daily if the BP control is inadequate after 1-2 wk.
Contraindications	Known hypersensitivity. Avoid concomitant K supplements. Pregnancy.
Special Precautions	Impaired hepatic or renal function, CHF, sick-sinus syndrome, severe ventricular dysfunction, hypertrophic cardiomyopathy. Elderly, children. Lactation. Volume-depleted patients; patients on diuretics and salt restriction; renal artery stenosis. Monitor serum K concentration.
Adverse Drug Reactions	Headache, dizziness, back pain, myalgia, resp tract disorders, asthenia/fatigue; first-dose hypotension; rash, cough, angioedema; neutropaenia GI disturbances; transient elevation of liver enzymes; taste disturbances and hyperkalaemia. Potentially Fatal: Hypotension, bradycardia, conductive system delay, CCF.
Drug Interactions	Amlodipine: Increased metabolism with rifampin. Reduced hypotensive effect with calcium. Potentiates effects of thiazide diuretics and ACE inhibitors. Avoid combination with β -blockers in patients with markedly impaired left ventricular function. Losartan: Concurrent use with NSAIDs may further worsen renal function. Cimetidine may increase the AUC of losartan by about 18%. Phenobarbital and other enzyme inducers may decrease levels of losartan and its active metabolite. Ketoconazole inhibits the conversion of losartan

	Losartan. Concurrent use with NSAIDs may further worsen renal function. Cimetidine may increase the AUC of losartan by about 18%. Phenobarbital and other enzyme inducers may decrease levels of losartan and its active metabolite. Ketoconazole inhibits the conversion of losartan to its active metabolite. Concurrent use with potassium-sparing diuretics or potassium supplements or salt substitutes containing potassium may increase serum potassium levels. Reduces lithium excretion; monitor lithium levels if used together. Potentially Fatal: Increased cyclosporine levels. Risk of lithium toxicity with losartan. Hypotensive effect of losartan potentiated by diuretics and other antihypertensives. Risk of hyperkalaemia increases with concomitant ACE inhibitors, potassium-sparing diuretics and K supplements.
Mechanism of Action	Amlodipine inhibits the movement of Ca ions across the cell membrane into vascular smooth muscles and myocytes. Action is greater in the arterial resistant vessels causing peripheral vasodilatation and reduction in afterload. Losartan is an angiotensin II receptor (type AT₁) antagonists antihypertensive which acts by blocking the actions of angiotensin II of renin-angiotensin-aldosterone system. The drug and its active metabolite selectively block the vasoconstrictor and aldosterone secreting effects of angiotensin II by selectively antagonising the binding of angiotensin II to AT₁ receptors. Absorption: Amlodipine: Plasma levels peak 6-12 hr after oral admin; absolute bioavailability is estimated to be 64-90%. Losartan: Well absorbed; undergoes substantial 1st pass metabolism by CYP450 enzymes; systemic bioavailability is about 33%; about 14% of an oral dose is converted to active metabolites. Distribution: Amlodipine: 93% bound to plasma proteins. Losartan and its active metabolites: Highly bound to plasma proteins, mainly albumin. Metabolism: Amlodipine: About 90% converted to inactive metabolites hepatically. Excretion: Amlodipine: 10% of parent compound and 60% of the metabolites are removed in the urine; elimination from the plasma is biphasic with terminal half-life of about 30-50 hr. Losartan and its active metabolites: Biliary excretion; terminal half-life: About 2 hr (losartan) and 6-9 hr (metabolites).
CIMS Class	Angiotensin II Antagonists / Calcium Antagonists
ATC Classification	C08CA01 - amlodipine; Belongs to the class of selective dihydropyridine derivative calcium-channel blockers with mainly vascular effects. Used in the treatment of cardiovascular diseases. C09CA01 - losartan; Belongs to the class of angiotensin II antagonists. Used in the treatment of cardiovascular disease.

amoxapine

CIMS Class : (Antidepressants)
amoxapine

P - Caution when used during pregnancy

L - Caution when used during lactation

related amoxapine information

Indication & Dosage	<i>Oral</i> Depression Adult: Initially, 50 mg bid-tid, increased gradually up to 100 mg tid. For severely depressed patients in the hospital: Up to 600 mg daily. Elderly: Initially, 25 mg bid-tid increased as necessary after 5-7 days up to 150 mg daily. Max: 300 mg daily.
Administration	May be taken with or without food.
Overdosage	May result in acute renal failure with rhabdomyolysis, coma and seizures.
Contraindications	Hypersensitivity, concurrent treatment with MAOIs, recent MI, heart block or other cardiac arrhythmias. Mania, severe liver disease.
Special Precautions	Recovery after MI, elderly, CVS disease, liver impairment, epilepsy, psychosis, increased intraocular pressure, history of urinary retention, alcohol, pregnancy and lactation; avoid abrupt withdrawal.
Adverse Drug Reactions	Postural hypotension, tachycardia, conduction disturbances; dry mouth, blurring of vision, constipation, urinary retention, fatigue, dizziness, weakness, tremors, headache, confusion and delirium in elderly, weight gain, tardive dyskinesia; neuroleptic malignant syndrome; sexual disturbances. Potentially Fatal: Agranulocytosis, thrombocytopenia; cardiac arrhythmias.
Drug Interactions	Reduced serum levels with barbiturates. Potentially Fatal: Potentiates sedative effect of alcohol. Antiparkinson agents, antipsychotic drugs increase risk of anticholinergic effects. Reduces effect of antihypertensives.

	Reduced serum levels with barbiturates. Potentially Fatal: Potentiates sedative effect of alcohol. Antiparkinson agents, antipsychotic drugs increase risk of anticholinergic effects. Reduces effect of antihypertensives. Marked hyperpyrexia, convulsions and coma with MAOIs. Potentiates hypertensive effects of sympathomimetics.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Amoxapine inhibits the neuronal re-uptake of noradrenaline and serotonin (5-HT₂) in the CNS. It also blocks the response of dopamine receptors to dopamine. Absorption: Readily absorbed from the GI tract (oral). Distribution: Enters breast milk. Protein-binding: Extensive. Metabolism: Undergoes hydroxylation; converted to 8-hydroxyamoxapine and 7-hydroxyamoxapine. Excretion: Urine (as metabolites). Elimination half-life: 30 hr (8-hydroxyamoxapine), 6.5 hr (7-hydroxyamoxapine).
CIMS Class	Antidepressants
ATC Classification	N06AA17 - amoxapine; Belongs to the class of non-selective monoamine reuptake inhibitors. Used in the management of depression.

Lyme disease

Adult: 250-500 mg every 8 hr or 500-875 mg every 12 hr.

Child: =10 yr: 125-250 mg every 8 hr; <40 kg: 20-40 mg/kg daily in divided doses every 8 hr. Max dose: Infant <3 mth: 30 mg/kg daily in divided doses every 12 hr.

Adult: 250-500 mg every 8 hr or 500-875 mg every 12 hr.
Child: =10 yr: 125-250 mg every 8 hr; <40 kg: 20-40 mg/kg daily in divided doses every 8 hr. Max dose: Infant <3 mth: 30 mg/kg daily in divided doses every 12 hr.
Renal impairment: Patients on haemodialysis should receive 250-500 mg every 24 hr and an additional dose during and after each dialysis session.

CrCl (ml/min)	Dosage Recommendation
10-30	250-500 every 12 hr.
<10	250-500 every 24 hr.

Oral

Uncomplicated gonorrhoea

Adult: 3 g as a single dose with probenecid 1 g.
Renal impairment: Patients on haemodialysis should receive 250-500 mg every 24 hr and an additional dose during and after each dialysis session.

CrCl (ml/min)	Dosage Recommendation
10-30	250-500 mg every 12 hr.
<10	250-500 mg every 24 hr.

Oral

Dental abscesses

Adult: Initially, 3 g, repeat once after 8 hr.
Renal impairment: Dose reduction may be required.

Oral

Uncomplicated acute urinary tract infections

Adult: Initially, 3 g, repeat once after 10-12 hr.
Renal impairment: Dose reduction may be required.

Oral

Prophylaxis of endocarditis

Adult: 2 or 3 g as a single dose, 1 hr before dental procedure.
Child: Single dose of 50 mg/kg. To be taken 1 hr prior to dental procedure. Max: 2 g/dose.
Renal impairment: Dose reduction may be required.

Oral

Severe or recurrent respiratory tract infections

Adult: 3 g bid.
Renal impairment: Patients on haemodialysis should receive 250-500 mg every 24 hr and an additional dose during and after each dialysis session.

CrCl (ml/min)	Dosage Recommendation
10-30	250-500 mg every 12 hr.
<10	250-500 mg every 24 hr.

Oral

Otitis media

Child: 3-10 yr: 750 mg bid for 2 days.

Oral

Otitis media

Child: 3-10 yr: 750 mg bid for 2 days.

Renal impairment: Patients on haemodialysis should receive 250-500 mg every 24 hr and an additional dose during and after each dialysis session.

CrCl (ml/min)	Dosage Recommendation
10-30	250-500 mg every 12 hr.
<10	250-500 mg every 24 hr.

Oral

H.pylori infection

Adult: 0.75 or 1 g bid or 500 mg tid in combination with either metronidazole or clarithromycin and a bismuth compound or an antisecretory drug.

Renal impairment: Patients on haemodialysis should receive 250-500 mg every 24 hr and an additional dose during and after each dialysis session.

CrCl (ml/min)	Dosage Recommendation
10-30	250-500 mg every 12 hr.
<10	250-500 mg every 24 hr.

Parenteral

Susceptible infections

Adult: 500 mg every 8 hr via IM or slow IV inj. Severe infections: May increase to 1 g every 6 hr via slow IV inj over 3-4 minutes or infuse over 30-60 minutes.

Child: >10 yr: 50-100 mg/kg daily in divided doses.

Renal impairment: Patients on haemodialysis should receive 250-500 mg every 24 hr and an additional dose during and after each dialysis session.

CrCl (ml/min)	Dosage Recommendation
10-30	250-500 mg every 12 hr.
<10	250-500 mg every 24 hr.

Intravenous

Listerial meningitis

Adult: 2 g every 4 hr for 10–14 days via IV infusion, to be used with other antibiotics.

Renal impairment: Patients on haemodialysis should receive 250-500 mg every 24 hr and an additional dose during and after each dialysis session.

CrCl (ml/min)	Dosage Recommendation
10-30	250-500 mg every 12 hr.
<10	250-500 mg every 24 hr.

Administration

May be taken with or without food. (May be taken w/ meals for better absorption & to reduce GI discomfort.)

	May be taken with or without food. (May be taken w/ meals for better absorption & to reduce GI discomfort.)
Contraindications	Hypersensitivity.
Special Precautions	Renal and hepatic disease; pregnancy, lactation; infectious mononucleosis.
Adverse Drug Reactions	Hyperactivity, agitation, insomnia, dizziness; maculopapular rash, exfoliative dermatitis, urticaria, hypersensitivity vasculitis; diarrhoea, nausea, vomiting; anaemia, thrombocytopenia, leucopenia, agranulocytosis. Potentially Fatal: Neuromuscular hypersensitivity; pseudomembranous colitis.
Drug Interactions	Increased levels with disulfiram and probenecid. Decreased effects with tetracyclines and chloramphenicol. Potentially Fatal: Increase effects of oral anticoagulants.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Store at 20-25°C. Parenteral: Store at 20-25°C.
Mechanism of Action	Amoxicillin inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell wall by binding to one or more of the penicillin-binding proteins (PBPs), thus inhibiting cell wall biosynthesis resulting in bacterial lysis. Absorption: Rapidly and completely absorbed from the GI tract with peak plasma concentrations after 1-2 hr (oral). Not inactivated by gastric acid and presence of food does not impair absorption. Distribution: Widely distributed, CSF (small concentrations except when the meninges are inflamed), bile (high concentrations); crosses the placenta and enters the breast milk (small amounts). Protein-binding: 20%. Metabolism: Converted to a limited extent to penicilloic acid. Excretion: Via the urine within 6 hr by glomerular filtration and tubular secretion (as penicilloic acid and 60% unchanged drug); via the faeces. May be removed by haemodialysis; 1-1.5 hr (elimination half-life).
CIMS Class	Penicillins
ATC Classification	J01CA04 - amoxicillin; Belongs to the class of penicillins with

ATC Classification	J01CA04 - amoxicillin; Belongs to the class of penicillins with extended spectrum. Used in the treatment of systemic infections.

amoxicillin + bromhexine

CIMS Class : (Penicillins)
amoxicillin + bromhexine

P - Caution when used during pregnancy

L - Contraindicated in lactation

Lab ✖ - Lab interference

Food ✖ - Food interaction

related amoxicillin + bromhexine information

Indication & Dosage	<i>Oral</i> Upper and lower respiratory tract infections Adult: Each capsule contains amoxicillin 250 mg and bromhexine 8 mg: 1-2 capsules 8 hrly. Child: 40mg/kg/day given in 3 divided doses.
Contraindications	Penicillin allergy, lactation.
Special Precautions	Pregnancy, renal and hepatic disease and history of peptic ulcer . Infectious mononucleosis.
Adverse Drug Reactions	Headache, nausea, dizziness, vomiting, diarrhoea, black hairy tongue, maculopapular rash, urticaria, eosinophilia, hemolytic anemia, thrombocytopenia. Potentially Fatal: Anaphylaxis, pseudomembranous colitis, acute cytolytic hepatitis and Stevens-Johnson syndrome.
Drug Interactions	Live oral typhoid vaccine should not be given 3 days before or 3 days after amoxicillin admin as immune response may be attenuated. Amoxicillin increases the anticoagulant response of coumarins. Amoxicillin may reduce OC pill absorption leading to breakthrough bleeding or pregnancy. Amoxicillin reduces the renal clearance of methotrexate and pemetrexate. Amoxicillin level significantly reduced when given with or 2 hr after acacia admin. Bromhexine enhances the penetration of amoxicillin into bronchial secretions.
Food Interaction	Tannins in catha reduced amoxicillin absorption if amoxicillin is admin <2 hr after chewing catha.
Lab Interference	Possible interference with urinary glucose tests using cupric sulfate. May increase degradation of aminoglycosides <i>in vitro</i> .

	Possible interference with urinary glucose tests using cupric sulfate. May increase degradation of aminoglycosides <i>in vitro</i> . Increase in ALT and AST.
Mechanism of Action	Amoxicillin inhibits the final transpeptidation of peptidoglycan synthesis in bacterial cell walls. Hence, cell wall synthesis is inhibited and results in bacterial lysis. Bromhexine is a mucolytic. It thins and liquifies the mucus and helps increased penetration of the antibiotic. The less viscous mucus is easily removed by ciliary movement and expectoration. Absorption: Amoxicillin: Rapidly and almost completely absorbed from the GI tract; peak plasma concentration (oral): 1-2 hr. Bromhexine: Bioavailability: 20% (oral); peak plasma concentration: 1 hr. Distribution: Amoxicillin: Protein binding: 17-20 %; Widely distributed to body fluid and bone, CSF (small concentrations except when meninges are inflamed). Bromhexine: Highly protein-bound; Widely distributed. Metabolism: Amoxicillin: Partially metabolised to penicilloic acid. Bromhexine: Extensively hepatically metabolized to ambroxol. Excretion: Amoxicillin: Via urine: 60% as unchanged drug. Elimination half-life: Adults: 0.7-1.4hr, CrCl:<10 ml/min: 7-21 hr; infants & children: 1-2 hr. Bromhexine: Via urine: As mainly metabolites; elimination half-life (terminal): 13-40 hr.
CIMS Class	Penicillins
ATC Classification	J01CA04 - amoxicillin; Belongs to the class of penicillins with extended spectrum. Used in the treatment of systemic infections. R05CB02 - bromhexine; Belongs to the class of mucolytics. Used in the treatment of wet cough.

amoxicillin + carbocisteine

CIMS Class : (Penicillins)
amoxicillin + carbocisteine

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab ✖ - Lab interference

Food ✖ - Food interaction

related amoxicillin + carbocisteine information

Indication & Dosage	<i>Oral</i> Respiratory tract infections associated with excessive and/or viscous mucus Adult: Each capsule contains amoxicillin 250/500 mg and carbocisteine 150 mg: 1 or 2 cap tid.
Contraindications	Allergy to penicillins, pregnancy.
Special Precautions	History of peptic ulcer, severe renal impairment. Infectious mononucleosis and lactation.
Adverse Drug Reactions	Headache, nausea, dizziness, vomiting, diarrhoea, GI discomfort/ bleeding, black hairy tongue, maculopapular rash, urticaria, eosinophilia, hemolytic anemia, thrombocytopenia. Potentially Fatal: Anaphylaxis, pseudomembranous colitis, acute cytolytic hepatitis and Stevens-Johnson syndrome.
Drug Interactions	Live oral typhoid vaccine should not be given 3 days before or 3 days after amoxicillin admin as immune response may be attenuated. Amoxicillin increases the anticoagulant response of coumarins. Amoxicillin may reduce OC pill absorption leading to breakthrough bleeding or pregnancy. Amoxicillin reduces the renal clearance of methotrexate and pemetrexate. Amoxicillin level significantly reduced when given with or 2 hr after acacia admin.
Food Interaction	Tannins in catha reduced amoxicillin absorption if amoxicillin is admin <2 hr after chewing catha.
Lab Interference	Possible interference with urinary glucose tests using cupric sulfate. May increase degradation of aminoglycosides <i>in vitro</i> . Increase in ALT and AST.

	Possible interference with urinary glucose tests using cupric sulfate. May increase degradation of aminoglycosides <i>in vitro</i> . Increase in ALT and AST.
Mechanism of Action	Amoxicillin inhibits the final transpeptidation of peptidoglycan synthesis in bacterial cell walls. Hence, cell wall synthesis is inhibited and results in bacterial lysis. Carbocisteine is a mucolytic. It penetrates into lung tissue and respiratory mucus. Reduces viscosity of bronchial secretions and allows greater penetration of antibacterial drug. Expectoration of the mucus is facilitated. Absorption: Amoxicillin: Rapidly and almost completely absorbed from the GI tract; peak plasma concentration (oral): 1-2 hr. Carbocisteine: Rapidly and well absorbed from GI tract; peak plasma concentration (oral): 2 hr. Distribution: Amoxicillin: Protein binding: 17-20 %; Widely distributed to body fluid and bone, CSF (small concentrations except when meninges are inflamed). Carbocisteine: Lungs. Metabolism: Amoxicillin: Partially metabolised to penicilloic acid. Carbocisteine: Metabolised via acetylation, decarboxylation and sulfoxidation. Excretion: Amoxicillin: Via urine: 60% as unchanged drug. Elimination half-life: Adults: 0.7-1.4hr, CrCl<10 ml/min: 7-21 hr; infants & children: 1-2 hr. Carbocisteine: Via urine: Unchanged and as metabolites.
CIMS Class	Penicillins
ATC Classification	J01CA04 - amoxicillin; Belongs to the class of penicillins with extended spectrum. Used in the treatment of systemic infections. R05CB03 - carbocisteine; Belongs to the class of mucolytics. Used in the treatment of wet cough.

amoxicillin + clavulanic acid

CIMS Class : (Penicillins)
amoxicillin + clavulanic acid

Food ✖ - Food interaction

related amoxicillin + clavulanic acid information

Indication & Dosage	<i>Oral</i> Susceptible infections Adult: Based on amoxicillin dose, 250-500 mg every 8 hr or 500-750 mg every 12 hr. Child: Based on amoxicillin dose: 125-250 mg every 8 hr. Children weighing <40 kg: 20-40 mg/kg/day in divided doses every 8 hr. Infants <3 mth: up to 30 mg/kg/day in divided doses every 12 hr. <i>Oral</i> Upper and lower respiratory tract infections Adult: Based on amoxicillin dose, 250-500 mg every 8 hr or 500-750 mg every 12 hr. Child: Based on amoxicillin dose: 125-250 mg every 8 hr. Children weighing <40 kg: 20-40 mg/kg/day in divided doses every 8 hr. Infants <3 mth: up to 30 mg/kg/day in divided doses every 12 hr. <i>Oral</i> Otitis media Adult: Based on amoxicillin dose, 250-500 mg every 8 hr or 500-750 mg every 12 hr. Child: Based on amoxicillin dose: 125-250 mg every 8 hr. Children weighing <40 kg: 20-40 mg/kg/day in divided doses every 8 hr. Infants <3 mth: up to 30 mg/kg/day in divided doses every 12 hr. <i>Oral</i> Sinusitis Adult: Based on amoxicillin dose, 250-500 mg every 8 hr or 500-750 mg every 12 hr. Child: Based on amoxicillin dose: 125-250 mg every 8 hr. Children weighing <40 kg: 20-40 mg/kg/day in divided doses every 8 hr. Infants <3 mth: up to 30 mg/kg/day in divided doses every 12 hr.

500-750 mg every 12 hr.

Child: Based on amoxicillin dose: 125-250 mg every 8 hr. Children weighing <40 kg: 20-40 mg/kg/day in divided doses every 8 hr. Infants <3 mth: up to 30 mg/kg/day in divided doses every 12 hr.

Oral

Skin and soft tissue infections

Adult: Based on amoxicillin dose, 250-500 mg every 8 hr or 500-750 mg every 12 hr.

Child: Based on amoxicillin dose: 125-250 mg every 8 hr. Children weighing <40 kg: 20-40 mg/kg/day in divided doses every 8 hr. Infants <3 mth: up to 30 mg/kg/day in divided doses every 12 hr.

Oral

Dental abscesses

Adult: Based on amoxicillin dose: 3 g as a single dose, followed by another dose 8 hr later.

Oral

Acute uncomplicated urinary tract infections

Adult: Based on amoxicillin dose: 3 g as a single dose, followed by another dose 10-12 hr later.

Oral

Severe or recurrent respiratory tract infections

Adult: Based on amoxicillin dose: 3 g bid.

Oral

Uncomplicated gonorrhoea

Adult: Based on amoxicillin dose: 3 g as a single dose with 1 g of oral probenecid.

Oral

Prophylaxis of endocarditis

Adult: Based on amoxicillin dose: 2 or 3 g as a single dose. To be taken 1 hr before the dental procedure.

Oral

***H.pylori* infection**

Adult: Based on amoxicillin dose: 0.75-1 g bid or 500 mg tid. To be taken with metronidazole or clarithromycin and a PPI or ranitidine bismuth citrate.

Parenteral

Susceptible infections

Adult: Based on amoxicillin dose: 500 mg every 8 hr. In severe infections, may increase to 1 g every 6 hr. Can be given via IM inj or slow IV inj over 3-4 minutes or IV infusion over 30-60 minutes.

Child: <10 yr: 50-100 mg/kg/day in divided doses.

Reconstitution: Powder for oral suspension: Reconstitute with appropriate amount of water as specified on the bottle. Shake vigorously until suspended.

Contraindications

Penicillin allergy.

Special

History of allergy especially to cephalosporins, infectious

Special Precautions	History of allergy especially to cephalosporins, infectious mononucleosis, severe renal impairment.
Adverse Drug Reactions	Nausea, vomiting, diarrhoea, indigestion, rash and urticaria, candida superinfection. Potentially Fatal: Anaphylactic reaction with CV collapse esp with parenteral use.
Drug Interactions	Allopurinol may reduce renal tubular secretion of amoxicillin thus increasing the serum levels of amoxicillin. Concurrent use may reduce the efficacy of oral contraceptives.
Food Interaction	None on absorption. But incidence and severity of GI effects may be reduced.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store below 25°C. Parenteral: Store below 25°C.
Mechanism of Action	Clavulanic acid has a high affinity for and binds to certain β -lactamases that generally inactivate amoxicillin by hydrolyzing its β -lactam ring. Combining clavulanate potassium with amoxicillin extends the antibacterial spectrum of amoxicillin to include many bacteria normally resistant to amoxicillin and other penicillins and cephalosporins. Distribution: Protein binding: About 25% (Clavulanic acid); about 18% (Amoxicillin). Amoxicillin distributes readily into most body tissues and fluids except the brain and spinal fluid. Excretion: Half-life after oral admin: 1.3 hr (Amoxicillin); 1 hr (Clavulanic acid). About 50-70% of amoxicillin and 25-40% of clavulanic acid are excreted unchanged in urine during the 1st 6 hr after admin.
CIMS Class	Penicillins
ATC Classification	J01CA04 - amoxicillin; Belongs to the class of penicillins with extended spectrum. Used in the treatment of systemic infections.

amoxicillin + cloxacillin

CIMS Class : (Penicillins)
amoxicillin + cloxacillin

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related amoxicillin + cloxacillin information

Indication & Dosage	<i>Oral</i> Susceptible infections Adult: Per capsule contains amoxicillin 250 mg and cloxacillin 250 mg: 2-4 caps tid. <i>Parenteral</i> Susceptible infections Adult: Per vial contains amoxicillin 250 mg and cloxacillin 250 mg: 1-2 vials every 6-8 hr. Dose may be given via IM/IV. Child: Per vial contains amoxicillin 250 mg and cloxacillin 250 mg: 1 mth-2 yr: 0.25-0.5 vial every 6-8 hr; 2-10 yr: 0.5-1 vial every 6-8 hr. Dose may be given via IM/IV.
Contraindications	Hypersensitivity to penicillins.
Special Precautions	Allergy to cephalosporins, infectious mononucleosis, neonates with jaundice, H/o convulsions, lactation.
Adverse Drug Reactions	GI upsets, rash, urticaria, neutropenia, neurotoxicity, agranulocytosis (rarely), increased incidence of phlebitis with IV use. Potentially Fatal: Rarely anaphylactic shock; pseudomembranous colitis.
Drug Interactions	Failure of OC may occur, loss of potency of cloxacillin in soln. reported with erythromycin, gentamicin, kanamycin, colistin, oxytetracycline, chlorpromazine, Vit.C, & polymyxin B sulphate. Products containing cloxacillin should not be added to IV lipids, blood products, protein hydrolysates or other proteinaceous fluids. Chloramphenicol & tetracycline antagonise bactericidal effect of penicillins. Probenecid prolongs serum drug concentration; Sulfonamides & aspirin inhibit serum protein

	to IV lipids, blood products, protein hydrolysates or other proteinaceous fluids. Chloramphenicol & tetracycline antagonise bactericidal effect of penicillins. Probenecid prolongs serum drug concentration; Sulfonamides & aspirin inhibit serum protein binding of cloxacillin, thereby increasing serum-free drug levels. Potentially Fatal: None reported.
Food Interaction	Food may delay cloxacillin absorption.
Lab Interference	Interferes with urinary test for Bence-Jones protein. Cloxacillin also interferes with urinary 17-oxosteroids measurements.
Mechanism of Action	Amoxicillin is bactericidal against non β -lactamase producing gm+ve organisms and selected gm-ve pathogens. Cloxacillin is a β -lactamase resistant penicillin active against gm+ve organisms including β -lactamase (penicillinase) producing strains of Staphylococci. It is highly active against <i>Staph aureus</i> , <i>Strep pyogenes</i> , <i>Strep viridans</i> and <i>Strep pneumoniae</i> . Also effective against penicillinase producing gonococci and against <i>N meningitidis</i> and <i>H influenzae</i> .
CIMS Class	Penicillins
ATC Classification	J01CA04 - amoxicillin; Belongs to the class of penicillins with extended spectrum. Used in the treatment of systemic infections. J01CF02 - cloxacillin; Belongs to the class of beta-lactamase resistant penicillins. Used in the treatment of systemic infections.

amphotericin b

CIMS Class : (Antifungals)
amphotericin b

P - Caution when used during pregnancy

L - Contraindicated in lactation

related amphotericin b information

related amphotericin b information	
Indication & Dosage	<i>Oral</i> Oral candidiasis Adult: Using conventional amphotericin B: 1 ml of a 100 mg/ml oral suspension 4 times daily retained in the mouth for a few minutes before swallowing or 10 mg loz dissolved in the mouth 4 times daily, increased to 8 loz daily if necessary or 100-200 mg tab/suspension 4 times daily. Continue for 48 hr after lesions have cleared. <i>Intravenous</i> Severe systemic fungal infections Adult: Using conventional amphotericin B: If needed, test dose of 1 mg infused over 20-30 minutes. Initial dose: 250 mcg/kg daily, increased gradually to a max of 1 mg/kg/day. For seriously ill patients, up to 1.5 mg/kg may be given daily or on alternate days may be needed. Daily dose is infused over 2-4 hr at a concentration of 100 mcg/ml in glucose 5%. If treatment is interrupted for more than 7 days, then restart at 250 mcg/kg daily and increase slowly. <i>Intrathecal</i> Severe meningitis Adult: Using conventional amphotericin B: If needed, test dose of 1 mg infused over 20-30 minutes. Initially, 25 mcg increased gradually to the max that can be tolerated without excessive discomfort. Usual dose: 0.25-1 mg 2-4 times a wk. <i>Intravenous</i> Aspergillosis, disseminated Adult: Using conventional amphotericin B: If needed, test dose of 1 mg infused over 20-30 minutes. 0.6-0.7 mg/kg daily for 3-6 mth. <i>Intravenous</i>

	Adult: Using conventional amphotericin B: If needed, test dose of 1 mg infused over 20-30 minutes. 0.6-0.7 mg/kg daily for 3-6 mth. <i>Intravenous</i> Endocarditis Adult: Using conventional amphotericin B: If needed, test dose of 1 mg infused over 20-30 minutes. 0.6-1 mg/kg/day for 1 wk, then 0.8 mg/kg/day every other day for 6-8 wk post-operatively. <i>Irrigation</i> Candiduria Adult: Using conventional amphotericin B: 50 mg daily in 1000 ml of sterile water by continuous bladder irrigation for 5-10 days or until cultures are clear. Reconstitution: For conventional amphotericin B: Reconstitute with sterile water for inj (without preservatives), then further dilute with glucose inj 5% (with a pH>4.2) to a final concentration not exceeding 0.1 mg/ml for peripheral infusion or 0.25 mg/ml for central infusion. Incompatibility: Precipitation may occur if added to normal saline or electrolyte solutions.
Overdosage	May result in cardiac arrest.
Contraindications	Hypersensitivity; lactation; do not give to patients receiving antineoplastics.
Special Precautions	Renal and hepatic impairment; pregnancy; monitor renal and liver function changes.
Adverse Drug Reactions	Topical: Local irritation, pruritus and skin rash. IV infusion: Fever, chills, convulsions, malaise; nausea, vomiting, diarrhoea, anorexia; tinnitus, vertigo, hearing loss; hypotension, hypertension, cardiac arrhythmias; peripheral neuropathy; phlebitis, pain at Inj site, disturbances in renal function and renal toxicity. Potentially Fatal: Anaphylactic reaction; leucoencephalopathy. Overdosage can result in cardio-respiratory arrest.
Drug Interactions	Increased toxicity with flucytosine. Drug induced renal toxicity enhanced in presence of other nephrotoxic medications. Antagonises effects of azole antifungals. Potentially Fatal: Potentiates K loss by corticosteroids. Avoid diuretics. Enhances digitalis toxicity and neuromuscular blocker effects.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in

	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intrathecal: Store at 2-8°C. Intravenous: Intact vials: Store at 2-8°C. Reconstituted vials: If protected from light, stable for 24 hr at room temperature and 1 wk if refrigerated. Parenteral admixtures: If protected from light, stable for 24 hr at room temperature and 2 days if refrigerated. Irrigation: Store at 2-8°C. Oral: Store at 2-8°C.
Mechanism of Action	Amphotericin B is a polyene antifungal antibiotic which alters cell membrane permeability by binding to ergosterol, thus causing leakage of cell components and subsequent cell death. It is active against <i>Absidia</i> spp, <i>Aspergillus</i> spp, <i>Basidiobolus</i> spp, <i>B. dermatitidis</i> , <i>Candida</i> spp, <i>C. immitis</i> , <i>Conidiobolus</i> spp, <i>C. neoformans</i> , <i>H. capsulatum</i> , <i>Mucor</i> spp, <i>P. brasiliensis</i> , <i>Rhizopus</i> spp, <i>Rodotorula</i> spp. and <i>S. schenckii</i> . Absorption: Little or no absorption from the GI tract (oral). Distribution: Distributed widely, CSF (small quantities). Excretion: Via urine (small amounts); not removed by dialysis; 24 hr (elimination half-life); may be increased to 15 days in long-term treatment.
CIMS Class	Antifungals
ATC Classification	A01AB04 - amphotericin B; Belongs to the class of local antiinfective and antiseptic preparations. Used in the treatment of diseases of the mouth. A07AA07 - amphotericin B; Belongs to the class of antibiotics. Used for the treatment of intestinal infections. G01AA03 - amphotericin B; Belongs to the class of antibiotics. Used in the treatment of gynecological infections. J02AA01 - amphotericin B; Belongs to the class of systemic antibiotics. Used in the treatment of mycotic infections.

related ampicillin information

Indication & Dosage

Oral

Otitis media

Adult: 250-500 mg every 6 hr.

Child: 50-100 mg/kg daily, given in equally divided doses every 6 hr. Max: 2-4 g/day.

Renal impairment: Patients undergoing haemodialysis should receive an additional dose after the session.

CrCl (ml/min)	Dosage Recommendation
<10	Dose reduction or increase in dose interval.

Oral

Peritonitis

Adult: 250-500 mg every 6 hr.

Child: 50-100 mg/kg daily, given in equally divided doses every 6 hr. Max: 2-4 g/day.

Renal impairment: Patients undergoing haemodialysis should receive an additional dose after the session.

CrCl (ml/min)	Dosage Recommendation
<10	Dose reduction or increase in dose interval.

Oral

Endocarditis

Adult: 250-500 mg every 6 hr.

Child: 50-100 mg/kg daily, given in equally divided doses every 6 hr. Max: 2-4 g/day.

Renal impairment: Patients undergoing haemodialysis should receive an additional dose after the session.

CrCl (ml/min)	Dosage Recommendation
---------------	-----------------------

every 6 hr. Max: 2-4 g/day.	
Renal impairment: Patients undergoing haemodialysis should receive an additional dose after the session.

<i>Oral</i> Perinatal streptococcal infections	

Oral

Perinatal streptococcal infections

Adult: 250-500 mg every 6 hr.

Child: 50-100 mg/kg daily, given in equally divided doses every 6 hr. Max: 2-4 g/day.

Renal impairment: Patients undergoing haemodialysis should receive an additional dose after the session.

CrCl (ml/min)	Dosage Recommendation
<10	Dose reduction or increase in dose interval.

Oral

Susceptible infections

Adult: 250-500 mg every 6 hr.

Child: 50-100 mg/kg daily, given in equally divided doses every 6 hr. Max: 2-4 g/day.

Renal impairment: Patients undergoing haemodialysis should receive an additional dose after the session.

CrCl (ml/min)	Dosage Recommendation
<10	Dose reduction or increase in dose interval.

Oral

Typhoid and paratyphoid fever

Adult: 1-2 g every 6 hr for 2 wk in acute infections and 4-12 wk in carriers.

Renal impairment: Patients undergoing haemodialysis should receive an additional dose after the session.

Oral

Uncomplicated gonorrhoea

Adult: 2 g with 1 g of probenecid as a single dose, recommended to be repeated in female patients.

Renal impairment: Patients undergoing haemodialysis should receive an additional dose after the session.

CrCl (ml/min)	Dosage Recommendation
<10	Dose reduction or increase in dose interval.

Intravenous

Intrapartum prophylaxis against group B Streptococcal infection in neonates

Adult: Initially, 2 g via inj followed by 1 g every 4 hr until delivery.

Renal impairment: Patients undergoing haemodialysis should receive an additional dose after the session.

CrCl (ml/min)	Dosage Recommendation
<10	Dose reduction or increase in dose interval.

Injection

As supplement in systemic therapy for treatment of

Injection

As supplement in systemic therapy for treatment of susceptible infections

Adult: For intrapleural or intraperitoneal injections: 500 mg daily, dissolved in 5-10 ml of water. For intra-articular inj: 500 mg daily, dissolved in up to 5 ml of water or a solution of 0.5% procaine HCl.

Child: ½ the adult dose.

Renal impairment: Patients undergoing haemodialysis should receive an additional dose after the session.

CrCl (ml/min)	Dosage Recommendation
---------------	-----------------------

<10	Dose reduction or increase in dose interval.
-----	--

Parenteral

Meningitis

Adult: 150-200 mg/kg daily in equally divided doses every 3-4 hr. May initiate with IV admin followed by IM injections.

Child: and infants: 150 mg/kg daily in divided doses.

Neonates: <1 wk: 50 mg/kg every 12 hr; older neonates: 50 mg/kg every 8 hr. Max: 3 g/day. May initiate with IV admin followed by IM injections.

Renal impairment: Patients undergoing haemodialysis should receive an additional dose after the session.

CrCl (ml/min)	Dosage Recommendation
---------------	-----------------------

<10	Dose reduction or increase in dose interval.
-----	--

Intravenous

Septicaemia

Adult: 150-200 mg/kg daily. Initiate with IV admin for at least 3 days, then continue with IM inj every 3-4 hr. Continue treatment for at least 48-72 hr after the patient has become asymptomatic or when there is evidence of bacterial eradication. Recommended treatment duration for infections caused by group-A β-haemolytic streptococci: At least 10-days to prevent occurrence of acute rheumatic fever or acute glomerulonephritis.

Renal impairment: Patients undergoing haemodialysis should receive an additional dose after the session.

CrCl (ml/min)	Dosage Recommendation
---------------	-----------------------

<10	Dose reduction or increase in dose interval.
-----	--

Parenteral

Susceptible infections

Adult: 250-500 mg every 6 hr, can be given via IM or slow IV inj over 3-5 minutes or infusion.

Child: 100-400 mg/kg daily in divided doses every 6 hr. Max: 12 g daily. Dose can be given via IM or slow IV inj over 3-5

	Susceptible infections	
	Adult: 250-500 mg every 6 hr, can be given via IM or slow IV inj over 3-5 minutes or infusion.	
	Child: 100-400 mg/kg daily in divided doses every 6 hr. Max: 12 g daily. Dose can be given via IM or slow IV inj over 3-5 minutes or infusion.	
	Renal impairment: Patients undergoing haemodialysis should receive an additional dose after the session.	
	CrCl (ml/min)	Dosage Recommendation
	<10	Dose reduction or increase in dose interval.
	Reconstitution: Reconstitute according to manufacturer's instructions. Incompatibility: Y-site incompatibility: Amphotericin B cholesteryl sulfate complex, ondansetron, sargramostim, verapamil, vinorelbine epinephrine, fluconazole, hydralazine, midazolam. Syringe incompatibility: Erythromycin lactobionate, gentamicin, lincomycin, metoclopramide, hydromorphone, kanamycin. Admixture incompatibility: Amikacin, hydralazine, prochlorperazine, chlorpromazine, dopamine, gentamicin.	
Administration	Should be taken on an empty stomach. (Take on an empty stomach 1 hr before or 2 hr after meals.)	
Overdosage	Discontinue medication, treat symptomatically, and institute supportive measures as required.	
Contraindications	Hypersensitivity; infectious mononucleosis.	
Special Precautions	Renal failure; patients with lymphatic leukaemia or HIV infections; pregnancy and lactation.	
Adverse Drug Reactions	GI upset, nausea, vomiting, diarrhoea; blood dyscrasias; urticaria, exfoliative dermatitis, rash; fever, seizures; interstitial nephritis. Potentially Fatal: Anaphylactic shock; pseudomembranous colitis; neuromuscular hypersensitivity; electrolyte imbalance.	
Drug Interactions	Simultaneous use with oral contraceptives may lead to increased risk of breakthrough bleeding and reduced efficacy of the contraceptive. Skin rash increased with allopurinol. Probenecid increases blood levels. Synergism with β-lactamase inhibitors, clavulanic acid or sulbactam, penicillinase-stable drugs eg, cloxacillin or flucloxacillin and aminoglycosides. Potentially Fatal: Increases disulfiram and anticoagulant effects.	
Food Interaction	Reduced absorption with food.	
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled	

	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Injection: Store at 20-25°C. For admin: Use freshly prepared solutions. IV and IM solutions should be used within 1 hr after preparation. Intravenous: Store at 20-25°C. For admin: Use freshly prepared solutions. IV and IM solutions should be used within 1 hr after preparation. Oral: Store at 20-25°C. Parenteral: Store at 20-25°C. For admin: Use freshly prepared solutions. IV and IM solutions should be used within 1 hr after preparation.
Mechanism of Action	Ampicillin exerts bactericidal action on both gm+ve and gm-ve organisms. Its spectrum includes gm+ve organisms eg, S pneumoniae and other Streptococci, L monocytogenes and gm-ve bacteria eg, M catarrhalis, N gonorrhoea, N meningitidis, E coli, P mirabilis, Salmonella, Shigella, and H influenzae. Ampicillin exerts its action by inhibiting the synthesis of bacterial cell wall. Absorption: Relatively well absorbed from the GI tract with peak plasma concentrations after 1-2 hr (oral); may be altered in the presence of food. Distribution: Widely distributed into the ascitic, pleural and joint fluids (therapeutic concentrations), CSF (small amounts except when the meninges are inflamed), bile (high concentrations); crosses the placenta and enters the breast milk (small amounts). Protein-binding: 20%. Metabolism: Converted to some extent to penicilloic acid; undergoes enterohepatic recycling. Excretion: Via the urine by glomerular filtration and tubular secretion; via the faeces. May be removed by haemodialysis.
CIMS Class	Penicillins
ATC Classification	J01CA01 - ampicillin; Belongs to the class of penicillins with extended spectrum. Used in the treatment of systemic infections. S01AA19 - ampicillin; Belongs to the class of antibiotics. Used in the treatment of eye infections.

ampicillin + cloxacillin

CIMS Class : (Penicillins)
ampicillin + cloxacillin

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related ampicillin + cloxacillin information

Indication & Dosage

Oral

Susceptible infections

Adult: Per capsule contains ampicillin 250 mg and cloxacillin 250 mg: 1 capsule 4 times daily. In severe infections, the dose can be increased up to 12 capsules daily.

Child: Per dose contains ampicillin 125 mg and cloxacillin 125 mg: 1 dose 4 times daily.

Intramuscular

Moderate to severe infections

Adult: 250 mg (ampicillin 125 mg + cloxacillin 125 mg) every 6 hr.

Intramuscular

Moderate to severe infections

Adult: 500 mg (ampicillin 250 mg and cloxacillin 250 mg) or 1 g (ampicillin 500 mg and cloxacillin 500 mg) every 6 hr. Doses higher than 500 mg should be given in two different sites of not more than 500 mg in 3ml.

Intramuscular

Severe infections

Adult: 500 mg (ampicillin 250 mg and cloxacillin 250 mg) or 1 g (ampicillin 500 mg and cloxacillin 500 mg) every 6 hr. Doses higher than 500 mg should be given in two different sites of not more than 500 mg in 3ml.

Intravenous

Severe infections

Adult: 500 mg (ampicillin 250 mg and cloxacillin 250 mg) in 10 ml or 1 g (ampicillin 500 mg and cloxacillin 500 mg) in 20 ml of water for inj. Given slowly over 3-4 minutes, repeated every 6 hr.

	Adult: 500 mg (ampicillin 250 mg and cloxacillin 250 mg) in 10 ml or 1 g (ampicillin 500 mg and cloxacillin 500 mg) in 20 ml of water for inj. Given slowly over 3-4 minutes, repeated every 6 hr. Child: 2-10 yr: Half the adult dose. < 2 yr: Quarter of adult dose.
Contraindications	Penicillin allergy.
Special Precautions	Allergy to cephalosporins, infectious mononucleosis, neonates with jaundice, history of convulsions, lactation.
Adverse Drug Reactions	G.I.disturbances, pruritus, urticaria, erythema, exfoliative dermatitis, rashes, fever, joint pain, eosinophilia, bronchial asthma, angioneuratic oedema, hemolytic anaemia, serum sickness, CNS effects like hyperactivity, agitation, insomnia, anxiety, behavioural changes, confusion, dizziness and convulsions. Potentially Fatal: Anaphylactic reaction.
Drug Interactions	Failure of oral contraceptives, increased rash with allopurinol, reduced bactericidal activity with chloramphenicol, erythromycin and tetracyclines. Potentially Fatal: NA.
Food Interaction	Reduced absorption for ampicillin & delayed absorption for cloxacillin.
Lab Interference	Ampicillin interferes with serum albumin, urinary aminoacid electrophoresis and urine sugar estimations. Cloxacillin interferes with Bradshaws's test for Bence-Jones protein in urine and measurement of urinary 17-oxosteroids or 17-oxogenic steroids.
Mechanism of Action	Ampicillin exerts bactericidal action on both gm+ve and gm-ve organisms. Its spectrum includes gm+ve organisms eg, <i>S pneumoniae</i> and other <i>Streptococci</i>, <i>L monocytogenes</i> and gm-ve bacteria eg, <i>M catarrhalis</i>, <i>N gonorrhoea</i>, <i>N meningitidis</i>, <i>E coli</i>, <i>P mirabilis</i>, <i>Salmonella</i>, <i>Shigella</i>, and <i>H influenzae</i>. Ampicillin exerts its action by inhibiting the synthesis of bacterial cell wall. Cloxacillin is a penicillinase-resistant penicillin. It is active against gm+ve organisms including penicillinase-producing strains of <i>Staphylococci</i>. Cloxacillin is highly active against <i>Staph aureus</i>, <i>Strep pyogenes</i>, <i>Strep viridans</i> and <i>Strep pneumoniae</i>. It is also active against penicillinase-producing gonococci and against <i>N meningitidis</i> and <i>H influenzae</i>. Other gm-ve organisms are resistant to cloxacillin as are also methicillin-resistant strains of <i>Staphylococci</i>.
CIMS Class	Penicillins
ATC Classification	J01CA01 - ampicillin; Belongs to the class of penicillins with extended spectrum. Used in the treatment of systemic infections. J01CF02 - cloxacillin; Belongs to the class of beta-lactamase

J01CA01 - ampicillin; Belongs to the class of penicillins with extended spectrum. Used in the treatment of systemic infections.

J01CF02 - cloxacillin; Belongs to the class of beta-lactamase resistant penicillins. Used in the treatment of systemic infections.

S01AA19 - ampicillin; Belongs to the class of antibiotics. Used in the treatment of eye infections.

related ampicillin + sulbactam information

Indication & Dosage

Parenteral

Susceptible infections

Adult: 1.5-3 g (ampicillin 1-2 g and sulbactam 0.5-1 g) every 6 hr. Dose may be given via deep IM inj or slow IV inj. Max: 12 g (ampicillin 8 g and sulbactam 4 g) daily.

Child: =1 yr: Usual dose: 300 mg (ampicillin 200 mg and sulbactam 100 mg)/kg/day, to be given in 4 equally divided doses. Up to 200-300 mg/kg/day of ampicillin, given in 4 equally divided doses may be used in infants =1 mth of age. Recommended duration: Not exceeding 14 days.

Renal impairment: Modifications in dose or dosing interval may be necessary.

CrCl (ml/min)	Dosage Recommendation
15-29	Recommended dosing interval: Every 12 hr.
5-14 and haemodialysis	Recommended dosing interval: Every 24 hr; dose to be given after dialysis.

Parenteral

Uncomplicated gonorrhoea

Adult: 1.5-3 g (ampicillin 1-2 g and sulbactam 0.5-1 g) as a single IV/IM inj. May be used in combination with oral probenecid 1 g.

Renal impairment: Modifications in dose or dosing interval may be necessary.

Parenteral

Pelvic inflammatory disease

Adult: 3 g (ampicillin 2 g and sulbactam 1 g) every 6 hr, to be used with doxycycline (100 mg orally or IV 12 hrly).

may be necessary.

Parenteral

Pelvic inflammatory disease

Adult: 3 g (ampicillin 2 g and sulbactam 1 g) every 6 hr, to be used with doxycycline (100 mg orally or IV 12 hrly).

Parenteral treatment may be discontinued 24 hr after clinical improvement; oral doxycycline at 100 mg bid should be continued to complete 14 days of treatment.

Renal impairment: Modifications in dose or dosing interval may be necessary.

CrCl (ml/min)	Dosage Recommendation
15-29	Recommended dosing interval: Every 12 hr.
5-14 and haemodialysis	Recommended dosing interval: Every 24 hr; dose to be given after dialysis.

Intravenous

Endocarditis

Adult: 3 g (ampicillin 2 g and sulbactam 1 g) every 6 hr for 4-6 wk, to be used with gentamicin or vancomycin.

Renal impairment: Modifications in dose or dosing interval may be necessary.

CrCl (ml/min)	Dosage Recommendation
15-29	Recommended dosing interval: Every 12 hr.
5-14 and haemodialysis	Recommended dosing interval: Every 24 hr; dose to be given after dialysis.

Intravenous

Community-acquired pneumonia

Adult: For aspiration, community-acquired pneumonia: 1.5-3 g (ampicillin 1-2 g and sulbactam 0.5-1 g) every 6 hr. For hospital-acquired pneumonia: 3 g (ampicillin 2 g and sulbactam 1 g) every 6 hr.

Renal impairment: Modifications in dose or dosing interval may be necessary.

CrCl (ml/min)	Dosage Recommendation
15-29	Recommended dosing interval: Every 12 hr.
5-14 and haemodialysis	Recommended dosing interval: Every 24 hr; dose to be given after dialysis.

Intravenous

Hospital-acquired pneumonia

Adult: For aspiration, community-acquired pneumonia: 1.5-3 g (ampicillin 1-2 g and sulbactam 0.5-1 g) every 6 hr. For hospital-acquired pneumonia: 3 g (ampicillin 2 g and sulbactam 1 g) every 6 hr.

Renal impairment: Modifications in dose or dosing interval may be necessary.

	g (ampicillin 1-2 g and sulbactam 0.5-1 g) every 6 hr. For hospital-acquired pneumonia: 3 g (ampicillin 2 g and sulbactam 1 g) every 6 hr. Renal impairment: Modifications in dose or dosing interval may be necessary. <table border="1"> <thead> <tr> <th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr> </thead> <tbody> <tr> <td>15-29</td><td>Recommended dosing interval: Every 12 hr.</td></tr> <tr> <td>5-14 and haemodialysis</td><td>Recommended dosing interval: Every 24 hr; dose to be given after dialysis.</td></tr> </tbody> </table> Reconstitution: For IM or IV admin: Reconstitute with sterile water for inj or 0.5-2% lidocaine hydrochloride injection (IM). Sodium chloride 0.9% is the diluent of choice for IV piggyback use. Solution to be used within 1 hour after preparation. Allow solutions to stand after dissolution to permit visual inspection for complete solubilisation. Incompatibility: For Y-site admin: Incompatible with aminoglycosides (gentamicin, tobramycin), amphotericin B cholesteryl sulfate complex, ciprofloxacin, idarubicin, ondansetron and sargramostim. For admixture compatibility: Incompatible with aminoglycosides; compatible with aztreonam.	CrCl (ml/min)	Dosage Recommendation	15-29	Recommended dosing interval: Every 12 hr.	5-14 and haemodialysis	Recommended dosing interval: Every 24 hr; dose to be given after dialysis.
CrCl (ml/min)	Dosage Recommendation						
15-29	Recommended dosing interval: Every 12 hr.						
5-14 and haemodialysis	Recommended dosing interval: Every 24 hr; dose to be given after dialysis.						
Overdosage	Symptoms include neurological effects, including convulsions may occur. Ampicillin may be removed from circulation by haemodialysis.						
Contraindications	Allergy to penicillins, infectious mononucleosis.						
Special Precautions	Monitor for signs of anaphylaxis during 1st dose. Monitor haematologic, renal and hepatic function during prolonged treatment. Monitor for signs of superinfections with mycotic or bacterial pathogens during treatment. Prolonged use may increase the risk of oral candidiasis. Pregnancy and lactation.						
Adverse Drug Reactions	Pain at Inj site, thrombophlebitis, diarrhoea, itching, nausea, vomiting, flatulence, candidiasis, fatigue, malaise, headache, chest pain, glossitis, abdominal distention, dysuria, urinary retention, oedema, erythema, epistaxis, mucosal bleeding. Potentially Fatal: Fatal anaphylaxis.						
Drug Interactions	Increased risk of rash with allopurinol. Concurrent use with probenecid may delay renal tubular secretion of ampicillin and sulbactam. If used with aminoglycosides - the two solutions should not be mixed and must be administered at different sites. Concurrent use with fusidic acid may decrease the efficacy of penicillins; penicillins should be given at least 2 hr before fusidic acid admin. May increase effects of warfarin.						
Lab Interference	False-positive glycosuria in urinalysis using Benedict's Solution, Fehling's Reagent and Clinitest. Transient decrease						

	False-positive glycosuria in urinalysis using Benedict's Solution, Fehling's Reagent and Clinitest. Transient decrease in plasma concentrations of total conjugated oestriol, oestriol-glucuronide, conjugated oestrone and oestradiol in pregnant women.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Store dry powder at 20-25°C. Parenteral: Store dry powder at 20-25°C.
Mechanism of Action	Ampicillin exerts bactericidal action on both gram-positive and gram-negative organisms. Its spectrum includes gram-positive organisms e.g. S pneumoniae and other Streptococci, L monocytogenes and gram-negative bacteria e.g. M catarrhalis, N gonorrhoea, N meningitidis, E coli, P mirabilis, Salmonella, Shigella, and H influenzae. Ampicillin exerts its action by inhibiting the synthesis of bacterial cell wall. Sulbactam inhibits β -lactamases and extends the spectrum of ampicillin to include β -lactamase producing pathogens. Distribution: Protein binding: About 28% (ampicillin); about 38%(sulbactam). Excretion: Ampicillin and sulbactam: Approximately 75-85% of both drugs are excreted unchanged in the urine.
CIMS Class	Penicillins
ATC Classification	J01CA01 - ampicillin; Belongs to the class of penicillins with extended spectrum. Used in the treatment of systemic infections. J01CG01 - sulbactam; Belongs to the class of beta-lactamase inhibitors. Used in the treatment of systemic infections. S01AA19 - ampicillin; Belongs to the class of antibiotics. Used in the treatment of eye infections.

amrinone

CIMS Class : (Cardiac Drugs)
amrinone

P - Caution when used during pregnancy

L - Caution when used during lactation

related amrinone information

Indication & Dosage	<i>Intravenous</i> Heart failure Adult: Loading dose: 750 mcg/kg by slow inj over 2-3 min (may be repeated after 30 minutes if necessary). Maintenance: 5-10 mcg/kg/min by infusion. Max cumulative dose: 10 mg/kg in 24 hr. Incompatibility: Incompatible with glucose-containing solutions and furosemide.
Overdosage	May result in severe hypotension. General supportive and symptomatic treatment, including circulatory support, should also be initiated as necessary.
Contraindications	Hypersensitivity.
Special Precautions	Obstructive pulmonary or aortic disease, hypertrophic cardiomyopathy; BP and heart rate monitored during drug administration; fluid and electrolyte balance should be maintained; platelet counts and liver function should be monitored; protect amp from light. Pregnancy and lactation.
Adverse Drug Reactions	GI disturbances, nausea, vomiting, thrombocytopenia, hypotension, chest pain, hypersensitivity, myositis, vasculitis, nail discoloration, Inj site pain, decreased tear production. Potentially Fatal: Cardiac arrhythmia, hepatotoxicity.
Drug Interactions	Chemical interaction with precipitation occurs with amrinone and dextrose or furosemide. Thus drug mixing should be avoided. Potentially Fatal: Concurrent usage with disopyramide may lead to severe hypotension.
Pregnancy	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 15-30°C.
Mechanism of Action	Amrinone is a phosphodiesterase inhibitor which has vasodilating and positive inotropic properties. It causes an increase in cyclic adenosine monophosphate conc leading to greater contractile force in cardiac muscle. Distribution: 10-22% bound to plasma proteins. Half-life after IV admin: 4-6 hr. Metabolism: Partially metabolised in liver. Excretion: 40% excreted unchanged.
CIMS Class	Cardiac Drugs
ATC Classification	C01CE01 - amrinone; Belongs to the class of phosphodiesterase inhibitors. Used in the treatment of heart failure.

anastrozole

CIMS Class : (Hormonal Chemotherapy)
anastrozole

P - Contraindicated in pregnancy

L - Caution when used during lactation

related anastrozole information

Indication & Dosage	<i>Oral</i> Advanced or locally advanced breast cancer, Adjuvant treatment in early breast cancer Adult: In postmenopausal women: 1 mg daily. Adjuvant treatment may be continued for up to 5 yr.
Administration	May be taken with or without food.
Overdosage	General supportive care, frequent monitoring of vital signs and close observation of the patient are recommended. Vomiting may be induced if patient is alert.
Contraindications	Pregnancy. Hypersensitivity, premenopausal women.
Special Precautions	Lactation. Moderate or severe hepatic impairment, hyperlipidaemias. Laboratory test for menopause if status is doubtful. Bone mass density test should be conducted at the start of the therapy and at regular intervals thereafter.
Adverse Drug Reactions	Hot flushes, vaginal dryness, vaginal bleeding, hair thinning, anorexia, nausea, vomiting, diarrhoea, headache, arthralgia, bone fractures, rash, oedema, myalgia, fever, weight gain, leucopenia, flu-like syndrome, asthenia, dizziness, drowsiness, abnormal liver enzyme values, thrombophlebitis, anaphylaxis.
Drug Interactions	Efficacy decreased by oestrogens. Plasma concentrations decreased by tamoxifen.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs

	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 20-25°C.
Mechanism of Action	Anastrozole prevents conversion of androstenedione to estrone and testosterone to oestradiol by inhibiting aromatase, thus leading to significantly reduced serum oestradiol concentrations. Absorption: Rapidly and almost completely absorbed from the GI tract (oral); peak plasma concentrations after 2 hr. May decrease the rate of absorption with food. Distribution: Protein-binding: 40%. Metabolism: Hepatic. Excretion: Via urine (as metabolites); 50 hr (elimination half-life).
CIMS Class	Hormonal Chemotherapy
ATC Classification	L02BG03 - anastrozole; Belongs to the class of enzyme inhibitors. Used in endocrine therapy.

aprotinin

CIMS Class : (Haemostatics)
aprotinin

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab - Lab interference

related aprotinin information

Indication & Dosage

Intravenous

Haemorrhage

Adult: Admin a test dose of 10,000 KIU at least 10 minutes before starting treatment. Loading dose: 500,000-1,000,000 KIU, given by slow inj or infusion (max rate: 100,000 KIU/minute) with the patient in supine position, may continue with 200,000 KIU/hr until the haemorrhage is controlled. Doses to be given via central venous line.

Child: 1 mth-18 yr: Test dose of 200 KIU/kg, followed after 10 minutes by a dose of 10,000 KIU/kg given over 20 minutes, then continuous infusion of 3,000 KIU/kg/hr until bleeding is controlled.

Intravenous

Open heart surgery

Adult: Admin a test dose of 10,000 KIU at least 10 minutes before starting treatment. Loading dose: 2,000,000 KIU over 20-30 minutes after induction of anaesthesia but before incision or reopening of wound, followed by continuous infusion of 500,000 KIU/hr until the end of the surgery. Add an additional dose of 2,000,000 KIU into the prime volume of the extracorporeal circuit. Doses to be given via central venous line. For patients with septic endocarditis, add a dose of 3 000 000 KIU into the prime volume of the circuit; may continue infusion into the early postoperative period. Usual total amount = 7 000 000 KIU.

Incompatibility: Incompatible with corticosteroids, heparin, tetracyclines, and nutrient solutions containing amino acids or fat emulsions.

	Incompatibility: Incompatible with corticosteroids, heparin, tetracyclines, and nutrient solutions containing amino acids or fat emulsions.
Contraindications	Hypersensitivity.
Special Precautions	Test dose should be administered to all patients at least 10 minutes before loading dose to assess for risk of hypersensitivity. Neonates and children. Greater risk of anaphylactic reactions upon re-exposure within 12 mth of previous use. Renal impairment. Pregnancy, lactation. Activated clotting time may not be a reliable method to monitor heparin therapy when on aprotinin treatment.
Adverse Drug Reactions	Fever and nausea. GI disturbances. Hypersensitivity or pseudo-allergic reactions may occur after 1st dose or thereafter e.g. skin rashes and eruptions, tachycardia, pallor or cyanosis, dyspnoea and anaphylactic shock. Potentially Fatal: Fatal anaphylactic reactions.
Drug Interactions	May reduce hypotensive action of captopril and enalapril. Risk of apnoea when used with neuromuscular blockers. Risk of fatal thrombotic complications when used with tretinoin.
Lab Interference	Prolongs clotting time of heparinised blood.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Store at 2-25°C.
Mechanism of Action	Aprotinin is a polypeptide and inhibits proteolytic enzymes including trypsin, chymotrypsin, kallikrein and plasmin. Inhibition of plasmin inhibits fibrinolysis and reduces operative blood loss. Metabolism: Inactivated in the GI tract. Excretion: Via urine as inactive degradation products; 5-10 hr (elimination half-life).
CIMS Class	Haemostatics
ATC Classification	B02AB01 - aprotinin; Belongs to the class of proteinase inhibitor antifibrinolytics. Used in the treatment of hemorrhage.

aripiprazole

CIMS Class : (Antipsychotics)
aripiprazole

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related aripiprazole information

Indication & Dosage	<i>Oral</i> Schizophrenia Adult: Initial dose: 10-15 mg once daily. Usual maintenance dose: 15 mg once daily. Adjust dose at intervals of at least 2 wk. Max dose: 30 mg once daily. <i>Oral</i> Acute manic episodes of bipolar disorder Adult: 30 mg once daily, decreased to 15 mg once daily based on tolerability.
Administration	May be taken with or without food.
Overdosage	Symptoms include nausea, vomiting, asthenia, diarrhoea and somnolence.
Contraindications	Hypersensitivity. Lactation. Children <18 yr.
Special Precautions	Patients with known CV diseases (e.g. history of MI, IHD, CCF or conduction abnormalities), cerebrovascular diseases or conditions which would predispose patients to hypotension; Alzheimer's disease and dementia. Caution when operating hazardous machinery, including automobiles when taking aripiprazole. Pregnancy.
Adverse Drug Reactions	Headache, agitation, insomnia, somnolence; dyspepsia, constipation, pain, nausea, vomiting; asthenia, dizziness, abdominal pain; dry mouth; anxiety, akathisia; orthostatic hypotension; hypertonia, tremor and blurred vision.
Drug Interactions	Drugs that induce CYP3A4 (e.g. carbamazepine) could cause an increase in aripiprazole clearance and lower blood levels. Inhibitors of CYP3A4 (e.g. ketoconazole) or CYP2D6 (e.g. quinidine, fluoxetine or paroxetine) can inhibit

	Drugs that induce CYP3A4 (e.g. carbamazepine) could cause an increase in aripiprazole clearance and lower blood levels. Inhibitors of CYP3A4 (e.g. ketoconazole) or CYP2D6 (e.g. quinidine, fluoxetine or paroxetine) can inhibit aripiprazole elimination and cause increased blood levels. Increased CNS depression with ethanol.
Food Interaction	Ingestion with a high-fat meal delays time to peak plasma level.
Mechanism of Action	Aripiprazole acts as a partial agonist at D ₂ and 5-HT _{1A} receptors and as an antagonist at 5-HT _{2A} receptors. Absorption: Well absorbed from the GI tract. Absolute bioavailability: about 87%. Distribution: Protein binding: about 99%. Metabolism: Mainly in the liver and the pathways involved include dehydrogenation and hydroxylation. Excretion: About 55% excreted in faeces and 25% in urine, mainly in the form of metabolites.
CIMS Class	Antipsychotics
ATC Classification	N05AX12 - aripiprazole;

artemether

CIMS Class : (Antimalarials)
artemether

P - Caution when used during pregnancy

L - Caution when used during lactation

related artemether information

Indication & Dosage	<i>Oral</i> Acute uncomplicated falciparum malaria Adult: 80 mg daily, to be taken with lumefantrine 480 mg daily. Doses to be taken at diagnosis and repeated after 8, 24, 36, 48 and 60 hr. Total doses: 6. Child: Daily doses based on body wt: 5-14 kg: 20 mg with lumefantrine 120 mg; 15-24 kg: 40 mg with lumefantrine 240 mg; 25-34 kg: 60 mg with lumefantrine 360 mg and >34 kg: 80 mg with lumefantrine 480 mg. Doses to be taken at diagnosis and repeated after 8, 24, 36, 48 and 60 hr. Total doses: 6.
Administration	Should be taken with food.
Contraindications	Hypersensitivity.
Special Precautions	Pregnancy and lactation. Avoid concomitant use of drugs known to prolong QT interval or monitor such patients.
Adverse Drug Reactions	Mild GI disturbance, dizziness, tinnitus, reduction in reticulocyte and leucocyte counts, nausea, vomiting, abdominal pain, bradycardia, 1st-degree heart block, transient increase in serum transaminases.
Drug Interactions	Artemether causes QT prolongation in some patients. Thus concomitant use of erythromycin, terfenadine, procainamide, quinidine, disopyramide, amiodarone, bretylium, bepridil, sotalol, astemizole, probucol, tricyclic antidepressants, phenothiazines may be avoided.
Storage	Oral: Store below 30°C.
Mechanism of Action	Artemether is a potent and rapidly acting blood schizontocide, which is highly efficacious in treating chloroquine-resistant falciparum malaria, and complicated

	Artemether is a potent and rapidly acting blood schizontocide, which is highly efficacious in treating chloroquine-resistant falciparum malaria, and complicated falciparum malaria including cerebral malaria. Its quick onset of effect and high efficacy in bringing down the parasite load are the properties which make this drug a suitable therapeutic option against falciparum infection. Metabolism: Rapidly hydrolysed to the active metabolite dihydroartemisinin. Excretion: Elimination half-life: about 4-11 hr after IM or oral admin.
CIMS Class	Antimalarials
ATC Classification	P01BE02 - artemether; Belongs to the class of artemisinin and derivative antimalarials. Used in the management of malarial infections.

artesunate

CIMS Class : (Antimalarials)
artesunate

P - Caution when used during pregnancy

L - Caution when used during lactation

related artesunate information

Indication & Dosage	<i>Parenteral</i> Falciparum malaria Adult: 2.4 mg/kg via IM or IV admin. Repeat 12 hr and 24 hr later, then once daily thereafter. Child: 2.4 mg/kg via IM or IV admin. Repeat 12 hr and 24 hr later, then once daily thereafter.
Contraindications	Hypersensitivity.
Special Precautions	Hepatic or renal insufficiency. Pregnancy and lactation.
Adverse Drug Reactions	Transient and reversible reticulocytopenia, drug fever, rash, bradycardia, transient 1st-degree heart block and reversible elevation of serum transaminases.
Drug Interactions	Antimalarial potentiating action seen with mefloquine, primaquine and tetracycline. Additive effect with chloroquine. Antagonistic effect with pyrimethamine and sulphonamides.
Mechanism of Action	Artesunate is a potent and rapidly-acting blood schizontocide derived from the leaves of the chinese herb, <i>Artemisia annua</i> . The exact mode of action is not clear but clinical studies have confirmed the effectiveness of artesunate in <i>P. vivax</i> and <i>falciparum malaria</i> . Excretion: Elimination half-life: about 45 min after IV admin.
CIMS Class	Antimalarials
ATC Classification	P01BE03 - artesunate; Belongs to the class of artemisinin and derivative antimalarials. Used in the management of malarial infections.

ascorbic acid

CIMS Class : (Vitamin C)
ascorbic acid

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab - Lab interference

related ascorbic acid information

Indication & Dosage	<i>Oral</i> Scurvy Adult: Prevention: 25-75 mg daily. Treatment: =250 mg daily, given in divided doses. May also be given via IM/IV/SC admin. Child: 1 mth–4 yr: 125–250 mg daily; 4–12 yr: 250–500 mg daily; 12–18 yr: 500 mg–1 g daily. Doses to be given in 1–2 divided doses. <i>Oral</i> Thalassaemia Adult: 100-200 mg daily, to be given with desferrioxamine. Child: 100–200 mg daily, to be given with desferrioxamine. <i>Oral</i> Metabolic disorders Child: Neonate: 50–200 mg daily, adjust if needed; 1 mth–18 yr: 200–400 mg daily in 1–2 divided doses, up to 1 g daily may be needed.
Special Precautions	G6PD deficiency. Haemochromatosis; hyperoxaluria. Diabetics; patients prone to recurrent renal calculi. Neonates; pregnancy (Ingestion of large doses has resulted in scurvy in neonates); lactation.
Adverse Drug Reactions	Diarrhea, GI disturbances. May cause acidification of the urine; precipitation of urate, cystine or oxalate stones, or drugs in the urinary tract.
Drug Interactions	Deferrioxamine, hormonal contraceptives, flufenazine, warfarin, elemental iron, salicylates, warfarin, fluphenazine, disulfiram, mexiletine, vitamin B ₁₂ .
Lab Interference	Presence of ascorbic acid in urine results in false decreases in the glucose conc determined by the glucose oxidase method;

Lab Interference	Presence of ascorbic acid in urine results in false decreases in the glucose conc determined by the glucose oxidase method; while in glucose determinations measured by cupric sulfate reagent, false increases have resulted.
Mechanism of Action	Ascorbic acid is a functional and principal <i>in vivo</i> form of vitamin C, an essential water-soluble vitamin which is fundamental in the synthesis of collagen and intercellular materials.
CIMS Class	Vitamin C
ATC Classification	G01AD03 - ascorbic acid; Belongs to the class of organic acid anti-infectives. Used in the treatment of gynecological infections. S01XA15 - ascorbic acid; Belongs to the class of other agents used as ophthalmologicals.

asparaginase

CIMS Class : (Cytotoxic Chemotherapy)
asparaginase

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab - Lab interference

related asparaginase information

Indication & Dosage	<i>Parenteral</i> Induction of remissions in acute lymphoblastic leukaemia Adult: 1000 units/kg/day via IV inj for 10 days after treatment with vincristine and prednisone or prednisolone. Alternatively, 6000 units/m² via IM inj, given every 3rd day for 9 doses during treatment with vincristine and prednisone or prednisolone. As monotherapy: 200 units/kg/day via IV inj for 28 days. IV inj to be given over at least 30 min in a running infusion of normal saline or glucose 5%. For IM admin, no more than 2 ml of a solution in normal saline should be injected at a single site. Child: As monotherapy: 200 units/kg/day via IV inj for 28 days, to be given over at least 30 min in a running infusion of normal saline or glucose 5%. Incompatibility: Incompatible with rubber and should not be mixed with other drugs.
Contraindications	Pancreatitis, hypersensitivity. Pregnancy.
Special Precautions	Should be used after skin testing, in hospital setting. Liver disease, frequently blood count monitoring. Lactation.
Adverse Drug Reactions	Chills, pyrexia, liver disorders. Hyperammonaemia, decrease of fibrinogen and clotting factors, alteration in blood lipids and cholesterol, hypoalbuminaemia, uraemia, renal failure (occasional). Hyperglycaemia. Nausea, vomiting, anorexia, weight loss. CNS disturbances including depression, coma, hallucinations, Parkinson-like syndrome. Marked leucopenia, transient bone-marrow depression.

	cholesterol, hypoalbuminaemia, uraemia, renal failure (occasional). Hyperglycaemia. Nausea, vomiting, anorexia, weight loss. CNS disturbances including depression, coma, hallucinations, Parkinson-like syndrome. Marked leucopenia, transient bone-marrow depression. Potentially Fatal: Acute anaphylaxis; fatal hyperthermia; pancreatitis; ketoacidosis.
Drug Interactions	Activity of methotrexate may be reduced if L-asparaginase is given before hand. Potentially Fatal: IV admin of asparaginase may increase vincristine neurotoxicity.
Lab Interference	Interferes with thyroid function tests.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Parenteral: Refrigerate at 2-8°C.
Mechanism of Action	Asparaginase interferes with malignant cell growth by breaking down asparagine to aspartic acid and ammonia as leukemic cells are unable to synthesise asparagine and depends on exogenous source of asparagine for survival. It acts on the G ₁ phase of the cell cycle. Distribution: Distributed at lymph; does not penetrate the CSF. Excretion: Urine (small amounts). Elimination half-life: 8-30 hr (IV); 49 hr (IM).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01XX02 - asparaginase; Belongs to the class of other antineoplastic agents. Used in the treatment of cancer.

related aspirin information

Indication & Dosage	<i>Oral</i> Prophylaxis of myocardial infarction Adult: 75-325 mg once daily. Lower doses should be used in patients receiving ACE inhibitors. <i>Oral</i> Stent implantation Adult: 325 mg 2 hr before procedure followed by 160-325 mg/day thereafter. <i>Oral</i> Juvenile rheumatoid arthritis Child: 80-100 mg/kg daily in 5 or 6 divided doses. Up to 130 mg/kg daily in acute exacerbations if necessary. <i>Oral</i> Mild to moderate pain and fever Adult: 325-650 mg repeated every 4-6 hr according to response. Max: 4 g/day. May also be given rectally. Max Dosage: <i>Oral</i> Pain and inflammation associated with musculoskeletal and joint disorders Adult: Initial: 2.4-3.6 g/day in divided doses. Usual maintenance: 3.6-5.4 g/day. Monitor serum concentrations.
Administration	Should be taken with food.
Overdosage	Symptoms may include hyperventilation, fever, restlessness, ketosis, and respiratory alkalosis and metabolic acidosis. CNS depression may lead to coma; CV collapse and respiratory failure.

	Symptoms may include hyperventilation, fever, restlessness, ketosis, and respiratory alkalosis and metabolic acidosis. CNS depression may lead to coma; CV collapse and respiratory failure. In children, drowsiness and metabolic acidosis commonly occur; hypoglycaemia may be severe.
Contraindications	Hypersensitivity (attacks of asthma, angioedema, urticaria or rhinitis), active peptic ulceration; pregnancy (3 rd trimester), children <12 yr, patients with haemophilia or haemorrhagic disorders, gout, severe renal or hepatic impairment, lactation.
Special Precautions	History of peptic ulcer or those prone to dyspepsia and those with gastric mucosal lesion, asthma or allergic disorders, dehydrated patients, uncontrolled hypertension, impaired renal or hepatic function, elderly.
Adverse Drug Reactions	GI disturbances; prolonged bleeding time, rhinitis, urticaria and epigastric discomfort; angioedema, salicylism, tinnitus; bronchospasm. Potentially Fatal: Gastric erosion, ulceration and bleeding; severe, occasionally fatal exacerbation of airway obstruction in asthma; Reye's syndrome (children <12 yr). Hepatotoxicity; CNS depression which may lead to coma; CV collapse and resp failure; paroxysmal bronchospasm and dyspnoea.
Drug Interactions	Alcohol, corticosteroids, analgin, phenylbutazone and oxyphenbutazone may increase risk of GI ulceration. Aspirin increases phenytoin levels. May antagonize actions of uricosurics and spironolactone. Potentially Fatal: May potentiate effects of anticoagulants, methotrexate and oral hypoglycaemics.
Food Interaction	Vitamin-rich foods increase urinary excretion.
Lab Interference	Interferes with thyroid function tests.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. if full-dose acetylsalicylic acid (aspirin) used in 3rd trimester. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Aspirin is an analgesic, anti-inflammatory and antipyretic. It inhibits cyclooxygenase, which is responsible for the synthesis of

Mechanism of Action	Aspirin is an analgesic, anti-inflammatory and antipyretic. It inhibits cyclooxygenase, which is responsible for the synthesis of prostaglandin and thromboxane. It also inhibits platelet aggregation. Duration: 4-6 hr. Absorption: Rapidly absorbed from the GI tract (oral); less reliable (rectal); absorbed through the skin (topical). Peak plasma concentrations after 1-2 hr. Distribution: Widely distributed; crosses the placenta; enters breast milk. Protein-binding: 80-90%. Metabolism: Hepatic; converted to metabolites. Excretion: Via urine by glomerular filtration, active renal tubular secretion and passive tubular reabsorption (as unchanged drug); via haemodialysis; 15-20 minutes (elimination half-life, parent drug).
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics) / Nonsteroidal Anti-inflammatory Drugs (NSAIDs)

aspirin + clopidogrel

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
aspirin + clopidogrel

P - Caution when used during pregnancy

L - Contraindicated in lactation

Lab - Lab interference

related aspirin + clopidogrel information

Indication & Dosage

Oral

Prophylaxis of ischaemic events

Adult: Each tablet contains clopidogrel 75 mg and aspirin 75 mg; 1 tablet once daily.

CrCl (ml/min)	Dosage Recommendation
<10	Avoid use.

Hepatic impairment: Severe hepatic impairment: Avoid use.

Oral

Acute coronary syndrome

Adult: Each tablet contains clopidogrel 75 mg and aspirin 75 mg; Loading dose: 4 tablets; maintenance: 1 tablet daily.

CrCl (ml/min)	Dosage Recommendation
<10	Avoid use.

Hepatic impairment: Severe hepatic impairment: Avoid use.

Contraindications

Hypersensitivity to aspirin, NSAIDs or clopidogrel; active peptic ulceration; children <12 yr; patients with haemophilia or haemorrhagic disorders; gout; severe renal or hepatic impairment; lactation.

Special Precautions

History of peptic ulcer or those prone to dyspepsia and those with gastric mucosal lesion or heavy ethanol consumption; asthma or allergic disorders; tinnitus; dehydrated patients; uncontrolled hypertension; impaired renal or hepatic function; children and elderly; pregnancy. Patients at risk of increased bleeding from trauma, surgery, or other pathological conditions. Increased risk of Reye's syndrome when used in patients with chicken pox, influenza or flu symptoms. Caution when used in patients with nasal allergies or nasal polyps. For patients undergoing elective surgery and an antiplatelet effect

	bleeding from trauma, surgery, or other pathological conditions. Increased risk of Reye's syndrome when used in patients with chicken pox, influenza or flu symptoms. Caution when used in patients with nasal allergies or nasal polyps. For patients undergoing elective surgery and an antiplatelet effect is not needed, clopidogrel should be discontinued 7-10 days before surgery.
Adverse Drug Reactions	Aspirin: GI disturbances, epigastric discomfort, prolonged bleeding time, rhinitis, urticaria; angioedema, salicylism, tinnitus. Clopidogrel: Dyspepsia, abdominal pain, nausea, vomiting, flatulence, constipation, gastritis, gastric and duodenal ulcers. Serious events include bleeding and GI haemorrhage. GI upset, diarrhoea, paraesthesia, vertigo, headache, dizziness, leucopaenia, eosinophilia, rash and pruritus. Potentially Fatal: Aspirin: Gastric erosion, ulceration and bleeding; severe, occasionally fatal exacerbation of airway obstruction in asthma; Reye's syndrome (childn <12 yrs). Hepatotoxicity; CNS depression, which may lead to coma; CV collapse, resp failure; paroxysmal bronchospasm and dyspnoea. Clopidogrel: Bleeding disorders including GI intracranial haemorrhage and thrombotic thrombocytopenic purpura.
Drug Interactions	Aspirin: Corticosteroids, phenylbutazone and oxyphenbutazone may increase risk of GI ulceration. Use with coumarins, anagrelide, agatroban, LMWH, bivalirudin, dasatinib, iloprost, lepirudin and tenecteplase may increase the risk of bleeding. Clopidogrel: Co-administration of clopidogrel with NSAIDs may increase the risk of stomach and intestinal bleeding. There is an increased risk of bleeding with coumarins, agatroban, dasatinib, heparin, LMWH, ginkgo biloba and iloprost. Increased risk of bleeding if clopidogrel and drotrecogin alfa are given within 7 days. May increase bupropion level and side effects (lightheadedness , GI discomfort). Potentially Fatal: Aspirin and clopidogrel: Increased risk of bleeding with dabigatran.
Lab Interference	Aspirin: Affects urinary glucose tests using cupric sulfate(false-positive) and glucose oxidase(false-negative). Interferes with thyroid function tests.
Mechanism of Action	Aspirin inhibits the formation of thromboxane A₂ in the platelets. This inhibits platelet aggregation and coagulation. This action lasts until the enzyme cyclo-oxygenase is regenerated in the platelets. Clopidogrel is a prodrug and is metabolised an active thiol metabolite. The active metabolite selectively inhibits the binding of adenosine diphosphate (ADP) to its platelet receptor and the subsequent ADP-mediated activation of the glycoprotein GP IIb/IIIa

	metabolised an active thiol metabolite. The active metabolite selectively inhibits the binding of adenosine diphosphate (ADP) to its platelet receptor and the subsequent ADP-mediated activation of the glycoprotein GP IIb/IIIa complex, thereby inhibiting platelet aggregation. Absorption: Aspirin: Rapid absorption (oral). Clopidogrel: Rapid, incomplete absorption. Distribution: Aspirin: Widely distributed; Protein binding: 80-90%. Clopidogrel: Protein binding: 98% (parent drug). Metabolism: Aspirin: Hydrolysed to salicylate in the gut wall; salicylate metabolised hepatically. Clopidogrel: Extensive hepatic metabolism; converted to inactive carboxylic acid derivative and thiol derivative(active). Excretion: Aspirin: Via urine by glomerular filtration, active renal tubular secretion and passive tubular reabsorption; haemodialysis (as salicylate); 15-20 minutes (elimination half-life, parent drug). Clopidogrel: Via urine (50%) and faeces (46%) as unchanged drug and metabolites. Elimination half-life: Approx 6 hr.
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC Classification	B01AC04 - clopidogrel; Belongs to the class of platelet aggregation inhibitors excluding heparin. Used in the treatment of thrombosis.

aspirin + dipyridamole

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
aspirin + dipyridamole

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related aspirin + dipyridamole information

Indication & Dosage

Oral

Reduce risk of stroke in patients who had transient ischaemia of the brain or completed ischaemic stroke due to thrombosis

Adult: Per capsule contains aspirin 25 mg and extended-release dipyridamole 200 mg: 1 capsule bid. For patients with intolerable headache: 1 capsule at bedtime with low-dose aspirin in the morning; may return to usual dose once tolerance to headache develops.

CrCl (ml/min)	Dosage Recommendation
<10	Avoid.

Hepatic impairment: Avoid in severe impairment.

Administration

May be taken with or without food. (Swallow whole, do not chew/ crush.)

Overdosage

Symptoms may include warm feeling, flushing, sweating, restlessness, feeling of weakness, dizziness, tinnitus. Gastric lavage may be used to remove unabsorbed drug. Treatment is mainly symptomatic and supportive.

Contraindications

Hypersensitivity, allergy to NSAIDs. Bleeding disorders (factor VII or IX deficiencies). Patients with asthma, rhinitis or nasal polyps. Children <16 yr with viral infections.

Special Precautions

Unstable angina, recent MI, subaortic stenosis, severe coronary artery disease, hypotension, history of peptic ulcer disease. Monitor for signs of ulceration or bleeding, even in the absence of previous GI symptoms. Patients with inherited or acquired bleeding disorders. Admin of dipyridamole may

	Unstable angina, recent MI, subaortic stenosis, severe coronary artery disease, hypotension, history of peptic ulcer disease. Monitor for signs of ulceration or bleeding, even in the absence of previous GI symptoms. Patients with inherited or acquired bleeding disorders. Admin of dipyridamole may cause increase in hepatic enzymes and hepatic failure. Avoid aspirin in patients with severe renal failure (CrCl <10 mL/minute). Discontinue if tinnitus or impaired hearing occurs. Dose of aspirin in this preparation is insufficient to prevent MI. Pregnancy, lactation.
Adverse Drug Reactions	GI disturbances, dyspepsia, abdominal pain, nausea, diarrhoea, vomiting, epigastric discomfort, rhinitis, urticaria, prolonged bleeding time, headache, dizziness, facial flushing, fainting, skin rash. Body pain, allergic reaction, fever, hypotension, tachycardia, palpitation, arrhythmia, hyperglycaemia, thirst, agitation, uterine haemorrhage, taste loss.
Drug Interactions	Aspirin: May reduce hypotensive and hyponatraemic effects of ACE inhibitors; may increase serum levels and toxicity of acetazolamide; increases anticoagulant effect of heparin, thus increasing bleeding risk; may reduce hypotensive effect of β-blockers; may reduce efficacy of diuretics in patients with underlying renal or CV disease; salicylate may inhibit renal clearance of methotrexate, thus increasing the risk of bone marrow toxicity; increased risk of bleeding or reduced renal function when used with NSAIDs; increased risk of hypoglycaemia when used with oral hypoglycaemic drugs; salicylate antagonises the uricosuric effect of uricosuric agents; may increase adverse effect of alendronate. Dipyridamole: May antagonise the anticholinesterase effect of cholinesterase inhibitors. Increased risk of bleeding when used with warfarin. Antiplatelet effect of aspirin may be increased by antidepressants e.g. TCAs, selective serotonin reuptake inhibitors. Potentially Fatal: Salicylates may increase adverse effect of drotrecogin alfa. Dipyridamole may increase plasma levels and CV effects of adenosine. Ketorolac may enhance adverse effect of aspirin. Dipyridamole may increase therapeutic effect of regadenoson. Salicylates may increase the anticoagulant effect of vit K antagonists. Salicylates may increase the adverse effect of varicella virus-containing vaccines.
Food Interaction	Increased risk of bleeding with chronic, heavy alcohol use. Gingko biloba may increase antiplatelet effects of salicylates.
Lab Interference	May elevate hepatic enzymes, blood urea nitrogen, serum creatinine, hyperkalaemia, proteinuria and prolonged bleeding time.
Pregnancy Category (US FDA)	

Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 25°C.
Mechanism of Action	Aspirin inhibits platelet aggregation by irreversible inhibition of platelet cyclooxygenase and thus the formation of thromboxane A₂ in the platelets. Dipyridamole inhibits platelet aggregation by preventing the uptake of adenosine into platelets, endothelial cells and RBCs. The combination results in additive antiplatelet effects. Absorption: Dipyridamole: Plasma levels peak 2 hr after oral admin. Aspirin: Plasma levels peak 0.63 hr after oral admin. Distribution: Dipyridamole: About 99% bound to plasma proteins, mainly alpha 1-acid glycoprotein and albumin. Aspirin: Poorly bound to plasma proteins. Metabolism: Dipyridamole: Hepatic metabolism, mainly by glucuronidation. Aspirin: Rapidly hydrolysed to salicylic acid; salicylic acid is mainly conjugated in the liver to form salicyluric acid. Excretion: Dipyridamole: About 95% of the glucuronide metabolite is removed via bile into the faeces. Aspirin: Half-life of salicylic acid is 1.71 hr.
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC Classification	B01AC07 - dipyridamole; Belongs to the class of platelet aggregation inhibitors excluding heparin. Used in the treatment of thrombosis.

aspirin + ticlopidine

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
aspirin + ticlopidine

P - Caution when used during pregnancy

L - Contraindicated in lactation

Lab - Lab interference

related aspirin + ticlopidine information

Indication & Dosage	<i>Oral</i> Antithrombotic Adult: Each tablet contains aspirin 100 mg and ticlopidine 250 mg: 1 tablet once daily. <table border="1"><thead><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr></thead><tbody><tr><td><10</td><td>Avoid use.</td></tr></tbody></table> Hepatic impairment: Severe hepatic impairment: Avoid use.	CrCl (ml/min)	Dosage Recommendation	<10	Avoid use.
CrCl (ml/min)	Dosage Recommendation				
<10	Avoid use.				
Contraindications	Hypersensitivity to aspirin, NSAIDs or clopidogrel; active peptic ulceration; children <12 years ; patients with bleeding disorders or at increased risk of bleeding; severe renal or hepatic impairment; lactation.				
Special Precautions	Pregnancy, history of peptic ulcer, bronchospasm, renal or hepatic impairment, elderly, children. Monitor alkaline phosphatase.				
Adverse Drug Reactions	Aspirin: GI disturbances, epigastric discomfort, prolonged bleeding time, rhinitis, urticaria; angioedema, salicylism. Ticlopidine: Increase in total cholesterol. Potentially Fatal: Aspirin: Gastric erosion, ulceration, bleeding , thrombocytopenia; severe, occasionally fatal exacerbation of airway obstruction in asthma; Reye's syndrome (children <12 yrs). Hepatotoxicity; CNS depression, which may lead to coma; CV collapse, resp failure; paroxysmal bronchospasm and dyspnoea. Ticlopidine: Intracranial bleeding, Stevens Johnson syndrome, thrombotic thrombocytopenic purpura.				
Drug Interactions	Aspirin: Corticosteroids, phenylbutazone and oxyphenbutazone may				

	Aspirin: Corticosteroids, phenylbutazone and oxyphenbutazone may increase risk of GI ulceration. Use with anagrelide, argatroban, LMWH, bivalirudin, dasatinib, iloprost, lepirudin and tenecteplase may increase the risk of bleeding. Ticlopidine: Increases theophylline and possibly aminophylline levels. Increased risk of bleeding with abciximab, argatroban, bivalirudin, dasatinib, iloprost, LMWH, drotrecogin alfa, fondaparinux and ginkgo biloba. May increase bupropion level and side effects (light headedness, GI discomfort). Antacids decrease absorption of ticlopidine. Potentially Fatal: Aspirin and ticlopidine: Risk of bleeding with dabigatran and coumarins. Ticlopidine: Increased risk of bleeding with phenindione. Increased risk of agranulocytosis with deferiprone.
Lab Interference	Aspirin: Interferes with thyroid function tests, urinary catecholamines, urine sugar, pregnancy tests and urine ketones.
Mechanism of Action	Aspirin inhibits platelet aggregation by its inhibitory effect on cyclo-oxygenase in thrombocytes. The anti-thrombotic action of ticlopidine is thought to be due to inhibition of ADP-mediated platelet aggregation. When used in combination, the anti-thrombotic effects of aspirin and ticlopidine are additive. Absorption: Aspirin: Rapid oral absorption. Ticlopidine: Rapid and almost complete absorption. Distribution: Aspirin: Widely distributed. Protein binding: 80-90%. Ticlopidine: Protein binding: 98% Metabolism: Aspirin: Hydrolysed to salicylate in the gut wall; salicylate metabolised hepatically. Ticlopidine: Extensive hepatic metabolism to active metabolite. Excretion: Aspirin: Via urine by glomerular filtration, active renal tubular secretion and passive tubular reabsorption; elimination half-life of parent drug: 15-20 minutes. Ticlopidine: Via urine (60%) and faeces (25%); half-life 30-50 hr (terminal half-life).
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC Classification	B01AC05 - ticlopidine; Belongs to the class of platelet aggregation inhibitors excluding heparin. Used in the treatment of thrombosis.

astemizole

This product is no longer actively marketed.

CIMS Class : (Antihistamines & Antiallergics)
astemizole

Food ⚠ - Food interaction

related astemizole information

Indication & Dosage	<i>Oral</i> Allergic conditions Adult: 10 mg once daily. Child: 6-12 yr: 5 mg once daily.
Administration	Should be taken on an empty stomach (i.e. At least one hour before food or two hours after food).
Contraindications	Porphyria.
Special Precautions	Prostatic hypertrophy, urinary retention, glaucoma, pyloroduodenal obstruction, epilepsy; children and elderly. Avoid in patients with cardiac disease, significant hepatic disease, known or suspected prolongation of the QT interval, hypokalaemia and other electrolyte imbalances. Not to exceed recommended doses due to risk of arrhythmias.
Adverse Drug Reactions	Increased appetite, wt gain. Rashes, hypersensitivity reactions. CNS depression eg, drowsiness, headache, psychomotor impairments; urinary retention, dry mouth, blurred vision, GI disturbances. Potentially Fatal: Ventricular arrhythmias, including torsades de pointes.
Drug Interactions	Imidazole, triazole antifungals, and the macrolide antibacterials inhibit the hepatic metabolism of astemizole. Avoid concomitant admin of other potentially arrhythmogenic drugs. Co-admin with diuretics may cause electrolyte imbalance. Concurrent use with terfenadine is not recommended.
Food Interaction	Grapefruit juice may inhibit the metabolism of astemizole.
Pregnancy Category (US)	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Astemizole is a piperidine derivative, non-sedating antihistamine. Absorption: Rapid absorption from GI tract. Distribution: Unchanged astemizole: Highly bound to plasma proteins Metabolism: Extensive 1st pass metabolism. Excretion: Metabolites are slowly excreted in the urine and faeces, and undergo enterohepatic recycling.
CIMS Class	Antihistamines & Antiallergics
ATC Classification	R06AX11 - astemizole; Belongs to the class of other agents used as systemic antihistamines.

***astemizole information:**

Note that there are some more drugs interacting with astemizole

atenolol

CIMS Class : (Beta-Blockers) , (Anti-Anginal Drugs)
atenolol

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab - Lab interference

related atenolol information

Indication & Dosage

Oral

Hypertension

Adult: 25-100 mg daily as a single dose, depending on response. Takes 1-2 wk for full effect to be observed.

CrCl (ml/min)	Dosage Recommendation
15-35	50 mg daily.
<15	25 mg daily or 50 mg on alternate days.
Dialysis	25-50 mg after each dialysis.

Oral

Angina pectoris

Adult: 50-100 mg daily given as single or divided doses. Max dose: 200 mg daily.

CrCl (ml/min)	Dosage Recommendation
15-35	50 mg daily.
<15	25 mg daily or 50 mg on alternate days.
Dialysis	25-50 mg after each dialysis.

Oral

Prophylaxis of migraine

Adult: 50-100 mg daily.

CrCl (ml/min)	Dosage Recommendation
15-35	50 mg daily.
<15	25 mg daily or 50 mg on alternate days.
Dialysis	25-50 mg after each dialysis.

Intravenous

Intravenous

Emergency treatment of cardiac arrhythmias

Adult: 2.5 mg injected at a rate of 1 mg/minute, may repeat every 5 minutes if needed. Max: 10 mg. Alternatively, 150 mcg/kg to be infused over 20 minutes. May repeat Inj or infusion procedure every 12 hr as needed. Once control is achieved, maintain with oral doses of 50-100 mg/day.

CrCl (ml/min)	Dosage Recommendation
15-35	10 mg once every 2 days.
<15	10 mg once every 4 days.

Intravenous

Acute myocardial infarction

Adult: To be given within 12 hr of the onset of chest pain. Inject 5-10 mg slowly at a rate of 1 mg/minute, followed by an oral dose of 50 mg 15 minutes later (if no adverse effects result from the inj). Alternatively, repeat an IV dose of 5 mg 10 minutes after the initial doser followed by an oral dose of 50 mg 10 minutes after the last IV dose. A further oral dose of 50 mg may be given 12 hr later. Thereafter, maintain with 50 mg every 12 hr or 100 mg/day for 6-9 days post-MI.

CrCl (ml/min)	Dosage Recommendation
15-35	10 mg once every 2 days.
<15	10 mg once every 4 days.

Administration

May be taken with or without food.

Overdosage

Symptoms include lethargy, sinus pause, bradycardia, hypotension, bronchospasm and/or hypoglycaemia. Unabsorbed drug may be removed by induced emesis, gastric lavage or admin of activated charcoal.

Contraindications

Hypersensitivity. Sinus bradycardia, sinus node dysfunction, heart block >1st degree, compensated cardiac failure, cardiogenic shock, bronchospastic diseases, peripheral vascular diseases. Pregnancy.

Special Precautions

Compensated heart failure. Variant angina, acute MI, DM; peripheral vascular disorders; hepatic and renal dysfunction; elderly patients, children. Lactation. If atenolol and clonidine are co-admin, then gradual withdrawal of clonidine should take place a few days after withdrawal of atenolol.

Adverse Drug Reactions

Bronchospasm; cold extremities, fatigue, dizziness, insomnia, lethargy, confusion, headache, depression, nightmares, nausea, diarrhoea, constipation, impotence and paraesthesia.

Potentially Fatal: Heart failure, 2nd or 3rd degree AV block.

Decreased effect with aluminum and calcium salts,

Drug Interactions	Decreased effect with aluminum and calcium salts, barbiturates, cholestyramine, NSAIDs, ampicillin, rifampicin. Potentially Fatal: May increase effects of drugs which slow AV conduction (digoxin, verapamil, diltiazem).
Lab Interference	Increased glucose levels, decreased HDL.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 20-25°C. Oral: Store at 20-25°C.
Mechanism of Action	Atenolol is a competitive cardioselective β_1-blocker. It does not have effect on β_2-receptors except in high doses. Its cardioselectivity is dose-related. Atenolol reduces resting and exercise-induced heart rate as well as myocardial contractility. Peripheral β-blockade may result in vasoconstriction. Atenolol reduces BP and heart rate which results in reduced myocardial work and O_2 requirement leading to improved exercise tolerance and reduced frequency and intensity of anginal attack. Absorption: Incompletely absorbed from the GI tract (oral); peak plasma concentrations after 1-4 hr. Distribution: Low lipid solubility, blood-brain barrier (small amounts); crosses the placenta and enters breast milk (concentrations higher than those in plasma). Protein-binding: Minimal. Metabolism: Hepatic: Minimal. Excretion: Via urine; elimination half-life: 6-7 hr.
CIMS Class	Beta-Blockers / Anti-Anginal Drugs
ATC Classification	C07AB03 - atenolol; Belongs to the class of selective beta-blocking agents. Used in the treatment of cardiovascular diseases.

atenolol + chlortalidone

CIMS Class : (Beta-Blockers) , (Diuretics)
atenolol + chlortalidone

P - Caution when used during pregnancy

L - Contraindicated in lactation

related atenolol + chlortalidone information

Indication & Dosage	<i>Oral</i>					
	Hypertension					
	Adult: Per tablet contains atenolol(mg) and chlorthalidone(mg) 50/12.5 or 100/25 : Take 1 tablet once daily.					
	<table><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr><tr><td>15-35</td><td>50 mg (atenolol component) /day.</td></tr><tr><td>10</td><td>50 mg (atenolol component) every other day.</td></tr></table>	CrCl (ml/min)	Dosage Recommendation	15-35	50 mg (atenolol component) /day.	10
CrCl (ml/min)	Dosage Recommendation					
15-35	50 mg (atenolol component) /day.					
10	50 mg (atenolol component) every other day.					
Overdosage	Symptoms may include bradycardia, hypotension, acute cardiac insufficiency and bronchospasm. Gastric lavage and activated charcoal and a laxative to prevent absorption of drug from the Gi tract. Excessive bradycardia may be treated with atropine and/or pacemaker. Glucagon may be used if needed. If response to glucagon is poor or glucagon is available, dobutamine may be admin. Treat bronchospasm with bronchodilators. Ensure fluid and electrolyte balance if there is excessive diuresis.					
Contraindications	Sinus bradycardia, 2nd or 3rd degree heart block, cardiogenic shock, hypotension, metabolic acidosis, severe peripheral arterial circulatory disturbances, sick sinus syndrome, untreated phaeochromocytoma, uncontrolled heart failure. Hypersensitivity to either product or sulphonamide derivatives. Pregnancy.					
Special Precautions	Caution in patients with a history of heart failure, poor cardiac reserve, 1st degree heart block or anaphylactic reactions to allergens . Renal or hepatic impairment, electrolyte disturbances, history of bronchospasm. May mask tachycardia as a symptom of hypoglycaemia. May mask signs of thyrotoxicosis. May increase frequency and duration of					

	reserve, 1st degree heart block or anaphylactic reactions to allergens. Renal or hepatic impairment, electrolyte disturbances, history of bronchospasm. May mask tachycardia as a symptom of hypoglycaemia. May mask signs of thyrotoxicosis. May increase frequency and duration of angina attacks in patients with Prinzmetal's angina. Avoid abrupt withdrawal in patients with ischaemic heart disease. Abrupt withdrawal in patients with hyperthyroidism may precipitate thyroid storm. Patients with known pre-disposition to DM. Chlorthalidone may precipitate overt disease in latent diabetics. Patients with known pre-disposition to DM. Chlorthalidone may precipitate acute gout in some patients, lactation. Avoid in patients with reversible obstructive airways disease. Monitor serum potassium levels, especially in elderly, patients receiving digitalis preparations for cardiac failure, patients on low-potassium diet or patients suffering from GI complaints. Chlorthalidone may precipitate acute gout in some patients. Patients with known pre-disposition to DM
Adverse Drug Reactions	Atenolol: Bradycardia, heart failure deterioration, precipitation of heart block, intermittent claudication, Raynaud's phenomenon. Confusion, dizziness, headache, mood changes, nightmares, dry mouth, GI disturbances. Leucopenia, purpura, thrombocytopenia, alopecia, dry eyes, skin rashes, paraesthesia, impotence, visual disturbances. Chlorthalidone: Chlorthalidone may cause hypersensitivity reactions & rarely hyponatraemia. Diabetes and gout may be precipitated. Gastric irritation, vomiting, cramping, constipation, cholestatic jaundice. Potentially Fatal: Atenolol: Heart failure, 2nd or 3rd degree AV block.
Drug Interactions	Both: Carboxolone may increase bp due to fluid retention but there may be an additive effect of the chlorthalidone. Atenolol: Reduced hypotensive effect with pseudoephedrine/xylometazoline. Increase risk of bradycardia with amisulpride, alprostadil, flecainide. Increase risk of hypotension with alprostadil and baclofen. Reduced effect of sulphonylureas. Chlorthalidone: May alter insulin requirements and impair diabetic control in diabetics using oral diabetic medicine; may reduce renal clearance of lithium and increases risk of lithium toxicity; May enhance digitalis toxicity; Risk of hypercalcaemia with paricalcitol or high dose calcium with or without vitamin D. Increased risk of hypokalaemia with ritodrine, corticosteroids and amphotericin B. Potentially Fatal: Atenolol: Risk of bronchospasm if atenolol is used concurrently with aminophylline/ theophylline. Cardiac depression when used with methoxyflurane. Atenolol has been withdrawn 24 hrs to 4 days pre-op if methoxyflurane is to be admin. Marked bp raise with dobutamine. Risk of bradycardia

	used concurrently with aminophylline/ theophylline. Cardiac depression when used with methoxyflurane. Atenolol has be be withdrawn 24 hrs to 4 days pre-op if methoxyflurane is to be admin. Marked bp raise with dobutamine. Risk of bradycardia and hypertension/hypotension when used concurrently with adrenaline. Severe cardio depression with verapamil. Paradoxical hypertension if used with clonidine. Chlorthalidone: Risk of death from arrhythmias with ketanserin.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Do not store >25°C.
Mechanism of Action	Atenolol is a β_1-blocker that acts preferentially on the β_1 adrenergic receptors in the heart. Chlorthalidone is a thiazide-like diuretic that reduces BP possibly by increasing excretion of sodium and chloride ions. Combination of the two drugs results in additive antihypertensive action. Absorption: Atenolol: Incomplete absorption of about 50% (oral); plasma levels peak 2-4 hr after oral admin. Chlorthalidone: Incomplete absorption of about 60%; peak plasma levels: 12 hr after oral admin. Distribution: Atenolol: Low plasma protein binding. Chlorthalidone: 90% bound to mainly red blood cells Metabolism: Atenolol: No significant hepatic metabolism. Excretion: Atenolol: Mainly via urine; Chlorthalidone: mainly via urine.
CIMS Class	Beta-Blockers / Diuretics
ATC Classification	C07AB03 - atenolol; Belongs to the class of selective beta-blocking agents. Used in the treatment of cardiovascular diseases.

atenolol + nifedipine

CIMS Class : (Beta-Blockers) , (Calcium Antagonists)
atenolol + nifedipine

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related atenolol + nifedipine information

Indication & Dosage	<i>Oral</i> Hypertension, Angina pectoris Adult: Per capsule contains atenolol 50 mg and nifedipine (sustained release) 20 mg: 1 capsule once or twice daily. Elderly: Per capsule contains atenolol 50 mg and nifedipine (sustained release) 20 mg: 1 capsule once daily.
Overdosage	May cause hypotension and congestive cardiac failure. Unabsorbed drug may be removed by gastric lavage or administration of activated charcoal. Atenolol may be removed by haemodialysis. Symptomatic treatment may be required.
Contraindications	Hypersensitivity, CCF, sinus bradycardia, heartblock > 1st degree, hypotension and overt cardiac failure, aortic stenosis, unstable angina, acute attacks of angina, acute MI or secondary prevention of MI, cardiogenic shock. Lactation.
Special Precautions	Peripheral vascular disease, hepatic or renal dysfunction, malignant hypertension, fixed left ventricular obstruction, withdrawal should be gradual. Excessive drop in BP may occur in some patients, especially elderly. Caution when used in patients with airway obstruction. Caution in diabetics as it may mask signs of hypoglycaemia. Continued depression of the myocardium by beta-blocker may lead to cardiac failure. Nifedipine may cause severe chest pain, increased severity, duration or frequency of angina. May mask signs of hyperthyroidism. Not to be used in patients with untreated pheochromocytoma. Caution when used in patients with peripheral circulatory disorders. Pregnancy.
Adverse Drug	Headache, palpitation, flushing, depression, wheezing,

Adverse Drug Reactions	Headache, palpitation, flushing, depression, wheezing, dizziness, hypotension, GI upsets, fatigue, vertigo, warmth and sweating. Itching, muscle cramps and cold extremities.
Drug Interactions	Increased risk of hypotension and/or bradycardia when used with catecholamine-depleting drugs. If used with clonidine, atenolol can worsen rebound hypertension following clonidine withdrawal. Hypotensive effect of atenolol may be reduced when used with prostaglandin synthase inhibiting drugs. Nifedipine may increase serum digoxin levels. Cimetidine may increase peak plasma levels and area-under-the-curve of nifedipine. Reduced efficacy of nifedipine with phenytoin or rifampicin. Calcium channel blockers may reduce clearance of nifedipine. Increased plasma levels of nifedipine with cisapride, quinupristin or daflopristin. Concurrent use with MAOIs, noradrenaline or adrenaline can cause excessive increase in BP. Cardiac depressant effects may be additive when atenolol is used with narcotics or antiarrhythmics. May potentiate the action of non-depolarising muscle relaxants.
Food Interaction	Do not take with grapefruit juice as the bioavailability of nifedipine will be increased.
Mechanism of Action	Atenolol is a beta 1-selective beta-adrenergic receptor blocker which results in reduction of systolic and diastolic BP at rest and on exercise, reduction in reflex orthostatic tachycardia, reduction in resting and exercise heart rate and cardiac output. Nifedipine is a dihydropyridine calcium-channel blocker. It acts primarily on the cells of the myocardium and the smooth muscle cells of the coronary arteries and the peripheral resistance vessels. Its main action is to cause peripheral vasodilatation and thus reduction of peripheral resistance. Absorption: Atenolol: Absorption is rapid but incomplete; about 50% of a dose is absorbed from the GI tract. Nifedipine: Almost completely absorbed from the GI tract. Distribution: Atenolol: 6-16% bound to plasma proteins. Nifedipine: 92-98% bound to plasma proteins. Metabolism: Atenolol: Little or no hepatic metabolism. Nifedipine: Extensive hepatic metabolism. Excretion: Atenolol: Absorbed portion is removed mainly via renal route; the unabsorbed portion is removed in the faeces; elimination half-life: About 6-7 hr. Nifedipine: <1% of the parent drug appeared unchanged in the urine; 70-80% of activity is removed mainly as metabolites in the urine, remainder is via the faeces.
CIMS Class	Beta-Blockers / Calcium Antagonists

	Beta-Blockers / Calcium Antagonists
ATC Classification	C07AB03 - atenolol; Belongs to the class of selective beta-blocking agents. Used in the treatment of cardiovascular diseases. C08CA05 - nifedipine; Belongs to the class of selective dihydropyridine derivative calcium-channel blockers with mainly vascular effects. Used in the treatment of cardiovascular diseases.

atomoxetine

CIMS Class : (Other CNS Drugs & Agents for ADHD)
atomoxetine

P - Caution when used during pregnancy

related atomoxetine information

Indication & Dosage	<i>Oral</i> Attention deficit hyperactivity disorder Adult: Initially, 40 mg daily, may increase gradually after at least 7 days to 80 mg daily; up to 100 mg daily may be used after 2-4 wk. Child: For adolescents and children (≥ 6 yr): ≤ 70 kg: Initially, 500 mcg/kg/day, may increase gradually to 1.2 mg/kg/day, up to 100 mg daily or 1.4 mg/kg/day whichever is lower; >70 kg: Initially, 40 mg daily, may increase gradually after at least 7 days to 80 mg daily, up to 100 mg daily may be used after 2-4 wk. Hepatic impairment: Moderate impairment: Reduce dose by 50%. Severe impairment: Reduce dose by 75%.
Administration	May be taken with or without food. (Swallow whole, do not open cap.)
Overdosage	Symptoms include somnolence, agitation, hyperactivity, abnormal behaviour, mydriasis, tachycardia, dry mouth and GI symptoms. Gastric emptying and use of activated charcoal may reduce drug absorption; monitor patient and provide supportive treatment. Dialysis may not be beneficial.
Contraindications	Angle-closure glaucoma. Not to be used with or within 14 days of discontinuing treatment with MAOIs.
Special Precautions	Monitor height and wt gain especially during the initial period of treatment; dose reduction or treatment interruption may be needed in children whose growth or wt gain is not satisfactory. Patients with high BP or cardiovascular conditions that may be worsened by increases in BP or heart rate. Caution when used in patients with a history of psychotic illness or bipolar disorder. May increase the risk of urinary obstruction or hesitancy. Monitor for signs of clinical

	conditions that may be worsened by increases in BP or heart rate. Caution when used in patients with a history of psychotic illness or bipolar disorder. May increase the risk of urinary obstruction or hesitancy. Monitor for signs of clinical worsening, suicidality or unusual behavioural changes especially during the start of treatment and during dose changes. Safety and efficacy have not been established in patients <6 yr. Not recommended for use in pregnancy.
Adverse Drug Reactions	GI disturbances, anorexia and wt loss, fatigue. CNS symptoms e.g. headache, insomnia, sleep disturbances, dizziness, irritability and emotional lability. Cough, sinusitis or rhinorrhoea, urinary hesitancy or retention. Reduced libido and sexual dysfunction. Skin rashes, increased sweating and hot flushes.
Drug Interactions	May cause additive effect when used with drugs that increase BP. May potentiate the effect of salbutamol on the CVS. Increased risk of seizures when used with drugs that are known to lower seizure threshold. May increase risk of cardiac events when used with drugs that affect cardiac conduction or electrolyte balance, or that inhibit CYP2D6 (e.g. chlorpromazine, delavirdine, fluoxetine, miconazole, pergolide, quinidine, ritonavir). Potentially Fatal: Concurrent use with or within 2 wk of discontinuing MAOIs may cause serious toxicity (e.g. hyperthermia, rigidity, myoclonus, mental status changes, autonomic instability, neuroleptic malignant syndrome). Combined use is contraindicated.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Atomoxetine hydrochloride selectively inhibits the reuptake of noradrenaline. It is used in the treatment of attention deficit hyperactivity disorder in adults and children aged ≥6 yr. Absorption: Good absorption after oral admin. Bioavailability ranges from 63-94% depending on whether the patient is an extensive or poor metaboliser. Distribution: About 98% bound to plasma proteins. Metabolism: Mainly metabolised by cytochrome P450 isoenzyme CYP2D6 to the active metabolite 4-hydroxyatomoxetine. Excretion: Largely excreted in the urine mainly as glucuronide metabolites; <17% of a dose is excreted in the faeces. Elimination half-life ranges from 5.2-21.6 hr.
CIMS Class	Other CNS Drugs & Agents for ADHD
ATC Classification	N06BA09 - atomoxetine; Belongs to the class of centrally-acting sympathomimetics. Used as CNS stimulant.

atorvastatin

CIMS Class : (Dyslipidaemic Agents)
atorvastatin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab - Lab interference

related atorvastatin information

Indication & Dosage	<i>Oral</i> Mixed dyslipidaemia Adult: Initially, 10 or 20 mg daily, may increase at 4-wkly intervals. May initiate with 40 mg once daily in patients who require >45% reduction in low-density lipoprotein cholesterol. Max dose: 80 mg/day. <i>Oral</i> Nonfamilial hypercholesterolaemia Adult: Initially, 10 or 20 mg daily, may increase at 4-wkly intervals. May initiate with 40 mg once daily in patients who require >45% reduction in low-density lipoprotein cholesterol. Max dose: 80 mg/day. <i>Oral</i> Heterozygous familial hypercholesterolaemia Adult: Initially, 10 or 20 mg daily. Usual range depending on response: 10-80 mg daily. Child: 10-17 yr: Initially, 10 mg daily, adjust dose based on response. Max: 20 mg daily.
Administration	May be taken with or without food.
Overdosage	Symptomatic and supportive treatment.
Contraindications	Hypersensitivity, active liver disease or unexplained persistent elevations of serum transaminase, porphyria, pregnancy, lactation.
Special Precautions	Patients who consume substantial quantities of alcohol. History of liver disease. Patients with risk factors for myopathy or rhabdomyolysis. Hypothyroidism should be properly managed prior to starting statin therapy. Children <10 yr. Premenarcheal females.

	Patients who consume substantial quantities of alcohol. History of liver disease. Patients with risk factors for myopathy or rhabdomyolysis. Hypothyroidism should be properly managed prior to starting statin therapy. Children <10 yr. Premenarcheal females.
Adverse Drug Reactions	Headache, flatulence, diarrhoea, nausea, vomiting, anorexia, xerostomia, angioedema, myalgia, rash/pruritus, alopecia, allergy, infection, chest pain. Potentially Fatal: Thrombocytopenia. Rhabdomyolysis with acute renal failure.
Drug Interactions	Increased AUC for norethindrone and ethinyl estradiol. Concomitant multiple doses of atorvastatin and digoxin increased steady-state digoxin levels. Increased risk of rhabdomyolysis when used concurrently with fibrates. Co-admin with antacid suspensions and colestipol decreased atorvastatin levels.
Lab Interference	Biochemical abnormalities of liver function tests.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Mechanism of Action	Atorvastatin competitively inhibits HMG-CoA reductase, the enzyme that catalyses the conversion of HMG-CoA to mevalonic acid. This results in the induction of the LDL receptors, leading to lowered LDL-cholesterol concentration. Absorption: Rapid from the GI tract (oral). Distribution: Protein-binding: 98%. Metabolism: Extensively hepatic; converted to active inhibitors of HMG-CoA reductase. Excretion: Faeces (as metabolites); 14 hr (elimination half-life).
CIMS Class	Dyslipidaemic Agents
ATC Classification	C10AA05 - atorvastatin; Belongs to the class of HMG CoA reductase inhibitors. Used in the treatment of hyperlipidemia.

atorvastatin + ezetimibe

CIMS Class : (Dyslipidaemic Agents)
atorvastatin + ezetimibe

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related atorvastatin + ezetimibe information

Indication & Dosage	<i>Oral</i> Hypercholesterolaemia Adult: Per tablet contains atorvastatin 10 mg and ezetimibe 10 mg: Usual starting: 1 tablet once daily.
Overdosage	Monitor LFTs and serum CPK. Haemodialysis may not be useful in removing atorvastatin. Supportive and symptomatic measures may be needed.
Contraindications	Hypersensitivity; active liver disease or unexplained persistent elevated liver function tests. Pregnancy and lactation.
Special Precautions	Hepatic impairment; patients consuming substantial quantities of alcohol with a history of liver disease. Not recommended for use in children <10 yr.
Adverse Drug Reactions	Headache, flatulence, dyspepsia, myalgia, rash, pruritus, allergy and infection. Abdominal discomfort, asthenia, constipation, diarrhoea, back pain, arthralgia, resp infection and fatigue.
Drug Interactions	Atorvastatin: Increases digoxin levels; increases anticoagulant effect of warfarin. Avoid the combination of HMG-CoA reductase inhibitors and fibrates. Ezetimibe: Cholestyramine decreases AUC of ezetimibe by approx 55%; ciclosporin may increase ezetimibe levels. Potentially Fatal: Antacids decrease atorvastatin levels; colestipol decreases atorvastatin plasma levels; propranolol decreases antihyperlipidaemic activity of atorvastatin.
Mechanism of Action	Atorvastatin competitively inhibits HMG-CoA reductase, the enzyme that catalyses the conversion of HMG-CoA to

Mechanism of Action	Atorvastatin competitively inhibits HMG-CoA reductase, the enzyme that catalyses the conversion of HMG-CoA to mevalonate which is an early rate-limiting step in cholesterol biosynthesis. Ezetimibe inhibits the absorption of cholesterol from the intestine, thus decreasing the delivery of intestinal cholesterol to the liver.
CIMS Class	Dyslipidaemic Agents
ATC Classification	C10AA05 - atorvastatin; Belongs to the class of HMG CoA reductase inhibitors. Used in the treatment of hyperlipidemia. C10AX09 - ezetimibe; Belongs to the class of other cholesterol and triglyceride reducers. Used in the treatment of hyperlipidemia.

atorvastatin + fenofibrate

CIMS Class : (Dyslipidaemic Agents)
atorvastatin + fenofibrate

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab - Lab interference

related atorvastatin + fenofibrate information

Indication & Dosage	<i>Oral</i> Mixed dyslipidaemia Adult: Per tablet contains atorvastatin 10 mg and fenofibrate (micronised) 160 mg: 1 tab once daily.
Overdosage	Monitor LFTs and serum CPK levels. Unabsorbed drug may be removed by gastric lavage or emesis. General supportive care.
Contraindications	Hypersensitivity, hepatic or severe renal dysfunction, unexplained persistent liver function abnormality, unexplained persistent elevations of serum transaminases exceeding 3 times the upper limit of normal. Preexisting gallbladder disease. Pregnancy and lactation.
Special Precautions	Uncomplicated myalgia, patients who consume substantial quantities of alcohol and have a history of liver disease. Monitor LFTs before starting therapy and at 12 wk after starting and periodically thereafter. Treatment should be temporarily discontinued in patients with acute, serious condition suggestive of myopathy or having risk factor predisposing to the development of renal failure secondary to rhabdomyolysis. Fenofibrate may increase risk of cholelithiasis; discontinue if gallbladder stones are found. Fenofibrate may increased risk of pancreatitis. Renal impairment. Safety and efficacy have not been established in paediatrics.
Adverse Drug Reactions	Abnormal LFTs, gastritis, abdominal pain, back pain, leg pain, joint pain, burning feet, body ache, numbness in legs, resp disorder, rhinitis. Constipation, flatulence, dyspepsia, headache, nausea, myalgia, asthenia, diarrhoea, insomnia.

	Abnormal LFTs, gastritis, abdominal pain, back pain, leg pain, joint pain, burning feet, body ache, numbness in legs, resp disorder, rhinitis. Constipation, flatulence, dyspepsia, headache, nausea, myalgia, asthenia, diarrhoea, insomnia. Potentially Fatal: Pancreatitis, cholelithiasis, hepatitis, cholecystitis, hepatomegaly, rhabdomyolysis; hypersensitivity.
Drug Interactions	Concurrent administration with colestipol may reduce the serum levels of atorvastatin by about 25%. Concurrent administration with digoxin may increase steady-state plasma digoxin levels by about 20%. Increased risk of myopathy when used with erythromycin. Concurrent use of atorvastatin with oral contraceptives containing norethindrone and ethinyl estradiol may increase plasma levels of norethindrone and ethinyl estradiol. Monitor prothrombin time/INR when used with oral anticoagulants. Increased risk of myopathy when used with ciclosporin or azole antifungals/niacin. Potentially Fatal: Co-administration with antacids suspended decreased atorvastatin levels. Plasma levels of atorvastatin decreased with co-administration of colestipol. Decrease in antihyperlipidaemic activity may occur with propranolol. Fenofibrate increases the clotting time and causes bleeding complications when co-administered with oral anticoagulants.
Lab Interference	Fenofibrate increases AST, ALT, creatinine, blood urea levels; decreased haemoglobin, haematocrit, uric acid.
Mechanism of Action	Atorvastatin competitively inhibits HMG-CoA reductase, the enzyme that catalyses the conversion of HMG-CoA to mevalonic acid. HMG-CoA reductase inhibitors increase HDL-C and decrease LDL-C, VLDL-C and plasma triglycerides. Fenofibric acid, active metabolite of fenofibrate, lowers plasma triglycerides by inhibiting TG synthesis, resulting in the reduction of VLDL-C. Also, it stimulates the catabolism of VLDL-C. It reduces serum uric acid levels by increasing the urinary excretion of uric acid. Absorption: Atorvastatin: Rapid absorption after oral admin. Absolute bioavailability: 14%. Fenofibrate: Well absorbed after oral admin. Distribution: Atorvastatin: >98% bound to plasma proteins. Fenofibrate: About 99% bound to plasma proteins. Metabolism: Atorvastatin: Extensively metabolised. Fenofibrate: Rapidly hydrolysed by esterases to the active metabolite, fenofibric acid. Excretion: Atorvastatin and its metabolites: Removed mainly in the bile. Mean elimination half-life: About 14 hr. Fenofibrate: Mainly removed in the urine as metabolites; fenofibric acid has an elimination half-life of about 16 hr.
CIMS Class	Dyslipidaemic Agents
ATC	C10AA05 - atorvastatin; Belongs to the class of HMG CoA

ATC
Classification

C10AA05 - atorvastatin; Belongs to the class of HMG CoA reductase inhibitors. Used in the treatment of hyperlipidemia.
C10AB05 - fenofibrate; Belongs to the class of fibrates. Used in the treatment of hyperlipidemia.

atracurium besilate

CIMS Class : (Muscle Relaxants)
atracurium besilate

P - Caution when used during pregnancy

L - Caution when used during lactation

related atracurium besilate information

related atracurium besilate information	
Indication & Dosage	<i>Intravenous</i> Aid controlled ventilation, Endotracheal intubation, Muscle relaxant in general anaesthesia Adult: Initially, 300-600 mcg/kg as inj. Subsequently, 100-200 mcg/kg when necessary or every 15-25 minutes for maintenance in prolonged procedures. Alternatively, maintenance can also be achieved by continuous infusion at 5-10 mcg/kg/minute. Initial dose should be given over 60 seconds in patients with CV disease. Dose should be calculated based on ideal body-weight in obese patients. Child: =2 mth: Initially, 400-500 mcg/kg as inj. Maintenance dose: 80-100 mcg/kg; first maintenance dose may be given 20-45 min after the initial dose, subsequently, may be repeated every 15-25 min. For children 1 mth-2 yr: 300-400 mcg/kg may be used as initial dose in those who are under halothane anaesthesia. Maintenance doses may be admin more frequently in infant and children than adults. Special Populations: For patients with significant CV disease or any history (e.g. severe anaphylactoid reactions or asthma) suggesting a greater risk of histamine release, an initial dose of 0.3-0.4 mg/kg should be given slowly or in divided doses over 1 min. For adults receiving atracurium following the use of succinylcholine for intubation under balanced anesthesia, an initial dose of 0.3-0.4 mg/kg is recommended. Dosage reductions may be necessary in patients with neuromuscular disease, severe electrolyte disorders or carcinomatosis in which potentiation of neuromuscular block or difficulties with reversal have been demonstrated.

	patients with neuromuscular disease, severe electrolyte disorders or carcinomatosis in which potentiation of neuromuscular block or difficulties with reversal have been demonstrated. Reconstitution: May be diluted in normal saline, dextrose 5% in water or dextrose 5% in normal saline. Incompatibility: Incompatible with alkaline solutions and lactated Ringer's solution. Y-site incompatibility: Diazepam, thiopental, propofol. Admixture incompatibility: Ranitidine, sodium nitroprusside, heparin, cefazolin, aminophylline, quinidine gluconate.
Overdosage	May lead to prolonged apnoea with CV collapse and the effects of histamine release.
Contraindications	Hypersensitivity.
Special Precautions	Neonates; severe CVS disorders; renal or hepatic dysfunction; myasthenia gravis and other neuromuscular disorders; severe electrolyte imbalances; respiratory insufficiency or pulmonary disease, asthma; burns; cardiopulmonary bypass; smoking; pregnancy and lactation. Dosage for obese patients should be based on ideal body-weight to prevent overdosing.
Adverse Drug Reactions	Cutaneous reactions; bradycardia, transient hypotension in patients with CVS disorders; dyspnoea, bronchospasm; rash and urticaria.
Drug Interactions	Mixed block with suxamethonium which is difficult to reverse with anticholinergic drugs. Ketamine may potentiate the effects of atracurium. Concurrent use with tamoxifen or danazol may prolong effects of atracurium. Potentially Fatal: Neuromuscular blockade potentiated by parenteral Mg salts, anaesthetics, aminoglycosides and polypeptide antibiotics, botulinum A toxin. Malignant hyperthermia with halogenated anaesthetics and succinylcholine. MAOIs.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Intact vials: Refrigerate at 2-8°C. Do not freeze. Dilutions of 0.2 mg/ml or 0.5 mg/ml are stable for up to 24 hr at room temperature or under refrigeration.
Mechanism of Action	Atracurium besilate blocks neural transmission at the neuromuscular junction by competitive binding at the cholinergic receptor sites on the motor end plate.

	Atracurium besilate blocks neural transmission at the neuromuscular junction by competitive binding at the cholinergic receptor sites on the motor end plate. Distribution: Protein binding: 80%. Excretion: Excretion in urine and bile, mostly as metabolites. Elimination half-life: about 20 min.
CIMS Class	Muscle Relaxants

atropine

CIMS Class : (Other Cardiovascular Drugs) , (Mydriatic Drugs) , (Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence)
atropine

P - Caution when used during pregnancy

related atropine information

Indication & Dosage

Parenteral

Premedication in balanced anaesthesia

Adult: 300-600 mcg IM/SC 30-60 minutes before anaesthesia. Alternatively, 300-600 mcg IV immediately before induction of anaesthesia.

Child: >20 kg: 300-600 mcg; 12-16 kg: 300 mcg; 7-9 kg: 200 mcg; >3 kg: 100 mcg. Doses to be given via IM/SC admin 30-60 minutes before anaesthesia.

Parenteral

Organophosphorus poisoning

Adult: 2 mg IV/IM, every 10-30 minutes until muscarinic effects disappear or atropine toxicity appears. In severe cases, dose can be given as often as every 5 minutes. In moderate to severe poisoning, a state of atropinisation is maintained for at least 2 days and continued for as long as symptoms are present.

Child: 20 mcg/kg given every 5-10 minutes.

Parenteral

Poisoning or overdosage with compounds having muscarinic actions

Adult: 0.6-1 mg IV/IM/SC, repeated every 2 hr.

Intravenous

Bradycardia

Adult: 500 mcg every 3-5 minutes. Total: 3 mg.

Max Dosage: 0.04 mg/kg body weight.

Ophthalmic

Inflammatory eye disorders

Adult: Instill 1-2 drops of a 0.5-1% solution up to 4 times daily.

Child: As sulfate: Instill 1-2 drops of a 0.5% soln (or 1 drop of a 1% solution) up to tid.

	Inflammatory eye disorders Adult: Instill 1-2 drops of a 0.5-1% solution up to 4 times daily. Child: As sulfate: Instill 1-2 drops of a 0.5% soln (or 1 drop of a 1% solution) up to tid. <i>Ophthalmic</i> Eye refraction Adult: Instill 1 drop of a 1% solution bid for 1-2 days before the procedure, or on a single occasion 1 hr before the procedure. Child: As sulfate: Instill 1 or 2 drops of a 0.5% soln (or 1 drop of a 1% solution) bid for 1-3 days before the procedure, with a further dose given 1 hr before the procedure. Incompatibility: Incompatible with hydroxybenzoate preservatives.
Administration	May be taken with or without food. (Take w/ food or water.)
Overdosage	May cause hyperthermia, hypertension, increased respiratory rate, nausea and vomiting. May also lead to CNS stimulation. Severe intoxication may lead to CNS depression, coma, respiratory failure and death.
Contraindications	Glaucoma, chronic respiratory disease, sick sinus syndrome, thyrotoxicosis, cardiac failure, pyloric stenosis, prostatic hypertrophy.
Special Precautions	Reflux oesophagitis, elderly, infants and children. Pregnancy.
Adverse Drug Reactions	Dry mouth, dysphagia, constipation, flushing and dryness of skin, tachycardia, palpitations, arrhythmias, mydriasis, photophobia, cycloplegia, raised intraocular pressure. Toxic doses cause tachycardia, hyperpyrexia, restlessness, confusion, excitement, hallucinations, delirium and may progress to circulatory failure and resp depression. Eye drops: Systemic toxicity esp in children, on prolonged use may lead to irritation, hyperaemia, oedema and conjunctivitis. Increased intraocular pressure. Inhalation: Dryness of mouth, throat. Potentially Fatal: Atrial arrhythmias, AV dissociation, multiple ventricular ectopics.
Drug Interactions	Additive anticholinergic effects with quinidine, antidepressants and some antihistamines.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.

Storage	Intravenous: Store at 15-30°C. Ophthalmic: Store at 15-30°C. Parenteral: Store at 15-30°C.
Mechanism of Action	Atropine is an anticholinergic agent which competitively blocks the muscarinic receptors in peripheral tissues such as the heart, intestines, bronchial muscles, iris and secretory glands. Some central stimulation may occur. Atropine abolishes bradycardia and reduces heart block due to vagal activity. Smooth muscles in the bronchi and gut are relaxed while glandular secretions are reduced. It also has mydriatic and cycloplegic effect. Absorption: Readily absorbed from the GI tract; also absorbed from mucous membranes, eye, and through intact skin. Distribution: Distributes throughout the body and crosses the blood-brain barrier and placenta. Metabolism: Incomplete metabolism in the liver. Excretion: Excreted in urine as unchanged drug and metabolites. Half-life reported to be 4 hr.
CIMS Class	Other Cardiovascular Drugs / Mydriatic Drugs / Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence
ATC Classification	A03BA01 - atropine; Belongs to the class of belladonna alkaloids, tertiary amines. Used in the treatment of functional gastrointestinal disorders. S01FA01 - atropine; Belongs to the class of anticholinergics used in the treatment of mydriasis and cyclopegia.

azathioprine

CIMS Class : (Immunosuppressants)
azathioprine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related azathioprine information

Indication & Dosage	<i>Oral</i> Prophylaxis of rejection in organ and tissue transplant Adult: 1-5 mg/kg/day. Adjust dose according to clinical response and haematological tolerance. Dose may also be given via IV admin. Renal impairment: Dose adjustments may be needed. Hepatic impairment: Dose adjustments may be needed. <i>Oral</i> Auto-immune diseases Adult: 1-3 mg/kg/day. Discontinue treatment if there is no improvement after 12 wk. Renal impairment: Dose adjustments may be needed. Hepatic impairment: Dose adjustments may be needed. <i>Oral</i> Rheumatoid arthritis Adult: Initially, 1 mg/kg/day given in 1-2 divided doses for 6-8 wk, may increase by 0.5 mg/kg every 4 wk until response or up to 2.5 mg/kg/day. Maintenance: Reduce dose gradually to achieve the lowest effective dose. Renal impairment: Dose adjustments may be needed. Hepatic impairment: Dose adjustments may be needed. <i>Intravenous</i> Renal homotransplantation Adult: Usual initial doses: 3-5 mg/kg daily beginning at the time of transplantation. Usually given as a single dose on the day of transplantation, may be given 1-3 days before transplantation in some cases. May reduce dose to maintenance levels at 1-3 mg/kg daily. May convert to use of oral tablets subsequently at the same dose level. Treatment
---------------------	--

	time of transplantation. Usually given as a single dose on the day of transplantation, may be given 1-3 days before transplantation in some cases. May reduce dose to maintenance levels at 1-3 mg/kg daily. May convert to use of oral tablets subsequently at the same dose level. Treatment discontinuation may be needed in cases of severe haematologic or other toxicity. Renal impairment: Dose adjustments may be needed. Hepatic impairment: Dose adjustments may be needed. Reconstitution: 10 ml of sterile water for Inj to be added to the vial containing 100 mg of the drug, giving a resultant concentration of 10 mg/ml. This may be given by slow IV inj or further diluted in saline or dextrose to be used as IV infusion usually over 30-60 minutes. Infusion periods of 5 minutes to 8 hr have been used.
Administration	May be taken with or without food. (Preferably taken w/ or after meals to reduce GI discomfort.)
Overdosage	Symptoms include nausea, vomiting, diarrhoea and mild abnormalities in the liver function.
Contraindications	Hypersensitivity; previous treatment with alkylating agents; pregnancy, lactation.
Special Precautions	Increased risk of serious infections and neoplasia in chronic immunosuppression; leucopenia, thrombocytopenia, renal or hepatic impairment. Increased risk of haematologic toxicity in patients with thiopurine methyltransferase deficiency. Monitor CBC (including platelet count) wkly during 1st mth, twice mthly for 2nd and 3rd mth, then mthly; monitor more frequently if there are dosage adjustments. Monitor LFT periodically; discontinue treatment if jaundice occurs. Reduce dose promptly or withdraw drug temporary if there is rapid decrease/persistently low WBC or signs of bone marrow depression. Dose reduction may be necessary in patients with reduced TPMT (thiopurine methyltransferase) activity.
Adverse Drug Reactions	Fever, chills; bone marrow depression characterised by leucopenia, thrombocytopenia or anaemia; anorexia, nausea, diarrhoea; arthralgias; secondary infections; hepatotoxicity, rash, alopecia. Potentially Fatal: Myelosuppression, mutagenicity and carcinogenicity; veno-occlusive liver disease.
Drug Interactions	Increased risk of haematotoxicity with aminosaliclates, drugs that affect myelopoiesis e.g. co-trimoxazole or trimethoprim. Increased risk of infections with intra-uterine devices and live vaccines. Increased risk of leucopenia with ACE inhibitors. Concurrent use may reduce the anticoagulant effect of vitamin K antagonists e.g. warfarin. Increased risk of myelosuppressive effects when used with drugs that inhibit TPMT (thiopurine methyltransferase) or xanthine oxidase e.g. olsalazine, allopurinol.

	effect of vitamin K antagonists e.g. warfarin. Increased risk of myelosuppressive effects when used with drugs that inhibit TPMT (thiopurine methyltransferase) or xanthine oxidase e.g. olsalazine, allopurinol. Potentially Fatal: Increased risk of serious haematotoxicity or hepatotoxicity with leflunomide. Increased risk of bone marrow suppression with mycophenolate mofetil. Increased risk of infections and malignancies with efalizumab.
Food Interaction	Avoid cat's claw and echinacea.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Powder for inj: Store intact vials between 15-25°C. Protect from light. Reconstituted solution: Stable for up to 2 wk at room temperature or up to 4 days refrigerated, however, manufacturer recommends use within 24 hr of reconstitution. Oral: Store between 15-25°C.
Mechanism of Action	Azathioprine is an imidazolyl derivative of mercaptopurine, which inhibits DNA, RNA and protein synthesis and antagonises purine synthesis. It also inhibits mitosis and interferes with cellular metabolism of susceptible organisms. Azathioprine inj should be converted to oral therapy as soon as the drug can be tolerated. Absorption: Well absorbed from the GI tract (oral). Distribution: Protein-binding: About 30%. Crosses placenta. Metabolism: Converted hepatically to 6-mercaptopurine which is further metabolised in the liver and GI tract via 3 main pathways: Hypoxanthine guanine phosphoribosyltransferase (to 6-thioguanine-nucleotides), xanthine oxidase (to 6-thiouric acid), and thiopurine methyltransferase (TPMT), which forms 6-methylmercaptopurine (6-MMP). Excretion: Via the urine (mainly as metabolites). Half-life elimination: Parent drug (12 minutes); mercaptopurine (0.7-3 hr); prolonged in end stage renal disease.
CIMS Class	Immunosuppressants
ATC Classification	L04AX01 - azathioprine; Belongs to the class of other immunosuppressive agents. Used to induce immunosuppression.

azelaic acid

CIMS Class : (Acne Treatment Preparations)
azelaic acid

P - Caution when used during pregnancy

L - Caution when used during lactation

related azelaic acid information

Indication & Dosage	<i>Topical/Cutaneous</i> Acne Adult: As 20% crm or 15% gel: Apply a thin film onto the affected areas bid for up to 6 mth after thorough washing. Improvement may be visible within 4 wk. Child: >12 yr: Apply a thin film of 20% crm bid (morning and evening) for up to 6 mth into infected skin after thorough washing and patting dry. <i>Topical/Cutaneous</i> Rosacea Adult: As 15% gel: Apply a thin film onto the affected areas bid for up to 12 wk. Child: >12 yr: Apply a thin film of 15% gel bid (morning and evening) after thorough washing and patting dry, for up to 12 wk
Contraindications	Hypersensitivity.
Special Precautions	Pregnancy, lactation. Avoid contact with eyes, mouth or other mucous membranes. Recommend patient to use only very mild soaps or soapless cleansing lotions for facial washing. Safety and efficacy not established in children <12 yr.
Adverse Drug Reactions	Local skin irritation. Hypopigmentation and rarely, photosensitivity.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in

	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Azelaic acid is a naturally-occurring aliphatic dicarboxylic acid that exhibits dermatological effects e.g. antibacterial and antiproliferative activity. It has also been used in hyperpigmentary skin disorders and malignant melanoma. The exact mechanism of action is still unknown, but is believed to inhibit protein synthesis, thereby preventing the growth of susceptible organisms (mainly P. acnes) on the skin surface. May also inhibit follicular keratinisation that prevents the development of comedones.
CIMS Class	Acne Treatment Preparations
ATC Classification	D10AX03 - azelaic acid; Belongs to the class of other topical preparations used in the treatment of acne.

azelastine

CIMS Class : (Nasal Decongestants & Other Nasal Preparations) , (Other Eye Preparations)
azelastine

P - Caution when used during pregnancy

L - Caution when used during lactation

related azelastine information

Indication & Dosage	<i>Nasal</i> Rhinitis Adult: 140 mcg by nasal spray into each nostril bid. Child: =5 yr: 140 mcg by nasal spray into each nostril bid. <i>Ophthalmic</i> Conjunctivitis Adult: Instill 1-2 drops of 0.05% solution into the affected eye/s bid, may increase to four times daily in severe cases. Child: =4 yr: Instill 1-2 drops of 0.05% solution into the affected eye/s bid, may increase to four times daily in severe cases.
Overdosage	Accidental oral ingestion of large doses may lead to tremor, convulsions, decreased muscle tone and salivation. General supportive measures should be used.
Contraindications	Hypersensitivity.
Special Precautions	Pregnancy, lactation. Tip of the bottle should be dipped in boiling water, dried and capped appropriately after every use.
Adverse Drug Reactions	Irritation, stinging and itching of the nasal mucosa. Sneezing, nosebleeds, headache; nausea, taste disturbances, somnolence, dry mouth.
Drug Interactions	Additive effects with CNS depressants and ethanol.
Storage	Nasal: Store at 20-25°C. Ophthalmic: Store at 2-25°C.
Mechanism of Action	Azelastine blocks histamine H ₁ -receptor activity and inhibits release of inflammatory mediators from mast cells. Absorption: 40% absorbed systemically through the nasal mucosa (intranasal).

	Azelastine blocks histamine H₁-receptor activity and inhibits release of inflammatory mediators from mast cells. Absorption: 40% absorbed systemically through the nasal mucosa (intranasal). Metabolism: Hepatic. Excretion: Via faeces.
CIMS Class	Nasal Decongestants & Other Nasal Preparations / Other Eye Preparations
ATC Classification	R01AC03 - azelastine; Belongs to the class of topical antiallergic preparations, excluding corticosteroids. Used as nasal decongestants. R06AX19 - azelastine; Belongs to the class of other agents used as systemic antihistamines. S01GX07 - azelastine; Belongs to the class of other agent used as ophthalmologic antiallergics.

azithromycin

CIMS Class : (Macrolides)
azithromycin

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚡ - Food interaction

related azithromycin information

Indication & Dosage

Oral

Skin and soft tissue infections

Adult: 500 mg once daily for 3 days. Alternatively, 500 mg as a single dose on the 1st day followed by 250 mg once daily for 4 days.

Child: >6 mth: 10 mg/kg; 15–25 kg: 200 mg; 26–35 kg: 300 mg; 36–45 kg: 400 mg. Doses to be taken once daily for 3 days

Oral

Respiratory tract infections

Adult: 500 mg once daily for 3 days. Alternatively, 500 mg as a single dose on the 1st day followed by 250 mg once daily for 4 days.

Child: >6 mth: 10 mg/kg; 15–25 kg: 200 mg; 26–35 kg: 300 mg; 36–45 kg: 400 mg. Doses to be taken once daily for 3 days

Oral

Uncomplicated genital infections due to *Chlamydia trachomatis*

Adult: 1 g as a single dose.

Oral

Uncomplicated gonorrhoea

Adult: 2 g as a single dose.

Oral

Prophylaxis of disseminated *Mycobacterium avium* complex (MAC) infections

Adult: 1.2 g once every wk. For treatment or secondary prophylaxis: 500 mg once daily with other antimycobacterials.

	avium complex (MAC) infections Adult: 1.2 g once every wk. For treatment or secondary prophylaxis: 500 mg once daily with other antimycobacterials. Child: >6 mth: 10 mg/kg once daily for 3 days. <i>Oral</i> Granuloma inguinale Adult: Initially, 1 g followed by 500 mg daily. Alternatively, 1 g once a wk for at least 3 wk, until all lesions have completely healed. <i>Intravenous</i> Active immunisation against typhoid fever caused by <i>Salmonella typhi</i> Adult: 500 mg once daily for 7 days.
Administration	Tab: May be taken with or without food. (May be taken w/ meals to reduce GI discomfort.) Susp: May be taken with or without food. (May be taken w/ meals to reduce GI discomfort.) Cap: Should be taken on an empty stomach. (Take on an empty stomach 1 hr before or 2 hr after meals.)
Contraindications	Hypersensitivity.
Special Precautions	Impaired liver and renal function; pregnancy and lactation; children.
Adverse Drug Reactions	Mild to moderate nausea, vomiting, abdominal pain, dyspepsia, flatulence, diarrhoea, cramping; angioedema, cholestatic jaundice; dizziness, headache, vertigo, somnolence; transient elevations of liver enzyme values.
Drug Interactions	Antacids containing aluminium and magnesium salts reduce rate of absorption. Increased risk of ergot toxicity. Potentially Fatal: Increased serum concentrations of digoxin and ciclosporin.
Food Interaction	Food may alter absorption.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Store below 30°C. Oral: Store below 30°C.
Mechanism of Action	Azithromycin blocks transpeptidation by binding to 50s ribosomal subunit of susceptible organisms and disrupting RNA-dependent protein synthesis at the chain elongation step. Absorption: Reduced by food (capsule formulation); peak

	Azithromycin blocks transpeptidation by binding to 50S ribosomal subunit of susceptible organisms and disrupting RNA-dependent protein synthesis at the chain elongation step. Absorption: Reduced by food (capsule formulation); peak plasma concentrations after 2-3 hr. Distribution: Extensive into the tissues (concentrations higher than those in blood), WBC (high concentrations), CSF (small amounts). Metabolism: Liver (demethylation). Excretion: Via the bile (as unchanged drug and metabolites); via the urine (6% of the dose). Elimination half-life: about 68 hr.
CIMS Class	Macrolides
ATC Classification	J01FA10 - azithromycin; Belongs to the class of macrolides. Used in the treatment of systemic infections. S01AA26 - azithromycin;

aztreonam

CIMS Class : (Other Beta-lactams)
aztreonam

P - Caution when used during pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related aztreonam information

Indication & Dosage

Parenteral

Pelvic infections

Adult: 1-8 g daily in divided doses every 6-12 hr by slow IV inj over 3-5 minutes or as IV infusion over 20-60 minutes. Max: 8 g/day. Dose may be given via deep IM inj or IV inj over 3-5 minutes or IV infusion.

Child: and infants >1 wk: 30 mg/kg every 6 or 8 hr; =2 yr: 50 mg/kg every 6 or 8 hr for severe infections. Dose may be given via deep IM inj or slow IV inj or infusion. Doses >1 g should be given via IV route. Max (=2 yr): 8 g/day.

Renal impairment: Moderate-severe impairment: Same initial doses, adjust maintenance doses according to the patient's CrCl. Haemodialysis: A supplementary dose of $\frac{1}{8}$ of the initial dose may be given after each session.

CrCl (ml/min)	Dosage Recommendation
10-30	Maintenance dose: Half of initial dose.
<10	Maintenance dose: One-quarter of initial dose.

Parenteral

Septicaemia

Adult: 1-8 g daily in divided doses every 6-12 hr by slow IV inj over 3-5 minutes or as IV infusion over 20-60 minutes. Max: 8 g/day. Dose may be given via deep IM inj or IV inj over 3-5 minutes or IV infusion.

Child: and infants >1 wk: 30 mg/kg every 6 or 8 hr; =2 yr: 50 mg/kg every 6 or 8 hr for severe infections. Dose may be given via deep IM inj or slow IV inj or infusion. Doses >1 g

Max: 8 g/day. Dose may be given via deep IM inj or IV inj over 3-5 minutes or IV infusion.

Child: and infants >1 wk: 30 mg/kg every 6 or 8 hr; =2 yr: 50 mg/kg every 6 or 8 hr for severe infections. Dose may be given via deep IM inj or slow IV inj or infusion. Doses >1 g should be given via IV route. Max (=2 yr): 8 g/day.

Skin and soft tissue infections

Adult: 1-8 g daily in divided doses every 6-12 hr by slow IV inj over 3-5 minutes or as IV infusion over 20-60 minutes. Max: 8 g/day. Dose may be given via deep IM inj or IV inj over 3-5 minutes or IV infusion.

Child: and infants >1 wk: 30 mg/kg every 6 or 8 hr; =2 yr: 50 mg/kg every 6 or 8 hr for severe infections. Dose may be given via deep IM inj or slow IV inj or infusion. Doses >1 g should be given via IV route. Max (=2 yr): 8 g/day.

Renal impairment: Moderate-severe impairment: Same initial doses, adjust maintenance doses according to the patient's CrCl. Haemodialysis: A supplementary dose of $\frac{1}{8}$ of the initial dose may be given after each session.

CrCl (ml/min)	Dosage Recommendation
10-30	Maintenance dose: Half of initial dose.
<10	Maintenance dose: One-quarter of initial dose.

Parenteral

Bone and joint infections

Adult: 1-8 g daily in divided doses every 6-12 hr by slow IV inj over 3-5 minutes or as IV infusion over 20-60 minutes. Max: 8 g/day. Dose may be given via deep IM inj or IV inj over 3-5 minutes or IV infusion.

Child: and infants >1 wk: 30 mg/kg every 6 or 8 hr; =2 yr: 50 mg/kg every 6 or 8 hr for severe infections. Dose may be given via deep IM inj or slow IV inj or infusion. Doses >1 g should be given via IV route. Max (=2 yr): 8 g/day.

Renal impairment: Moderate-severe impairment: Same initial doses, adjust maintenance doses according to the patient's CrCl. Haemodialysis: A supplementary dose of $\frac{1}{8}$ of the initial dose may be given after each session.

Renal impairment: moderate-severe impairment: Same initial doses, adjust maintenance doses according to the patient's CrCl. Haemodialysis: A supplementary dose of $\frac{1}{8}$ of the initial dose may be given after each session.

CrCl (ml/min)	Dosage Recommendation
10-30	Maintenance dose: Half of initial dose.
<10	Maintenance dose: One-quarter of initial dose.

Parenteral
Meningitis

Adult: 1-8 g daily in divided doses every 6-12 hr by slow IV inj over 3-5 minutes or as IV infusion over 20-60 minutes. Max: 8 g/day. Dose may be given via deep IM inj or IV inj over 3-5 minutes or IV infusion.

Child: and infants >1 wk: 30 mg/kg every 6 or 8 hr; =2 yr: 50 mg/kg every 6 or 8 hr for severe infections. Dose may be given via deep IM inj or slow IV inj or infusion. Doses >1 g should be given via IV route. Max (=2 yr): 8 g/day.

Renal impairment: Moderate-severe impairment: Same initial doses, adjust maintenance doses according to the patient's CrCl. Haemodialysis: A supplementary dose of $\frac{1}{8}$ of the initial dose may be given after each session.

CrCl (ml/min)	Dosage Recommendation
10-30	Maintenance dose: Half of initial dose.
<10	Maintenance dose: One-quarter of initial dose.

Parenteral
Intra-abdominal infections

Adult: 1-8 g daily in divided doses every 6-12 hr by slow IV inj over 3-5 minutes or as IV infusion over 20-60 minutes. Max: 8 g/day. Dose may be given via deep IM inj or IV inj over 3-5 minutes or IV infusion.

Child: and infants >1 wk: 30 mg/kg every 6 or 8 hr; =2 yr: 50 mg/kg every 6 or 8 hr for severe infections. Dose may be given via deep IM inj or slow IV inj or infusion. Doses >1 g should be given via IV route. Max (=2 yr): 8 g/day.

Renal impairment: Moderate-severe impairment: Same initial doses, adjust maintenance doses according to the patient's CrCl. Haemodialysis: A supplementary dose of $\frac{1}{8}$ of the initial dose may be given after each session.

CrCl (ml/min)	Dosage Recommendation
10-30	Maintenance dose: Half of initial dose.
<10	Maintenance dose: One-quarter of initial dose.

Parenteral

Lower respiratory tract infections

Adult: 1-8 g daily in divided doses every 6-12 hr by slow IV inj over 3-5 minutes or as IV infusion over 20-60 minutes.

Max: 8 g/day. Dose may be given via deep IM inj or IV inj over 3-5 minutes or IV infusion.

Child: and infants >1 wk: 30 mg/kg every 6 or 8 hr; =2 yr: 50 mg/kg every 6 or 8 hr for severe infections. Dose may be given via deep IM inj or slow IV inj or infusion. Doses >1 g should be given via IV route. Max (=2 yr): 8 g/day.

Renal impairment: Moderate-severe impairment: Same initial doses, adjust maintenance doses according to the patient's CrCl. Haemodialysis: A supplementary dose of $\frac{1}{8}$ of the initial dose may be given after each session.

CrCl (ml/min)	Dosage Recommendation
10-30	Maintenance dose: Half of initial dose.
<10	Maintenance dose: One-quarter of initial dose.

Parenteral

Gonorrhoea

Adult: 1-8 g daily in divided doses every 6-12 hr by slow IV inj over 3-5 minutes or as IV infusion over 20-60 minutes.

Max: 8 g/day. Dose may be given via deep IM inj or IV inj over 3-5 minutes or IV infusion.

Child: and infants >1 wk: 30 mg/kg every 6 or 8 hr; =2 yr: 50 mg/kg every 6 or 8 hr for severe infections. Dose may be given via deep IM inj or slow IV inj or infusion. Doses >1 g should be given via IV route. Max (=2 yr): 8 g/day.

Renal impairment: Moderate-severe impairment: Same initial doses, adjust maintenance doses according to the patient's CrCl. Haemodialysis: A supplementary dose of $\frac{1}{8}$ of the initial dose may be given after each session.

CrCl (ml/min)	Dosage Recommendation
10-30	Maintenance dose: Half of initial dose.
<10	Maintenance dose: One-quarter of initial dose.

Parenteral

Susceptible infections

Adult: 1-8 g daily in divided doses every 6-12 hr by slow IV inj over 3-5 minutes or as IV infusion over 20-60 minutes.

Max: 8 g/day. Dose may be given via deep IM inj or IV inj over 3-5 minutes or IV infusion.

Adult: 1-8 g daily in divided doses every 6-12 hr by slow IV inj over 3-5 minutes or as IV infusion over 20-60 minutes. Max: 8 g/day. Dose may be given via deep IM inj or IV inj over 3-5 minutes or IV infusion.

Child: and infants >1 wk: 30 mg/kg every 6 or 8 hr; =2 yr: 50 mg/kg every 6 or 8 hr for severe infections. Dose may be given via deep IM inj or slow IV inj or infusion. Doses >1 g should be given via IV route. Max (=2 yr): 8 g/day.

Renal impairment: Moderate-severe impairment: Same initial doses, adjust maintenance doses according to the patient's CrCl. Haemodialysis: A supplementary dose of $\frac{1}{8}$ of the initial dose may be given after each session.

Parenteral

Urinary tract infections

Adult: 0.5–1 g every 8–12 hr. Dose may be given via deep IM inj or IV inj over 3-5 minutes or IV infusion.

Incompatibility: Incompatible with cefradine, metronidazole,

	Primary tract infections Adult: 0.5–1 g every 8–12 hr. Dose may be given via deep IM inj or IV inj over 3-5 minutes or IV infusion. Incompatibility: Incompatible with cefradine, metronidazole, nafcillin and vancomycin.
Overdosage	If needed, haemodialysis and/or peritoneal dialysis may be used to remove drug from serum.
Contraindications	Hypersensitivity; lactation.
Special Precautions	Hypersensitivity to other β -lactams; renal and hepatic impairment; pregnancy.
Adverse Drug Reactions	IV: Phloebitis and thrombophloebitis. IM: Pain and swelling at inj site; diarrhoea, nausea, vomiting, altered taste; jaundice, hepatitis, high liver enzymes; long prothrombin time, partial thromboplastin time; rash, urticaria, eosinophilia. Potentially Fatal: Thrombocytopenia, neutropenia; overgrowth of susceptible organisms; pseudomembranous colitis.
Drug Interactions	Concurrent use with oral anticoagulants may increase prothrombin time.
Lab Interference	Interferes with urine glucose test using cupric sulfate. False-positive with Coomb's test.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intramuscular: Once reconstituted, it should be used within 48 hr if stored at 15-30°C or 7 days if stored at 2-8°C. Parenteral: Once reconstituted, it should be used within 48 hr if stored at 15-30°C or 7 days if stored at 2-8°C.
Mechanism of Action	Aztreonam exhibits bactericidal action by inhibiting bacterial cell wall synthesis due to its high affinity for penicillin-binding protein 3 (PBP-3) of gram-negative bacteria. It is highly resistant to hydrolysis by β-lactamases. It is active against Enterobacteriaceae spp, E. coli, Klebsiella, Proteus, Providencia, Salmonella, Serratia, Shigella and Yersinia spp.. Absorption: Absorbed poorly from the GI tract (oral). Distribution: Body tissues and fluids (wide), bile, CSF (especially in the presence of meningitis), crosses the placenta and enters breast milk. Protein-binding: 56%. Metabolism: Minimal metabolism; SQ-26992 (primary metabolite, inactive).

	Distribution: Body tissues and fluids (wide), bile, CSF (especially in the presence of meningitis), crosses the placenta and enters breast milk. Protein-binding: 56%. Metabolism: Minimal metabolism; SQ-26992 (primary metabolite, inactive). Excretion: Via urine by renal tubular secretion and glomerular filtration (60-70% as unchanged), via faeces (small amounts of unchanged drug and metabolites); 1.7 hr (elimination half-life). Removed by dialysis and peritoneal dialysis (lesser extent).
CIMS Class	Other Beta-lactams
ATC Classification	J01DF01 - aztreonam; Belongs to the class of monobactams. Used in the treatment of systemic infections.

baclofen

CIMS Class : (Muscle Relaxants)

baclofen

P - Caution when used during pregnancy

related baclofen information

Indication & Dosage

Oral

Severe chronic spasticity

Adult: Initially, 5 mg tid for 3 days increased to 10 mg tid for 3 days, then in similar increments and intervals until either 20 mg tid is reached or until desired effect is obtained. Max: 100 mg daily.

Child: 0.75-2 mg/kg daily. May initiate with 2.5 mg 4 times daily, increased gradually every 3 days until desired effect is obtained. Maintenance: 6-10 yr: 30-60 mg daily; 2-6 yr: 20-30 mg daily; 12 mth-2 yr: 10-20 mg daily. Max: >10 yr: 2.5 mg/kg daily.

Elderly: Initiate with lower doses.

Renal impairment: Dose reduction may be required.

Patients on chronic haemodialysis: 5 mg daily.

Intrathecal

Severe chronic spasticity

Adult: Test dose: 25 or 50 mcg administered into the intrathecal space by barbotage over at least 1 minute; increase dose by 25 mcg not more often than every 24 hr until 100 mcg/dose to determine appropriate dose.

Non-responders to a test dose of 100 mcg are not suitable for intrathecal treatment. For responders with response lasting >8-12 hr, the test dose that was used to produce the response can be given as a 24-hr infusion; if the test-dose response lasted =8-12 hr, then a dose equivalent to twice the test dose is given. Adjust daily dosage as required.

Maintenance: 12 mcg-2 mg daily for spasticity of spinal origin; 22 mcg-1.4 mg daily for spasticity of cerebral origin.

Child: 4-18 yr with spasticity of cerebral origin: Initially, 25 mcg over at least 1 minute via catheter or lumbar puncture, increase by 25 mcg every 24 hr to a max of 100 mcg to determine appropriate dose then dose-titration phase.

	origin; 22 mcg-1.4 mg daily for spasticity of cerebral origin. Child: 4-18 yr with spasticity of cerebral origin: Initially, 25 mcg over at least 1 minute via catheter or lumbar puncture, increase by 25 mcg every 24 hr to a max of 100 mcg to determine appropriate dose then dose-titration phase. Maintenance: <12 yr: 24 mcg-1.2 mg daily; >12 yr: 1.4 mg daily.
Administration	Should be taken with food.
Overdosage	Symptoms include muscular hypotonia, drowsiness, respiratory depression, coma and convulsions. Gastric lavage may be used.
Contraindications	Hypersensitivity. Active peptic ulcer disease.
Special Precautions	Cerebrovascular disorders, epilepsy, severe psychotic disorders, confusional states, history of peptic ulcer, respiratory depression, DM, hepatic or renal impairment, elderly, pregnancy. Avoid sudden withdrawal.
Adverse Drug Reactions	Sedation, drowsiness, ataxia, dizziness, headache, confusion, hallucinations, skin reactions, GI symptoms, enuresis. Potentially Fatal: Respiratory or CV depression, seizures.
Drug Interactions	Hypotensive effect may be increased with antihypertensives. Concomitant use with levodopa in Parkinson patients may result in confusion, agitation, hallucinations. Potentially Fatal: CNS depressants and alcohol may potentiate CNS effects.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store below 25°C.
Mechanism of Action	Baclofen is an antispastic. It inhibits both monosynaptic and polysynaptic reflexes at spinal level. Absorption: Rapidly and almost completely absorbed from the GI tract (oral); peak plasma concentrations after 1-3 hr. Distribution: Blood-brain barrier, CSF (equivalent to 12% conc found in plasma). Protein-binding: 30%. Metabolism: Hepatic (15% of the dose). Excretion: Via urine (70-80% as unchanged drug); elimination half-life: 3-4 hr (plasma), 5 hr (CSF).
CIMS Class	Muscle Relaxants
ATC Classification	M03BX01 - baclofen; Belongs to the class of otheragents used as centrally-acting muscle relaxants.

balsalazide

CIMS Class : (GIT Regulators, Antiflatulents & Anti-inflammatories)
balsalazide

P - Caution when used during pregnancy

L - Caution when used during lactation

related balsalazide information

Indication & Dosage	<i>Oral</i> Ulcerative colitis Adult: Acute attack: 2.25 g tid (max: 6.75 g/day), until remission occurs or up to 12 wk. Maintenance: 1.5 g bid, adjusted according to response. Max: 6 g daily. Child: 5-17 yr: 750 mg tid or 2.25 g tid, treatment may continue for up to 8 wk.
Administration	Should be taken with food. (Take w/ or immediately after meals.)
Overdosage	Treatment is supportive and electrolyte abnormalities should be corrected.
Contraindications	Hypersensitivity to salicylates or any other ingredients of the cap or balsalazide metabolites.
Special Precautions	Renal impairment, pregnancy, lactation; blood disorders can occur.
Adverse Drug Reactions	Diarrhoea, nausea, vomiting, abdominal pain, exacerbation of symptoms of colitis, headache, hypersensitivity reactions (including rash and urticaria). Adverse effects that occur rarely include acute pancreatitis, hepatitis, myocarditis, pericarditis, lung disorders (including eosinophilia and fibrosing alveolitis), peripheral neuropathy, blood disorders (including agranulocytosis, aplastic anaemia, leucopenia, methaemoglobinaemia, neutropenia, and thrombocytopenia), renal dysfunction (interstitial nephritis, nephrotic syndrome), myalgia, arthralgia, skin reactions (including lupus erythematosus-like syndrome, Stevens-Johnson syndrome), alopecia.
Storage	Oral: Store at 25°C.

Storage	Oral: Store at 25°C.
Mechanism of Action	Balsalazide is delivered intact to the colon where it is enzymatically cleaved by colonic bacterial azoreductases to release 5-aminosalicylic acid (5-ASA) which is the active component and the inert 4-aminobenzoyl-β-alanine. The mechanism of action of 5-ASA is unknown, but its action appears to be local rather than systemic. It is possible that 5-ASA inhibits the action of cyclooxygenase and leukotriene synthesis, thus diminishing the formation of inflammatory metabolites in the colon via these two pathways. Absorption: Very little of an oral dose is absorbed in the GI tract. Almost the entire dose reaches the site of action in the colon. Metabolism: Broken down by colonic bacterial to 5-ASA (active) and 4-aminobenzoylalanine (inert carrier). Approx 25% of released 5-ASA is absorbed and acetylated; a small percentage of 4-aminobenzoylalanine is absorbed and acetylated during the 1st pass effect in the liver. Excretion: Acetylated metabolites are removed in the urine.
CIMS Class	GIT Regulators, Antiflatulents & Anti-inflammatories
ATC Classification	A07EC04 - balsalazide; Belongs to the class of aminosalicylic acid and similar antiinflammatory. Used in the treatment of intestinal inflammation.

bambuterol hydrochloride

CIMS Class : (Antiasthmatic & COPD Preparations)
bambuterol hydrochloride

P - Caution when used during pregnancy

related bambuterol hydrochloride information

Indication & Dosage	<i>Oral</i> Persistent reversible airways obstruction Adult: 10-20 mg once daily at bedtime. <table><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr><tr><td><50</td><td>Initial dose should be halved.</td></tr></table>	CrCl (ml/min)	Dosage Recommendation	<50	Initial dose should be halved.
CrCl (ml/min)	Dosage Recommendation				
<50	Initial dose should be halved.				
Administration	May be taken with or without food. (Preferably taken shortly before bedtime.)				
Contraindications	Severe hepatic impairment; cirrhosis.				
Special Precautions	DM, hyperthyroidism, myocardial insufficiency, arrhythmias, susceptibility to QT-interval prolongation. Pregnancy.				
Adverse Drug Reactions	Fine tremor of skeletal muscle (e.g. hands), palpitations and muscle cramps; tachycardia, tenseness and peripheral vasodilation.				
Drug Interactions	Risk of hypokalaemia increased by co-admin of corticosteroids, diuretics or xanthines. Prolong the action of drugs e.g. suxamethonium.				
Storage	Oral: Store below 30°C.				
Mechanism of Action	Bambuterol HCl is a prodrug of terbutaline. It relaxes bronchial smooth muscle by selectively acting on β_2 -receptors. Duration: 24 hr. Absorption: Absorbed from the GI tract following oral admin. Metabolism: Converted to active metabolite, terbutaline, at a slow rate of 4-7 hr.				
CIMS Class	Antiasthmatic & COPD Preparations

basiliximab

CIMS Class : (Immunosuppressants)
basiliximab

P - Caution when used during pregnancy

L - Caution when used during lactation

related basiliximab information

Indication & Dosage	<i>Intravenous</i> Prophylaxis of acute graft rejection in renal transplantation Adult: 20 mg dose given by IV bolus or infusion over 20-30 min within 2 hr prior to transplantation surgery. Repeat once 4 days later. Withhold 2 nd dose if graft loss or severe hypersensitivity reaction occurs. Child: <35 kg: 10 mg dose 2 hr before surgery, repeated once 4 days later; ≥35 kg: same as adult dosing. Withhold 2 nd dose if graft loss or severe hypersensitivity reaction occurs.
Contraindications	Hypersensitivity to basiliximab and murine proteins.
Special Precautions	Pregnancy and lactation. Re-exposure to a subsequent course of therapy of basiliximab.
Adverse Drug Reactions	Peripheral oedema, hypertension, atrial fibrillation; fever, headache, insomnia, pain; wound complication, acne; hypokalaemia, hyperglycaemia, hyperuricaemia, hypophosphataemia, hypercholesterolaemia; GI effects; UTI; anaemia; tremor; dyspnoea, infection. Rarely, hypersensitivity and anaphylactoid-type reactions.
Drug Interactions	Immunosuppressives other than ciclosporin and corticosteroids may increase the potential for over-immunosuppression.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies

	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Basiliximab, a chimeric murine/human monoclonal antibody, blocks the α -chain of the interleukin-2 receptor complex on the surface of activated T-lymphocytes. Duration: 36 days. Excretion: Terminal half-life: 7 days (adult) and 9 days (children).
CIMS Class	Immunosuppressants
ATC Classification	L04AC02 - basiliximab;

beclometasone

CIMS Class : (Antiasthmatic & COPD Preparations) , (Nasal Decongestants & Other Nasal Preparations) , (Topical Corticosteroids)
beclometasone

P - Caution when used during pregnancy

L - Caution when used during lactation

related beclometasone information

Indication & Dosage

Nasal

Treatment and prophylaxis of allergic and non allergic rhinitis

Adult: 100 mcg bid or 50 mcg 3-4 times daily in each nostril.
Max: 400 mcg daily.

Inhalation

Asthma prophylaxis

Adult: Initially, 600-800 mcg daily. Maintenance: 400 mcg daily in 2-4 divided doses.

Child: As dipropionate: 50 or 100 mcg bid-qid or 100 or 200 mcg bid.

Inhalation

Severe asthma

Adult: 250 mcg four times daily or 500 mcg bid. May be increased to 500 mcg 3-4 times daily if necessary. Max: 2 mg daily.

Topical/Cutaneous

Corticosteroid-responsive dermatoses

Adult: Apply a 0.025% cream/ointment onto affected area.

Special Populations: When switching from oral to inhalation steroid for stable asthmatics. Initially, the inhalation is added to existing oral steroid dosage. After 1 wk, oral dose is reduced by 2.5 mg prednisone or its equivalent. Similar reduction is made at wkly intervals depending on patient response. Reinstatement of oral steroid may be needed in times of stress or exacerbation of asthma. Inhalation of β -agonists should be done 5 min before the steroids.

Contraindications

Hypersensitivity. Acute infections uncontrolled by

Contraindications	Hypersensitivity. Acute infections uncontrolled by antimicrobial chemotherapy.
Special Precautions	Active or doubtfully quiescent tuberculosis, paradoxical bronchospasm; children, elderly; pregnancy and lactation.
Adverse Drug Reactions	Loss of skin collagen and SC atrophy; local hypopigmentation of deeply pigmented skin; dryness, irritation, epistaxis, rarely ulceration or perforation of the nasal septum; smell and taste disturbances; hoarseness and candidiasis of the mouth or throat.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Inhalation: Store at 15-30°C. Nasal: Store at 15-30°C. Topical/Cutaneous: Store at 15-30°C.
Mechanism of Action	Beclometasone controls the rate of protein synthesis, depresses the migration of polymorphonuclear leukocytes, fibroblasts, reverses capillary permeability and lysosomal stabilisation at the cellular level to prevent or control inflammation. Absorption: Readily absorbed after local application. Distribution: Rapidly distributed to all body tissues. Metabolism: Mainly hepatic but also in other tissues including GI tract and lungs. Excretion: Chiefly in the urine and as metabolites in the faeces.
CIMS Class	Antiasthmatic & COPD Preparations / Nasal Decongestants & Other Nasal Preparations / Topical Corticosteroids
ATC Classification	A07EA07 - beclometasone; Belongs to the class of corticosteroids acting locally. Used in the treatment of intestinal inflammation. D07AC15 - beclometasone; Belongs to the class of potent (group III) corticosteroids. Used in the treatment of dermatological diseases. R01AD01 - beclometasone; Belongs to the class of topical corticosteroids used as nasal decongestants. R03BA01 - beclometasone; Belongs to the class of other inhalants used in the treatment of obstructive airway diseases, glucocorticoids.

benazepril

CIMS Class : (ACE Inhibitors)

benazepril

P - Contraindicated in pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related benazepril information

Indication & Dosage

Oral

Hypertension

Adult: Initially, 10 mg once daily. Maintenance: 20-40 mg daily as a single or in 2 divided doses. Max dose: 80 mg/day.

Child: ≥6 yr: 0.2 mg/kg/day. Max dose: 40 mg/day.

Max Dosage:

Renal impairment: Avoid usage in children with CrCl <30 ml/min.

CrCl (ml/min)	Dosage Recommendation
<30	Initial dose: 5 mg daily. Max maintenance dose: 40 mg daily.

Oral

Heart failure

Adult: Initially, 2.5 mg once daily adjusted according to patient's response. Max: 20 mg daily.

Administration

May be taken with or without food.

Overdosage

May lead to hypotension.

Contraindications

Hypersensitivity. History of bilateral renal artery stenosis, angioedema; pregnancy.

Special Precautions

Valvular stenosis, before, during or immediately after anaesthesia, unilateral renal artery stenosis, preexisting renal insufficiency. Withdraw diuretics 2-3 days before benazepril treatment. SC epinephrine (1:1000) to be readily available in the event of angioedema. vol or salt-depleted states; collagen vascular disease; concomitant potassium

	malfunction, unilateral renal artery stenosis, pre-existing renal insufficiency. Withdraw diuretics 2-3 days before benazepril treatment. SC epinephrine (1:1000) to be readily available in the event of angioedema. vol or salt-depleted states; collagen vascular disease; concomitant potassium supplements or potassium-sparing drugs; severe renal impairment (CrCl <30 ml/min). Lactation. Immunosuppressive therapy.
Adverse Drug Reactions	Headache, dizziness, fatigue; cough; somnolence, nausea; hypotension, transient elevations in BUN and serum creatinine; palpitations; constipation, gastritis; melena, rash, pruritus; musculoskeletal pain; paraesthesia, anxiety; UTI; hyperkalaemia; leucopenia and flushing. Potentially Fatal: Angioedema (rare).
Drug Interactions	Thiazides and other diuretics may cause excessive fall in BP when used with benazepril. Increased risk of lithium toxicity when used concurrently. Potentially Fatal: Concomitant potassium-sparing diuretics or potassium supplements can increase the risk of hyperkalaemia.
Food Interaction	Rate of absorption delayed but the extent is not affected.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Benazepril and its metabolite benazeprilat inhibit ACE that catalyzes the conversion of angiotensin I to angiotensin II, thus leading to reduced aldosterone secretion by the adrenal cortex and decreased vasopressor activity. Absorption: 37% of dose is absorbed from the GI tract (oral); peak plasma concentrations after 1-2 hr (fasting state), 2-4 hr (nonfasting state). Distribution: Enters breast milk. Protein-binding: 95%. Metabolism: Hepatic (almost complete); converted to benazeprilat (active metabolite). Excretion: Mainly via urine; via bile (11-12% of dose); 10-11 hr (elimination half-life), may be slowed in renal impairment.

	Metabolism: Hepatic (almost complete); converted to benazeprilat (active metabolite). Excretion: Mainly via urine; via bile (11-12% of dose); 10-11 hr (elimination half-life), may be slowed in renal impairment.
CIMS Class	ACE Inhibitors
ATC Classification	C09AA07 - benazepril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

benfotiamine

CIMS Class : (Vitamin B-Complex / with C)
benfotiamine

related benfotiamine information

Indication & Dosage	<i>Oral</i> Diabetic neuropathy, Alcoholic neuropathy Adult: 100 mg 4 times daily.
Contraindications	Hypersensitivity.
Mechanism of Action	Benfotiamine is an allithiamine that boosts Advanced Glycation Endproduct (AGE)-inhibiting thiamine pyrophosphate and cell-shielding transketolase activity.
CIMS Class	Vitamin B-Complex / with C
ATC Classification	A11DA03 - benfotiamine;

benzocaine

CIMS Class : (Other Ear Preparations) , (Mouth/Throat Preparations) , (Anaesthetics - Local & General)
benzocaine

P - Caution when used during pregnancy

Lab - Lab interference

related benzocaine information

Indication & Dosage	<i>Mouth/Throat</i> Sore throat Adult: Up to 10 mg lozenge may be dissolved slowly in the mouth and repeated every 2 hr as necessary. Child: Not recommended for child under 3 yr old. Elderly: May require lower doses. <i>Mouth/Throat</i> Surface anaesthesia of mouth and throat Adult: As gel, paste, spray or solution up to 20%: Apply to affected area up to 4 times daily. Elderly: May require lower doses. <i>Topical/Cutaneous</i> Topical analgesia and anaesthesia Adult: As gel, paste, cream, lotion, spray, solution or suppository up to 20%: Apply to affected area as directed. Elderly: May require lower doses.
Contraindications	Hypersensitivity. Complete heart block. Low plasma-cholinesterase concentrations. Pyrogenic infection at or near the skin. Inj into or application to inflamed, infected tissues, to damaged skin mucosa or on perforated tympanic membrane.
Special Precautions	Elderly, debilitated, child. Epilepsy, impaired cardiac conduction or resp function, shock or hepatic impairment. Myasthenia gravis. Avoid: Contact with middle ear; prolonged use or application on extensive areas of the skin. Avoid eating or drinking for at least 3-4 hr after the anaesthetic; rubbing or touching the eye while anaesthesia persists. The anaesthetised eye should be protected from dust and bacterial contamination. Chemical burns must be neutralised

	use or application on extensive areas of the skin. Avoid eating or drinking for at least 3-4 hr after the anaesthetic; rubbing or touching the eye while anaesthesia persists. The anaesthetised eye should be protected from dust and bacterial contamination. Chemical burns must be neutralised before treatment with benzocaine. Pregnancy.
Adverse Drug Reactions	Hypersensitivity reactions; vertigo; nystagmus; sensitization. CNS excitation; tinnitus; blurred vision; nausea and vomiting; muscle twitching and tremors; convulsions. Numbness of tongue and perioral region; drowsiness. CVS effects; angioedema; contact dermatitis; burning and stinging effects.
Drug Interactions	Antagonism with sulfonamides; aminosalicylic acid; anticholinesterases; suxamethonium; antiarrhythmics; MAOIs; TCAs.
Lab Interference	Cytoscopic procedures following pyelography. Pancreatic function determination using bentiromide.
Mechanism of Action	Benzocaine is a local anaesthetic which acts by preventing the generation and transmission of impulses along nerve fibers and at nerve endings. Depolarisation and ion-exchange are inhibited. In general, loss of pain occurs before loss of sensory, autonomic and motor functions. Onset: 1 min. Duration: 15-20 min.
CIMS Class	Other Ear Preparations / Mouth/Throat Preparations / Anaesthetics - Local & General
ATC Classification	C05AD03 - benzocaine; Belongs to the class of products containing local anesthetics. Used in the treatment of hemorrhoids. D04AB04 - benzocaine; Belongs to the class of topical anesthetics used in the treatment of pruritus. N01BA05 - benzocaine; Belongs to the class of esters of aminobenzoic acid. Used as local anesthetics. R02AD01 - benzocaine; Belongs to the class of local anesthetics used in throat preparations.

benzoyl peroxide

CIMS Class : (Acne Treatment Preparations)

benzoyl peroxide

related benzoyl peroxide information

Indication & Dosage	<i>Topical/Cutaneous</i> Acne Adult: Apply a 2.5-10% preparation once or twice daily, often used with other antimicrobials. <i>Topical/Cutaneous</i> Decubitus/stasis ulcers Adult: Apply a 20% lotion every 8-12 hr.
Contraindications	Hypersensitivity.
Special Precautions	Discontinue if severe irritation develops. Restart with tolerable levels of treatment after irritation has cleared. Do not use occlusive dressing. May cause dermatitis in allergic patients. Apply carefully near the eyes, mouth, neck and other mucous membranes as well as other sensitive areas.
Adverse Drug Reactions	Excessive drying of skin, allergic dermatitis. May bleach fabrics or hair. Skin discoloration; skin rash, peeling, transient local oedema.
Drug Interactions	PABA sunscreens may transiently discolour fabric.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Topical/Cutaneous: Store at 15-30°C.
Mechanism of Action	Benzoyl peroxide has mild keratolytic effect and antimicrobial activity which is attributed to its oxidative property. It is active against <i>S.epidermidis</i> and <i>P.acne</i> . Metabolism: Skin; converted to benzoic acid.

	Benzoyl peroxide has mild keratolytic effect and antimicrobial activity which is attributed to its oxidative property. It is active against <i>S.epidermidis</i> and <i>P.acne</i>. Metabolism: Skin; converted to benzoic acid. Excretion: Urine.
CIMS Class	Acne Treatment Preparations
ATC Classification	D10AE01 - benzoyl peroxide; Belongs to the class of topical peroxide preparations used in the treatment of acne.

benzydamine

CIMS Class : (Preparations for Vaginal Conditions) , (Mouth/Throat Preparations) , (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
benzydamine

related benzydamine information

Indication & Dosage	<i>Mouth/Throat</i> Pain or irritation of the mouth and throat Adult: Rinse or gargle 15 ml of a 0.15% solution (diluted with water if stinging occurs) every 1-3 hr for not >7 days. Alternatively, admin 4-8 puffs of a 0.15% spray onto the affected area every 1.5-3 hr. Child: 6-12 yr: 4 puffs every 1.5-3 hr. <i>Topical/Cutaneous</i> Pain and inflammation associated with musculoskeletal and joint disorders Adult: Apply a 3-5% cream. As salicylate: Apply a 6% cream/spray on the skin. Use as instructed.
Overdosage	May lead to hallucination.
Contraindications	Hypersensitivity.
Adverse Drug Reactions	Topical: Erythema, rash, photosensitivity. Mouth/throat preparations: Numbness or stinging sensation of oral mucosa.
Storage	Mouth/Throat: Store below 30°C. Topical/Cutaneous: Store below 30°C.
Mechanism of Action	Benzydamine has anti-inflammatory and analgesic properties.
CIMS Class	Preparations for Vaginal Conditions / Mouth/Throat Preparations / Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	A01AD02 - benzydamine; Belongs to the class of other local agents. Used in the treatment of diseases of the mouth. G02CC03 - benzydamine; Belongs to the class of antiinflammatory products for vaginal administration used in the treatment and prevention of inflammation.

agents. Used in the treatment of diseases of the mouth.
G02CC03 - benzydamine; Belongs to the class of antiinflammatory products for vaginal administration used in the treatment and prevention of inflammation.
M01AX07 - benzydamine; Belongs to the class of other non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism.
M02AA05 - benzydamine; Belongs to the class of non-steroidal antiinflammatory preparations for topical use. Used in the treatment of joint and muscular pains.

betahistine

CIMS Class : (Antivertigo Drugs)
betahistine

P - Caution when used during pregnancy

L - Caution when used during lactation

related betahistine information

Indication & Dosage	<i>Oral</i> Meniere's disease Adult: Initially, 16 mg tid. Maintenance: 24-48 mg daily.
Administration	Should be taken with food.
Contraindications	Phaeochromocytoma. Porphyria.
Special Precautions	Active peptic ulcer, bronchial asthma, pregnancy and lactation.
Adverse Drug Reactions	Rash, pruritus, urticaria, dyspepsia, nausea, peptic ulcer disease, headache, dizziness, insomnia.
Drug Interactions	May antagonise antihistamines. May decrease bronchodilator effects of β_2 agonists.
Storage	Oral: Store below 25°C.
Mechanism of Action	Betahistine improves the microcirculation in the labyrinth which reduces endolymphatic pressure. Absorption: Rapid and complete. Metabolism: Hepatic. Excretion: Urine (as inactive metabolites); 3.4 hr (elimination half-life).
CIMS Class	Antivertigo Drugs
ATC Classification	N07CA01 - betahistine; Belongs to the class of preparations used in the treatment of vertigo.

betamethasone

CIMS Class : (Antiasthmatic & COPD Preparations) , (Corticosteroid Hormones) , (Eye Corticosteroids) , (Ear Corticosteroids) , (Topical Corticosteroids)
betamethasone

P - Caution when used during pregnancy

L - Caution when used during lactation

Food α - Food interaction

related betamethasone information

Indication & Dosage

Oral

Allergic and inflammatory disorders

Adult: 0.5-5 mg daily.

Child: For inflammatory conditions: ≥ 12 yr: 0.0175-0.125 mg base/kg daily, dose may be divided every 6-12 hr.

Oral

Congenital adrenal hyperplasia

Adult: 0.5-5 mg daily.

Child: For inflammatory conditions: ≥ 12 yr: 0.0175-0.125 mg base/kg daily, dose may be divided every 6-12 hr.

Intramuscular

Allergic and inflammatory disorders

Adult: As betamethasone sodium phosphate and betamethasone acetate: Initially, 0.25-9 mg daily may be given in 1-2 divided doses. Dose should be individualised based on the severity of the condition being treated and patient's response. Reduce dose gradually when an adequate response is achieved.

Child: ≥ 12 yr: 0.0175-0.125 mg base/kg daily, dose may be divided every 6-12 hr.

Elderly:

Ophthalmic

Allergic and inflammatory conditions of the eye

Adult: As sodium phosphate: Apply a 0.1% solution every 1-2 hr until symptoms are controlled or a 0.1% ointment 2-4 times daily or at night in conjunction with the eye drops into the affected eye/s.

Topical/Cutaneous

	1-2 hr until symptoms are controlled or a 0.1% ointment 2-4 times daily or at night in conjunction with the eye drops into the affected eye/s. <i>Topical/Cutaneous</i> Skin disorders Adult: As dipropionate: Apply 0.05% into affected area. As valerate: Apply 0.025 or 0.1% into affected area.
Administration	Should be taken with food.
Contraindications	Hypersensitivity; systemic fungal or acute infections.
Special Precautions	Uncontrolled diabetes, peptic ulcer, osteoporosis, psychosis, psychoneurosis, pregnancy and lactation. Congestive heart failure, hypertension, epilepsy, CRF, elderly, regular monitoring of patients on long term therapy, withdraw gradually, glaucoma, hypothyroidism, cirrhosis, ocular herpes simplex, ulcerative colitis, infants and children.
Adverse Drug Reactions	Sodium and fluid retention, potassium and calcium depletion. Muscle wasting, weakness, osteoporosis. GI disturbances and bleeding. Increased appetite and delayed wound healing; hirsutism, bruising, striae, acne; raised intracranial pressure, headache, depression, psychosis, menstrual irregularities. Hyperglycaemia, DM. Suppression of pituitary-adrenocortical axis. Growth retardation in children (prolonged therapy). Increased susceptibility for infections. Topical use: Dermal atrophy, local irritation, folliculitis, hypertrichosis. Inhalation: Hoarseness, candidiasis of mouth and throat. Topical application to the eye: Corneal ulcers, raised IOP and reduced visual acuity. Intradermal injection: Local hypopigmentation of deeply pigmented skin. Intra-articular injection: Joint damage, fibrosis, esp in load bearing joints. Potentially Fatal: Abrupt withdrawal leading to acute adrenal insufficiency manifesting as malaise, weakness, mental changes, muscle and joint pains, dystonia, hypoglycaemia, hypotension, dehydration and death. Rapid IV inj may cause CV collapse.
Drug Interactions	Increased hyperglycaemia and hypokalaemia with thiazide diuretics. Increased incidence of peptic ulcer or GI bleeding with concurrent NSAIDs admin. Response to anticoagulants altered. Dose of antidiabetics and antihypertensives needs to be increased. Decreases serum conc of salicylates and antimuscarinic agents. Potentially Fatal: Reduced efficacy with concurrent use of carbamazepine, phenytoin, primidone, barbiturates and rifampicin. Enhanced effect in women taking oestrogens or oral contraceptives.
Food Interaction	May be taken with food to decrease GI stress.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 1st trimester. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intramuscular: Store below 25°C. Ophthalmic: Store below 25°C. Oral: Store below 25°C. Topical/Cutaneous: Store at 2-30°C.
Mechanism of Action	Betamethasone is a corticosteroid with mainly glucocorticoid activity. It prevents and controls inflammation by controlling the rate of protein synthesis, depressing the migration of polymorphonuclear leukocytes and fibroblasts, and reversing capillary permeability and lysosomal stabilisation. Absorption: Readily absorbed from the GI tract (oral). Distribution: Distributed throughout body tissues; crosses the placenta and enters the breast milk. Metabolism: Hepatic. Excretion: Via urine (<5% as unchanged drug).
CIMS Class	Antiasthmatic & COPD Preparations / Corticosteroid Hormones / Eye Corticosteroids / Ear Corticosteroids / Topical Corticosteroids
ATC Classification	A07EA04 - betamethasone; Belongs to the class of corticosteroids acting locally. Used in the treatment of intestinal inflammation. C05AA05 - betamethasone; Belongs to the class of products containing corticosteroids for topical use. Used in the treatment of hemorrhoids. D07AC01 - betamethasone; Belongs to the class of potent (group III) corticosteroids. Used in the treatment of dermatological diseases. D07XC01 - betamethasone; Belongs to the class of potent (group III) corticosteroids in other combinations. Used in the treatment of dermatological diseases. H02AB01 - betamethasone; Belongs to the class of glucocorticoids. Used in systemic corticosteroid preparations. R01AD06 - betamethasone; Belongs to the class of topical

(grouping) corticosteroids in other combinations used in the treatment of dermatological diseases.
H02AB01 - betamethasone; Belongs to the class of glucocorticoids. Used in systemic corticosteroid preparations.
R01AD06 - betamethasone; Belongs to the class of topical corticosteroids used as nasal decongestants.
R03BA04 - betamethasone; Belongs to the class of other inhalants used in the treatment of obstructive airway diseases, glucocorticoids.
S01BA06 - betamethasone; Belongs to the class of corticosteroids. Used in the treatment of inflammation of the eye.
S01CB04 - betamethasone; Belongs to the class of corticosteroids/antiinfectives/mydriatics combinations. Used in the treatment of eye diseases.
S02BA07 - betamethasone; Belongs to the class of corticosteroids used in the treatment of inflammation of the ear.
S03BA03 - betamethasone; Belongs to the class of corticosteroids used in ophthalmologic and otologic preparations.

betamethasone dipropionate + clotrimazole

CIMS Class : (Topical Anti-infectives with Corticosteroids)

betamethasone dipropionate + clotrimazole

P - Caution when used during pregnancy

L - Caution when used during lactation

related betamethasone dipropionate + clotrimazole information

Indication & Dosage	<i>Topical/Cutaneous</i> Inflamed tinea pedis, tinea cruris and tinea corporis Adult: =17 yr: As cream/lotion (per g containing clotrimazole 10 mg and betamethasone dipropionate 0.64 mg): Apply onto the affected area(s) bid. Recommended treatment duration: Up to 2 wk (tinea corporis and tinea cruris) and 4 wk (tinea pedis). Max: 45 g/wk.
Overdosage	Acute overdosage with topical application is unlikely to occur.
Contraindications	Hypersensitivity.
Special Precautions	Systemic absorption of betamethasone may result in suppression of the hypothalamic-pituitary-adrenal axis; prolonged or excessive use may increase systemic absorption of the drug. Monitor for signs of infection. Safety and efficacy have not been established in children <17 yr. Elderly. Pregnancy and lactation.
Adverse Drug Reactions	Dry skin, burning sensation at the site of application, paresthesia, oedema, rash, secondary infections, stinging, skin atrophy.
Storage	Topical/Cutaneous: Store at 25°C.
Mechanism of Action	Betamethasone dipropionate is a corticosteroid that prevents and reduce inflammation by depressing the migration of polymorphonuclear leukocytes and fibroblasts; reversing capillary permeability and lysosomal stabilisation at the cellular level. Clotrimazole is an antifungal agent that binds to phospholipids in the fungal cell membrane. It causes loss of essential intracellular components by altering cell wall permeability. Absorption: Betamethasone dipropionate: Percutaneous

	cellular level. Clotrimazole is an antifungal agent that binds to phospholipids in the fungal cell membrane. It causes loss of essential intracellular components by altering cell wall permeability. Absorption: Betamethasone dipropionate: Percutaneous absorption depends on several factors e.g. use of occlusive dressings and integrity of the epidermal barrier. Distribution: Betamethasone dipropionate: Once absorbed systemically, it is bound to plasma proteins in varying extents. Metabolism: Betamethasone dipropionate: Once absorbed through the skin, it is metabolised mainly by the liver. Excretion: Betamethasone dipropionate: Once absorbed through the skin, it is excreted largely renally; may also be excreted via the bile.
CIMS Class	Topical Anti-infectives with Corticosteroids
ATC Classification	A01AB18 - clotrimazole; Belongs to the class of local antiinfective and antiseptic preparations. Used in the treatment of diseases of the mouth. D01AC01 - clotrimazole; Belongs to the class of imidazole and triazole derivatives for topical use. Used in the treatment of fungal infection. G01AF02 - clotrimazole; Belongs to the class of imidazole derivative antiinfectives. Used in the treatment of gynecological infections.

betamethasone dipropionate + salicylic acid

CIMS Class : (Psoriasis, Seborrhea & Ichthyosis Preparations)

betamethasone dipropionate + salicylic acid

P - Caution when used during pregnancy

L - Caution when used during lactation

related betamethasone dipropionate + salicylic acid information

Indication & Dosage	<i>Topical/Cutaneous</i> Seborrheic dermatitis, Psoriasis Adult: As lotion (containing betamethasone 0.05% w/w as dipropionate and salicylic acid 2% w/w) or ointment (containing betamethasone 0.05% w/w as dipropionate and salicylic acid 3% w/w): Apply to the affected area 1-2 times daily.
Overdosage	Excessive prolonged use of topical corticosteroids can lead to pituitary-adrenal suppression resulting in secondary adrenal insufficiency. Excessive topical application of preparations containing salicylic acid may also result in symptoms of salicyclism. Treatment is symptomatic.
Contraindications	Viral skin infections e.g. vaccinia, varicella and herpes simplex. Tuberculosis, acne rosacea, fungal skin infections (moniliasis), perioral dermatitis and ulcerative conditions.
Special Precautions	Not to be used in or near the eyes. Avoid contact with mucous membranes. Prolonged topical corticosteroid treatment may result in systemic corticosteroid effects; may also lead to formation of striae or atrophy of the skin or subcutaneous tissue. Absorption of corticosteroid through the skin is increased when used with occlusive dressings. Caution when used in patients with stasis dermatitis or other skin diseases with impaired blood circulation. Treatment should be re-evaluated on a 4-wkly basis. Pregnancy and lactation.
Adverse Drug Reactions	Pruritus, irritation, folliculitis, maceration of skin, skin atrophy, hypertrichosis, acneiform eruptions, secondary infection, hypopigmentation, perioral dermatitis, allergic contact dermatitis, striae and miliaria.

	Pruritus, irritation, folliculitis, maceration of skin, skin atrophy, hypertrichosis, acneiform eruptions, secondary infection, hypopigmentation, perioral dermatitis, allergic contact dermatitis, striae and miliaria.
Storage	Topical/Cutaneous: Lotion: Store <25°C. Ointment: Store <30°C.
Mechanism of Action	Betamethasone dipropionate is a synthetic fluorinated corticosteroid. It is active topically and produces a rapid and sustained response in inflammatory dermatoses. It is also effective in less responsive conditions e.g. scalp psoriasis, chronic plaque psoriasis of the hands and feet. Salicylic acid has keratolytic action. It softens keratin, loosens cornified epithelium and desquamates the epidermis. It aids in the penetration of betamethasone. Absorption: Betamethasone dipropionate: Percutaneous absorption depends on several factors e.g. use of occlusive dressings and integrity of the epidermal barrier. Salicylic acid: Exerts only local action after topical application. Distribution: Betamethasone dipropionate: Once absorbed systemically, it is bound to plasma proteins in varying extents. Metabolism: Betamethasone dipropionate: Once absorbed through the skin, it is metabolised mainly by the liver. Excretion: Betamethasone dipropionate: Once absorbed through the skin, it is excreted largely renally; may also be excreted via the bile.
CIMS Class	Psoriasis, Seborrhea & Ichthyosis Preparations
ATC Classification	D01AE12 - salicylic acid; Belongs to the class of other antifungals for topical use. Used in the treatment of fungal infection. S01BC08 - salicylic acid; Belongs to the class of non-steroidal antiinflammatory agents. Used in the treatment of inflammation of the eye.

betamethasone + neomycin

CIMS Class : (Topical Anti-infectives with Corticosteroids) , (Eye Antiseptics with Corticosteroids)
betamethasone + neomycin

P - Caution when used during pregnancy

L - Caution when used during lactation

related betamethasone + neomycin information

Indication & Dosage	<i>Ophthalmic</i> Ocular inflammation with suspected or confirmed bacterial infection Adult: As ophthalmic ointment containing betamethasone sodium phosphate 0.1% w/w and neomycin sulfate 0.5% w/w: Apply ¼ inch long to the lower eye lid 2-3 times daily and/or at night. Usual treatment duration: Up to 7 days/course. <i>Topical/Cutaneous</i> Corticosteriod-responsive dermatoses with secondary infection Adult: As cream/ointment containing betamethasone (as valerate) 0.122% w/w and neomycin sulfate 0.5% w/w: Apply onto the affected area(s) 2-3 times daily. Child: =2 yr: As cream/ointment containing betamethasone (as valerate) 0.122% w/w and neomycin sulfate 0.5% w/w: Apply onto the affected area(s) 2-3 times daily. Usual treatment duration: Up to 5 days/course. Renal impairment: Dose reduction may be necessary.
Overdosage	Acute overdosage is unlikely to occur. Prolonged excessive use may lead to sufficient systemic absorption resulting in symptoms of Cushing's syndrome, in which case, gradual withdrawal of the drug is recommended. Significant systemic absorption of neomycin sulfate may cause ototoxicity and nephrotoxicity. Treatment involves withdrawal of drug and monitoring general status, hearing acuity, renal and neuromuscular functions of the patient.
Contraindications	Hypersensitivity. Rosacea, acne vulgaris, perioral dermatitis, perianal and genital pruritus and primary cutaneous viral infections. Not to be used in otitis externa complicated by

	Hypersensitivity. Rosacea, acne vulgaris, perioral dermatitis, perianal and genital pruritus and primary cutaneous viral infections. Not to be used in otitis externa complicated by ear-drum perforation. Treatment of primary infected skin lesions caused by fungi or bacteria; primary or secondary infections due to yeast; or secondary infections due to <i>Pseudomonas</i> or <i>Proteus</i> species. Children <2 yr. Ophthalmic preparation: Not to be used in patients with glaucoma or herpetic keratitis.
Special Precautions	Avoid prolonged treatment as it may lead to systemic corticosteroid effects even without occlusion. Avoid prolonged excessive application to the facial areas. Withdraw treatment if there is spread of the infection. Risk of glaucoma development if preparation enters eye(s). Regular monitoring is recommended when used in psoriasis due to treatment tolerance, rebound relapses, generalised pustular psoriasis or systemic toxicity. Increased risk of contact sensitisation when used for extended period or recurrently. Pregnancy and lactation. Ophthalmic preparation: Monitor intraocular pressure, cataract formation or unsuspected infections; evaluate treatment if there is no clinical improvement after 7 days. Not to be used for undiagnosed red eye.
Adverse Drug Reactions	Prolonged use may cause local atrophic changes in the skin e.g. thinning, striae and dilatation of superficial blood vessels. Local skin burning sensation, pruritus, pigmentation changes, allergic contact dermatitis and hypertrichosis. Ophthalmic preparation: Corneal ulceration, increased intraocular pressure, mydriasis, ptosis, epithelial punctate keratitis.
Drug Interactions	If there is significant systemic absorption, neomycin sulfate may increase the respiratory depressant effects of neuromuscular blockers.
Storage	Ophthalmic: Store <25°C. Topical/Cutaneous: Store <25°C.
Mechanism of Action	Betamethasone valerate is a corticosteroid which is effective in inflammatory dermatoses. It is also effective in less responsive conditions such as psoriasis. Neomycin sulfate is a broad spectrum antibiotic. It is bactericidal against many bacteria which are commonly associated with skin infections. Absorption: Betamethasone: Absorption through the skin depends on several factors e.g. presence of occlusive dressing, integrity of the epidermal barrier. Distribution: Betamethasone: Bound to plasma proteins to varying extent. Metabolism: Betamethasone: Largely metabolised hepatically. Excretion: Betamethasone: Mainly excreted via the kidneys.
CIMS Class	Topical Anti-infectives with Corticosteroids / Eye Antiseptics

CIMS Class	Topical Anti-infectives with Corticosteroids / Eye Antiseptics with Corticosteroids
ATC Classification	A07EA04 - betamethasone; Belongs to the class of corticosteroids acting locally. Used in the treatment of intestinal inflammation. C05AA05 - betamethasone; Belongs to the class of products containing corticosteroids for topical use. Used in the treatment of hemorrhoids. D07AC01 - betamethasone; Belongs to the class of potent (group III) corticosteroids. Used in the treatment of dermatological diseases. D07XC01 - betamethasone; Belongs to the class of potent (group III) corticosteroids in other combinations. Used in the treatment of dermatological diseases. H02AB01 - betamethasone; Belongs to the class of glucocorticoids. Used in systemic corticosteroid preparations. R01AD06 - betamethasone; Belongs to the class of topical corticosteroids used as nasal decongestants. R03BA04 - betamethasone; Belongs to the class of other inhalants used in the treatment of obstructive airway diseases, glucocorticoids. S01BA06 - betamethasone; Belongs to the class of corticosteroids. Used in the treatment of inflammation of the eye. S01CB04 - betamethasone; Belongs to the class of corticosteroids/antiinfectives/mydriatics combinations. Used in the treatment of eye diseases. S02BA07 - betamethasone; Belongs to the class of corticosteroids used in the treatment of inflammation of the ear. S03BA03 - betamethasone; Belongs to the class of corticosteroids used in ophthalmologic and otologic preparations.

betaxolol

CIMS Class : (Beta-Blockers) , (Antiglaucoma Preparations)
betaxolol

P - Contraindicated in pregnancy

L - Caution when used during lactation

related betaxolol information

Indication & Dosage	<i>Oral</i> Hypertension Adult: Initially, 10-20 mg once daily. May increase dose to 40 mg/day if necessary after 7-14 days depending on the patient's response. Elderly: Initial dose of 5-10 mg/day. Renal impairment: Patients with severe impairment or on dialysis: initially, 5 mg daily. May increase by 5 mg every 2 wk. Max: 20 mg daily. <i>Oral</i> Angina pectoris Adult: Initially, 10-20 mg once daily. May increase dose to 40 mg/day if necessary after 7-14 days depending on the patient's response. Elderly: Initial dose of 5-10 mg/day. Renal impairment: Patients with severe impairment or on dialysis: initially, 5 mg daily. May increase by 5 mg every 2 wk. Max: 20 mg daily. <i>Ophthalmic</i> Open-angle glaucoma Adult: Instil 1 drop of 0.25% or 0.5% solution bid. <i>Ophthalmic</i> Ocular hypertension Adult: Instil 1 drop of 0.25% or 0.5% solution bid.
Administration	May be taken with or without food.
Overdosage	May lead to bradycardia, congestive heart failure, hypotension, bronchospasm, and hypoglycemia. Stop treatment and observe patient.
Contraindications	Sinus bradycardia, cardiogenic shock, overt cardiac failure.

Contraindications	Sinus bradycardia, cardiogenic shock, overt cardiac failure. Pregnancy .
Special Precautions	Poor cardiac reserve, bronchospastic diseases, DM, renal or hepatic impairment. May mask signs of hyperthyroidism. Gradual withdrawal is recommended. Children. Lactation.
Adverse Drug Reactions	Topical use in eye: Mild ocular stinging and discomfort, usually transient and well-tolerated. Rarely, decreased corneal sensitivity, erythema, itching, keratitis and photophobia reported; tiredness, fatigue, headache, impotence, sleep disturbances, cold hands and feet, GI upsets, bradycardia especially in elderly.
Drug Interactions	May cause mydriasis when used concurrently with epinephrine. Close observation needed when on β -blocker and catecholamine-depleting drugs such as reserpine, due to possible additive effects resulting in hypotension and/or bradycardia. Caution when used concomitantly with adrenergic, psychotropic drugs. Potentially Fatal: Enhances calcium channel blockers, anaesthetics and clonidine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 15-25°C.
Mechanism of Action	Betaxolol is a cardioselective β -blocker which has greater affinity for β_1 -receptors and has little or no effect on β_2 -receptors. It also causes the reduction of intraocular pressure by decreasing the production of aqueous humor. Absorption: Completely absorbed from the GI tract and undergoes minimal first pass effect. Distribution: Protein binding: 50%. Crosses the placenta and distributes into the breast milk. Excretion: Elimination half-life: about 16-20 hr. Mainly

	Absorption: Completely absorbed from the GI tract and undergoes minimal first pass effect. Distribution: Protein binding: 50%. Crosses the placenta and distributes into the breast milk. Excretion: Elimination half-life: about 16-20 hr. Mainly excreted via hepatic metabolism and urinary excretion.
CIMS Class	Beta-Blockers / Antiglaucoma Preparations
ATC Classification	C07AB05 - betaxolol; Belongs to the class of selective beta-blocking agents. Used in the treatment of cardiovascular diseases. S01ED02 - betaxolol; Belongs to the class of beta blocking agents used in the treatment of glaucoma and miosis.

bethanechol chloride

CIMS Class : (Other Drugs Acting on the Genito-Urinary System)
bethanechol chloride

P - Caution when used during pregnancy

L - Contraindicated in lactation

Lab ∇ - Lab interference

related bethanechol chloride information

Indication & Dosage	<i>Oral</i> Urinary retention Adult: 10-50 mg 3-4 times daily.
Administration	Should be taken on an empty stomach (i.e. At least one hour before food or two hours after food). (Take on an empty stomach 1 hr before or 2 hr after meals.)
Overdosage	Signs include abdominal discomfort, salivation, skin flushing, sweating, nausea and vomiting. Antidote: Atropine Sulfate. Recommended dose for adults is 0.6 mg. Doses can be given repeated every 2 hr, according to clinical response. Recommended dosage in infants and children up to 12 yr: 0.01 mg/kg (max: 0.4 mg/dose) repeated every 2 hr as needed until the desired effect is achieved. SC inj is preferred except in emergencies when the IV route may be used.
Contraindications	Hypersensitivity, hyperthyroidism, peptic ulcer, obstructive pulmonary disease, pronounced bradycardia or hypotension, vasomotor instability, epilepsy, parkinsonism, mechanical obstruction of the GIT, bladder neck obstruction, spastic GI disturbances; IV/IM admin; lactation.
Special Precautions	Urinary retention, pregnancy, children.
Adverse Drug Reactions	Nausea, vomiting, abdominal cramps, diarrhoea; frequency of micturition; blurred vision; tachycardia, flushing; headache, malaise.
Lab Interference	Interferes with liver function tests.
	Oral: Store at 20-25°C.

Storage	Oral: Store at 20-25°C.
Mechanism of Action	Bethanechol has a stimulant action on the muscarinic cholinergic receptors in the smooth muscles of the bladder and GI tract, leading to increased ureteric and oesophagal peristalsis, increased pancreatic and GI secretions as well as bladder muscle contraction. Onset: 30-90 min (oral); 5-15 min (SC). Duration: 1-2 hr. Absorption: Poor absorption from the GI tract (oral). Distribution: Does not cross the blood-brain barrier. Metabolism: Not hydrolysed by cholinesterases.
CIMS Class	Other Drugs Acting on the Genito-Urinary System
ATC Classification	N07AB02 - bethanechol; Belongs to the class of choline esters used as parasympathomimetics.

bicalutamide

CIMS Class : (Hormonal Chemotherapy)
bicalutamide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related bicalutamide information

Indication & Dosage	<i>Oral</i> Palliative treatment of advanced prostate cancer Adult: When used with gonadorelin analogue: Usual dose: 50 mg once daily. May be started with or at least 3 days before starting gonadorelin analogue therapy. <i>Oral</i> Monotherapy or adjuvant therapy to surgery or radiotherapy in locally advanced prostatic cancer Adult: 150 mg once daily.
Administration	May be taken with or without food.
Contraindications	Hypersensitivity. Females, children. Pregnancy, lactation.
Special Precautions	Monitor liver function regularly in hepatically impaired patients on prolonged therapy. Monitoring serum levels of Prostate Specific Antigen (PSA) may be useful in evaluating the patient's clinical progress.
Adverse Drug Reactions	Nausea, vomiting, diarrhoea, asthenia, gynaecomastia, breast tenderness, hot flushes, pruritus, dry skin, alopecia, hirsutism, decreased libido, impotence, weight gain; less commonly hypersensitivity reactions including angioneurotic oedema and urticaria, interstitial lung disease; rarely abdominal pain, CV disorders (including angina, heart failure and arrhythmias), depression, dyspepsia, haematuria, cholestasis, jaundice, thrombocytopenia.
Drug Interactions	Enhances effect of coumarin anticoagulants.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of

	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Oral: Store below 30°C.
Mechanism of Action	Bicalutamide competes with androgen for the binding of androgen receptors, consequently blocking the action of androgens of adrenal and testicular origin, thus preventing the growth of normal and malignant prostatic tissue. Absorption: Well absorbed from the GI tract (oral). Distribution: Protein-binding: 96%. Metabolism: Extensively hepatic by oxidation and glucuronidation. Excretion: Urine and faeces (as metabolites); 6-7 days (elimination half-life of the R-enantiomer).
CIMS Class	Hormonal Chemotherapy
ATC Classification	L02BB03 - bicalutamide; Belongs to the class of anti-androgens. Used in endocrine therapy.

bisacodyl

CIMS Class : (Laxatives, Purgatives)

bisacodyl

P - Caution when used during pregnancy

Lab ✖ - Lab interference

related bisacodyl information

Indication & Dosage	<i>Oral</i> Constipation Adult: 5-10 mg at night. Child: >4 yr: 5 mg at night time. Elderly: <i>Oral</i> Bowel evacuation Adult: Initially, 10-20 mg the night before the procedure followed by 10 mg suppository admin rectally the next morning. Child: >10 yr: Same as adult dose. 4-10 yr: 5 mg the night before the procedure and 5 mg suppository admin rectally the following morning. . <i>Rectal</i> Constipation Adult: 10 mg suppository/enema admin in the morning. Child: <10 yr: 5 mg in the morning.
Administration	Should be taken on an empty stomach. (Take on an empty stomach for rapid effect. Do not take within 1 hr of antacids, milk or other dairy products.)
Overdosage	Overdosage may result in diarrhoea with excessive loss of water and electrolytes.
Contraindications	Acute surgical abdomen or intestinal obstruction, severe dehydration, faecal impaction, chronic use.
Special Precautions	Swallow the tab whole. Pregnancy; inflammatory bowel disease.
Adverse Drug Reactions	Abdominal discomfort (colic, cramps). Suppositories may cause irritation and proctitis.

	Abdominal discomfort (colic, cramps). Suppositories may cause irritation and proctitis.
Drug Interactions	Do not give antacids or milk within 1 hr of taking the drug (enteric coated).
Lab Interference	False urinary glucose levels.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store below 25°C. Rectal: Store below 25°C.
Mechanism of Action	Bisacodyl acts mainly in the large intestine by increasing its motility to effect bowel evacuation. Onset: 6-12 hr (oral). 15-60 min (rectal). Absorption: Minimal from the GI tract (oral, as enteric-coated tablets/suppositories). Metabolism: Converted to bis(p-hydroxyphenyl)pyridyl-2-methane by intestinal or bacterial enzymes. Excretion: Faeces; urine (as glucuronide).
CIMS Class	Laxatives, Purgatives
ATC Classification	A06AB02 - bisacodyl; Belongs to the class of contact laxatives. Used in the treatment of constipation. A06AG02 - bisacodyl; Belongs to the class of enemas. Used in the treatment of constipation.

bisoprolol

CIMS Class : (Beta-Blockers)
bisoprolol

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab - Lab interference

related bisoprolol information

Indication & Dosage	<i>Oral</i>	
	Hypertension	
	Adult: 2.5-10 mg daily as a single dose. Max: 20 mg daily.	
	CrCl (ml/min)	Dosage Recommendation
	<40	Initial dose should be 2.5 mg daily.
	<20	Max: 10 mg daily.
	Hepatic impairment: Severe impairment: Initially, 2.5 mg daily. Max: 10 mg daily.	
	<i>Oral</i>	
	Angina pectoris	
	Adult: 2.5-10 mg daily as a single dose. Max: 20 mg daily.	
	CrCl (ml/min)	Dosage Recommendation
	<40	Initial dose should be 2.5 mg daily.
	<20	Max: 10 mg daily.
	Hepatic impairment: Severe impairment: Initially, 2.5 mg daily. Max: 10 mg daily.	
	<i>Oral</i>	
	Heart failure	
	Adult: Initially, 1.25 mg once daily doubled after 1 wk if tolerated, then increased gradually at 1-4-wk intervals. Max: 10 mg daily.	
	Renal impairment: Dosage reduction may be necessary.	
	Hepatic impairment: Dosage reduction may be necessary.	
	Administration	May be taken with or without food.
Overdosage	Symptoms include bradycardia, hypotension, congestive heart failure, bronchospasm, and hypoglycemia. Treatment include stopping the drug and instituting supportive and	

	Symptoms include bradycardia, hypotension, congestive heart failure, bronchospasm, and hypoglycemia. Treatment include stopping the drug and instituting supportive and symptomatic measures.
Contraindications	Low cardiac output and uncompensated cardiac failure; sinus bradycardia, 1 st ° heart block, cardiogenic shock, bronchospasm; severe haemorrhage. Pregnancy.
Special Precautions	Bronchospastic disease, hyperthyroidism, peripheral vascular disease, undergoing anaesthesia. Monitor blood glucose regularly. May mask symptoms of hypoglycaemia. Elderly. Gradual withdrawal is advised. Lactation.
Adverse Drug Reactions	Giddiness, headache, fatigue, bradycardia. Nausea, vomiting, diarrhoea or constipation, stomach discomfort, mild ocular stinging, photophobia, keratitis, decreased sexual ability. GI disturbances, dyspnoea, cold extremities, insomnia, hallucination, drowsiness and mood alterations. Potentially Fatal: AV block, bradycardia. Rare but may occur in patients with preexisting cardiac disease. Includes severe bronchospasm, hypoglycaemia, hypotension, orthostatic hypotension, bradyarrhythmias. 'Rebound phenomenon' leading to unstable angina or MI on sudden withdrawal.
Drug Interactions	Decreased effect with aluminum and calcium salts, barbiturates, cholestyramine, NSAIDs, ampicillin, rifampicin. May mask tachycardia from hypoglycaemia induced by insulin and oral hypoglycaemics. Effects of other antihypertensives may be intensified. Potentially Fatal: May increase the effects of drugs which slow AV conduction, a-blockers and a-adrenergic stimulants. Enhances the action of anaesthetic agents, clonidine, calcium antagonists, digitalis, hypoglycaemic agents and NSAIDs.
Lab Interference	Increased cholesterol, thyroxine, glucose and triglycerides levels.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be

	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store below 25°C.
Mechanism of Action	Bisoprolol selectively and competitively blocks β -1 receptors but has little or no effect on β -2 receptors except at high doses. Absorption: Absorbed completely from the GI tract (oral); peak plasma concentrations after 2-4 hr. Distribution: Protein-binding: 30%. Metabolism: In the liver. Excretion: Excreted in urine. 10-12 hr (elimination half-life).
CIMS Class	Beta-Blockers
ATC Classification	C07AB07 - bisoprolol; Belongs to the class of selective beta-blocking agents. Used in the treatment of cardiovascular diseases.

bivalirudin

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
bivalirudin

P - Caution when used during pregnancy

L - Caution when used during lactation

related bivalirudin information

Indication & Dosage	<i>Intravenous</i> As an anticoagulant in percutaneous coronary intervention Adult: 750 mcg/kg by IV inj followed by an infusion of 1.75 mg/kg/hr during procedure and up to 4 hr postprocedure. If needed, may continue infusion at 0.2 mg/kg/hr for up to 20 hr. <table><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr><tr><td>30-59</td><td>Reduce dose by 20%.</td></tr><tr><td><30</td><td>Contraindicated.</td></tr><tr><td>Dialysis</td><td>Contraindicated.</td></tr></table>	CrCl (ml/min)	Dosage Recommendation	30-59	Reduce dose by 20%.	<30	Contraindicated.	Dialysis	Contraindicated.
CrCl (ml/min)	Dosage Recommendation								
30-59	Reduce dose by 20%.								
<30	Contraindicated.								
Dialysis	Contraindicated.								
Contraindications	Active major bleeding. CrCl <30 ml/min and dialysis-dependent patients.								
Special Precautions	Patients at risk of serious bleeding, recent major surgery or puncture of large vessels or organ biopsy. Hepatic or renal impairment.								
Adverse Drug Reactions	Bleeding, hypersensitivity reactions. Hypertension, hypotension, bradycardia, nausea, vomiting, dyspepsia, urinary retention, back pain, headache, inj site pain and anxiety. Potentially Fatal: Severe anaphylactic reactions which may lead to death.								
Drug Interactions	May increase risk of bleeding when used with thrombolytics, oral anticoagulants or drugs that affect platelet function.								
Storage	Intravenous: Store unopened vials at 15-30°C. Store reconstituted vials at 2-8°C.								
Mechanism of Action	Bivalirudin is an analogue of the peptide hirudin. It is a specific and reversible direct thrombin inhibitor that works								

Mechanism of Action	Bivalirudin is an analogue of the peptide hirudin. It is a specific and reversible direct thrombin inhibitor that works by binding to the catalytic and anionic exosite of circulating and clot-bound thrombin. It is used as an anticoagulant in percutaneous coronary intervention. Distribution: Does not bind to plasma proteins. Metabolism: Partly metabolised by the kidneys. Excretion: Partially cleared renally and proteolytic cleavage. Elimination half-life (normal renal function): 25 minutes.
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC Classification	B01AE06 - bivalirudin;

bleomycin

CIMS Class : (Cytotoxic Chemotherapy)

bleomycin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related bleomycin information

Indication & Dosage	<i>Parenteral</i> Squamous cell or testicular tumours Adult: 15,000 IU 3 times a wk or 30,000 IU twice a wk IM/IV, repeated at usual intervals of 3-4 wk up to a total cumulative dose of 500,000 IU. Elderly: Dose reduction is necessary. Renal impairment: Dose reduction is necessary. <i>Intramuscular</i> Lymphoma Adult: 15,000 IU once or twice a wk, up to a total cumulative dose of 225,000 IU. Elderly: Dose reduction is necessary. Renal impairment: Dose reduction is necessary. <i>Injection</i> Malignant effusions Adult: 60,000 IU in 100 ml of 0.9% sodium chloride instilled into the affected serous cavity, may be repeated up to a total cumulative dose of 500,000 IU. Elderly: Dose reduction is necessary. Renal impairment: Dose reduction is necessary. Incompatibility: Incompatible with solutions of essential amino acids, riboflavin, dexamethasone or furosemide.
Contraindications	Hypersensitivity. Severe pulmonary disease; pregnancy and lactation.
Special Precautions	Pulmonary infection, preexisting pulmonary function impairment, renal impairment. Patients who received radiotherapy, particularly to the thorax. Regular chest x-rays should be done. Elderly. Discontinue treatment if chest x-rays show infiltrates or breathlessness occurs.

	Pulmonary infection, preexisting pulmonary function impairment, renal impairment. Patients who received radiotherapy, particularly to the thorax. Regular chest x-rays should be done. Elderly. Discontinue treatment if chest x-rays show infiltrates or breathlessness occurs.
Adverse Drug Reactions	Fever, thrombophlebitis (inj). Acute anaphylactoid reactions, hyperpyrexia. Rash, erythema, pruritus, vesiculation, hyperkeratosis, nail changes, alopecia, hyperpigmentation, striae, stomatitis. Potentially Fatal: Pulmonary toxicity, interstitial pneumonitis, fibrosis, cardiorespiratory collapse in patients with lymphoma.
Drug Interactions	Lomustine increases severity of leukopenia. Elimination decreased by cisplatin. Decreases plasma levels of digoxin and phenytoin. Potentially Fatal: Enhanced pulmonary toxicity in patients given with oxygen.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Injection: Refrigerate at 2-8°C. Intramuscular: Refrigerate at 2-8°C. Parenteral: Refrigerate at 2-8°C.
Mechanism of Action	Bleomycin causes breakage of single- and double- stranded DNA by binding to DNA and inhibiting DNA synthesis. To a lesser extent, it also inhibits RNA and protein synthesis. It causes very little bone marrow suppression. Absorption: Poorly absorbed from the GI tract (oral). Distribution: Crosses the placenta. Metabolism: Enzymatic degradation in plasma, liver and other organs. Excretion: Urine (as active drug). Elimination half-life: Initial: 0.5 hr (IV bolus), 1.3 hr (infusion); terminal: 4 hr (IV bolus), 9 hr (infusion).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01DC01 - bleomycin; Belongs to the class of other cytotoxic antibiotics. Used in the treatment of cancer.

bortezomib

CIMS Class : (Targeted Cancer Therapy)
bortezomib

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related bortezomib information

Indication & Dosage	<i>Intravenous</i> Multiple myeloma Adult: Patients without symptoms or with Grade 1 peripheral neuropathy symptoms: 1.3 mg/m² as IV bolus over 3-5 sec on days 1, 4, 8 and 11 of a 21-day cycle, followed by a 10-day rest period (days 12-21). At least 72 hr should elapse between consecutive doses. Special Populations: Onset of any Grade 3 non-haematological or Grade 4 haematological toxicities excluding neuropathy: Withhold therapy until toxicities symptoms resolved, then reinitiate at 25% reduced dose. Grade 1 with pain or Grade 2 peripheral neuropathy symptoms: 1 mg/m² twice wkly for 2 wk (days 1, 4, 8, 11), then a 10-day rest period (days 12-21). At least 72 hr should elapse between consecutive doses. Grade 2 with pain or Grade 3 peripheral neuropathy symptoms: Withhold therapy until toxicity resolves, then reduce dose to 0.7 mg/m² wkly. Grade 4 peripheral neuropathy symptoms: Discontinue.
Overdosage	Symptoms include hypotension and thrombocytopenia. Monitor vital signs and admin appropriate supportive care.
Contraindications	Hypersensitivity. Child. Pregnancy and lactation.
Special Precautions	Hepatic or renal impairment; history of syncope, orthostatic hypotension; dehydration. Impairs ability to drive or operate machinery. Monitor for symptoms of peripheral neuropathy. Monitor closely the blood glucose levels in patients receiving oral antidiabetic agents.
Adverse Drug	Asthenic conditions; pyrexia; GI disturbances, anorexia;

Adverse Drug Reactions	Asthenic conditions; pyrexia; GI disturbances, anorexia; dehydration; peripheral neuropathy; thrombocytopenia, neutropenia, anaemia; hypotension; cardiac disorders; bone and body pain; cough, dyspnoea; rash, oedema; hypersensitivity reactions; painful or difficult urination. Potentially Fatal: Pneumonia, pyrexia, diarrhoea, vomiting, dehydration and nausea.
Drug Interactions	Concurrent use of amiodarone, antivirals, isoniazid, nitrofurantoin, statins may increase the chance of peripheral neuropathy. Concurrent use of antihypertensives increases the chance of hypotension.
Mechanism of Action	Bortezomib is a reversible inhibitor of the chymotrypsin-like activity of the 26-S proteasome. It prevents targeted proteolysis that affects multiple signaling cascades responsible for normal homeostatic functions within the cell, leading to cell death. Distribution: Protein binding: >80%. Metabolism: Mainly metabolised via the cytochrome P450 isoenzymes CYP3A4, CYP2C19 and CYP1A2.
CIMS Class	Targeted Cancer Therapy
ATC Classification	L01XX32 - bortezomib; Belongs to the class of other antineoplastic agents. Used in the treatment of cancer.

brimonidine

CIMS Class : (Antiglaucoma Preparations)
brimonidine

P - Caution when used during pregnancy

L - Caution when used during lactation

related brimonidine information

Indication & Dosage	<i>Ophthalmic</i> Open-angle glaucoma Adult: Instill 1 drop of a 0.2% solution bid-tid.
Contraindications	Hypersensitivity. Patients receiving MAO inhibitor therapy.
Special Precautions	Patients wearing soft contact lenses should wait for at least 15 min after instilling brimonidine tartrate before inserting soft contact lenses. Renal or hepatic impairment. CV disease. Use with caution in patients with depression, cerebral or coronary insufficiency, Raynaud's phenomenon, orthostatic hypotension or thromboangitis obliterans. Pregnancy, lactation.
Adverse Drug Reactions	Oral dryness; ocular hyperaemia, burning and stinging; headache, blurring of vision; foreign body sensation, fatigue or drowsiness; conjunctival follicles, ocular allergic reactions and ocular pruritus. Corneal staining or erosion, photophobia, eyelid erythema, ocular ache and pain, ocular dryness, tearing; upper respiratory symptoms; eyelid oedema, conjunctival oedema, dizziness, blepharitis, ocular irritation; GI symptoms; asthenia; conjunctival blanching, abnormal vision and muscular pain.
Drug Interactions	Possibility of an additive or potentiating effect with CNS depressants e.g. alcohol, barbiturates, opiates, sedatives or anaesthetics. Caution when used with β -blockers (ophthalmic and systemic), antihypertensives or cardiac glycosides. TCAs can affect the metabolism and uptake of circulating amines.
Pregnancy Category (US FDA)	

Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Ophthalmic: Store at 15-25°C.
Mechanism of Action	Brimonidine is an α_2 -adrenoceptor agonist which works to reduce aqueous humor production and increase uveoscleral flow.
CIMS Class	Antiglaucoma Preparations
ATC Classification	S01EA05 - brimonidine; Belongs to the class of sympathomimetics used in glaucoma therapy.

bromocriptine

CIMS Class : (Antiparkinsonian Drugs) , (Other Drugs Affecting Hormonal Regulation)
bromocriptine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food α - Food interaction

related bromocriptine information

Indication & Dosage

Oral

Parkinson's disease

Adult: As adjunct to levodopa: 1st wk: Initially, 1-1.25 mg at night; 2nd wk: 2-2.5 mg at night; 3rd wk: 2.5 mg bid; 4th wk: 2.5 mg tid, then increased by 2.5 mg every 3-14 days as required. Maintenance: 10-40 mg daily.

Oral

Hypogonadism

Adult: 1-1.25 mg at bedtime increased to 2-2.5 mg at bedtime after 2-3 days and subsequently increased by 1 mg at 2-3 days intervals, up to 2.5 mg bid or more if necessary. Max: 30 mg daily.

Oral

Galactorrhoea

Adult: 1-1.25 mg at bedtime increased to 2-2.5 mg at bedtime after 2-3 days and subsequently increased by 1 mg at 2-3 days intervals, up to 2.5 mg bid or more if necessary. Max: 30 mg daily.

Oral

Infertility

Adult: 1-1.25 mg at bedtime increased to 2-2.5 mg at bedtime after 2-3 days and subsequently increased by 1 mg at 2-3 days intervals, up to 2.5 mg bid or more if necessary. Max: 30 mg daily.

Oral

Adjunct to surgery and radiotherapy in patients with acromegaly

Adult: Initially, 2.5 mg bid, may increase further by 2.5 mg

	<i>Oral</i> Adjunct to surgery and radiotherapy in patients with acromegaly Adult: Initially, 2.5 mg bid, may increase further by 2.5 mg every 2-3 days, if necessary up to 5 mg every 6 hr depending on response. <i>Oral</i> Suppression of lactation Adult: 2.5 mg daily for 2-3 days, increased gradually to 2.5 mg bid for 14 days. <i>Oral</i> Prophylaxis of puerperal lactation Adult: 2.5 mg on the day of delivery followed by 2.5 mg bid for 14 days. <i>Oral</i> Cyclical benign breast and menstrual disorders Adult: 2.5 mg bid.
Administration	Should be taken with food.
Contraindications	Breast carcinoma, hypersensitivity to ergot alkaloids, uncontrolled hypertension, severe ischaemic heart disease. Pregnancy and lactation.
Special Precautions	Increased risk of conception, patients with peptic ulcer, diabetes, diabetic retinopathy, impaired hepatic or renal function, pleuropulmonary signs and symptoms, history of psychosis, CV disease, dementia or concurrent antihypertensive therapy, ability to drive vehicles or operating machinery may be impaired.
Adverse Drug Reactions	Nausea, vomiting, gastric haemorrhage (acromegaly), dizziness, headache, drowsiness, depression, postural hypotension, nasal congestion, pleural effusion, mania, ataxia. High doses produce confusion, hallucinations, delirium, psychosis.
Drug Interactions	Bioavailability increased if given along with erythromycin. Alcohol reduces tolerance to bromocriptine and vice-versa. Effects of antihypertensives may be potentiated. Avoid concurrent psychotropics.
Food Interaction	Food reduces nausea caused by bromocriptine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Bromocriptine is a dopamine D ₂ and D ₃ -agonist which works by activating postsynaptic dopamine receptors in the

	Bromocriptine is a dopamine D₂ and D₃-agonist which works by activating postsynaptic dopamine receptors in the tuberoinfundibular and nigrostriatal pathways. It also inhibits the secretion of prolactin from the anterior pituitary and is used in the treatment of prolactinoma and in endocrinological disorders. Absorption: 30% absorbed from the GIT (oral). Distribution: Protein-binding: 90-96% Metabolism: Extensive hepatic first-pass metabolism by hydrolysis to lysergic acid and peptides. Excretion: Mainly via faeces, via urine (minimal amounts).
CIMS Class	Antiparkinsonian Drugs / Other Drugs Affecting Hormonal Regulation
ATC Classification	G02CB01 - bromocriptine; Belongs to the class of prolactine inhibitors. Used to suppress lactation. N04BC01 - bromocriptine; Belongs to the class of dopamine agonist. Used in the management of parkinson's disease.

budesonide

CIMS Class : (Antiasthmatic & COPD Preparations) , (Nasal Decongestants & Other Nasal Preparations) , (Corticosteroid Hormones)
budesonide

P - Caution when used during pregnancy

L - Caution when used during lactation

related budesonide information

Indication & Dosage

Oral

Inflammatory bowel disease

Adult: Active disease: 9 mg daily; up to 8 wk, reduce dose before stopping therapy. Recurring episodes of active disease: May repeat an 8-wk course. Maintenance of remission: 6 mg once daily, for up to 3 mth; thereafter, gradually reduce dose before stopping treatment.

Hepatic impairment: Dose reduction may be needed.

Nasal

Treatment and prophylaxis of rhinitis

Adult: Initially, 200 mcg into each nostril daily, reduced to 100 mcg into each nostril daily until symptoms are controlled. Or initially, 100 mcg into each nostril bid.

Nasal

Nasal polyps

Adult: 100 mcg bid into each nostril up to 3 mth.

Inhalation

Asthma

Adult: MDI: 400 mcg daily in 2 divided doses, increased up to 1.6 mg daily in severe cases. Maintenance: 200-400 mcg daily. As dry powd inhaler: 200-800 mcg daily in single dose or 2 divided doses. As nebulised solution: Usual dose: 1-2 mg inhaled bid. Maintenance dose: 0.5-1 mg bid.

Child: MDI: 50-400 mcg bid. Nebulised solution: 3 mth-12 yr: Initially, 0.5-1 mg bid. Maintenance dose: 0.25-0.5 mg bid.

Max Dosage: Adult: Dry powd inhaler: 800 mcg bid.

Administration

Should be taken with food. (Swallow whole, do not chew/crush. Avoid grapefruit juice.)

Contraindications

Hypersensitivity. Acute infections uncontrolled by

Contraindications	Hypersensitivity. Acute infections uncontrolled by antimicrobial chemotherapy.
Special Precautions	Active or doubtfully quiescent tuberculosis, paradoxical bronchospasm; children, elderly; pregnancy, lactation.
Adverse Drug Reactions	Loss of skin collagen and SC atrophy; local hypopigmentation of deeply pigmented skin; dryness, irritation, epistaxis, rarely ulceration or perforation of the nasal septum; smell and taste disturbances; hoarseness and candidiasis of the mouth or throat.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Inhalation: Store at 20-25°C. Nasal: Store at 20-25°C. Oral: Store at 20-25°C.
Mechanism of Action	Budesonide controls the rate of protein synthesis, depresses the migration of polymorphonuclear leukocytes, fibroblasts, reverses capillary permeability and lysosomal stabilisation at the cellular level to prevent or control inflammation. Absorption: Rapid and almost complete after oral admin but has poor systemic availability. Metabolism: Undergoes first-pass metabolism.
CIMS Class	Antiasthmatic & COPD Preparations / Nasal Decongestants & Other Nasal Preparations / Corticosteroid Hormones
ATC Classification	A07EA06 - budesonide; Belongs to the class of corticosteroids acting locally. Used in the treatment of intestinal inflammation. D07AC09 - budesonide; Belongs to the class of potent (group III) corticosteroids. Used in the treatment of dermatological diseases. R01AD05 - budesonide; Belongs to the class of topical

inhalant information:

D07AC09 - budesonide; Belongs to the class of potent (group III) corticosteroids. Used in the treatment of dermatological diseases.

R01AD05 - budesonide; Belongs to the class of topical corticosteroids used as nasal decongestants.

R03BA02 - budesonide; Belongs to the class of other inhalants used in the treatment of obstructive airway diseases, glucocorticoids.

bupivacaine

CIMS Class : (Anaesthetics - Local & General)
bupivacaine

P - Caution when used during pregnancy

L - Contraindicated in lactation

related bupivacaine information

Indication & Dosage

Injection

Percutaneous infiltration anaesthesia

Adult: 0.25% solution is typically used. For prolonged action: 9 mg (1.8 ml) of a 0.5% solution with adrenaline (1:200,000) can be admin, repeated once after 2-10 min if necessary. Max total: 90 mg/dental sitting. Max single dose: 150 mg with or without adrenaline, followed by 50 mg every 2 hr if needed.

Injection

Peripheral nerve block

Adult: 12.5 mg (5 ml) of a 0.25% solution or 25 mg (5 ml) of a 0.5% solution. Max single dose: 150 mg with or without adrenaline, followed by 50 mg every 2 hr if needed.

Injection

Sympathetic nerve block

Adult: 50-125 mg (20-50 ml) of a 0.25% solution.

Injection

Retrobulbar block

Adult: 15-30 mg (2-4 ml) of a 0.75% solution.

Injection

Caudal block

Adult: In surgery: 37.5-75 mg (15-30 ml) of a 0.25% solution or 75-150 mg (15-30 ml) of a 0.5% solution. With analgesia during labour: 25-50 mg (10-20 ml) of a 0.25% solution or 50-100 mg (10-20 ml) of a 0.5% solution.

Injection

Lumbar epidural block

Adult: In surgery: 25-50 mg (10-20 ml) of a 0.25% solution or 50-100 mg (10-20 ml) of a 0.5% solution. With analgesia during labour: 15-30 mg (6-12 ml) of a 0.25% solution or

	Lumbar epidural block Adult: In surgery: 25-50 mg (10-20 ml) of a 0.25% solution or 50-100 mg (10-20 ml) of a 0.5% solution. With analgesia during labour: 15-30 mg (6-12 ml) of a 0.25% solution or 30-60 mg (6-12 ml) of a 0.5% solution. In non-obstetric surgery: 75-150 mg (10-20 ml) of a 0.75% solution.
Overdosage	Management includes careful and constant monitoring of CV and respiratory vital signs and the patient's state of consciousness after each local anaesthetic inj. Establish and maintain a patent airway, oxygen may be needed. If necessary, drugs may be used to control convulsions. Hypotension may also be managed by giving IV fluids such as sodium chloride inj.
Contraindications	Hypersensitivity to local anaesthetics of amide type. IV regional anaesthesia; paracervical block in obstetrics; spinal anaesthesia <18 yr. Lactation. Solutions containing preservatives for caudal or epidural block.
Special Precautions	Hepatic disease; CV disease; children <12 yr; pregnancy. Elderly and debilitated patients.
Adverse Drug Reactions	CNS excitation may be followed by depression. Hypotension, bradycardia, arrhythmias and cardiac arrest; methaemoglobinaemia; seizures, restlessness, dizziness. Hypersensitivity. Prolonged block. Potentially Fatal: Cardiac and sudden respiratory arrest.
Drug Interactions	Decreased duration with hyaluronidase. Decreased clearance with cimetidine and ranitidine. Potentiates lidocaine and mepivacaine. Allergic-type reactions with formulations containing sodium metabisulfite. Potentially Fatal: May potentiate systemic toxicity of other local amide anaesthetics. Increased risk of myocardial depression with antiarrhythmics.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Bupivacaine blocks both the initiation and conduction of nerve impulses reducing the permeability of neuronal membranes to Na ions resulting in inhibition of depolarization with resultant blockade of conduction. Onset: 4-10 min. Duration: 1.5-8.5 hr. Distribution: Crosses the placenta, diffuses into CSF, enters breast milk (small amounts). Protein-binding: 95%. Metabolism: Hepatic.

	Duration: 1.5-8.5 hr. Distribution: Crosses the placenta, diffuses into CSF, enters breast milk (small amounts). Protein-binding: 95%. Metabolism: Hepatic. Excretion: Urine (as metabolites); 1.5-5.5 hr (elimination half-life).
CIMS Class	Anaesthetics - Local & General
ATC Classification	N01BB01 - bupivacaine; Belongs to the class of amides. Used as local anesthetics.

buprenorphine

CIMS Class : (Analgesics (Opioid))
buprenorphine

P - Caution when used during pregnancy

L - Caution when used during lactation

related buprenorphine information

Indication & Dosage	<i>Sublingual</i> Moderate to severe pain Adult: 200-400 mcg every 6-8 hr. Child: >6 yr: 37.5-50 kg: 200-300 mcg; 25-37.5 kg: 100-200 mcg; 16-25 kg: 100 mcg. To be given every 6-8 hr. <i>Parenteral</i> Moderate to severe pain Adult: 300-600 mcg IM or slow IV Inj repeated every 6-8 hr if needed. Child: >6 mth: 3-6 mcg/kg every 6-8 hr. Max: 9 mcg/kg every 6-8 hr. <i>Intramuscular</i> Premedication before anaesthesia Adult: 300 mcg. May also be given sublingually at 400 mcg. <i>Intravenous</i> As a perioperative analgesic supplement Adult: 300-450 mcg via slow IV inj.
Contraindications	Acute alcoholism; convulsive disorders; head injuries; increased intracranial pressure; comatose patients; resp depression and obstructive airway disease; patients on established opioid agonists.
Special Precautions	Hepatic or renal disease; pregnancy, lactation; hypothyroidism; adrenocortical insufficiency; asthma; prostatic hyperplasia; shock; hypotension; inflammatory or obstructive bowel disorders; myasthenia gravis; infants/neonates. Reduce dose in elderly and debilitated patients. May precipitate withdrawal symptoms in narcotic addicts.
Adverse Drug	Sedation, nausea, dizziness, vertigo, hypotension, miosis,

Adverse Drug Reactions	Sedation, nausea, dizziness, vertigo, hypotension, miosis, headache, hypoventilation, resp or CNS depression; tachycardia, bradycardia, urinary retention, coma, vomiting, drowsiness, sweating, confusion, dry mouth, diaphoresis, withdrawal syndrome.
Drug Interactions	Plasma-buprenorphine concentrations may be affected when co-administered with drugs that induce or inhibit cytochrome P450 isoenzyme CYP3A4. Enhanced depressant effects with other CNS depressants e.g. alcohol, anaesthetics, anxiolytics, hypnotics, TCAs and antipsychotics. Potentially Fatal: Diazepam may produce resp and cardiac collapse.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intramuscular: Store at 15-30°C. Intravenous: Store at 15-30°C. Parenteral: Store at 15-30°C. Sublingual: Store at 15-30°C.
Mechanism of Action	Buprenorphine exerts its analgesic effect by binding to the mu-opioid receptors in the CNS. It has a longer duration of analgesic action than morphine. Its partial agonist activity gives it a low level of physical dependence. Buprenorphine and morphine show similar dose-related resp depressant effect. Absorption: Rapidly absorbed through the muscles (IM), buccal mucosa (sublingual); peak plasma concentrations after 90 minutes (sublingual). Distribution: Enters breast milk. Protein-binding: 96%. Metabolism: Minimal 1st-pass effect; converted to N-dealkylbuprenorphine and conjugated metabolites. There is enterohepatic recirculation. Excretion: Via faeces (mainly unchanged), via urine (small amounts as unchanged); 1.2-7.2 hr (elimination half-life).
CIMS Class	Analgesics (Opioid)
ATC Classification	N02AE01 - buprenorphine; Belongs to the class of oripavine derivative opioids. Used to relieve pain. N07BC01 - buprenorphine; Belongs to the class of drugs used in the management of opioid dependence.

bupropion hydrochloride

CIMS Class : (Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence) , (Antidepressants)
bupropion hydrochloride

P - Caution when used during pregnancy

related bupropion hydrochloride information

Indication & Dosage	<i>Oral</i> Smoking cessation Adult: Modified-release preparation: Initially, 150 mg once daily for 6 days then increased to 150 mg bid. Period of treatment: 7-12 wk. To discontinue treatment if abstinence is not achieved by 7th wk. Max: 300 mg/day. Elderly: 150 mg/day. <i>Oral</i> Depression Adult: Initially, 100 mg bid increased to 100 mg tid after 3 days if necessary. Increased further to 150 mg tid if no improvement has been observed after several wk of therapy. Max: 150 mg tid. As a modified-release preparation: 150 mg once daily in the morning, increased to 150 mg bid after 3 days if necessary, may further increase to 200 mg bid after several wk if needed. Max: 450 mg as a single dose.
Administration	May be taken with or without food.
Overdosage	Symptoms include hallucinations, loss of consciousness, sinus tachycardia, and ECG changes such as conduction disturbances or arrhythmias. Maintain an adequate airway, oxygenation, and ventilation. Monitor cardiac rhythm and vital signs. EEG monitoring is also recommended for the first 48 hr post-ingestion. General supportive and symptomatic measures are also recommended. Induction of emesis is not recommended.
Contraindications	Epilepsy; eating disorders (e.g. bulimia or anorexia nervosa); hypersensitivity.
Special Precautions	History of seizure disorders, bipolar disorders; MI or unstable heart disease; pregnancy; renal or hepatic impairment.

Special Precautions	History of seizure disorders, bipolar disorders; MI or unstable heart disease; pregnancy; renal or hepatic impairment. Monitor BP before and after treatment; monitor wkly if used with nicotine products. May impair ability to drive and operate machinery. Avoid use within 2 wk of MAO inhibitor withdrawal.
Adverse Drug Reactions	Facial oedema; nausea, dry mouth, constipation, diarrhoea, anorexia; mouth ulcer; thirst; myalgia, arthralgia; insomnia, dream, abnormality, anxiety, disturbed concentration, dizziness, nervousness, tremor, dysphoria; rhinitis, increased cough, pharyngitis, sinusitis; dyspnoea, epistaxis, agitation, insomnia, tremor, headache, weight loss, vomiting, skin rash. Potentially Fatal: Stevens-Johnson syndrome.
Drug Interactions	Neuroleptics, lithium and TCAs, benzodiazepine, alcohol, drugs that lower seizure threshold. Increased risk of side effects when co-admin with levodopa. Reduced hepatic clearance with fluoxetine. Caution when administering with agents that will affect hepatic drug metabolizing enzymes. Increased risk of toxicity when used with ritonavir. Potentially Fatal: Concurrent use with MAO inhibitors may cause acute toxicity symptoms and increased risk of fatality.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-25°C.
Mechanism of Action	Bupropion HCl is a relatively weak inhibitor of the neuronal uptake of norepinephrine, serotonin and dopamine. The mechanism by which it aids in smoking cessation is presumed to be mediated by its noradrenergic and/or dopaminergic actions. Absorption: Well absorbed from the GI tract but undergoes extensive first pass effect. Distribution: =80% bound to plasma proteins. Crosses the placenta and distributed into breast milk. Excretion: Terminal half-life of immediate-release preparation: about 14 hr. Mainly excreted in the urine as metabolites.
CIMS Class	Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence / Antidepressants

buspirone

CIMS Class : (Anxiolytics)

buspirone

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related buspirone information

Indication & Dosage	<i>Oral</i> Short-term management of anxiety Adult: Initially, 5 mg bid/tid increased by 5-mg increments at intervals of 2-3 days. Max: 45 mg daily in divided doses. Max Dosage: 45 mg daily in divided doses.
Administration	May be taken with or without food. (Take consistently either always w/ or always without meals.)
Contraindications	Hypersensitivity. Epilepsy; severe renal or hepatic impairment; children <18 yr; pregnancy, lactation.
Special Precautions	Preceding co-administration of MAOIs, decreased hepatic or renal function. In patients on benzodiazepines, withdraw the drug gradually. May impair ability to drive or operate machinery.
Adverse Drug Reactions	Dizziness, nausea, headache, nervousness, lightheadedness, excitement, paraesthesia, sleep disturbances, chest pain, tinnitus, nasal congestion, sore throat. Less sedation and lower potential for dependence compared to other anxiolytics.
Drug Interactions	Enhanced sedative effects with alcohol or CNS depressants. Increases serum haloperidol. Concurrent admin with MAOIs may lead to increase in BP. Potentially Fatal: Elevation of BP when taken concomitantly with MAOIs.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies

	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Buspirone exerts anxiolytic activity through high affinity for serotonin 5-HT_{1A} and 5-HT₂ receptors. It has moderate affinity for dopamine D₂-receptors but no affinity for GABA receptors. Absorption: Rapidly absorbed from the GI tract (oral); peak plasma concentrations after 40-90 minutes. Distribution: Protein-binding: 95%. Metabolism: Extensively hepatic via hydroxylation and oxidative dealkylation. Excretion: Urine and faeces (as metabolites); 2-4 hr (elimination half-life).
CIMS Class	Anxiolytics
ATC Classification	N05BE01 - buspirone; Belongs to the class of azaspirodecanedione derivatives anxiolytics. Used in the management of anxiety, agitation or tension.

busulfan

CIMS Class : (Cytotoxic Chemotherapy)
busulfan

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related busulfan information

Indication & Dosage	<i>Oral</i> Palliative treatment of chronic myeloid leukemia Adult: 60 mcg/kg daily. Maintenance: 0.5-2 mg daily. Max: 4 mg daily. <i>Oral</i> Polycythemia vera Adult: 4-6 mg daily continued for 4-6 wk with blood counts monitoring. <i>Oral</i> Essential thrombocythaemia Adult: 2-4 mg daily. <i>Oral</i> Conditioning regimens for bone marrow transplantation Adult: 3.5-4 mg/kg daily in divided doses for 4 days up to a total dose of 14-16 mg/kg. Usually used with cyclophosphamide for ablation of recipient's bone marrow. <i>Intravenous</i> Conditioning regimens for bone marrow transplantation Adult: When used with phenytoin, recommended dose: 3.2 mg/kg ideal body-weight/day for 4 days (total dose 12.8 mg/kg); actual body-weight is used for dose calculation if it is <the ideal weight. Daily dose is given as 4 infusions of 800 mcg/kg at 6-hrly intervals; each dose is diluted in sodium chloride 0.9% or glucose 5% to a final concentration of about 500 mcg/mL, given over 2 hr through a central venous catheter using an infusion pump. Start cyclophosphamide only at least 24 hr after last dose of busulfan.
Administration	May be taken with or without food. (Take w/ chilled liqd, ensure adequate fluid intake.)
Contraindications	Pregnancy and lactation. Hypersensitivity.

Contraindications	Pregnancy and lactation. Hypersensitivity.
Special Precautions	Prior treatment with other myelosuppressive drugs, patients predisposed to seizures. May cause secondary malignancies (tumors, acute leukaemias, ovarian failure). Previous irradiation/therapy. Monitor blood counts carefully during therapy. Discontinue if lung toxicity develops.
Adverse Drug Reactions	GI symptoms, anorexia, wt loss, weakness, hyperpigmentation, amenorrhoea, cataracts, cough or hoarseness, impaired fertility and gonadal function, dry skin, liver damage, gynaecomastia. Potentially Fatal: Bone marrow depression manifesting as thrombocytopaenia, leucopaenia, anaemia. Interstitial pulmonary fibrosis (known as "busulfan lung" on prolonged treatment).
Drug Interactions	Decreased clearance when used with cyclophosphamide and itraconazole. Increased clearance by phenytoin. May reduce response to vaccines, possibility of generalized infections with live vaccines. Combination with thioguanine results in oesophageal varices and abdominal liver function tests. Potentially Fatal: Cytotoxic agents may increase risk of pulmonary toxicity.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store below 25°C.
Mechanism of Action	Busulfan reacts with N-7 position of guanosine and interferes with DNA replication and RNA transcription by alkylating and cross-linking the DNA strands. Absorption: Readily absorbed from the GIT (oral). Distribution: Crosses the blood-brain barrier. Metabolism: Extensively hepatic. Excretion: Urine (as sulfur-containing metabolites); 2-3 hrs (elimination half-life).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01AB01 - busulfan; Belongs to the class of alkylating agents, alkyl sulfonates. Used in the treatment of cancer.

***busulfan information:**

butenafine

CIMS Class : (Topical Antifungals & Antiparasites)
butenafine

related butenafine information

Indication & Dosage	<i>Topical/Cutaneous</i> Skin fungal infections Adult: Apply 1% cream on affected area. Tinea pedis: Apply bid for 7 days. Tinea corporis and tinea cruris: Once daily for 2 wk. Tinea versicolor: Once daily for 2 wk.
Contraindications	Application to eye area.
Special Precautions	Avoid occlusive dressings. Avoid contact with mouth, eyes and other mucous membranes. Affected areas should be thoroughly cleansed with soap and dried prior to application. Hands should always be washed after applying cream. Child <12 yr.
Adverse Drug Reactions	Mild burning sensation at the site of application.
Storage	Topical/Cutaneous: Store at 5-30°C.
Mechanism of Action	Butenafine, a benzylamine antifungal, inhibits the enzyme squalene monooxygenase thus decreasing sterol biosynthesis.
CIMS Class	Topical Antifungals & Antiparasites
ATC Classification	D01AE23 - butenafine; Belongs to the class of other antifungals for topical use. Used in the treatment of fungal infection.

cabergoline

CIMS Class : (Antiparkinsonian Drugs) , (Other Drugs Affecting Hormonal Regulation)
cabergoline

P - Caution when used during pregnancy

L - Caution when used during lactation

related cabergoline information

Indication & Dosage

Oral

Inhibition of physiological lactation

Adult: 1 mg as a single dose on the 1st day postpartum.

Hepatic impairment: Dosage adjustments may be needed.

Oral

Suppression of lactation

Adult: 250 mcg every 12 hr for 2 days.

Hepatic impairment: Dosage adjustments may be needed.

Oral

Hyperprolactinaemia-associated disorders

Adult: Initially, 500 mcg/wk then increased at mthly intervals by 500 mcg/wk according to response. Wkly dose may be admin on a single occasion or in 2 divided doses on separate days; doses >1 mg should be given as divided doses. Usual dose: 1 mg (up to 4.5 mg)/wk.

Hepatic impairment: Dosage adjustments may be needed.

Oral

As monotherapy in Parkinson's disease

Adult: Initially, 0.5 mg daily in monotherapy and 1 mg daily as adjunct, may increase in increments of 0.5-1 mg at 7- or 14-day intervals. Max: 3 mg daily.

Elderly: Start with lower doses.

Hepatic impairment: Dosage adjustments may be needed.

	as adjunct, may increase in increments of 0.5-1 mg at 7- or 14-day intervals. Max: 3 mg daily. Elderly: Start with lower doses. Hepatic impairment: Dosage adjustments may be needed. <i>Oral</i> Adjunct to levodopa treatment in Parkinson's disease Adult: Initially, 0.5 mg daily in monotherapy and 1 mg daily as adjunct, may increase in increments of 0.5-1 mg at 7- or 14-day intervals. Max: 3 mg daily. Elderly: Start with lower doses. Hepatic impairment: Dosage adjustments may be needed.
Administration	Should be taken with food.
Overdosage	Symptoms may include nasal congestion, syncope or hallucinations. Measures to support BP should be taken if necessary.
Contraindications	Hypersensitivity to ergot derivatives. Uncontrolled hypertension.
Special Precautions	CV disease, Raynaud's syndrome, renal or hepatic impairment, peptic ulcer, GI bleeding, history of psychosis, hypertension. May affect ability to drive or operate machinery. Pregnancy, lactation. Prolonged use and/or usage of high doses may lead to psychiatric disorders, pleural/retroperitoneal fibrosis or cardiac valvular fibrosis. Monitor serum prolactin level mthly until normalisation. Monitor hepatic function regularly in patients with hepatic impairment.
Adverse Drug Reactions	Decrease in BP, dizziness, vertigo, headache, nausea, sleeplessness, abdominal pain, dyspepsia, gastritis, weakness, fatigue, constipation, vomiting, breast pain, hot flushes, depression, tingling, leg cramps, Raynaud's syndrome, psychosis with hallucinations, delusions and confusion. Potentially Fatal: Risk of serotonin syndrome with sibutramine; avoid combination.
Drug Interactions	Increased risk of orthostatic hypotension when used with antihypertensives. May increase vasoconstriction effect of dopamine. May reduce vasodilation effect of nitroglycerin. Concurrent use with SSRIs or TCAs may increase the risk of

	Increased risk of orthostatic hypotension when used with antihypertensives. May increase vasoconstriction effect of dopamine. May reduce vasodilation effect of nitroglycerin. Concurrent use with SSRIs or TCAs may increase the risk of serotonin syndrome. Potentially Fatal: Risk of serotonin syndrome with sibutramine.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 20-25°C.
Mechanism of Action	Cabergoline is a long-acting dopamine D₂-agonist. It inhibits prolactin secretion through hypothalamic inhibitory control exerted through the release of dopamine. Absorption: Absorbed from the GI tract. Undergoes 1st pass effect. Distribution: Plasma protein binding: about 40%. Metabolism: Extensively metabolised to inactive metabolites. Excretion: Mainly via faeces.
CIMS Class	Antiparkinsonian Drugs / Other Drugs Affecting Hormonal Regulation
ATC Classification	G02CB03 - cabergoline; Belongs to the class of prolactine inhibitors. Used to suppress lactation. N04BC06 - cabergoline; Belongs to the class of dopamine agonist. Used in the management of parkinson's disease.

calcitonin, salmon

CIMS Class : (Agents Affecting Bone Metabolism)
calcitonin, salmon

P - Caution when used during pregnancy

L - Caution when used during lactation

related calcitonin, salmon information

Indication & Dosage	<i>Nasal</i>
	Postmenopausal osteoporosis
	Adult: 200 units daily, alternating nostrils everyday.
	Renal impairment: Dosage reduction may be required.
	<i>Parenteral</i>
	Paget's disease of bone
	Adult: Initial dose: 100 units SC/IM daily. Maintenance regimen: 50 units SC/IM 3 times wkly to 100 units daily in patients with serious bone deformity or neurologic involvement.
	Renal impairment: Dosage reduction may be required.
	<i>Parenteral</i>
	Adjunct in hypercalcaemia
	Adult: 100 units every 6-8 hr by SC/IM inj. Adjust dose according to response. In severe cases, IV infusion up to 10 units/kg can be given over 6 hr. Max: 400 units every 6-8 hr.
	Renal impairment: Dosage reduction may be required.
	<i>Parenteral</i>
	Postmenopausal osteoporosis

	units/kg can be given over 6 hr. max. 400 units every 6-8 hr. Renal impairment: Dosage reduction may be required. <i>Parenteral</i> Postmenopausal osteoporosis Adult: 100 units daily or every other day by SC/IM Inj together with calcium and vitamin D supplements. Renal impairment: Dosage reduction may be required. <i>Parenteral</i> Bone pain due to malignant neoplasms Adult: 200 units 4 times daily or 400 units bid for up to 48 hr by SC/IM inj. Renal impairment: Dosage reduction may be required. <i>Intravenous</i> Emergency treatment of hypercalcaemia Adult: 5-10 units/kg daily in 500 ml of 0.9% sodium chloride by slow IV infusion over 6 hr. Renal impairment: Dosage reduction may be required.
Overdosage	May cause nausea and vomiting. Treatment may include parenteral admin of calcium.
Contraindications	Hypersensitivity.
Special Precautions	Prior intradermal test preferably done. Children <18 yr, renal impairment. Pregnancy, lactation.
Adverse Drug Reactions	Nausea, vomiting, tingling of hands; Inj site inflammatory reactions, rashes, facial flushing, bronchospasm, headache, unusual taste, abdominal pain, anorexia. Nasal: Local irritation, ulceration, rhinitis, sinusitis, epistaxis. Potentially Fatal: Anaphylactic shock.
Drug Interactions	Concurrent use with digitalis, mithramycin, or biphosphonate resorption inhibitors calls for dosage adjustments of these drugs.
Pregnancy Category (US FDA)	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Refrigerate at 2-8°C. Nasal: Refrigerate at 2-8°C. Parenteral: Refrigerate at 2-8°C.
Mechanism of Action	Calcitonin inhibits osteoclastic bone resorption and reduces bone turnover. It decreases tubular reabsorption and promotes renal excretion of calcium, phosphate, sodium, magnesium and potassium. Absorption: Rapidly inactivated (oral); peak plasma concentrations after 30-40 min (nasal), 15-25 min (IM). Distribution: Protein binding: 30-40%. Metabolism: Rapidly in the kidneys; blood and peripheral tissues. Excretion: Urine (inactive metabolites, small amounts of unchanged drug); 70-90 min (elimination half-life).
CIMS Class	Agents Affecting Bone Metabolism

calcitriol

CIMS Class : (Agents Affecting Bone Metabolism)
calcitriol

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related calcitriol information

Indication & Dosage

Oral

Hyperparathyroidism in renal failure

Adult: 0.25 mcg daily or every other day. May increase by 0.25 mcg daily at intervals of 4-8 wk.

Child: 0.25-2 mcg daily with haemodialysis.

Oral

Hypoparathyroidism/pseudohypoparathyroidism

Adult: 0.5-2 mcg once daily.

Child: 1-5 yr: 0.25-0.75 mcg once daily; >6 yr: 0.5-2 mcg once daily.

Oral

Vitamin D-resistant rickets (familial hypophosphataemia)

Adult: 0.015-0.02 mcg/kg once daily. Maintenance:

0.03-0.06 mcg/kg once daily. Max: 2 mcg once daily.

Child: 0.015-0.02 mcg/kg once daily. Maintenance: 0.03-0.06 mcg/kg once daily. Max: 2 mcg once daily.

Oral

Hypocalcaemia in premature infants

Child: 1 mg once daily for 5 days.

Intravenous

Hyperparathyroidism in dialysis patients

Adult: 0.5-4 mcg 3 times/wk, increased if needed in steps of 0.25-0.5 mcg at intervals of 2-4 wk; max. 8 mcg 3 times/wk.

	Hyperparathyroidism in dialysis patients Adult: 0.5-4 mcg 3 times/wk, increased if needed in steps of 0.25-0.5 mcg at intervals of 2–4 wk; max. 8 mcg 3 times/wk. Child: 1 mcg once daily. <i>Intravenous</i> Hyperparathyroidism in renal failure Adult: 0.5 mcg daily 3 times/wk if undergoing haemodialysis. If necessary, dose can be increased by 0.25-0.5 mcg at intervals of 2-4 wk. Maintenance: 0.5-3 mcg 3 times/wk. <i>Intravenous</i> Hypocalcaemic tetany in premature infants Child: 0.05 mcg/kg once daily for 5-12 days.
Administration	May be taken with or without food. (May be taken w/ meals to reduce GI discomfort.)
Overdosage	Symptoms include hypercalcaemia, hypercalciuria and hyperphosphatemia. Treatment: Immediate discontinuation of calcitriol therapy, institute low-calcium diet and withdraw calcium supplements. Determine serum calcium levels daily until normocalcaemia returns.
Contraindications	Hypercalcaemia; evidence of vitamin D toxicity. Pregnancy (dose exceeding RDA). Lactation.
Special Precautions	Idiopathic hypercalcaemia. Pediatric doses must be individualised and monitored under close medical supervision. Coronary disease, renal function impairment and arteriosclerosis, especially in the elderly. Hypoparathyroidism.
Adverse Drug Reactions	Weakness; headache; somnolence; nausea; vomiting; dry mouth; constipation; muscle pain; bone pain; metallic taste; polyuria; polydipsia; anorexia; irritability; weight loss; nocturia; mild acidosis; reversible azotemia; generalized vascular calcification; nephrocalcinosis; conjunctivitis (calcific); pancreatitis; photophobia; rhinorrhoea; pruritus; hyperthermia; decreased libido; elevated BUN; albuminuria; hypercholesterolaemia; elevated AST and ALT; ectopic calcification; hypertension; cardiac arrhythmias.
Drug Interactions	Hypermagnesaemia may develop in patients on chronic renal dialysis. Hypercalcaemia in patients on digitalis may precipitate cardiac arrhythmias. Intestinal absorption of

	Hypermagnesaemia may develop in patients on chronic renal dialysis. Hypercalcaemia in patients on digitalis may precipitate cardiac arrhythmias. Intestinal absorption of calcitriol may be reduced by cholestyramine and colestipol. Phenytoin, barbiturates may decrease the $T_{1/2}$ of calcitriol. May develop hypercalcaemia with thiazide diuretics.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. if dose > US RDA. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 15-30°C. Oral: Store at 15-30°C.
Mechanism of Action	Calcitriol promotes calcium absorption in the intestines and retention at the kidneys thus increasing serum calcium levels. It also increases renal tubule phosphate resorption consequently decreasing serum phosphatase levels, PTH levels and bone resorption. Absorption: Well absorbed from the GI tract. Excretion: Mainly excreted in the bile and faeces.
CIMS Class	Agents Affecting Bone Metabolism
ATC Classification	A11CC04 - calcitriol; Belongs to the class of vitamin D and analogues. Used as dietary supplements. D05AX03 - calcitriol; Belongs to the class of other topical agents used in the treatment of psoriasis.

calcium carbonate

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants) , (Electrolytes) , (Calcium/with Vitamins)
calcium carbonate

Food ⚠ - Food interaction

related calcium carbonate information

Indication & Dosage

Oral

Hyperacidity

Adult: Per tablet contains 500 mg calcium carbonate: Take 1-2 tablets as needed, up to a max of 16 tablets/day. May suck or chew tablets. Pregnant women: 1-2 tablets as needed, up to a max of 7 tablets in 24 hr.

CrCl (ml/min)	Dosage Recommendation
<25	Dosage adjustments may be needed depending on serum calcium levels.

Oral

Hyperphosphataemia in patients with chronic renal failure

Adult: Initially, 2.5 g daily, given in divided doses, may increase up to 17 g daily in divided doses if needed.

CrCl (ml/min)	Dosage Recommendation
<25	Dosage adjustments may be needed depending on serum calcium levels.

Administration

May be taken with or without food. (Take w/ meals for better absorption. Avoid taking w/ large amt of fibre-rich food.)

Contraindications

Patients with Ca renal calculi or history of renal calculi; hypercalcaemia; hypophosphataemia. Patients with

	Patients with Ca renal calculi or history of renal calculi; hypercalcaemia; hypophosphataemia. Patients with suspected digoxin toxicity.
Special Precautions	Renal impairment, hypoparathyroid disease, hypercalcaemia-associated diseases. Calcium absorption is impaired in achlorhydria; use an alternate salt and take with food. Caution when used in patients with a history of kidney stones.
Adverse Drug Reactions	Constipation, flatulence; hypercalcaemia; metabolic alkalosis; milk-alkali syndrome, tissue-calcification. Gastric hypersecretion and acid rebound (with prolonged use).
Drug Interactions	Co-administration with thiazide diuretics or vit D may lead to milk-alkali syndrome and hypercalcaemia. Decreased absorption with corticosteroids. Decreases absorption of tetracyclines, atenolol, iron, quinolones, alendronate, Na fluoride, Zn and calcium-channel blockers. Enhances cardiac effects of digitalis glycosides and may precipitate digitalis intoxication.
Food Interaction	Absorption may be increased with food. Decreased absorption with bran, foods high in oxalates and whole grain cereals. Calcium may reduce iron absorption.
Mechanism of Action	Calcium carbonate can neutralise gastric acid rapidly and effectively. However, it may adversely activate Ca dependent processes, leading to secretion of gastric and hydrochloric acid. It can induce rebound acid secretion and, prolonged high doses may cause hypercalcemia, alkalosis and milk-alkali syndrome. Absorption: Converted to calcium chloride by gastric acid. Some of the calcium is absorbed in the intestines. Calcium is absorbed in soluble, ionized form; solubility of calcium is increased in an acidic environment. Distribution: Crosses placenta, enters breast milk. Excretion: Mainly in the faeces as unabsorbed calcium; urine (20%).
CIMS Class	Antacids, Antireflux Agents & Antiulcerants / Electrolytes / Calcium/with Vitamins

	Antacids, Antireflux Agents & Antulcerants / Electrolytes / Calcium/with Vitamins
ATC Classification	A02AC01 - calcium carbonate; Belongs to the class of calcium-containing antacids. Used for the treatment of acid-related disorders. A12AA04 - calcium carbonate; Belongs to the class of calcium-containing preparations used as dietary supplements.

calcium carbonate + vitamin d3

CIMS Class : (Calcium/with Vitamins)
calcium carbonate + vitamin d3

Food ☒ - Food interaction

related calcium carbonate + vitamin d3 information

Indication & Dosage	<i>Oral</i> Supplementation of calcium and vitamin D3 Adult: As effervescent tablet containing calcium carbonate 1500 mg and vitamin D ₃ 10 mcg: 1 tablet bid, to be dissolved in a glass of water and taken immediately. Dosing regimen may vary with brands and dosage forms.
Overdosage	Overdose can lead to hypercalcaemia. Symptoms: Anorexia, thirst, nausea, vomiting, constipation, abdominal pain, muscle weakness, fatigue, bone pain, nephrocalcinosis, nephrolithiasis, mental disturbances, polydipsia, polyuria and cardiac arrhythmias (severe cases). Extreme hypercalcaemia may lead to coma and death. Irreversible renal damage and soft tissue calcification may occur as a result of prolonged hypercalcaemia. Treatment of hypercalcaemia: Rehydrate and discontinue calcium supplement and any treatment with thiazide diuretics, lithium, vitamin A or D and cardiac glycosides. Monitor serum electrolytes, renal function and diuresis.
Contraindications	Patients with hypercalcaemia and/or hypercalciuria. Nephrolithiasis, hypervitaminosis D, hypophosphataemia.
Special Precautions	Impaired calcium absorption in achlorhydria which is common in elderly. Increased risk of hypercalcaemia and hypercalciuria in hypoparathyroid patients receiving high

	Impaired calcium absorption in achlorhydria which is common in elderly. Increased risk of hypercalcaemia and hypercalciuria in hypoparathyroid patients receiving high doses of vitamin D. Caution when using in patients with history of kidney stones. Renal impairment; frequent monitoring of serum calcium and phosphorus is recommended.
Adverse Drug Reactions	Constipation, flatulence, nausea, abdominal pain and diarrhoea. Pruritus, rash and urticaria.
Drug Interactions	May affect the absorption of tetracycline when used together. Concurrent use with systemic corticosteroids may reduce calcium absorption. Thiazide diuretics may decrease urinary excretion of calcium. Concurrent use with ion-exchange resins may reduce GI absorption of vitamin D. Hypercalcaemia may increase the toxicity of cardiac glycosides during treatment with calcium and vitamin D, monitor ECG and serum calcium levels. Bisphosphonate or sodium fluoride should be given at least 3 hr before calcium-containing preparations.
Food Interaction	Foods that are rich in oxalic acid (e.g. spinach and rhubarb) and phytic acid (e.g. whole cereals) may reduce calcium absorption by formation of insoluble calcium salts, thus calcium products should not be taken within 2 hr of eating such foods.
Storage	Oral: Store below 25°C.
Mechanism of Action	Calcium carbonate is a calcium supplement that is used in deficiency states and as an adjunct in the prevention and treatment of osteoporosis. Vitamin D3 is a fat-soluble sterol, it aids in the regulation of calcium and phosphate homeostasis and bone mineralisation. Absorption: Calcium carbonate: About 15-25% gets absorbed in the GI tract. Converted to calcium chloride by gastric acid. Vitamin D: Well-absorbed in the GI tract in the presence of bile. Metabolism: Vitamin D: Undergoes hydroxylation in the liver and kidney to form the active metabolite, 1,25-dihydrocolecalciferol. Excretion: Vitamin D and metabolites are mainly excreted in

	Metabolism: Vitamin D: Undergoes hydroxylation in the liver and kidney to form the active metabolite, 1,25-dihydrocolecalciferol. Excretion: Vitamin D and metabolites are mainly excreted in the bile and faeces.
CIMS Class	Calcium/with Vitamins
ATC Classification	A02AC01 - calcium carbonate; Belongs to the class of calcium-containing antacids. Used for the treatment of acid-related disorders. A12AA04 - calcium carbonate; Belongs to the class of calcium-containing preparations used as dietary supplements.

calcium citrate + vitamin d3

CIMS Class : (Calcium/with Vitamins)
calcium citrate + vitamin d3

Food ▯ - Food interaction

related calcium citrate + vitamin d3 information

Indication & Dosage	<i>Oral</i> Supplementation of calcium and vitamin D3 Adult: Calcium (expressed in terms of elemental calcium): 19-50 yr: 1000 mg/day and >50 yr: 1200 mg/day. Vitamin D3: 10 mcg daily. 20 mcg daily for patients with limited sunlight exposure, low vitamin D diet or bedridden elderly patients. Renal impairment: Use with caution in renal failure. Frequent monitoring of serum calcium and phosphorus needed.
Overdosage	Overdose can lead to hypercalcaemia. Symptoms: Anorexia, thirst, nausea, vomiting, abdominal pain, muscle weakness, mental disturbances, polydipsia, polyuria and cardiac arrhythmias. Treatment of hypercalcaemia: Rehydrate and discontinue calcium supplement and any treatment with thiazide diuretics or vitamin D. Corticosteroids may be given to reduce the GI absorption of calcium. Biphosphonates may also be used for life-threatening hypercalcaemia.
Contraindications	Patients with hypercalcaemia, hypercalciuria or hypophosphatemia. Nephrolithiasis, hypervitaminosis D.
Special Precautions	Impaired calcium absorption in achlorhydria which is common in elderly. Increased risk of hypercalcaemia and hypercalciuria in hypoparathyroid patients on high doses of vitamin D. History of kidney stones. Renal impairment.

	common in elderly. Increased risk of hypercalcaemia and hypercalciuria in hypoparathyroid patients on high doses of vitamin D. History of kidney stones. Renal impairment.
Adverse Drug Reactions	Constipation, nausea, abdominal pain, hypercalcaemia, hypercalciuria, headache, muscle weakness.
Drug Interactions	Reduced absorption of tetracyclines, quinolones and oral biphosphates with concurrent calcium use. Calcium absorption may be reduced by corticosteroids. Increased risk of hypercalcemia and metabolic alkalosis with thiazide diuretics. High blood calcium level may increase the effect of cardiac glycosides. Reduced erlotinib efficacy with calcium. Increased risk of hypercalcaemia with paricalcitol. Enzyme-inducing antiepileptics increases the metabolism of Vit D. Potentially Fatal: Fatal encephalopathy can occur in patients with renal failure when given calcium citrate and aluminium products concurrently due to marked rise in aluminium levels.
Food Interaction	Foods that are rich in oxalic acid (e.g. spinach and rhubarb) and phytic acid (e.g. whole cereals) may reduce calcium absorption by formation of insoluble calcium salts.
Mechanism of Action	Calcium salt can be used in the prevention and treatment of calcium deficiency states. It is also used as an adjunct in the prevention and treatment of osteoporosis. Vitamin D3 is a fat-soluble sterol. It is necessary for the regulation and regulation of calcium and phosphate homeostasis and bone mineralisation. Absorption: Calcium: Approx 33% of oral calcium absorbed via active transport and passive diffusive in small intestine. Vitamin D3: Well-absorbed from GI tract in the presence of bile. Distribution: Calcium: Skeletal tissue, breast milk. Crosses placenta. Vitamin D: Vitamin D and metabolites binds to vitamin D -binding protein and are circulated in the blood. May be stored in adipose and muscle tissue for prolonged periods. Metabolism: Vitamin D3: Hydroxylated in liver to form 25-hydroxycholecalciferol, then hydroxylated in kidney to

	may be stored in adipose and muscle tissue for prolonged periods. Metabolism: Vitamin D3: Hydroxylated in liver to form 25-hydroxycholecalciferol, then hydroxylated in kidney to form active metabolite 1,25-dihydroxycholecalciferol. Excretion: Calcium salt: Unabsorbed calcium mainly excreted via faeces. Excess absorbed calcium excreted via urine. Vitamin D: Vitamin D and metabolites are mainly excreted in the bile and faeces.
CIMS Class	Calcium/with Vitamins

calcium dobesilate

CIMS Class : (Phlebitis & Varicose Preparations) , (Anorectal Preparations)
calcium dobesilate

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related calcium dobesilate information

Indication & Dosage	<i>Oral</i> Peripheral circulatory disorders Adult: 0.5-1 g daily in divided doses. May also be given rectally for haemorrhoids.
Contraindications	Hypersensitivity. Pregnancy and lactation.
Special Precautions	Severe renal impairment. In case of skin rash, treatment should be stopped.
Adverse Drug Reactions	Nausea, diarrhoea, skin rash, fever, headache and vertigo
Mechanism of Action	Calcium dobesilate acts selectively on the capillary walls regulating their physiological functions of resistance and permeability. It lowers blood viscosity and restores normal blood flow. This action is beneficial in all cases of capillary fragility due to metabolic disturbances (constitutional or acquired), and surgical stress or induced by certain medicines.
CIMS Class	Phlebitis & Varicose Preparations / Anorectal Preparations
ATC Classification	C05BX01 - calcium dobesilate; Belongs to the class of other sclerosing agent used in antivaricose therapy.

***calcium dobesilate information:**

calcium folinate

CIMS Class : (Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence) , (Supportive Care Therapy) , (Vitamins & Minerals (Pre & Post Natal) / Antianemics)
calcium folinate

P - Caution when used during pregnancy

related calcium folinate information

Indication & Dosage

Oral

Antidote for methotrexate toxicity

Adult: 15 mg every 6 hr for 10 doses starting 24 hr after the start of methotrexate infusion. Continue admin until serum levels of methotrexate is <0.05 micromolar. May also be given via IM/IV inj.

Oral

Folate-deficient megaloblastic anaemia

Adult: 15 mg daily.

Intravenous

Adjunct to fluorouracil in colorectal cancer

Adult: 200 mg/m² BSA by slow IV inj over at least 3 min followed by 370 mg/m² fluorouracil by IV inj. Treatment is given for 5 consecutive days and repeated at intervals of 28 days for 2 courses. Subsequently, may repeat at 4-5 wkly intervals if the patient has recovered completely from the toxic effects of the prior treatment course.

Intramuscular

Folate-deficient megaloblastic anaemia

Adult: Up to 1 mg/day.

Incompatibility: Incompatible with fluorouracil when mixed in various ratios and stored in PVC containers at various

	Adult: Up to 1 mg/day. Incompatibility: Incompatible with fluorouracil when mixed in various ratios and stored in PVC containers at various temperatures.
Contraindications	Hypersensitivity, pernicious anaemia and other megaloblastic anaemias secondary to vit B ₁₂ -deficiency, intrathecal and intraventricular admin.
Special Precautions	Undiagnosed megaloblastic anaemia, folate dependent tumors; pregnancy. Monitor calcium levels in patients receiving combined 5-Fluorouracil/Folinic acid treatment. To be given parenterally in the presence of GI toxicity, nausea or vomiting. Monitor serum levels of methotrexate to determine the optimal dose and duration of folinic acid admin. Monitor CBC, electrolytes and liver function tests before and regularly during treatment.
Adverse Drug Reactions	Allergic sensitisation, rash, pruritus, erythema, urticaria, nausea, vomiting, pyrexia.
Drug Interactions	Reduces methotrexate toxicity. Enhances cytotoxic and anti-neoplastic effects of fluorouracil. Increases risk of seizures in epileptic patients treated with primidone, phenytoin, phenobarbital and succinimides.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 15-30°C. Oral: Store at 15-30°C.
Mechanism of Action	Calcium folinate enters the cells as 5-methyl tetrahydrofolate and supplies the cofactor blocked by methotrexate. It stabilises the binding of 5-dUMP and thymidylate synthetase, enhances fluorouracil activity and neutralises the effects of folic acid antagonists such as methotrexate but increases those of 5-fluorouracil. Absorption: Well absorbed (oral, IM). Distribution: Widely distributed; concentrated in the liver and CSF.

	increases those of 5-fluorouracil. Absorption: Well absorbed (oral, IM). Distribution: Widely distributed; concentrated in the liver and CSF. Metabolism: Hepatic, intestinal; converted to biologically active 5-methyltetrahydrofolate. Excretion: Urine, faeces (small amounts).
CIMS Class	Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence / Supportive Care Therapy / Vitamins & Minerals (Pre & Post Natal) /Antianemics
ATC Classification	V03AF03 - calcium folinate; Belongs to the class of detoxifying agents used in antineoplastic treatment.

camylofin

CIMS Class : (Antispasmodics)
camylofin

related camylofin information

Indication & Dosage	<i>Parenteral</i> Intestinal colic, Biliary colic, Renal colic, Dysmenorrhoea Adult: 1mL (25 mg) by IM or IV Inj up to a max of tid.
Contraindications	Narrow-angle glaucoma, prostatic hypertrophy, mechanical stenoses.
Special Precautions	Camylofin Inj must be administered with care in thyrotoxicosis, obstructive airway disease, during cardiac surgery, elderly or those with fever.
Adverse Drug Reactions	Injection may cause skin rashes, other allergic reactions and infrequently atropine-like side effects.
Drug Interactions	Camylofin Inj should be co-administered with caution in patients taking amantadine, quinidine and tricyclic antidepressants.
Mechanism of Action	Camylofin is a smooth muscle relaxant with both anticholinergic action as well as direct smooth muscle action. Anticholinergic action is produced by inhibiting the binding of acetylcholine to muscarinic receptors, but the action is less pronounced. Direct smooth muscle relaxation is achieved by inhibiting phosphodiesterase type IV, which leads to increased cyclic AMP and eventually reduced cytosolic calcium. Thus camylofin has a comprehensive action to relieve smooth muscle spasm.
CIMS Class	Antispasmodics

	Antispasmodics
ATC Classification	A03AA03 - camylofin; Belongs to the class of synthetic anticholinergics, esters with tertiary amino group. Used in the treatment of functional bowel disorders.

***camylofin information:**

candesartan

CIMS Class : (Angiotensin II Antagonists)
candesartan

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related candesartan information

Indication & Dosage

Oral

Hypertension

Adult: Initially, 8 mg once daily adjusted according to response. Maintenance: 8 mg once daily. Max: 32 mg daily.

Renal impairment: For patients with renal impairment or on haemodialysis: Initially, 4 mg once daily.

Hepatic impairment: Initially, 2 mg once daily. Avoid in severe impairment.

Oral

Heart failure

Adult: Initially, 4 mg once daily, may double dose at intervals of not <2 wk. Max: 32 mg daily.

Renal impairment: Reduce dose or discontinue treatment if renal function deteriorates.

Hepatic impairment: Initially, 2 mg once daily. Avoid in severe impairment.

Administration

May be taken with or without food.

Contraindications

Hypersensitivity. Pregnancy (2nd and 3rd trimester) and lactation.

Special Precautions

Volume or sodium depletion, preexisting renal insufficiency; aortic or mitral valve stenosis, hypertrophic obstructive cardiomyopathy, renal artery stenosis, primary

	Volume or sodium depletion, preexisting renal insufficiency; aortic or mitral valve stenosis, hypertrophic obstructive cardiomyopathy, renal artery stenosis, primary hyperaldosteronism. Patients with a history of angioedema, urticaria. Monitor serum potassium levels especially in elderly and renally impaired patients. Hypotension may occur during major surgery and anaesthesia due to suppression of the renin-angiotensin system.
Adverse Drug Reactions	Dizziness, headache, vertigo, depression, somnolence, fever, back pain, upper respiratory tract infections, 1st dose orthostatic hypotension, rash, diarrhoea, decreased haemoglobin, renal impairment, hepatitis.
Drug Interactions	Prior treatment with diuretics increases risk of excessive hypotension; use a lower initial dose. Potassium, potassium-sparing diuretics, trimethoprim or potassium supplements may increase risk of hyperkalaemia. NSAIDs may reduce antihypertensive response and increase risk of hyperkalaemia or acute renal failure. Excretion of lithium may be reduced; monitor lithium concentration.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Candesartan inhibits the binding of angiotensin II to AT₁ receptors in many tissues such as vascular smooth muscles and adrenal gland which leads to vasoconstriction blockade and aldosterone release.

	Candesartan inhibits the binding of angiotensin II to AT₁ receptors in many tissues such as vascular smooth muscles and adrenal gland which leads to vasoconstriction blockade and aldosterone release. Absorption: Absorbed from the GI tract (oral); peak plasma concentrations after 3-4 hr. Distribution: Protein-binding: 99%. Metabolism: Hydrolysed to the active form, candesartan. Excretion: Via urine and bile (as unchanged drug and small amounts of inactive metabolites); 9 hr (elimination half-life).
CIMS Class	Angiotensin II Antagonists
ATC Classification	C09CA06 - candesartan; Belongs to the class of angiotensin II antagonists. Used in the treatment of cardiovascular disease.

51-80	No adjustment needed.
30-50	Reduce dose to 950 mg/m ² bid when starting dose is 1.25 g/m ² bid. No dose adjustment is needed when starting dose is 1 g/m ² .
<30	Avoid use.

Oral

Gastric cancer

Adult: Used in combination with a platinum-based compound, 1 g/m² bid for 14 days, followed by a 7-day rest period. 1st dose is given on the evening of day 1 and the last dose on the morning of day 15.

CrCl (ml/min)	Dosage Recommendation
51-80	No adjustment needed.
30-50	Reduce dose to 950 mg/m ² bid when starting dose is 1.25 g/m ² bid. No dose adjustment is needed when starting dose is 1 g/m ² .
<30	Avoid use.

Administration	Should be taken with food. (Take within ½ hr after meals.)
Overdosage	Acute overdose may lead to nausea, vomiting, diarrhoea, GI irritation and bleeding, and bone marrow depression. Treatment includes supportive medical interventions aimed at correcting the presenting clinical manifestations.
Contraindications	History of severe and unexpected reactions to fluoropyrimidine therapy; severe renal impairment; pregnancy, lactation. Hypersensitivity.
Special Precautions	Hepatic dysfunction, bone marrow suppression, poor nutritional status, warfarin therapy. Child, elderly, prior extensive pelvic radiation or alkylating therapy. Moderate renal impairment; CBC with differential; monitor hepatic and renal function. Discontinue use if intractable diarrhoea,

	nutritional status, warfarin therapy. Child, elderly, prior extensive pelvic radiation or alkylating therapy. Moderate renal impairment; CBC with differential; monitor hepatic and renal function. Discontinue use if intractable diarrhoea, stomatitis, bone marrow suppression or MI develops.
Adverse Drug Reactions	Diarrhoea, nausea and vomiting, stomatitis, palmar-plantar syndrome, dermatitis. Fatigue, mucosal inflammation, pyrexia, asthenia and lethargy; headache, dizziness and insomnia; lower limb oedema, anorexia, dehydration. Potentially Fatal: Cardiotoxicity, bone-marrow depression and hyperbilirubinaemia.
Drug Interactions	Antacids containing aluminum and magnesium, leucovorin, anticoagulants, phenytoin, allopurinol.
Food Interaction	Food reduces rate and absorption. Admin within 30 min after a meal.
Lab Interference	Elevation in serum concentrations of alkaline phosphatase and hepatic aminotransferases.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 25°C.
Mechanism of Action	Capecitabine is a prodrug that is converted to fluorouracil following oral administration, which in turn inhibits thymidylate synthetase, blocking the methylation of deoxyuridylic acid to thymidylic acid, interfering with DNA, and to a lesser degree, RNA synthesis.
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01BC06 - capecitabine; Belongs to the class of antimetabolites, pyrimidine analogues. Used in the treatment of cancer.

capreomycin

CIMS Class : (Anti-TB Agents)
capreomycin

P - Caution when used during pregnancy

L - Caution when used during lactation

related capreomycin information

Indication & Dosage	<i>Parenteral</i> Tuberculosis Adult: 1 g daily by deep IM or IV Inj for 2-4 mth, then 2 or 3 times a wk for the remainder of therapy. Max: 20 mg/kg/day. Child: and infants: 15-30 mg/kg daily. Max: 1 g/day. Renal impairment: Dose reduction may be needed.
Contraindications	Hypersensitivity.
Special Precautions	Renal impairment; when given with other anti-TB drugs, pregnancy, lactation, childn, ototoxicity, hypokalaemia. Audiometry and vestibular tests should be conducted at the start of and at regular intervals during treatment.
Adverse Drug Reactions	Toxic nephritis, electrolyte disturbances resembling Bartter's syndrome may occur, hearing loss, tinnitus, vertigo, hepatic impairment, leukocytosis or leukopenia, urticaria, maculopapular skin rashes associated with febrile reactions, pain and bleeding at Inj site, sterile abscesses.
Drug Interactions	Co-admin with aminoglycosides may increase the risk of ototoxicity, resp paralysis and renal dysfunction. Increased risk of nephrotoxicity and ototoxicity with cisplatin and vancomycin. Concurrent colistin increases the risk of nephrotoxicity.
Storage	Parenteral: Store at 15-30°C.

Storage	Parenteral: Store at 15-30°C.
Mechanism of Action	Capreomycin is a cyclic polypeptide antimicrobial. It is bacteriostatic against various Mycobacteria, particularly those that have become resistant to primary anti-TB drugs. Absorption: Poor absorption from GI tract. Excretion: About 50% of a dose is removed unchanged by glomerular filtration within 12 hr.
CIMS Class	Anti-TB Agents
ATC Classification	J04AB30 - capreomycin; Belongs to the class of antibiotics. Used in the treatment of tuberculosis.

captopril

CIMS Class : (ACE Inhibitors)
captopril

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related captopril information

Indication & Dosage

Oral

Hypertension

Adult: Initially, 12.5 mg bid or 6.25 mg bid in combination with a diuretic, at bedtime to avoid precipitous fall in BP, gradually increased at 2-4-wk intervals according to response. Maintenance: 25-50 mg bid. Max: 50 mg tid.

Child: Neonate: Test dose: 10–50 mcg/kg (for neonates <37 wk postmenstrual age: 10 mcg/kg), monitor BP for 1–2 hr; if tolerated give 10–50 mcg/kg 2–3 times daily, increased if needed. Max: 2 mg/kg daily in divided doses (for neonates <37 wk postmenstrual age: 300 mcg/kg daily in divided doses). 1 mth–12 yr: Test dose: 100 mcg/kg (max: 6.25 mg), monitor BP for 1–2 hr; if tolerated give 100–300 mcg/kg 2–3 times daily, increased if needed. Max: 6 mg/kg daily in divided doses (for 1-12 mth: Max: 4 mg/kg daily in divided doses). 12–18 yr: Test dose: 100 mcg/kg or 6.25 mg, monitor BP for 1–2 hr; if tolerated give 12.5–25 mg 2–3 times daily, increased if needed. Max: 150 mg daily in divided doses.

Elderly: Initially, 6.25 mg bid.

CrCl (ml/min)	Dosage Recommendation
---------------	-----------------------

daily, increased if needed. Max: 100 mg daily in divided doses.

Elderly: Initially, 6.25 mg bid.

CrCl (ml/min)	Dosage Recommendation
21-40	Initially, 25 mg daily. Max: 100 mg daily.
10-20	Initially, 12.5 mg daily. Max: 75 mg daily.
<10	Initially, 6.25 mg daily. Max: 37.5 mg daily.

Oral

Heart failure

Adult: Initially, 6.25-12.5 mg bid-tid. Maintenance: 25 mg bid-tid. Max: 50 mg tid.

Child: Neonate: Test dose: 10–50 mcg/kg (for neonates <37 wk postmenstrual age: 10 mcg/kg), monitor BP for 1–2 hr; if tolerated give 10–50 mcg/kg 2–3 times daily, increased if needed. Max: 2 mg/kg daily in divided doses (for neonates <37 wk postmenstrual age: 300 mcg/kg daily in divided doses). 1 mth–12 yr: Test dose: 100 mcg/kg (max: 6.25 mg), monitor BP for 1–2 hr; if tolerated give 100–300 mcg/kg 2–3 times daily, increased if needed. Max: 6 mg/kg daily in divided doses (for 1-12 mth: Max: 4 mg/kg daily in divided doses). 12–18 yr: Test dose: 100 mcg/kg or 6.25 mg, monitor BP for 1–2 hr; if tolerated give 12.5–25 mg 2–3 times daily, increased if needed. Max: 150 mg daily in divided doses.

CrCl (ml/min)	Dosage Recommendation
21-40	Initially, 25 mg daily. Max: 100 mg daily.
10-20	Initially, 12.5 mg daily. Max: 75 mg daily.
<10	Initially, 6.25 mg daily. Max: 37.5 mg daily.

Oral

Post myocardial infarction

Adult: May be started 3 days after MI. Initially, 6.25 mg/day increased after several wk to 150 mg daily in divided doses if tolerated.

CrCl (ml/min)	Dosage Recommendation
21-40	Initially, 25 mg daily. Max: 100 mg daily.
10-20	Initially, 12.5 mg daily. Max: 75 mg daily.
<10	Initially, 6.25 mg daily. Max: 37.5 mg daily.

Oral

Oral

Diabetic nephropathy

Adult: Proteinuria >500 mg per 24 hr (in patients with Type 1 diabetes mellitus and retinopathy): 25 mg tid. May be taken with other anti-hypertensives if patient requires further lowering of BP.

Child: Neonate: Test dose: 10–50 mcg/kg (for neonates <37 wk postmenstrual age: 10 mcg/kg), monitor BP for 1–2 hr; if tolerated give 10–50 mcg/kg 2–3 times daily, increased if needed. Max: 2 mg/kg daily in divided doses (for neonates <37 wk postmenstrual age: 300 mcg/kg daily in divided doses). 1 mth–12 yr: Test dose: 100 mcg/kg (max: 6.25 mg), monitor BP for 1–2 hr; if tolerated give 100–300 mcg/kg 2–3 times daily, increased if needed. Max: 6 mg/kg daily in divided doses (for 1–12 mth: Max: 4 mg/kg daily in divided doses). 12–18 yr: Test dose: 100 mcg/kg or 6.25 mg, monitor BP for 1–2 hr; if tolerated give 12.5–25 mg 2–3 times daily, increased if needed. Max: 150 mg daily in divided doses.

CrCl (ml/min)	Dosage Recommendation
21–40	Initially, 25 mg daily. Max: 100 mg daily.
10–20	Initially, 12.5 mg daily. Max: 75 mg daily.
<10	Initially, 6.25 mg daily. Max: 37.5 mg daily.

Administration	Should be taken on an empty stomach. (Take on an empty stomach 1 hr before or 2 hr after meals.)
Overdosage	Treatment includes correction of hypotension. Volume expansion with an IV infusion of normal saline may be used for restoration of BP.
Contraindications	Known hypersensitivity to the drug. Bilateral renal artery stenosis, hereditary angioedema; renal impairment; pregnancy.
Special Precautions	Patients on diuretics or with sodium depletion should discontinue diuretics or increase sodium intake prior to initiation of therapy. Renal impairment, SLE and other autoimmune collagen disorders and during concurrent use of immunosuppressant or leucopenic drugs, monitor WBC

	initiation of therapy. Renal impairment, SLE and other autoimmune collagen disorders and during concurrent use of immunosuppressant or leucopenic drugs, monitor WBC count and urinary protein before and during therapy. Lactation. Porphyria. Severe CHF.
Adverse Drug Reactions	Hypotension, tachycardia, chest pain, palpitations, pruritus, hyperkalaemia. Proteinuria; angioedema, skin rashes; taste disturbance, nonproductive cough, headache. Potentially Fatal: Neutropenia, usually occurs within 3 mth of starting therapy especially in patients with renal dysfunction or collagen diseases. Hyperkalaemia. Anaphylactic reactions.
Drug Interactions	Concurrent treatment with diuretics increases the hypotensive action of ACE inhibitors hence, starting dose must be kept low. Potentially Fatal: Risk of bone marrow depression increased with concomitant therapy with immunosuppressive drugs. Hyperkalaemia may result if used along with potassium supplements and potassium-sparing diuretics especially if renal function is impaired. Probenecid delays excretion of captopril thereby increasing blood levels. Analgesic and respiratory depression of morphine may be accentuated by captopril. NSAIDs may result in further deterioration of renal function.
Food Interaction	Concurrent admin with food may reduce serum levels of captopril. Avoid dong quai (if using for hypertension), ephedra, yohimbe, ginseng (may worsen hypertension) and garlic (may increase antihypertensive effect).
Lab Interference	False-positive test for urinary nitrites and acetone. Increased BUN, creatinine and potassium.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters.

	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store below 30°C
Mechanism of Action	Captopril competitively inhibits the conversion of angiotensin I (ATI) to angiotensin II (ATII), thus resulting in reduced ATII levels and aldosterone secretion. It also increases plasma renin activity and bradykinin levels. Reduction of ATII leads to decreased sodium and water retention. By these mechanisms, captopril produces a hypotensive effect and a beneficial effect in congestive heart failure. Absorption: 60-75% absorbed from the GI tract (oral); peak plasma concentrations after 1 hr. Absorption may be reduced in the presence of food. Distribution: Protein-binding: 30%; crosses the placenta and enters breast milk at about 1% of maternal blood concentrations. Excretion: Via urine (40-50% as unchanged, the rest as disulfide and other metabolites); 2-3 hr (elimination half-life), may be increased in renal impairment. Removed by haemodialysis.
CIMS Class	ACE Inhibitors
ATC Classification	C09AA01 - captopril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

captopril + hydrochlorothiazide

CIMS Class : (ACE Inhibitors) , (Diuretics)
captopril + hydrochlorothiazide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related captopril + hydrochlorothiazide information

Indication & Dosage	<i>Oral</i> Hypertension, Chronic heart failure Adult: Per tablet contains captopril 25 mg and hydrochlorothiazide 15 mg: Initially, 1 tablet once daily. Daily dose should not exceed: 150 mg (captopril) and 50 mg (hydrochlorothiazide).
Administration	Should be taken on an empty stomach. (Take on an empty stomach 1 hr before meals.)
Contraindications	Hypersensitivity, anuria and severe renal impairment, allergy to sulphonamide-related drugs, collagen - vascular disease, renal artery stenosis. Pregnancy (2nd and 3rd trimesters).
Special Precautions	Neonates and children, elderly patients, renal disease, liver disease, DM, gout, hyperlipidaemia, ECG evidence of LVH. Lactation.
Adverse Drug Reactions	Skin rashes, dysgeusia, cough, hypochloraemic alkalosis, rarely haemolytic anaemia, thrombocytopenia, jaundice, pancreatitis, noncardiogenic pulmonary oedema, hypomagnesaemia leading to fatigue, weakness and paralysis. Hyperuricaemia, impotence in diabetics, significant reduction in tear production and glucose tolerance and increase in plasma Ca concentrations.

	hypomagnesaemia leading to fatigue, weakness and paralysis. Hyperuricaemia, impotence in diabetics, significant reduction in tear production and glucose tolerance and increase in plasma Ca concentrations. Potentially Fatal: Hyperkalaemia in patients having renal impairment, rarely idiosyncratic hypersensitivity reactions like Stevens-Johnson syndrome, SLE and acute pancreatitis. Severe hyponatraemia.
Drug Interactions	Hypotensive action of captopril blunted by NSAIDs. Impairment in glycaemic control by thiazides. Decreased renal excretion of captopril by probenecid. Hypotensive effect of captopril may be increased by other hypotensives. Symptomatic hyponatremia and impaired renal function may result with concomitant use of carbamazepine and allopurinol. Thiazide absorption is increased and decreased by anticholinergics and cholestyramine respectively. May reduce clearance of lithium; monitor serum lithium levels when used together. Potentially Fatal: Increase in bone marrow depression on concomitant therapy with immunosuppressants. Analgesic and resp depression effects of morphine potentiated. Potentiation of nephrotoxicity caused by aminoglycosides, precipitation of digitalis toxicity and lithium toxicity by thiazide diuretics.
Lab Interference	Captopril causes a false +ve test for urinary nitrites and acetone.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which

	Category D: There is positive evidence of human fetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Captopril is an ACE inhibitor. It reduces angiotensin II (ATII) levels leading to fall in BP and reduced Na and water retention. Hydrochlorothiazide is a diuretic. It contributes to reduction of BP by its natriuretic and diuretic actions and reducing the vol factor.
CIMS Class	ACE Inhibitors / Diuretics
ATC Classification	C03AA03 - hydrochlorothiazide; Belongs to the class of low-ceiling thiazide diuretics. Used to promote excretion of urine. C09AA01 - captopril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

carbamazepine

CIMS Class : (Anticonvulsants)
carbamazepine

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related carbamazepine information

Indication & Dosage

Oral

Epilepsy

Adult: Initially, 100-200 mg once or bid gradually increased by increments of 100-200 mg every 2 wk. Maintenance: 0.8-1.2 g daily in divided doses. Max dose: 2 g daily.

Child: =1 yr: 100-200 mg daily, 1-5 yr: 200-400 mg daily, 5-10 yr: 400-600 mg daily, 10-15 yr: 0.6-1 g daily. Alternatively, 10-20 mg/kg daily in divided doses.

Oral

Trigeminal neuralgia

Adult: Initially, 100 mg once or bid gradually increased as necessary. Maintenance: 400-800 mg daily in 2-4 divided doses. Max: 1.2 g daily.

Oral

Prophylaxis of bipolar disorder

Adult: Initially, 400 mg daily in divided doses gradually increased if necessary. Maintenance: 400-600 mg daily. Max: 1.6 g daily.

Rectal

Epilepsy

Adult: 250 mg every 6 hr for patients incapable of oral treatment.

	Epilepsy Adult: 250 mg every 6 hr for patients incapable of oral treatment.
Administration	Should be taken with food. (Avoid grapefruit juice.)
Contraindications	Hypersensitivity; bone marrow depression; porphyria, pregnancy.
Special Precautions	Lactation; CV disease, hepatic or renal disorders, history of blood disorders or haematological reactions to other drugs; glaucoma; skin disorders; elderly, patients on MAO inhibitors; abrupt withdrawal of treatment.
Adverse Drug Reactions	Dizziness, drowsiness, ataxia; dry mouth, abdominal pain, nausea, vomiting, anorexia; leucopenia, proteinuria, renal failure, heart failure and hyponatraemia. Potentially Fatal: Agranulocytosis, aplastic anaemia, hepatic failure, severe exfoliative dermatitis and Stevens-Johnson syndrome.
Drug Interactions	Reduces tolerance to alcohol; shortens $T_{1/2}$ of doxycycline. Decreased efficacy of oral contraceptives when used with carbamazepine. Increased plasma concentrations of carbamazepine by propoxyphene. Serum level decreases with phenytoin, phenobarbital, primidone. Potentially Fatal: Neurotoxic reactions when combined with lithium.
Lab Interference	False-positive result in urine sugar, elevated serum alkaline phosphatase and serum bilirubin values.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store below 30°C Rectal: Store below 30°C
Mechanism of Action	Carbamazepine reduces polysynaptic responses and blocks post-tetanic potentiation. It is effective in partial and generalised convulsions as well as in mixed types but not in petit mal seizures. It reduces or abolishes pain in trigeminal and glossopharyngeal neuralgia.

	post tetanic potentiation. It is effective in partial and generalised convulsions as well as in mixed types but not in petit mal seizures. It reduces or abolishes pain in trigeminal and glossopharyngeal neuralgia. Absorption: Slowly and irregularly absorbed from the GI tract (oral). Distribution: Crosses the placenta; enters breast milk. Protein-binding: 75%. Well distributed in the body. Metabolism: Hepatic; converted to its metabolites. Excretion: Urine (as metabolites), faeces; 5-26 hr (elimination half-life).
CIMS Class	Anticonvulsants
ATC Classification	N03AF01 - carbamazepine; Belongs to the class of carboxamide derivatives antiepileptic. Used in the management of epilepsy.

carbidopa + levodopa

CIMS Class : (Antiparkinsonian Drugs)
carbidopa + levodopa

P - Caution when used during pregnancy

L - Contraindicated in lactation

Lab ✖ - Lab interference

Food ✖ - Food interaction

related carbidopa + levodopa information

Indication & Dosage	<i>Oral</i> As monotherapy in Parkinson's disease Adult: Per tablet contains L-dopa 100 mg and carbidopa 25 mg. Initially, 1 tab tid. Increase by 1 tab/day every 1-2 days up to a max. of 8 tabs of any strength/day. If the patient has been taking L-dopa alone, the combination should be started after a gap of at least 8 hr after stopping L-dopa.
Administration	Should be taken on an empty stomach. (Take on an empty stomach if possible. If GI distress occurs, take w/ food.)
Contraindications	Lactation, narrow angle glaucoma, melanoma, psychosis, severely decompensated endocrine.
Special Precautions	Heart disease, liver disease, dementia, psychosis, pregnancy, elderly, heart disease. Regular monitoring of renal and hepatic function is recommended.
Adverse Drug Reactions	Nausea, vomiting, anorexia, increased risk of GI bleeding in peptic ulcer patients. Orthostatic hypotension, cardiac arrhythmias. Psychiatric symptoms (depression with or without suicidal tendency). Abnormal involuntary movements or dyskinesias, delirium, hallucinations (elderly). Slight elevation of liver enzymes, leucopenia and

	arrhythmias. Psychiatric symptoms (depression with or without suicidal tendency). Abnormal involuntary movements or dyskinesias, delirium, hallucinations (elderly). Slight elevation of liver enzymes, leucopenia and thrombocytopenia. Potentially Fatal: Severe postural hypotension in elderly.
Drug Interactions	Pyridoxine reverses effects of levodopa. Type-B MAOIs have synergistic effect. Effect reduced by phenothiazines, haloperidol, reserpine, pyridoxine, diazepam, oxazepam, chlordiazepoxide, phenobarbitone. Effects of levodopa enhanced by carbidopa, amantadine, anticholinergics, amphetamine. Effects of sympathomimetic agents enhanced. Potentially Fatal: Enhances hypotensive effects of bethanidine, bretylium, guanethidine. Hypertensive crises with furazolidone or MAO inhibitors.
Food Interaction	Food reduces absorption of levodopa. Effects of levodopa reduced by beans, liver, skimmed milk, yeast and wheat germ. Large neutral amino acids reduce absorption and passage across blood-brain barrier.
Lab Interference	Interferes with serum tests for bilirubin, catecholamines, creatinine, glucose and uric acid & urine tests for creatinine, oestrogen, glucose, homogentisic acid, ketone and vanillylmandelic acid.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store below 30°C.
Mechanism of Action	Levodopa, a precursor of dopamine, crosses the blood-brain barrier and gets converted to dopamine in the basal ganglia while carbidopa is a dopa-decarboxylase inhibitor. The latter prevents conversion of L-dopa to dopamine outside the brain and minimises side effects.
CIMS Class	Antiparkinsonian Drugs
ATC Classification	N04BA01 - levodopa; Belongs to the class of dopa and

ATC Classification

N04BA01 - levodopa; Belongs to the class of dopa and dopa derivative dopaminergic agents. Used in the management of parkinson's disease.

carbimazole

CIMS Class : (Antithyroid Agents)
carbimazole

P - Caution when used during pregnancy

L - Caution when used during lactation

related carbimazole information

Indication & Dosage	<i>Oral</i> Hyperthyroidism, Preparation for thyroidectomy, Adjunct to radio-iodine therapy, Grave's disease Adult: Initially, 20-60 mg daily as a single or divided dose, reduced gradually once euthyroidism is achieved. Maintenance: 5-15 mg daily for at least 1 yr or 18 mth. Child: 4-12 yr: Initially, 15 mg daily.
Administration	May be taken with or without food. (Take consistently w/ or without meals.)
Contraindications	Hyperthyroidism due to nodular goitre.
Special Precautions	Liver diseases, pregnancy, lactation.
Adverse Drug Reactions	Mild leucopaenia, sore throat, mouth ulcers, fever, bruising, malaise; rarely cholestatic jaundice; nephrotic syndrome. Nausea, loss of taste, headache, arthralgia, alopecia. Potentially Fatal: Agranulocytosis, aplastic anaemia, hypoprothrombinaemia, neutropaenia; hypothyroidism and goitre.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a

	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store below 25°C.
Mechanism of Action	Carbimazole is metabolised to methimazole which is responsible for its antithyroid action. It blocks the production of thyroid hormones by inhibiting thyroid peroxidase. Absorption: Rapid from the GIT (oral); peak plasma concentrations after 1-2 hrs. Distribution: High concentrations in the thyroid gland; crosses the placenta; enters breast milk. Metabolism: Hepatic; converted to methimazole. Excretion: Urine (<12% unchanged drug); 3-6 hrs (elimination half-life).
CIMS Class	Antithyroid Agents
ATC Classification	H03BB01 - carbimazole; Belongs to the class of sulfur-containing imidazole derivative agents. Used in the management of thyroid diseases.

carboplatin

CIMS Class : (Cytotoxic Chemotherapy)
carboplatin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related carboplatin information

Indication & Dosage

Intravenous

Advanced ovarian carcinoma

Adult: As a single agent in previously untreated patients: 400 mg/m². As a single agent in previously treated patients with recurrent disease: 360 mg/m². When used with cyclophosphamide in previously untreated patients: 300 mg/m². Doses to be given by IV infusion over 15-60 minutes and not more frequently than every 4 wk. Subsequent doses should be adjusted based on nadir of WBC and platelet counts.

CrCl (ml/min)	Dosage Recommendation
≥40	Recommended dose: 400 mg/m ² .
20-39	Recommended dose: 250 mg/m ² .

Contraindications

Previous allergy; pregnancy, lactation; allergy to other platinum compounds; severe bone marrow depression; significant bleeding, aluminium containing needles and IV sets.

Special Precautions

Neonates; diminished renal function; neurotoxicity; liver function impairment.

Adverse Drug Reactions

Thrombocytopenia, neutropenia, leukopenia, anaemia; nausea, vomiting, central neurotoxicity, peripheral neuropathies, ototoxicity; elevation of ALT, AST, blood urea

	Thrombocytopenia, neutropenia, leukopenia, anaemia; nausea, vomiting, central neurotoxicity, peripheral neuropathies, ototoxicity; elevation of ALT, AST, blood urea and bilirubin levels, electrolyte disturbances; alopecia; asthenia, pain; cardiac failure, embolism and cerebrovascular accidents may occur; mucositis. Potentially Fatal: Bone marrow suppression and anaphylactic reactions.
Drug Interactions	Increased risk of ototoxicity when used with aminoglycosides.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 25°C.
Mechanism of Action	Carboplatin is an alkylating agent which binds covalently to DNA. It modifies the cell cycle by interfering with DNA structure and function. Excretion: About 70% of a dose is excreted unchanged in the urine. Terminal half-life: 1.5-6 hr.
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01XA02 - carboplatin; Belongs to the class of platinum-containing antineoplastic agents. Used in the treatment of cancer.

carboprost

CIMS Class : (Drugs Acting on the Uterus)
carboprost

P - Contraindicated in pregnancy

related carboprost information

Indication & Dosage	<i>Intramuscular</i> Pregnancy termination in the 2nd trimester Adult: As tromethamine: 250 mcg deep IM, repeated at 1.5 to 3.5-hr intervals depending on uterine response. May be increased to 500 mcg if necessary. Max: 12 mg. <i>Intramuscular</i> Postpartum haemorrhage Adult: As tromethamine: 250 mcg deep IM at 15- to 90-min intervals. Max Dosage: 2 mg.
Contraindications	Hypersensitivity. Acute pelvic inflammatory disease. Patients with acute cardiac, pulmonary, renal or hepatic disease. History of caesarian, major uterine surgery. Pregnancy.
Special Precautions	Cardiopulmonary disorders, glaucoma, asthma, epilepsy, severe hepatic or renal dysfunction, labour.
Adverse Drug Reactions	Nausea, vomiting, diarrhoea, abdominal pain, flushing, shivering, headache, dizziness and hypotension, temporary pyrexia, dyspnoea, pulmonary oedema. Potentially Fatal: Severe CVS disorders including fatal hypotension, tachypnea, pyrexia and MI (in patients with high risk factors) following intra-amniotic or intravaginal admin. Convulsions and ECG changes, amniotic fluid

	hypotension, tachypnea, pyrexia and MI (in patients with high risk factors) following intra-amniotic or intravaginal admin. Convulsions and ECG changes, amniotic fluid embolism and uterine rupture, foetal distress and rarely foetal death during induction of labour.
Drug Interactions	Action enhanced by prior inj of hyperosmolar urea. Potentially Fatal: Enhances action of oxytocin hence both drugs should be used sequentially and carefully monitored.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Intramuscular: Refrigerate at 2-8°C.
Mechanism of Action	Carboprost is a uterine stimulant which results in expulsion of the products of conception. It is also used to induce abortion between 13-20 wk of pregnancy. It produces myometrial contractions responsible for placental hemostasis.
CIMS Class	Drugs Acting on the Uterus
ATC Classification	G02AD04 - carboprost; Belongs to the class of prostaglandins. Used to induce abortion or augment labour and to minimize blood loss from the placental site.

carisoprodol

CIMS Class : (Muscle Relaxants)
carisoprodol

P - Caution when used during pregnancy

L - Contraindicated in lactation

related carisoprodol information

Indication & Dosage	<i>Oral</i> Painful muscle spasm associated with musculoskeletal conditions Adult: 350 mg 3-4 times daily for up to 2-3 wk. Elderly: Half of the usual dose.
Administration	May be taken with or without food.
Contraindications	Acute intermittent porphyria, hypersensitivity. Lactation.
Special Precautions	Renal and hepatic failure, childn <12 yrs. Pregnancy. Should be used with caution in addiction prone individuals.
Adverse Drug Reactions	Dizziness, drowsiness, nausea, epigastric distress, tachycardia, orthostatic hypotension, Hypersensitivity reactions, rash. Potentially Fatal: Idiosyncratic reaction (rare).
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C.
Mechanism of	Carisoprodol blocks interneuronal synaptic activity in the

Mechanism of Action	Carisoprodol blocks interneuronal synaptic activity in the descending reticular formation and spinal cord resulting in skeletal muscle relaxation. Duration: 4-6 hrs. Absorption: Absorbed from the GIT (oral); peak plasma concentrations after 30 min. Distribution: Enters breast milk (significant amounts). Metabolism: Hepatic; yields meprobamate. Excretion: Via urine (as metabolites).
CIMS Class	Muscle Relaxants
ATC Classification	M03BA02 - carisoprodol; Belongs to the class of carbamic esters used as centrally-acting muscle relaxants.

carvedilol

CIMS Class : (Beta-Blockers)
carvedilol

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food ∇ - Food interaction

related carvedilol information

Indication & Dosage

Oral

Hypertension

Adult: Initially, 12.5 mg once daily increased to 25 mg once daily after 2 days. Alternatively, initial dose of 6.25 mg bid increased to 12.5 mg bid after 1-2 wk, increased further if necessary to 50 mg once daily or in divided doses.

Elderly: 12.5 mg once daily.

Oral

Angina pectoris

Adult: Initially, 12.5 mg bid increased to 25 mg bid after 2 days.

Oral

Heart failure

Adult: Initially, 3.125 mg bid, doubled to 6.25 mg bid after 2 wk if tolerated, then gradually increased to the max dose the patient can tolerate at intervals of not <2 wk. Max dose: >85 kg: 50 mg bid; <85 kg: 25 mg bid.

Oral

Left ventricular dysfunction post myocardial infarction

Adult: Initially: 6.25 mg bid, if tolerated, after 3-10 days, increase to 12.5 mg bid and then to a target dose of 25 mg bid.

	Adult: Initially: 6.25 mg bid, if tolerated, after 3-10 days, increase to 12.5 mg bid and then to a target dose of 25 mg bid.
Administration	Should be taken with food.
Overdosage	Symptoms include severe hypotension, bradycardia, cardiac insufficiency, cardiogenic shock and cardiac arrest. Respiratory problems, bronchospasms, vomiting, lapses of consciousness and generalised seizures may also occur. Place the patient in a supine position. Gastric lavage or pharmacologically induced emesis may be used shortly after ingestion.
Contraindications	Hypersensitivity; severe chronic heart failure, bronchial asthma or related bronchospastic conditions; severe hepatic impairment. Patients with NYHA class IV cardiac failure, 2nd or 3rd ° AV block, sick sinus syndrome (unless a permanent pacemaker is in place), cardiogenic shock or severe bradycardia. Lactation.
Special Precautions	Avoid abrupt withdrawal as it may precipitate thyroid storm or exacerbate hyperthyroidism. Liver injury; vascular disease, renal failures, suspected phaeochromocytoma and Prinzmetal's variable angina; worsening cardiac failure or fluid retention during increase in dosage of carvedilol; diabetic patients. Pregnancy.
Adverse Drug Reactions	Bradycardia, AV block, angina pectoris, hypervolaemia, leucopenia, hypotension, peripheral oedema, allergy, malaise, fluid overload, melena, periodontitis, hyperuricaemia, hyponatraemia, increased alkaline phosphatase, glycosuria, prothrombin time, SGPT and SGOT levels, purpura, somnolence, impotence, albuminuria, hypokinesia, nervousness, sleep disorder, skin reaction, tinnitus, dry mouth, anaemia, sweating, fatigue, arthralgia, aggravation, dizziness. Diarrhoea, nausea, vomiting, insomnia, hypercholesterolaemia, weight gain, abnormal vision, rhinitis, pharyngitis and hypertriglyceridaemia.
Drug Interactions	Potentiates insulin-induced hypoglycaemic action. Concurrent use with catecholamine-depleting agents and β-receptor blockers may cause marked hypotension. Serum levels may be increased by fluoxetine. May increase serum

	Potentiates insulin-induced hypoglycaemic action. Concurrent use with catecholamine-depleting agents and β-receptor blockers may cause marked hypotension. Serum levels may be increased by fluoxetine. May increase serum levels of ciclosporin and digoxin. Potentially Fatal: Rifampin pretreatment results in a decreased $C_{\max}$ and AUC. Combination with verapamil can lead to severe bradycardia and myocardial depression.
Food Interaction	Food reduces rate of absorption and risk of hypotension.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store below 30°C.
Mechanism of Action	Carvedilol causes vasodilation by blocking the activity of α-blockers, mainly at α-1 receptors. It exerts antihypertensive effect partly by reducing total peripheral resistance and vasodilation. It is used in patients with renal impairment, NIDDM or IDDM. Absorption: Absorbed well from the GI tract (oral); peak plasma concentrations after 1-2 hr. Distribution: Enters breast milk. Protein-binding: >98%. Metabolism: Hepatic: Considerable first-pass effect. Excretion: Via bile (as metabolites); 6-10 hr (elimination half-life).
CIMS Class	Beta-Blockers
ATC Classification	C07AG02 - carvedilol; Belongs to the class of α and β blocking agents. Used in the treatment of cardiovascular

cefaclor

CIMS Class : (Cephalosporins)
cefaclor

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related cefaclor information

Indication & Dosage	<i>Oral</i> Urinary tract infections, Upper and lower respiratory tract infections, Skin infections, Otitis media Adult: As monohydrate: 250-500 mg every 8 hr. Max: 4 g daily. Child: >1 mth: 20 mg/kg daily in 3 divided doses, increased to 40 mg/kg daily if necessary, <1 yr: 62.5 mg tid, 1-5 yr: 125 mg tid, >5 yr: 250 mg tid.
Administration	May be taken with or without food.
Contraindications	Known hypersensitivity to cephalosporins.
Special Precautions	Severe renal impairment; history of allergy to penicillin; pregnancy, lactation.
Adverse Drug Reactions	Allergic reactions; diarrhoea, nausea, vomiting; candidiasis, eosinophilia; elevated transaminases. Potentially Fatal: Anaphylactic reaction; pseudomembranous colitis.
Drug Interactions	Probenecid slows tubular excretion. Potentially Fatal: May enhance nephrotoxicity of aminoglycosides and furosemide. Bleeding may occur if taken with anticoagulants.

	Probenecid slows tubular excretion. Potentially Fatal: May enhance nephrotoxicity of aminoglycosides and furosemide. Bleeding may occur if taken with anticoagulants.
Food Interaction	Plasma levels slightly reduced.
Lab Interference	False-positive results for direct Coombs' test and urine sugar (Benedict's, Fehling's or other reagents but not with enzyme-based methods). Interferes with Jaffe method of measuring creatinine.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Cefaclor binds to one or more of the penicillin-binding proteins (PBPs) which inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell wall, thus inhibiting biosynthesis and arresting cell wall assembly resulting in bacterial cell death. It has bactericidal activity against gm-ve bacteria including E. coli, S. pneumoniae, N. gonorrhoea, P. mirabilis and H. influenzae. Absorption: Well absorbed from the GIT (oral); rate but not extent of absorption is altered by food. Distribution: Widely distributed; crosses the placenta and enters breast milk (low concentrations). Protein-binding: 25% Excretion: Via the urine by the kidneys within 8 hrs (as 85% unchanged); the greater part of the dose within 2 hrs. Elimination half-life: 0.5-1 hr, slightly prolonged in renal impairment. May be removed by haemodialysis.
CIMS Class	Cephalosporins
ATC Classification	J01DC04 - cefaclor;

cefaalexin

CIMS Class : (Cephalosporins)
cefaalexin

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related cefalexin information

Indication & Dosage

Oral

Susceptible infections

Adult: 1-2 g daily given in divided doses at 6-, 8-, 12-hr intervals, increased to 6 g in deep-seated infections.

Child: 25-100 mg/kg daily in divided doses. Max: 4 g daily.

CrCl (ml/min)	Dosage Recommendation
40-50	Max: 3 g daily.
10-40	Max: 1.5 g daily.
<10	Max: 750 mg daily.

Oral

Prophylaxis of recurrent urinary tract infections

Adult: 125 mg at night.

CrCl (ml/min)	Dosage Recommendation
40-50	Max: 3 g daily.
10-40	Max: 1.5 g daily.
<10	Max: 750 mg daily.

Administration

May be taken with or without food. (May be taken w/ meals to reduce GI discomfort.)

Contraindications

Hypersensitivity to cephalosporins.

Special

Hypersensitivity to penicillins; pseudomembranous colitis;

Special Precautions	Hypersensitivity to penicillins; pseudomembranous colitis; renal failure; pregnancy and lactation.
Adverse Drug Reactions	Pain at inj site; hypersensitivity; GI disturbances; eosinophilia, neutropenia, leucopenia, thrombocytopenia. Potentially Fatal: Anaphylactic reactions; nephrotoxicity.
Drug Interactions	Probenecid produces higher and prolonged serum levels. Potentially Fatal: Increased nephrotoxicity with aminoglycosides and furosemide.
Food Interaction	Rate of absorption is delayed by food.
Lab Interference	False-positive for urine sugar, Coomb's test and serum or creatinine with Jaffe reaction.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 25°C.
Mechanism of Action	Cefalexin binds to one or more of the penicillin-binding proteins (PBPs) which inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell wall, thus inhibiting biosynthesis and arresting cell wall assembly resulting in bacterial cell death. Absorption: Almost completely absorbed from the GI tract with peak plasma concentrations after 1 hr (oral); may be delayed if taken with food. Distribution: Widely distributed but does not penetrate the CSF; bile (therapeutic concentrations). Crosses the placenta and enters the breast milk (small amounts). Protein-binding: Up to 15% Metabolism: Not metabolised. Excretion: Via the urine within 6 hr by glomerular filtration and renal tubular secretion (>80% as unchanged); via the bile. May be removed by haemodialysis and peritoneal

	metabolism: Not metabolised. Excretion: Via the urine within 6 hr by glomerular filtration and renal tubular secretion (>80% as unchanged); via the bile. May be removed by haemodialysis and peritoneal dialysis; 1 hr (elimination half-life).

Lab α - Lab interference

related cefazolin information

Indication & Dosage

Parenteral

Susceptible infections

Adult: As sodium: 0.5-1 g deep IM, slow IV Inj over 3-5 min or as iv infusion every 6-12 hr. Max: Up to 6-12 g daily for life-threatening infections.

Child: >1 mth: 25-50 mg/kg daily in 3 or 4 divided doses. Max: Up to 100 mg/kg daily for severe infections.

Renal impairment: Children: CrCl: 40-70 ml/min: 60% of normal daily dose given in 2 divided doses; 20-40 ml/min: 25% of normal daily dose given in 2 divided doses and 5-20 ml/min: 10% of normal daily dose every 24 hr. See table for adult dosing recommendations.

CrCl (ml/min)	Dosage Recommendation
35-54	Increase dosing interval to at least 8 hr.
11-34	Half the usual dose every 12 hr.
≤ 10	Half the usual dose every 18-24 hr.

Parenteral

Prophylaxis of surgical infections

Adult: As sodium: 1 g given 0.5-1 hr before surgery followed by 0.5-1 g during surgery for lengthy procedures; 0.5-1 g every 6-8 hrly may be given after surgery for 24 hr or up to 5 days.

	Adult: As sodium: 1 g given 0.5-1 hr before surgery followed by 0.5-1 g during surgery for lengthy procedures; 0.5-1 g every 6-8 hrly may be given after surgery for 24 hr or up to 5 days. Elderly: Renal impairment: Children: CrCl: 40-70 ml/min: 60% of normal daily dose given in 2 divided doses; 20-40 ml/min: 25% of normal daily dose given in 2 divided doses and 5-20 ml/min: 10% of normal daily dose every 24 hr. See table for adult dosing recommendations. <table><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr><tr><td>35-54</td><td>Increase dosing interval to at least 8 hr.</td></tr><tr><td>11-34</td><td>Half the usual dose every 12 hr.</td></tr><tr><td>≤10</td><td>Half the usual dose every 18-24 hr.</td></tr></table>	CrCl (ml/min)	Dosage Recommendation	35-54	Increase dosing interval to at least 8 hr.	11-34	Half the usual dose every 12 hr.	≤10	Half the usual dose every 18-24 hr.	
CrCl (ml/min)	Dosage Recommendation									
35-54	Increase dosing interval to at least 8 hr.									
11-34	Half the usual dose every 12 hr.									
≤10	Half the usual dose every 18-24 hr.									
Contraindications	Hypersensitivity.									
Special Precautions	Impaired renal function; pregnancy, lactation. Consider possibility of pseudomembranous colitis in patients who present with diarrhoea after antimicrobial usage. Risk of seizures in patients on high doses, especially in renally impaired patients. May decrease prothrombin activity; monitor prothrombin time in patients at risk e.g. those on anticoagulant treatment, prolonged antimicrobial treatment or those with renal or hepatic impairment.									
Adverse Drug Reactions	Superinfection; nausea, vomiting, abdominal pain, anorexia, diarrhoea; rash, leukopenia, thrombocytopaenia, haemorrhage, elevated transaminases. Potentially Fatal: Anaphylactic reaction; pseudomembranous colitis.									
Drug Interactions	Probenecid reduces tubular secretion of cefazolin thereby prolonging its half-life. Disulfiram-like reaction with alcohol. Potentially Fatal: Concurrent use with furosemide and aminoglycosides increase risk of nephrotoxicity.									
Lab Interference	False-positive results for direct Coombs' test and urine sugar (Benedict's, Fehling's or other reagents but not with enzyme-based methods). Interferes with Jaffe method of measuring creatinine.									
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not									

Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Parenteral: Store at 25°C.
Mechanism of Action	Cefazolin binds to one or more of the penicillin-binding proteins (PBPs) which inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell wall, thus inhibiting biosynthesis and arresting cell wall assembly resulting in bacterial cell death. Absorption: Poorly absorbed from the GI tract (oral). Distribution: Bile (high concentrations); bone; ascitic, pleural and synovial fluids; CSF (small amounts). Crosses the placenta into the foetal circulation; enters the breast milk (low concentrations). Protein-binding: 85% Excretion: Via the urine by glomerular filtration, with some renal tubular secretion (as unchanged); 80% of a dose within 24 hr (IM). Removed to some extent by haemodialysis.
CIMS Class	Cephalosporins
ATC Classification	J01DB04 - cefazolin;

related cefepime information

Indication & Dosage

Intravenous

Urinary tract infections

Adult: 0.5-1 g every 12 hr for 7-10 days. May be given via direct inj over 5 minutes or infuse over 30 minutes.

Child: 2 mth - 16 yr: ≤ 40 kg: 50 mg/kg every 12 hr for 7-10 days. May be given via direct inj over 5 minutes or infuse over 30 minutes. Dose may also be given via IM inj for mild-moderate infections; for IM inj, it should be given via deep inj into large muscle mass.

Renal impairment: Haemodialysis: 1 g on the 1st day of treatment, followed by 500 mg every 24 hr; dose should be given after haemodialysis on dialysis days and preferably at the same time each day. CAPD: Normal recommended doses every 48 hr.

CrCl (ml/min)	Dosage Recommendation
30-60	0.5-1 g every 24 hr.
11-29	0.5 g every 24 hr.
≤ 10	0.25 g every 24 hr.

Intravenous

Empiric therapy for febrile neutropenic patients

Adult: 2 g every 8 hr for 7 days or until resolution of neutropenia. For patients who remain neutropenic for >7 days despite fever resolution, the need for continued anti-microbial treatment should be reviewed. May be given via direct inj

Adult: 2 g every 8 hr for 7 days or until resolution of neutropenia. For patients who remain neutropenic for >7 days despite fever resolution, the need for continued anti-microbial treatment should be reviewed. May be given via direct inj over 5 minutes or infuse over 30 minutes.

Child: 2 mth - 16 yr: =40 kg: 50 mg/kg every 8 hr for 7 days or until neutropenia resolves. May be given via direct inj over 5 minutes or infuse over 30 minutes.

Renal impairment: Haemodialysis: 1 g every 24 hr, dose should be given after haemodialysis on dialysis days and preferably at the same time each day. CAPD: Normal recommended doses every 48 hr.

CrCl (ml/min)	Dosage Recommendation
30-60	2 g every 12 hr.
11-29	2 g every 24 hr.
≤10	1 g every 24 hr.

Intravenous

Moderate to severe pneumonia

Adult: 1-2 g every 12 hr for 10 days. May be given via direct inj over 5 minutes or infuse over 30 minutes.

Child: 2 mth - 16 yr: =40 kg: 50 mg/kg every 12 hr for 10 days. May be given via direct inj over 5 minutes or infuse over 30 minutes.

Renal impairment: Haemodialysis: 1 g on the 1st day of treatment, followed by 500 mg every 24 hr; dose should be given after haemodialysis on dialysis days and preferably at the same time each day. CAPD: Normal recommended doses every 48 hr.

CrCl (ml/min)	Dosage Recommendation
30-60	1-2 g every 24 hr.
11-29	0.5-1 g every 24 hr.
≤10	0.25-0.5 g every 24 hr.

Intravenous

Complicated intra-abdominal infections

Adult: 2 g every 12 hr for 7-10 days. Usually used in combination with metronidazole. May be given via direct inj over 5 minutes or infuse over 30 minutes.

Renal impairment: Haemodialysis: 1 g on the 1st day of

2 g every 12 hr for 10 days. Usually used in combination with metronidazole. May be given via direct inj over 5 minutes or infuse over 30 minutes.

Renal impairment: Haemodialysis: 1 g on the 1st day of treatment, followed by 500 mg every 24 hr; dose should be given after haemodialysis on dialysis days and preferably at the same time each day. CAPD: Normal recommended doses every 48 hr.

CrCl (ml/min)	Dosage Recommendation
30-60	2 g every 24 hr.
11-29	1 g every 24 hr.
≤10	0.5 g every 24 hr.

Intravenous

Uncomplicated skin and skin structure infections

Adult: 2 g every 12 hr for 10 days. May be given via direct inj over 5 minutes or infuse over 30 minutes.

Child: 2 mth - 16 yr: ≤40 kg: 50 mg/kg every 12 hr for 10 days. May be given via direct inj over 5 minutes or infuse over 30 minutes.

Renal impairment: Haemodialysis: 1 g on the 1st day of treatment, followed by 500 mg every 24 hr; dose should be given after haemodialysis on dialysis days and preferably at the same time each day. CAPD: Normal recommended doses every 48 hr.

CrCl (ml/min)	Dosage Recommendation
30-60	2 g every 24 hr.
11-29	1 g every 24 hr.
≤10	0.5 g every 24 hr.

Incompatibility: Y-site admin: Acyclovir, amphotericin B, amphotericin B cholesteryl sulfate complex, chlordiazepoxide, chlorpromazine, cimetidine, famotidine, ciprofloxacin, filgrastim, floxuridine, ganciclovir, haloperidol, hydroxyzine, idarubicin, ifosfamide, magnesium sulfate, mannitol, mechlorethamine, meperidine, metoclopramide, mitomycin, mitoxantrone, morphine, nalbuphine, ofloxacin, ondansetron, plicamycin, prochlorperazine edisylate, promethazine, streptozocin, vancomycin, vinblastine, vincristine, cisplatin, dacarbazine, daunorubicin, diazepam,

	mitomycin, mitoxantrone, morphine, nalbuphine, ofloxacin, ondansetron, plicamycin, prochlorperazine edisylate, promethazine, streptozocin, vancomycin, vinblastine, vincristine, cisplatin, dacarbazine, daunorubicin, diazepam, diphenhydramine, dobutamine, dopamine, doxorubicin, droperidol, enalaprilat, etoposide, etoposide phosphate. Admixture incompatibility: Metronidazole, vancomycin, gentamicin, tobramycin, netilmicin sulfate, aminophylline or solutions of ampicillin at concentrations >40 mg/ml.
Overdosage	Symptoms include encephalopathy, myoclonus, seizures and neuromuscular excitability. Careful observation and supportive treatment are recommended. In the presence of renal insufficiency, haemodialysis may be used to remove cefepime from the body.
Contraindications	Hypersensitivity to cefepime or other cephalosporins.
Special Precautions	Renal impairment; history of penicillin or cephalosporin allergy; lactation, pregnancy. Caution when used in patients with history of GI diseases, especially colitis. May decrease prothrombin activity; monitor prothrombin time in patients with poor nutritional state, renal or hepatic impairment and those on prolonged treatment. Prolonged treatment may result in overgrowth of nonsusceptible organisms, resulting in superinfection. Consider the possibility of <i>Clostridium difficile</i> associated diarrhoea in patients who present with diarrhoea after treatment. Caution when used in patients with a history of seizures.
Adverse Drug Reactions	Positive Coombs' test without haemolysis; rash, pruritus; diarrhoea, nausea, vomiting; fever, headache; pain and erythema at inj site; agranulocytosis; anaphylactic shock; leucopenia; neutropenia; thrombocytopenia.
Drug Interactions	Increased effect with high-dose probenecid; increased nephrotoxic potential with aminoglycosides.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a

	demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: In dry state: Store at 2-25°C and protected from light. After reconstitution: Cefepime solution is stable for 24 hr at controlled room temperature (2-25°C) and for 7 days under refrigeration (2-8°C).
Mechanism of Action	Cefepime is a 4th generation cephalosporin which inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell wall by binding to one or more of the penicillin-binding proteins (PBPs). Absorption: IM admin: Rapid and almost complete absorption. Distribution: 16-19% bound to plasma proteins. Volume of distribution: 14-20 L; crosses the blood brain barrier. Penetrates into inflammatory fluid at concentrations of about 80% of serum levels. Metabolism: Minimally hepatic. Excretion: Plasma half-life: 2 hr. Excreted in urine with 85% as unchanged drug.
CIMS Class	Cephalosporins
ATC Classification	J01DE01 - cefepime;

cefetamet

CIMS Class : (Cephalosporins)
cefetamet

L - Caution when used during lactation

related cefetamet information

Indication & Dosage	<i>Oral</i> Ear, nose and/or throat infections, Otitis media, Sinusitis, Pharyngo tonsillitis, Lower respiratory tract infections, Acute bacterial exacerbation of chronic bronchitis, Tracheobronchitis, Pneumonia, Urinary tract infections, Gonococcal urethritis in men Adult: 500 mg bid.
Contraindications	Known hypersensitivity to cephalosporins.
Special Precautions	Hypersensitivity to penicillins. Renal insufficiency; lactation.
Adverse Drug Reactions	Diarrhoea, nausea, vomiting, hypersensitivity reactions.
Storage	Oral: Store at 25°C.
Mechanism of Action	Cefetamet is a 3rd generation cephalosporin. It inhibits the final transpeptidation step of peptidoglycan synthesis in the bacterial cell wall by binding to one or more of the penicillin-binding proteins (PBPs).
CIMS Class	Cephalosporins
ATC Classification	J01DD10 - cefetamet;

cefixime

CIMS Class : (Cephalosporins)
cefixime

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related cefixime information

Indication & Dosage

Oral

Susceptible infections

Adult: 200-400 mg/day as a single dose or in 2 divided doses.

Child: 8 mg/kg/day as a single dose or in 2 divided doses;
<6 mth: Not recommended. Treatment should be continued for 48 hr after disappearance of symptoms.

Renal impairment: Dose reduction is necessary.

CrCl (ml/min)	Dosage Recommendation
<20	Max: 200 mg daily.

Oral

Uncomplicated gonorrhoea

Adult: 400 mg as a single dose.

Renal impairment: Dose reduction is necessary.

CrCl (ml/min)	Dosage Recommendation
<20	Max: 200 mg daily.

Administration

Should be taken with food.

Contraindications

Hypersensitivity to cephalosporin.

Special Precautions

History of allergy to penicillins; pregnancy, lactation; renal failure; GI disease.

Special Precautions	History of allergy to penicillins; pregnancy, lactation; renal failure; GI disease.
Adverse Drug Reactions	Diarrhoea, nausea, vomiting, abdominal pain; headache, dizziness, thrombocytopenia, eosinophilia. Potentially Fatal: Pseudomembranous colitis.
Drug Interactions	Increased concentrations with probenecid. Potentially Fatal: May increase prothrombin time with anticoagulants.
Food Interaction	Absorption delayed in the presence of food.
Lab Interference	False-positive serum or urine creatinine with Jaffe reaction.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store below 25°C.
Mechanism of Action	Cefixime binds to one or more of the penicillin-binding proteins (PBPs) which inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell wall, thus inhibiting biosynthesis and arresting cell wall assembly resulting in bacterial cell death. Absorption: Only 40-50% is absorbed from the GI tract (oral); rate may be decreased if taken with food. Greater absorption from oral suspension than tablets. Distribution: Bile, urine (high concentrations); crosses the placenta. Protein-binding: 65%. Excretion: 20% of an oral dose excreted via urine unchanged; 60% nonrenal elimination; some is excreted via the faeces from the bile. Substantially removed by dialysis.
CIMS Class	Cephalosporins
ATC Classification	J01DD08 - cefixime;

cefoperazone

CIMS Class : (Cephalosporins)
cefoperazone

P - Caution when used during pregnancy

L - Caution when used during lactation

related cefoperazone information

Indication & Dosage	<i>Parenteral</i> Susceptible infections Adult: As sodium: 2-4 g daily in 2 divided doses, increased to 12 g daily in 2-4 divided doses for severe infections given as deep IM or IV infusion. Renal impairment: With liver impairment: 1-2 g daily. Hepatic impairment: Max dose for liver impairment or biliary obstruction: 4 g daily.
Contraindications	Hypersensitivity to cephalosporin.
Special Precautions	History of penicillin allergy; renal or hepatic impairment; pregnancy, lactation; cystic fibrosis.
Adverse Drug Reactions	Skin rash, urticaria; eosinophilia, diarrhoea, nausea, vomiting; phlebitis; hypoprothrombinaemia; superinfection. Potentially Fatal: Neuromuscular hypersensitivity; nephrotoxicity.
Drug Interactions	Disulfiram-like reaction with alcohol. Potentiates anticoagulants. Potentially Fatal: Enhances nephrotoxicity by aminoglycosides and furosemide.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not

	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Parenteral: Store below 25°C.
Mechanism of Action	Cefoperazone binds to one or more of the penicillin-binding proteins (PBPs) which inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell wall, thus inhibiting biosynthesis and arresting cell wall assembly resulting in bacterial cell death. Distribution: Widely distributed into body tissues and fluids; poor CSF penetration. Crosses the placenta and enters breast milk (low concentrations); bile (high concentrations). Protein-binding: 82-93% Excretion: Mainly via the bile. Via the urine within 12-24 hrs by glomerular filtration (30% as unchanged); proportion may be increased in hepatic or biliary disease.
CIMS Class	Cephalosporins
ATC Classification	J01DD12 - cefoperazone;

cefoperazone + sulbactam

CIMS Class : (Cephalosporins)
cefoperazone + sulbactam

related cefoperazone + sulbactam information

Indication & Dosage

Intravenous

Skin and soft tissue infections, Respiratory tract infections, Meningitis, Intra-abdominal infections, Urinary tract infections, Septicaemia, Bone and joint infections, Gynaecological infections

Adult: Ratio of sulbactam:cefoperazone is 1:1. Doses are expressed in terms of cefoperazone. Mild to moderate infections: 1-2 g daily, given in equally divided doses every 12 hr. Severe infections: Up to 4 g daily, given in equally divided doses every 12 hr; max dose of sulbactam: 4 g daily.

Child: Ratio of sulbactam:cefoperazone is 1:1. Doses are expressed in terms of cefoperazone. Recommended doses: 20-40 mg/kg/day, given in equally divided doses every 6-12 hr. For serious infections: Up to 160 mg/kg/day, given in 2-4 equally divided doses may be used. Max dose of sulbactam: 80 mg/kg/day

Renal impairment: Dose adjustments may be needed.

Reconstitution: For IV infusion, each vial should be reconstituted with suitable amount of sterile water for inj, normal saline, 5% dextrose in water, and then diluted to 20 ml using the same diluent followed by admin over 15-60 minutes. For IV inj, each vial should be reconstituted as above and given over at least 3 minutes.

Contraindications

Hypersensitivity. Known allergy to penicillins.

Contraindications	Hypersensitivity. Known allergy to penicillins.
Special Precautions	Pregnancy, lactation.
Adverse Drug Reactions	Rash, skin reactions, fever, eosinophilia, urticaria, and pruritus. Haematological - Slight decreases in Hb conc and haematocrit value. GI effects, diarrhoea or loose stools, nausea, and vomiting. Mild, transient elevations of serum SGOT, SGPT, and alkaline phosphatase concentrations. Renal effects - Transient elevations in BUN and serum creatinine concentrations.
Drug Interactions	With aminoglycosides: Concomitant admin may increase risk of nephrotoxicity. With heparin/warfarin: Concurrent use may cause marked hypoprothrombinemia and/or prolonged bleeding time.
Storage	Intravenous: Before reconstitution: Store below 25°C. Reconstituted solutions are stable for 7 days at 2-8°C and for 24 hr at 8-25°C. All unused portions after the above stated time periods should be discarded.
Mechanism of Action	Cefoperazone, a bactericidal antibiotic, inhibits bacterial cell wall synthesis of actively dividing cells by binding to one or more penicillin binding proteins (PBPs). Sulbactam is a β -lactamase inhibitor and acts primarily by irreversible inactivation of β -lactamases.
CIMS Class	Cephalosporins
ATC Classification	J01CG01 - sulbactam; Belongs to the class of beta-lactamase inhibitors. Used in the treatment of systemic infections. J01DD12 - cefoperazone;

Max Dosage: Adult: 12 g.

Renal impairment: Dose reduction is necessary.

Parenteral

Bone and joint infections

Adult: 1-2 g every 4-12 hr depending on the severity of the infection. May be given via deep IM inj or slow IV inj over 3-5 minutes or by IV infusion over 20-60 minutes. Max: 12 g daily.

Child: =1 mth: 50 mg/kg/dose, given every 8-12 hr; 1 mth-12 yr and <50 kg: 50-180 mg/kg/day, given in 4-6 equally divided doses. Higher doses may be used in more severe infections. =50 kg: 1-2 g every 4-12 hr depending on

	Adult: 1-2 g every 6-12 hr; 50-180 mg/kg/day, given every 6-12 hr, 1-mth-12 yr and <50 kg: 50-180 mg/kg/day, given in 4-6 equally divided doses. Higher doses may be used in more severe infections. ≥50 kg: 1-2 g every 4-12 hr depending on the severity of the infection. May be given via deep IM inj or slow IV inj over 3-5 minutes or by IV infusion over 20-60 minutes. Max Dosage: Adult: 12 g. Renal impairment: Dose reduction is necessary. <i>Parenteral</i> Prophylaxis of surgical infections Adult: 1 g, given 30-90 minutes before surgery. May be given via IM or IV inj or infusion. Renal impairment: Dose reduction is necessary. <i>Parenteral</i> Gonorrhoea Adult: A single dose of 0.5-1 g, given via IM inj or slow IV inj or infusion. Renal impairment: Dose reduction is necessary.
Contraindications	Hypersensitivity to cephalosporins.
Special Precautions	History of penicillin allergy; colitis; impaired renal function; pregnancy, lactation.
Adverse Drug Reactions	Pain at inj site; hypersensitivity reactions, rash, pruritus; diarrhoea, nausea, vomiting; candidiasis; eosinophilia, neutropenia, leucopenia, thrombocytopenia. Potentially Fatal: Anaphylactic reaction; nephrotoxicity.
Drug Interactions	Probenecid decreases cefotaxime elimination. Potentially Fatal: Nephrotoxicity with furosemide and aminoglycosides.
Lab Interference	False-positive result for urine-glucose, serum or urine creatinine with Jaffe reaction.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).

Storage	Parenteral: Store below 30°C.
Mechanism of Action	Cefotaxime binds to one or more of the penicillin-binding proteins (PBPs) which inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell wall, thus inhibiting biosynthesis and arresting cell wall assembly resulting in bacterial cell death. Absorption: Rapidly absorbed (IM); peak plasma concentrations after 30 min (IM), 4 hr (IV). Distribution: Widely distributed into body tissues and fluids; CSF (therapeutic concentrations, esp when the meninges are inflamed). Crosses the placenta and enters breast milk. Protein-binding: 40%. Metabolism: Hepatic (partial); converted to desacetylcefotaxime and inactive metabolites. Excretion: Mainly by the kidneys via the urine (40% as unchanged drug within 24 hr); further 20% as desacetylcefotaxime. Removed by haemodialysis.
CIMS Class	Cephalosporins
ATC Classification	J01DD01 - cefotaxime;

cefotaxime + sulbactam

CIMS Class : (Cephalosporins)
cefotaxime + sulbactam

P - Caution when used during pregnancy

L - Caution when used during lactation

related cefotaxime + sulbactam information

Indication & Dosage	<i>Oral</i> Genitourinary infections, Lower respiratory tract infections Adult: Mild to moderate infections: 1/0.5 g to 2/1 g of cefotaxime/sulbactam every 8-12 hrs. Moderate to severe infections: 1/0.5 g to 2/1 g of cefotaxime/sulbactam every 6-8 hrs. Child: 100/50 mg to 150/75 mg of cefotaxime/sulbactam /kg/day in 3 divided doses. Life-threatening infections: Dose of cefotaxime may be increased up to 12 g/day. Max Dosage: Sulbactam: Adult: 4 g. Child: 80 mg/kg/day in divided doses. Renal impairment: Dose adjustment may be needed.
Contraindications	Hypersensitivity to cefotaxime, sulbactam or the combination.
Special Precautions	Previous hypersensitivity to penicillins or other drugs; patients with renal insufficiency; history of GI disease, esp colitis. Pregnancy and lactation.
Adverse Drug Reactions	Local reactions including pain at the Inj site and phloebitis. Others: Skin rash, diarrhoea, nausea, vomiting and colitis.
Drug Interactions	Concomitant admin of cephalosporins and aminoglycoside antibiotics.
Mechanism of	Cefotaxime is a bactericidal drug, which inhibits the bacterial

Mechanism of Action	Cefotaxime is a bactericidal drug, which inhibits the bacterial wall synthesis of the actively dividing cells by binding to one or more penicillin-binding proteins. Sulbactam is a semisynthetic β -lactam sulphone, which inhibits β -lactamases of the Richmond types II, III, IV and V (plasmid or chromosomally mediated). This inhibition is reported to be both reversible and irreversible. It acts as a suicide inhibitor by forming a reversible inactive enzyme-sulbactam complex. This reversible acyl-intermediate may then revert to a more stable complex, which irreversibly inhibits the β -lactamase. Sulbactam is able to protect the activity of various β -lactam antibiotics by rendering β -lactamases inactive.
CIMS Class	Cephalosporins
ATC Classification	J01CG01 - sulbactam; Belongs to the class of beta-lactamase inhibitors. Used in the treatment of systemic infections. J01DD01 - cefotaxime;

cefpirome

CIMS Class : (Cephalosporins)
cefpirome

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab - Lab interference

related cefpirome information

Indication & Dosage

Intravenous

Susceptible infections

Adult: As sulfate: 1-2 g every 12 hr via IV inj over 3-5 minutes or infuse over 20-30 minutes.

Renal impairment: Loading dose: 1-2 g followed by a maintenance dose adjusted according to CrCl.

CrCl (ml/min)	Dosage Recommendation
20-50	0.5-1 g bid.
5-20	0.5-1 g once daily.
<5 (in haemodialysis patients)	0.5 or 1 g once daily with half-dose after each dialysis session.

Contraindications

Hypersensitivity; porphyria.

Special Precautions

Allergy to penicillin or to cephalosporins; renal impairment, monitor renal and haematological status; pregnancy and lactation.

Adverse Drug Reactions

Rash, pruritus, urticaria; nausea, vomiting, abdominal pain, diarrhoea; increased plasma levels of ASAT, ALAT, gamma-GT, LDH, bilirubin and/or alkaline phosphatase; interstitial nephritis, acute renal failure; thrombocytopaenia, eosinophilia, haemolytic anaemia, neutropaenia, agranulocytosis; thrombophlebitis, pain at Inj site; convulsions, fever; haemorrhage.

	interstitial nephritis, acute renal failure; thrombocytopenia, eosinophilia, haemolytic anaemia, neutropenia, agranulocytosis; thrombophlebitis, pain at Inj site; convulsions, fever; haemorrhage. Potentially Fatal: Pseudomembranous colitis.
Drug Interactions	Reduced clearance with probenecid.
Lab Interference	Interferes with Jaffe method of creatinine conc measurement in determining renal function.
Storage	Intravenous: Store below 25°C.
Mechanism of Action	Cefpirome binds to one or more of the penicillin-binding proteins (PBPs) which inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell wall, thus inhibiting biosynthesis and arresting cell wall assembly resulting in bacterial cell death. Distribution: Widely distributed into body tissues and fluids; enters breast milk. Protein-binding: 10% Excretion: Mainly by the kidneys via the urine (80-90% as unchanged); significantly removed by haemodialysis; 2 hrs (elimination half-life); prolonged in renal impairment.
CIMS Class	Cephalosporins
ATC Classification	J01DE02 - cefpirome;

	10-39	Increase dosing intervals to 24 hrly.
	<10	Increase dosing intervals to 48 hrly.
	<i>Oral</i> Otitis media Child: 8-10 mg/kg/day in 2 divided doses. Max dose: 400 mg daily. Renal impairment: Patients on haemodialysis: Dose should be given after each dialysis session.	
	CrCl (ml/min)	Dosage Recommendation
	10-39	Increase dosing intervals to 24 hrly.
	<10	Increase dosing intervals to 48 hrly.
	<i>Oral</i> Uncomplicated gonorrhoea Adult: A single dose of 200 mg may be used. Renal impairment: Dose reduction may be required.	
Overdosage	Toxic symptoms may include nausea, vomiting, epigastric distress and diarrhoea. Haemodialysis or peritoneal dialysis may aid in the removal of cefpodoxime from the body, particularly if renal function is compromised.	
Contraindications	Hypersensitivity.	
Special Precautions	History of allergy to penicillin; severe renal impairment; pregnancy and lactation.	
Adverse Drug Reactions	Anaphylactic shock; purpuric nephritis, skin rash, pruritus; diarrhoea, nausea, abdominal pain, vomiting. Potentially Fatal: Pseudomembranous colitis;	

	Anaphylactic shock; purpuric nephritis, skin rash, pruritus; diarrhoea, nausea, abdominal pain, vomiting. Potentially Fatal: Pseudomembranous colitis; nephrotoxicity.
Drug Interactions	Antacids or H ₂ -blockers may decrease the absorption of cefpodoxime. Probenecid inhibits renal excretion. Potentially Fatal: Monitor renal function during admin. Additive nephrotoxic effects with furosemide.
Food Interaction	Food delays absorption; cefpodoxime levels may be increased with food.
Lab Interference	Urinary glucose test by Benedict's and Fehling's tests solution may produce false-positive result. May induce a positive direct Coombs' test.
Storage	Oral: Store at 20-25°C.
Mechanism of Action	Cefpodoxime binds to one or more of the penicillin-binding proteins (PBPs) which inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell wall, thus inhibiting biosynthesis and arresting cell wall assembly resulting in bacterial cell death. Absorption: Decreased absorption in conditions of low gastric acidity. Bioavailability: about 50%. Distribution: Respiratory and GU tract (therapeutic concentrations); enters breast milk (low concentrations). Protein-binding: 20-30%. Metabolism: De-esterified to cefpodoxime in the intestinal lumen. Excretion: Via the urine (as unchanged); removed by dialysis; 2-3 hr (elimination half-life); prolonged in renal impairment.
CIMS Class	Cephalosporins

cefprozil

CIMS Class : (Cephalosporins)
cefprozil

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related cefprozil information

Indication & Dosage	<i>Oral</i> Skin and soft tissue infections, Susceptible infections Adult: 500 mg/day as a single dose or in 2 divided doses, increased to 500 mg bid if necessary. Child: 20 mg/kg/day once or twice daily, up to a max dose of 500 mg once daily, if necessary, bid for otitis media. <table border="1"><thead><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr></thead><tbody><tr><td><30</td><td>Half normal dose.</td></tr></tbody></table>	CrCl (ml/min)	Dosage Recommendation	<30	Half normal dose.
CrCl (ml/min)	Dosage Recommendation				
<30	Half normal dose.				
Administration	May be taken with or without food. (May be taken w/ meals to reduce GI discomfort.)				
Contraindications	Hypersensitivity.				
Special Precautions	Hypersensitivity to penicillins; renal impairment; porphyria. Monitor renal and haematologic status. Pregnancy, lactation.				
Adverse Drug Reactions	Nausea; vomiting; diarrhoea; hypersensitivity reactions; nephrotoxicity; convulsions; CNS toxicity; hepatic dysfunction; haematologic disorders; pain at Inj site (IM); thrombophlebitis (IV infusion); superinfection with prolonged use. Potentially Fatal: Pseudomembranous colitis.				
Drug Interactions	Renal excretion delayed by probenecid. Decreases				

Drug Interactions	Renal excretion delayed by probenecid. Decreases contraceptive effect of oestrogen-containing oral contraceptives.
Lab Interference	Positive direct antiglobulin Coombs' test; falsely high values with Jaffe method of measuring creatinine concentrations; +ve reactions for false glucose using copper-reduction reactions; transient increases in liver enzyme values.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Cefprozil inhibits cell wall synthesis and has activity against a broad range of gram-positive and gram-negative bacteria. Absorption: Well absorbed from the GI tract. Bioavailability: 90-95%. Distribution: 35-45% bound to plasma proteins. Widely distributed in the body tissues. Excretion: Plasma half-life: 1-1.4 hr; prolonged in renal impairment. About 60% excreted unchanged in the urine.
CIMS Class	Cephalosporins
ATC Classification	J01DC10 - cefprozil;

ceftazidime

CIMS Class : (Cephalosporins)
ceftazidime

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab - Lab interference

related ceftazidime information

Indication & Dosage

Parenteral

Pseudomonal lung infections in cystic fibrosis

Adult: 90-150 mg/kg/day in 3 divided doses via IM or IV inj or IV infusion, up to 9 g/day. Doses >1 g should be given via IV route.

Max Dosage: 9 g daily. Doses >1 g should be administered IV.

Renal impairment: Loading dose: 1 g; maintenance doses based on CrCl. May need to increase doses by 50% in severe infections. Peritoneal dialysis: Loading dose is followed by 500 mg every 24 hr; may add ceftazidime to the dialysis fluid (usually 125-250 mg for 2 litres of dialysis fluid). Haemodialysis: Admin loading dose then 0.5-1 g after each dialysis period.

CrCl (ml/min)	Dosage Recommendation
31-50	1 g every 12 hr.
16-30	1 g every 24 hr.
6-15	500 mg every 24 hr.
<5	500 mg every 48 hr.

Parenteral

Prophylaxis of surgical infection in patients undergoing prostate surgery

Parenteral

Prophylaxis of surgical infection in patients undergoing prostate surgery

Adult: 1 g at induction of anesthes repeated if necessary upon removal of catheter.

Renal impairment: Loading dose: 1 g; maintenance doses based on CrCl. May need to increase doses by 50% in severe infections. Peritoneal dialysis: Loading dose is followed by 500 mg every 24 hr; may add ceftazidime to the dialysis fluid (usually 125-250 mg for 2 litres of dialysis fluid). Haemodialysis: Admin loading dose then 0.5-1 g after each dialysis period.

CrCl (ml/min)	Dosage Recommendation
31-50	1 g every 12 hr.
16-30	1 g every 24 hr.
6-15	500 mg every 24 hr.
<5	500 mg every 48 hr.

Parenteral

Endophthalmitis

Adult: 1-6 g daily in divided doses every 8 or 12 hr as deep IM, slow IV Inj over 3-5 min or infusion for up to 30 min.

Child: 30-100 mg/kg/day in 2 or 3 divided doses increased up to 150 mg/kg daily in severe cases. Neonates and infants <2 mth: 25-60 mg/kg/day in 2 divided doses. Max dose: 6 g daily in divided doses.

Elderly: Max dose: 3 g daily.

Renal impairment: Loading dose: 1 g; maintenance doses based on CrCl. May need to increase doses by 50% in severe infections. Peritoneal dialysis: Loading dose is followed by 500 mg every 24 hr; may add ceftazidime to the dialysis fluid (usually 125-250 mg for 2 litres of dialysis fluid). Haemodialysis: Admin loading dose then 0.5-1 g after each dialysis period.

CrCl (ml/min)	Dosage Recommendation
31-50	1 g every 12 hr.
16-30	1 g every 24 hr.
6-15	500 mg every 24 hr.
<5	500 mg every 48 hr.

Parenteral

Upper respiratory tract infections

Adult: 1-6 g daily in divided doses every 8 or 12 hr as deep IM, slow IV Inj over 3-5 min or infusion for up to 30 min.

Child: 30-100 mg/kg/day in 2 or 3 divided doses increased up to 150 mg/kg daily in severe cases. Neonates and infants <2 mth: 25-60 mg/kg/day in 2 divided doses. Max dose: 6 g daily in divided doses.

Elderly: Max dose: 3 g daily.

Renal impairment: Loading dose: 1 g; maintenance doses based on CrCl. May need to increase doses by 50% in severe infections. Peritoneal dialysis: Loading dose is followed by 500 mg every 24 hr; may add ceftazidime to the dialysis fluid (usually 125-250 mg for 2 litres of dialysis fluid). Haemodialysis: Admin loading dose then 0.5-1 g after each dialysis period.

CrCl (ml/min)	Dosage Recommendation
31-50	1 g every 12 hr.
16-30	1 g every 24 hr.
6-15	500 mg every 24 hr.
<5	500 mg every 48 hr.

Parenteral

Skin infections

Adult: 1-6 g daily in divided doses every 8 or 12 hr as deep IM, slow IV Inj over 3-5 min or infusion for up to 30 min.

Child: 30-100 mg/kg/day in 2 or 3 divided doses increased up to 150 mg/kg daily in severe cases. Neonates and infants <2 mth: 25-60 mg/kg/day in 2 divided doses. Max dose: 6 g daily in divided doses.

Elderly: Max dose: 3 g daily.

Renal impairment: Loading dose: 1 g; maintenance doses based on CrCl. May need to increase doses by 50% in severe infections. Peritoneal dialysis: Loading dose is followed by 500 mg every 24 hr; may add ceftazidime to the dialysis fluid (usually 125-250 mg for 2 litres of dialysis fluid).

based on CrCl. May need to increase doses by 50% in severe infections. Peritoneal dialysis: Loading dose is followed by 500 mg every 24 hr; may add ceftazidime to the dialysis fluid (usually 125-250 mg for 2 litres of dialysis fluid). 16-30	1 g every 24 hr.
6-15	500 mg every 24 hr.
<5	500 mg every 48 hr.

Parenteral

Pneumonia

Adult: 1-6 g daily in divided doses every 8 or 12 hr as deep IM, slow IV Inj over 3-5 min or infusion for up to 30 min.

Child: 30-100 mg/kg/day in 2 or 3 divided doses increased up to 150 mg/kg daily in severe cases. Neonates and infants <2 mth: 25-60 mg/kg/day in 2 divided doses. Max dose: 6 g

IM, slow IV Inj over 3-5 min or infusion for up to 30 min.

Child: 30-100 mg/kg/day in 2 or 3 divided doses increased up to 150 mg/kg daily in severe cases. Neonates and infants <2 mth: 25-60 mg/kg/day in 2 divided doses. Max dose: 6 g daily in divided doses.

Elderly: Max dose: 3 g daily.

Renal impairment: Loading dose: 1 g; maintenance doses based on CrCl. May need to increase doses by 50% in severe infections. Peritoneal dialysis: Loading dose is followed by 500 mg every 24 hr; may add ceftazidime to the dialysis fluid (usually 125-250 mg for 2 litres of dialysis fluid). Haemodialysis: Admin loading dose then 0.5-1 g after each dialysis period.

CrCl (ml/min)	Dosage Recommendation
31-50	1 g every 12 hr.
16-30	1 g every 24 hr.
6-15	500 mg every 24 hr.
<5	500 mg every 48 hr.

Parenteral

Melioidosis

Adult: 1-6 g daily in divided doses every 8 or 12 hr as deep IM, slow IV Inj over 3-5 min or infusion for up to 30 min.

Child: 30-100 mg/kg/day in 2 or 3 divided doses increased up to 150 mg/kg daily in severe cases. Neonates and infants <2 mth: 25-60 mg/kg/day in 2 divided doses. Max dose: 6 g daily in divided doses.

Elderly: Max dose: 3 g daily.

Renal impairment: Loading dose: 1 g; maintenance doses based on CrCl. May need to increase doses by 50% in severe infections. Peritoneal dialysis: Loading dose is followed by 500 mg every 24 hr; may add ceftazidime to the dialysis fluid (usually 125-250 mg for 2 litres of dialysis fluid). Haemodialysis: Admin loading dose then 0.5-1 g after each dialysis period.

CrCl (ml/min)	Dosage Recommendation
31-50	1 g every 12 hr.
16-30	1 g every 24 hr.
6-15	500 mg every 24 hr.
<5	500 mg every 48 hr.

Parenteral

Infections in immunocompromised patients

Adult: 1-6 g daily in divided doses every 8 or 12 hr as deep IM, slow IV Inj over 3-5 min or infusion for up to 30 min.

Child: 30-100 mg/kg/day in 2 or 3 divided doses increased up to 150 mg/kg daily in severe cases. Neonates and infants <2 mth: 25-60 mg/kg/day in 2 divided doses. Max dose: 6 g daily in divided doses.

Elderly: Max dose: 3 g daily.

Renal impairment: Loading dose: 1 g; maintenance doses based on CrCl. May need to increase doses by 50% in severe infections. Peritoneal dialysis: Loading dose is followed by 500 mg every 24 hr; may add ceftazidime to the dialysis fluid (usually 125-250 mg for 2 litres of dialysis fluid). Haemodialysis: Admin loading dose then 0.5-1 g after each dialysis period.

CrCl (ml/min)	Dosage Recommendation
31-50	1 g every 12 hr.
16-30	1 g every 24 hr.
6-15	500 mg every 24 hr.
<5	500 mg every 48 hr.

Parenteral

Meningitis

Adult: 1-6 g daily in divided doses every 8 or 12 hr as deep IM, slow IV Inj over 3-5 min or infusion for up to 30 min.

Child: 30-100 mg/kg/day in 2 or 3 divided doses increased up to 150 mg/kg daily in severe cases. Neonates and infants <2 mth: 25-60 mg/kg/day in 2 divided doses. Max dose: 6 g daily in divided doses.

Elderly: Max dose: 3 g daily.

Renal impairment: Loading dose: 1 g; maintenance doses based on CrCl. May need to increase doses by 50% in severe infections. Peritoneal dialysis: Loading dose is followed by 500 mg every 24 hr; may add ceftazidime to the dialysis fluid (usually 125-250 mg for 2 litres of dialysis fluid).

based on CrCl. May need to increase doses by 50% in severe infections. Peritoneal dialysis: Loading dose is followed by 500 mg every 24 hr; may add ceftazidime to the dialysis fluid (usually 125-250 mg for 2 litres of dialysis fluid). Haemodialysis: Admin loading dose then 0.5-1 g after each dialysis period.

CrCl (ml/min)	Dosage Recommendation
31-50	1 g every 12 hr.
16-30	1 g every 24 hr.
6-15	500 mg every 24 hr.
<5	500 mg every 48 hr.

Parenteral

Bone and joint infections

Adult: 1-6 g daily in divided doses every 8 or 12 hr as deep IM, slow IV Inj over 3-5 min or infusion for up to 30 min.

Child: 30-100 mg/kg/day in 2 or 3 divided doses increased up to 150 mg/kg daily in severe cases. Neonates and infants <2 mth: 25-60 mg/kg/day in 2 divided doses. Max dose: 6 g daily in divided doses.

Elderly: Max dose: 3 g daily.

Renal impairment: Loading dose: 1 g; maintenance doses based on CrCl. May need to increase doses by 50% in severe infections. Peritoneal dialysis: Loading dose is followed by 500 mg every 24 hr; may add ceftazidime to the dialysis fluid (usually 125-250 mg for 2 litres of dialysis fluid). Haemodialysis: Admin loading dose then 0.5-1 g after each dialysis period.

CrCl (ml/min)	Dosage Recommendation
31-50	1 g every 12 hr.
16-30	1 g every 24 hr.
6-15	500 mg every 24 hr.
<5	500 mg every 48 hr.

Parenteral

Biliary tract infections

Adult: 1-6 g daily in divided doses every 8 or 12 hr as deep IM, slow IV Inj over 3-5 min or infusion for up to 30 min.

Child: 30-100 mg/kg/day in 2 or 3 divided doses increased up to 150 mg/kg daily in severe cases. Neonates and infants <2 mth: 25-60 mg/kg/day in 2 divided doses. Max dose: 6 g

IM, slow IV inj over 3-5 min or infusion for up to 30 min.

Child: 30-100 mg/kg/day in 2 or 3 divided doses increased up to 150 mg/kg daily in severe cases. Neonates and infants <2 mth: 25-60 mg/kg/day in 2 divided doses. Max dose: 6 g daily in divided doses.

Elderly: Max dose: 3 g daily.

Renal impairment: Loading dose: 1 g; maintenance doses based on CrCl. May need to increase doses by 50% in severe infections. Peritoneal dialysis: Loading dose is followed by 500 mg every 24 hr; may add ceftazidime to the dialysis fluid (usually 125-250 mg for 2 litres of dialysis fluid). Haemodialysis: Admin loading dose then 0.5-1 g after each dialysis period.

CrCl (ml/min)	Dosage Recommendation

16-30	1 g every 24 hr.
6-15	500 mg every 24 hr.
<5	500 mg every 48 hr.

Parenteral

Urinary tract infections

Adult: 1-6 g daily in divided doses every 8 or 12 hr as deep IM, slow IV Inj over 3-5 min or infusion for up to 30 min.

Child: 30-100 mg/kg/day in 2 or 3 divided doses increased up to 150 mg/kg daily in severe cases. Neonates and infants <2 mth: 25-60 mg/kg/day in 2 divided doses. Max dose: 6 g daily in divided doses.

Elderly: Max dose: 3 g daily.

Renal impairment: Loading dose: 1 g; maintenance doses based on CrCl. May need to increase doses by 50% in severe infections. Peritoneal dialysis: Loading dose is followed by 500 mg every 24 hr; may add ceftazidime to the dialysis fluid (usually 125-250 mg for 2 litres of dialysis fluid). Haemodialysis: Admin loading dose then 0.5-1 g after each dialysis period.

CrCl (ml/min)	Dosage Recommendation
31-50	1 g every 12 hr.
16-30	1 g every 24 hr.
6-15	500 mg every 24 hr.
<5	500 mg every 48 hr.

Contraindications

Hypersensitivity to cephalosporins.

Contraindications	Hypersensitivity to cephalosporins.
Special Precautions	History of penicillin allergy; severe renal impairment; pregnancy, lactation.
Adverse Drug Reactions	Hypersensitivity, dizziness, diarrhoea, nausea, vomiting, renal impairment, rash, erythema multiforme, thrombocytopaenia, superinfection, phlebitis and thrombophlebitis at the site of injection. Potentially Fatal: Anaphylactic reactions, nephrotoxicity, pseudomembranous colitis.
Drug Interactions	Probenecid may decrease ceftazidime elimination time. Potentially Fatal: Furosemide and aminoglycosides may increase nephrotoxicity.
Lab Interference	False-positives for Coombs' test and urinary glucose.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Parenteral: Store at 15-30°C.
Mechanism of Action	Ceftazidime binds to one or more of the penicillin-binding proteins (PBPs) which inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell wall, thus inhibiting biosynthesis and arresting cell wall assembly resulting in bacterial cell death. Absorption: Peak plasma concentrations after 1 hr (IM), 5 min (IV bolus). Distribution: Widely distributed in body tissues and fluids; CSF (therapeutic concentrations when meninges are inflamed). Crosses the placenta and enters breast milk. Protein-binding: 10% Excretion: Mainly by the kidneys via the urine by glomerular filtration (80-90% as unchanged drug within 24 hr); passively excreted in bile but only a small proportion is eliminated.

	Protein-binding: 10% Excretion: Mainly by the kidneys via the urine by glomerular filtration (80-90% as unchanged drug within 24 hr); passively excreted in bile but only a small proportion is eliminated. Clearance enhanced in cystic fibrosis; 2 hr (elimination half-life), prolonged in neonates and renal impairment.
CIMS Class	Cephalosporins

related ceftizoxime information

Indication & Dosage

Parenteral

Susceptible infections

Adult: 1-2 g every 8-12 hr given as deep IM or slow IV Inj over 3-5 min, increased to 2-4 g IV every 8 hr in severe infections. Max dose: 2 g every 4 hr.

Child: >6 mth: 50 mg/kg every 6-8 hr.

Renal impairment: Loading dose: 0.5-1 g. Maintenance dose: According to CrCl.

CrCl (ml/min)	Dosage Recommendation
50-79	0.5-1.5 g every 8 hr.
5-49	0.25-1 g every 12 hr.
<5	0.25-0.5 g every 24 hr or 0.5-1 g every 48 hr, after dialysis.

Parenteral

Uncomplicated urinary tract infections

Adult: 0.5 g every 12 hr.

Renal impairment: Loading dose: 0.5-1 g. Maintenance dose: According to CrCl.

CrCl (ml/min)	Dosage Recommendation
50-79	0.5-1.5 g every 8 hr.

	Dose: According to CrCl.	
	5-49	0.25-1 g every 12 hr.
	<5	0.25-0.5 g every 24 hr or 0.5-1 g every 48 hr, after dialysis.
	<i>Intramuscular</i> Uncomplicated gonorrhoea Adult: 1 g as a single dose.	
Contraindications	Hypersensitivity to cephalosporins.	
Special Precautions	Hypersensitivity to penicillins; severe renal impairment; pregnancy, lactation.	
Adverse Drug Reactions	Burning; rash, pruritus, fever; anorexia, nausea, vomiting, diarrhoea; rarely neutropaenia, leucopaenia, thrombocytopaenia. Transient elevations of transaminases (SGOT and SGPT) and alkaline phosphatase, transient rise in BUN and creatinine. Potentially Fatal: Anaphylactoid reactions, nephrotoxicity, pseudomembranous colitis,	
Drug Interactions	Renal clearance reduced with probenecid. Potentially Fatal: Increased risk of nephrotoxicity with aminoglycosides and furosemide.	
Lab Interference	False-positive for urine glucose and Coomb's test. False-positive serum or creatinine with Jaffe reaction.	
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).

ceftriaxone + tazobactam

CIMS Class : (Cephalosporins)
ceftriaxone + tazobactam

L - Caution when used during lactation

Lab - Lab interference

related ceftriaxone + tazobactam information

related ceftriaxone + tazobactam information	
Indication & Dosage	<i>Intravenous</i> Skin and skin structure infections, Bacterial septicaemia, Urinary tract infections, Lower respiratory tract infections, Intra-abdominal infections, Bacterial meningitis, Bone and joint infections, Community-acquired pneumonia, Uncomplicated gonorrhoea, Pelvic inflammatory disease Adult: Expressed in terms of ceftriazone/tazobactam: 1000/125 mg once daily or in equally divided doses twice a day. Total daily dose should not exceed 4 g of ceftriaxone. Continue treatment for at least 2 days after the signs and symptoms have resolved. Usual duration: 7-14 days; longer treatment may be needed in more serious infections. For <i>Streptococci pyogenes</i> infections, treatment should continue for at least 10 days. Child: Expressed in terms of ceftriaxone: Serious infections: 50-75 mg/kg/day, given in divided doses every 12 hr. Total daily dose should not exceed 2 g of ceftriaxone. Continue treatment for at least 2 days after the signs and symptoms have resolved. Usual duration: 7-14 days; longer treatment may be needed in more serious infections. For <i>Streptococci pyogenes</i> infections, treatment should continue for at least 10 days.

	have resolved. Usual duration: 7–14 days; longer treatment may be needed in more serious infections. For <i>Streptococci pyogenes</i> infections, treatment should continue for at least 10 days. Incompatibility: Vancomycin and fluconazole are incompatible with ceftriaxone in admixture.
Overdosage	Symptomatic and supportive treatment should be initiated.
Contraindications	Hypersensitivity to cephalosporins and β -lactamase inhibitors.
Special Precautions	History of penicillin allergy; lactation. Consider possibility of pseudomembranous colitis in patients who present with diarrhoea subsequent to the admin of antibacterial agents. Monitor prothrombin time in patients with impaired vit K synthesis or low vit K stores during treatment. Prolonged treatment may result in overgrowth of nonsusceptible organisms. Caution in patients with a history of GI disease, especially colitis. Discontinue treatment in patients who develop signs/symptoms suggestive of gallbladder disease. Not to be used in hyperbilirubinemic neonates, especially prematures.
Adverse Drug Reactions	Superinfection; anaphylaxis; diarrhoea; local reactions; blood dyscrasias; rash, fever, pruritus; elevated transaminases and alkaline phosphatase. GI effects; pseudomembranous colitis; hematologic effects; hypersensitivity reactions; CNS disturbances; hypertension; chest pain; edema; moniliasis; rhinitis; dyspnea; hypotension; ileus; syncope; local Inj site reactions; rigors. Potentially Fatal: Pseudomembranous colitis; nephrotoxicity.
Drug Interactions	Probenecid; aminoglycosides; vecuronium, methotrexate; oral anticoagulants; heparin. Potentially Fatal: Disulfiram-like reaction with alcohol. Nephrotoxicity with aminoglycosides and furosemide.
Lab Interference	Ceftriaxone Na may interfere with urinary glucose test and gives false-positive Coomb's test. Transient increases in AST, ALT, alkaline phosphatase, bilirubin with Tazobactam.
Storage	Intravenous: Before reconstitution: Store below 25°C.
Mechanism of	Ceftriaxone interferes with the biosynthesis of the

Mechanism of Action	Ceftriaxone interferes with the biosynthesis of the peptidoglycan component of the bacterial cell wall by binding to and inactivating penicillin-binding proteins (PBPs). Tazobactam is a penicillanic acid sulfone derivative with β-lactamase inhibitory properties. It enhances the activity of β-lactam antibiotics against β-lactamase-producing bacteria. Distribution: Ceftriaxone: 98% bound to plasma proteins; crosses the blood brain barrier. Tazobactam: About 30% bound to plasma proteins; widely distributed to tissues and body fluids. Excretion: Ceftriaxone: Elimination half-life is about 8.7 hr; 33-67% removed as unchanged drug. Tazobactam: Removed mainly via kidneys with 80% of an administered dose as unchanged drug.
CIMS Class	Cephalosporins
ATC Classification	J01CG02 - tazobactam; Belongs to the class of beta-lactamase inhibitors. Used in the treatment of systemic infections. J01DD04 - ceftriaxone;

cefuroxime

CIMS Class : (Cephalosporins)
cefuroxime

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related cefuroxime information

Indication & Dosage	<i>Oral</i> Uncomplicated urinary tract infections Adult: 125 mg bid.
	<i>Oral</i> Respiratory tract infections Adult: 250-500 mg bid.
	Child: >3 mth: 125 mg bid or 10 mg/kg bid. Max dose: 250 mg daily.
	<i>Oral</i> Uncomplicated gonorrhoea Adult: 1 g as a single dose. 1 g oral probenecid may be given concurrently.
	<i>Oral</i> Otitis media Child: >2 yr: 250 mg bid or 15 mg/kg bid up to 500 mg daily.
	<i>Intravenous</i> Meningitis Adult: 3 g every 8 hr. Child: 200-240 mg/kg/day in 3-4 divided doses, decreased to 100 mg/kg/day after 3 days or once symptoms have

Prophylaxis

Adult: 3 g every 8 hr.

Child: 200-240 mg/kg/day in 3-4 divided doses, decreased to 100 mg/kg/day after 3 days or once symptoms have improved. Neonate: 100 mg/kg/day, decreased to 50 mg/kg/day when control has been achieved.

Renal impairment: Patients undergoing haemodialysis should receive an additional 750-mg dose after each dialysis; those undergoing continuous peritoneal dialysis may be given 750 mg bid.

CrCl (ml/min)	Dosage Recommendation
10-20	750 mg bid.
<10	750 mg once daily.

Intramuscular

Gonorrhoea

Adult: 1.5 mg as a single dose divided between 2 inj sites. 1 g oral probenecid may be given concurrently.

Renal impairment: Patients undergoing haemodialysis should receive an additional 750-mg dose after each dialysis; those undergoing continuous peritoneal dialysis may be given 750 mg bid.

CrCl (ml/min)	Dosage Recommendation
10-20	750 mg bid.
<10	750 mg once daily.

Parenteral

Prophylaxis of surgical infections

Adult: 1.5 g IV before the procedure followed by 750 mg IM every 8 hr for up to 24-48 hr depending on the procedure. For total joint replacement, 1.5 g of cefuroxime may be mixed with methylmethacrylate cement.

Renal impairment: Patients undergoing haemodialysis should receive an additional 750-mg dose after each dialysis; those undergoing continuous peritoneal dialysis may be given 750 mg bid.

CrCl (ml/min)	Dosage Recommendation
10-20	750 mg bid.
<10	750 mg once daily.

Parenteral

	<i>Parenteral</i> Susceptible infections Adult: 750 mg every 8 hr given as deep IM or slow IV inj over 3-5 min or IV infusion, increased to 1.5 g every 6-8 hr in severe infections. Child: 30-60 mg/kg/day, may increase to 100 mg/kg/day if necessary. To be given in 3-4 divided doses or 2-3 divided doses in neonates. Renal impairment: Patients undergoing haemodialysis should receive an additional 750-mg dose after each dialysis; those undergoing continuous peritoneal dialysis may be given 750 mg bid. <table><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr><tr><td>10-20</td><td>750 mg bid.</td></tr><tr><td><10</td><td>750 mg once daily.</td></tr></table> Incompatibility: Incompatible with aminoglycosides.	CrCl (ml/min)	Dosage Recommendation	10-20	750 mg bid.	<10	750 mg once daily.	
CrCl (ml/min)	Dosage Recommendation							
10-20	750 mg bid.							
<10	750 mg once daily.							
Administration	Should be taken with food.							
Contraindications	Hypersensitivity to cephalosporins.							
Special Precautions	Severe renal impairment; pregnancy, lactation; hypersensitivity to penicillins.							
Adverse Drug Reactions	Large doses can cause cerebral irritation and convulsions; nausea, vomiting, diarrhoea, GI disturbances; erythema multiforme, Stevens-Johnson syndrome, epidermal necrolysis. Potentially Fatal: Anaphylaxis, nephrotoxicity, pseudomembranous colitis.							
Drug Interactions	Probenecid decreases renal clearance of cefuroxime. Potentially Fatal: Nephrotoxicity with aminoglycosides and furosemide.							
Food Interaction	Oral cefuroxime axetil is better absorbed after food intake.							
Lab Interference	False-positive for Coombs' test. It may interfere with urine-sugar estimation.							
Pregnancy								

Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intramuscular: Store at 15-30°C. Intravenous: Store at 15-30°C. Oral: Store at 15-30°C. Parenteral: Inj: Store at 15-30°C.
Mechanism of Action	Cefuroxime binds to one or more of the penicillin-binding proteins (PBPs) which inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell wall, thus inhibiting biosynthesis and arresting cell wall assembly resulting in bacterial cell death. Absorption: Absorbed from the GI tract with peak plasma concentrations after 2-3 hr (oral); may be enhanced by the presence of food. Distribution: Pleural and synovial fluid, sputum, bone and aqueous fluids; CSF (therapeutic concentrations). Crosses the placenta and enters breast milk. Protein-binding: Up to 50%. Metabolism: Rapidly hydrolysed (intestinal mucosa and blood). Excretion: Via the urine by glomerular filtration and renal tubular secretion (as unchanged); via bile (small amounts); 70 min (elimination half-life); prolonged in neonates and renal impairment.
CIMS Class	Cephalosporins
ATC Classification	J01DC02 - cefuroxime;

celecoxib

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
celecoxib

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ✖ - Lab interference

Food ✖ - Food interaction

related celecoxib information

Indication & Dosage

Oral

Osteoarthritis

Adult: 200 mg as a single dose or in 2 divided doses. May increase to 200 mg bid if necessary.

Hepatic impairment: Child-Pugh category B: Reduce dose by 50%. Child-Pugh category C: Avoid use.

Oral

Rheumatoid arthritis

Adult: 100-200 mg bid.

Elderly: 100 mg bid.

Hepatic impairment: Child-Pugh category B: Reduce dose by 50%. Child-Pugh category C: Avoid use.

Oral

Pain relief

Adult: Initially, 400 mg followed by 200 mg if necessary on the 1st day. Maintenance: 200 mg bid.

Hepatic impairment: Child-Pugh category B: Reduce dose by 50%. Child-Pugh category C: Avoid use.

Oral

Dysmenorrhoea

Adult: Initially, 400 mg followed by 200 mg if necessary on

	by 50%. Child-Pugh category C: Avoid use. <i>Oral</i> Dysmenorrhoea Adult: Initially, 400 mg followed by 200 mg if necessary on the 1st day. Maintenance: 200 mg bid. Hepatic impairment: Child-Pugh category B: Reduce dose by 50%. Child-Pugh category C: Avoid use. <i>Oral</i> Familial adenomatous polyposis Adult: 400 mg bid. Hepatic impairment: Child-Pugh category B: Reduce dose by 50%. Child-Pugh category C: Avoid use.
Administration	May be taken with or without food. (Dose for OA/RA may be given w/ or without meals, but doses for FAP must be given w/ meals.)
Overdosage	Symptoms include lethargy, drowsiness, nausea, vomiting, and epigastric pain, which are generally reversible with supportive care. GI bleeding may occur. Hypertension, acute renal failure, respiratory depression and coma may also occur.
Contraindications	Hypersensitivity including those in whom attacks of angioedema, rhinitis and urticaria have been precipitated by aspirin, NSAIDs or sulfonamides. Severe hepatic impairment; severe heart failure; inflammatory bowel disease; peptic ulcer; renal impairment (CrCl <30 ml/min); pregnancy and lactation.
Special Precautions	History of GI bleeding; renal/hepatic insufficiency; asthma or allergic disorders; hypertension; monitor haemoglobin or haematocrit levels for signs of anaemia. History of cerebrovascular disease or ischaemic heart disease.
Adverse Drug Reactions	Abdominal pain, diarrhea, nausea, oedema, dizziness, headache, insomnia, upper respiratory tract infections; rash. Potentially Fatal: Serious skin reactions such as exfoliative dermatitis, Stevens-Johnson syndrome, and toxic epidermal necrolysis.
Drug Interactions	Co-admin with fluconazole increases plasma concentrations of celecoxib. Avoid co-admin with cytochrome P450 2C9 inhibitors. Increased risk of GI bleeding when used with oral corticosteroids, anticoagulants or alcohol.

	Co-admin with fluconazole increases plasma concentrations of celecoxib. Avoid co-admin with cytochrome P450 2C9 inhibitors. Increased risk of GI bleeding when used with oral corticosteroids, anticoagulants or alcohol. Potentially Fatal: Co-admin with lithium salts may result in an increase in plasma-lithium concentrations.
Food Interaction	Increased absorption when taken with food.
Lab Interference	May cause BUN elevation.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 3rd trimester or near delivery. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 25°C.
Mechanism of Action	Celecoxib has COX-2 specific inhibitory activity. It inhibits the conversion of arachidonic acid to prostaglandins while having no effect on the formation of prostaglandins that mediate the normal homeostasis in the GI tract, kidneys and platelets catalysed by COX-1. Absorption: Absorbed from the GI tract (oral); peak plasma concentrations after 3 hr. Distribution: Protein-binding: 97%. Metabolism: Hepatic; converted to inactive metabolites. Excretion: Faeces and urine (as metabolites and unchanged drug); 11 hr (elimination half-life).
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	L01XX33 - celecoxib; Belongs to the class of other antineoplastic agents. Used in the treatment of cancer. M01AH01 - celecoxib; Belongs to the class of non-steroidal

L01XX33 - celecoxib; Belongs to the class of other antineoplastic agents. Used in the treatment of cancer.

M01AH01 - celecoxib; Belongs to the class of non-steroidal antiinflammatory and antirheumatic products, coxibs. Used in the treatment of inflammation and rheumatism.

cetirizine hydrochloride

CIMS Class : (Antihistamines & Antiallergics)
cetirizine hydrochloride

P - Caution when used during pregnancy

L - Contraindicated in lactation

related cetirizine hydrochloride information

Indication & Dosage	<i>Oral</i> Allergic conditions Adult: 10 mg once daily or 5 mg bid. Child: 6 mth-2 yr: 2.5 mg once daily (up to 2.5 mg bid in children $\leq$ 12 mth) ; 2-5 yr: 5 mg once daily or 2.5 mg bid; >6 yr: 10 mg once daily or 5 mg bid. Elderly: Renal impairment: Half the usual dose. Hepatic impairment: Half the usual dose.
Contraindications	Hypersensitivity; lactation.
Special Precautions	Hepatic or renal impairment; elderly; tasks requiring mental alertness eg, driving or operating heavy machinery; pregnancy.
Adverse Drug Reactions	Somnolence, insomnia, malaise, headache, dizziness; GI discomfort, dry mouth, abdominal pain, diarrhoea, nausea, vomiting; occasional hypersensitivity; epistaxis, pharyngitis, bronchospasm.
Drug Interactions	Risk of increased INR and epistaxis when taken together with warfarin. Potentially Fatal: CNS depressants and anticholinergics may potentiate CNS depression of cetirizine.
Storage	Oral: Store at 20-25°C. Syr: Can also refrigerate at 2-8°C.

Storage	Oral: Store at 20-25°C. Syr: Can also refrigerate at 2-8°C.
Mechanism of Action	Cetirizine is a potent and highly selective antagonist of the peripheral histamine H₁-receptor on effector cells in the GI tract, blood vessels and respiratory tract. Absorption: Absorbed rapidly from the GI tract (oral); peak plasma concentrations after 1 hr. Rate, but not extent, of absorption altered by food. Distribution: Enters breast milk; crosses the blood-brain barrier (insignificant amounts). Protein-binding: Highly bound. Excretion: Via the urine (as unchanged); 10 hr (elimination half-life).
CIMS Class	Antihistamines & Antiallergics

cetirizine + pseudoephedrine

CIMS Class : (Cough & Cold Preparations)
cetirizine + pseudoephedrine

P - Caution when used during pregnancy

related cetirizine + pseudoephedrine information

Indication & Dosage	<i>Oral</i> Allergic rhinitis Adult: Each extended release tablet containing cetirizine 5 mg and pseudoephedrine 120 mg: 1 tablet bid. Child: ≥12 yr: As extended release tablet each containing cetirizine 5 mg and pseudoephedrine 120 mg: 1 tablet twice daily. Renal impairment: CrCl: 11–31 ml/min or patients on haemodialysis with CrCl <7 ml/min: 1 tablet once daily is recommended Hepatic impairment: 1 tablet once daily is recommended.
Administration	Extended-release: May be taken with or without food. (Swallow whole, do not chew/ crush.)
Overdosage	Overdosage may lead to restlessness, irritability, giddiness, headache, nausea, vomiting, sweating, thirst, tachycardia, precordial pain, palpitations, difficulty in micturition, muscular weakness and tenseness, anxiety and insomnia. In severe cases, patients can present a toxic psychosis with delusions and hallucinations. Treatment is symptomatic or supportive.
Contraindications	Patients with narrow-angle glaucoma or urinary retention. Patients on MAOI treatment or within 14 days of stopping such treatment. Patients with severe hypertension or severe

	Patients with narrow-angle glaucoma or urinary retention. Patients on MAOI treatment or within 14 days of stopping such treatment. Patients with severe hypertension or severe coronary artery disease.
Special Precautions	Caution when used in patients with hypertension, DM, ischaemic heart disease, increased intraocular pressure, hyperthyroidism, renal impairment or prostatic hypertrophy. May cause CNS stimulation with convulsions or CV collapse with accompanying hypotension. Elderly are more prone to developing the adverse reactions. Pregnancy.
Adverse Drug Reactions	Insomnia, dry mouth, somnolence, fatigue.
Drug Interactions	Concurrent use with digitalis may increase ectopic pacemaker activity. Additive effects on the CV system may occur when used with sympathomimetic amines. Potentially Fatal: Not to be used concurrently with MAOIs or within 14 days of stopping MAOI treatment.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 20-25°C.
Mechanism of Action	Cetirizine is an antihistamine that works mainly via selective inhibition of H₁ receptors. Pseudoephedrine hydrochloride is an orally active sympathomimetic amine that exerts a decongestant action on the nasal mucosa. It is used for the relief of nasal congestion due to allergic rhinitis. Absorption: Cetirizine: Rapidly absorbed from the GI tract after oral admin. Pseudoephedrine: Readily absorbed after oral admin. Distribution: Cetirizine: About 93% bound to plasma proteins. Metabolism: Cetirizine: Limited metabolism by oxidative O-dealkylation to a metabolite with little or no antihistaminic activity. Pseudoephedrine: About 1-7% of a dose is metabolised to nor-pseudoephedrine by N-demethylation.

	Metabolism: Cetirizine: Limited metabolism by oxidative O-dealkylation to a metabolite with little or no antihistaminic activity. Pseudoephedrine: About 1-7% of a dose is metabolised to nor-pseudoephedrine by N-demethylation. Excretion: Mean elimination half-life: 7.9 hr (cetirizine) and 6 hr (pseudoephedrine).
CIMS Class	Cough & Cold Preparations
ATC Classification	R01BA02 - pseudoephedrine; Belongs to the class of systemic sympathomimetic preparations used as nasal decongestants. R06AE07 - cetirizine; Belongs to the class of piperazine derivatives used as systemic antihistamines.

cetrimide

CIMS Class : (Skin Antiseptics & Disinfectants)
cetrimide

related cetrimide information

Indication & Dosage	<i>Topical/Cutaneous</i> Wound cleansing Adult: Apply 0.1-1% aqueous solution or 0.5% cream onto affected area. <i>Topical/Cutaneous</i> Seborrhoeic dermatitis Adult: Apply 10% shampoo solution onto the scalp. Incompatibility: Incompatible with soaps and other anionic surfactants, bentonite, iodine, phenylmercuric nitrate and alkali hydroxides.
Contraindications	Hypersensitivity; contact with eyes, brain, meninges and middle ear; use in body cavities or as an enema; sterilising surgical instruments and heat-labile articles; disinfection of soft contact lenses.
Special Precautions	Prolonged usage may increase risk of hypersensitivity reactions. To be used externally only.
Adverse Drug Reactions	Oral: Nausea and vomiting, oesophageal damage and necrosis. IV/Intrauterine: Haemolysis. Topical: Rarely, burns.
Mechanism of Action	Cetrimide has actions and uses typical of cationic surfactants which dissociates in aqueous soln into a smaller inactive anion and into a large and complex cation responsible for the surface activity. It has bactericidal activity against gram-positive bacteria.

	surfactants which dissociates in aqueous soln into a smaller inactive anion and into a large and complex cation responsible for the surface activity. It has bactericidal activity against gram-positive bacteria.
CIMS Class	Skin Antiseptics & Disinfectants
ATC Classification	D08AJ04 - cetrimide; Belongs to the class of quaternary ammonium compound antiseptics. Used in the treatment of dermatological diseases. D11AC01 - cetrimide; Belongs to the class of medicated shampoos. Used in the treatment of dermatological diseases.

chlorambucil

CIMS Class : (Cytotoxic Chemotherapy)
chlorambucil

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related chlorambucil information

Indication & Dosage

Oral

Hodgkin's disease

Adult: 200 mcg/kg daily. Not to exceed 100 mcg/kg/day if the bone marrow is hypoplastic or if there is lymphocytic infiltration in the bone marrow. Once remission is established, start maintenance at 30-100 mcg/kg/day.

Oral

Non-Hodgkin's lymphoma

Adult: 100 mcg/kg daily. Not to exceed 100 mcg/kg/day if the bone marrow is hypoplastic or if there is lymphocytic infiltration in the bone marrow. Once remission is established, start maintenance at 30-100 mcg/kg/day.

Oral

Chronic lymphocytic leukaemia

Adult: 100-200 mcg/kg daily (usually 4-10 mg once daily) for 3-8 wk. Not to exceed 100 mcg/kg/day if the bone marrow is hypoplastic or if there is lymphocytic infiltration in the bone marrow. Once remission is established, start maintenance at 30-100 mcg/kg/day.

Elderly:

Oral

Waldenstrom's macroglobulinaemia

Adult: Initially, 6-12 mg daily until leucopenia develops.

	Oral Waldenstrom's macroglobulinaemia Adult: Initially, 6-12 mg daily until leucopenia develops. Maintenance: 2-8 mg daily.
Administration	Should be taken on an empty stomach. (Take on an empty stomach. Ensure adequate hydration. Swallow whole, do not chew/crush.)
Overdosage	May cause reversible pancytopenia. Neurological toxicity ranging from agitated behavior and ataxia to multiple grand mal seizures may also occur. Management includes monitoring CBC closely and general supportive measures. Appropriate blood transfusions may be given, if necessary. Chlorambucil is not dialysable.
Contraindications	Hypersensitivity. Pregnancy and lactation. Porphyria.
Special Precautions	Renal or hepatic dysfunction. Perform blood counts regularly. Seizure disorder, bone marrow suppression. Patient who has received radiation therapy, myelosuppressive drugs or has a depressed baseline leukocyte/platelet count within the previous 4 wk. Increased incidence of acute leukaemias and other secondary malignancies.
Adverse Drug Reactions	Reversible progressive lymphocytopenia and neutropenia; GI disturbances; hepatotoxicity; skin rashes; peripheral neuropathy; central neurotoxicity including seizures; interstitial pneumonia, pulmonary fibrosis. High doses may produce azoospermia and amenorrhoea. Sterility when given to boys at or before puberty. Potentially Fatal: Severe bone marrow suppression, carcinogenic and human infertility.
Drug Interactions	Impairs immune response to vaccines, possible infection after admin of live vaccines.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Refrigerate at 2-8°C.

Storage	Oral: Refrigerate at 2-8°C.
Mechanism of Action	Chlorambucil interferes with DNA replication and RNA transcription by alkylation and cross-linking cellular DNA strands, thus leading to disruption of the nucleic acid function. Absorption: Rapid and almost complete from the GI tract (oral). Distribution: Protein-binding: Extensive. Metabolism: Extensively hepatic; converted to phenylacetic acid mustard. Excretion: Urine (as metabolites and unchanged drug); 1.5 hr (elimination half-life).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01AA02 - chlorambucil; Belongs to the class of alkylating agents, nitrogen mustard analogues. Used in the treatment of cancer.

Renal impairment: Dose reduction may be required.

Hepatic impairment: Dose reduction may be required.

Oral

Tularaemia

Adult: 50 mg/kg/day in 4 divided doses increased to 100 mg/kg/day for meningitis or severe infections due to moderately resistant organisms. Continue treatment after the patient's temperature has normalised for a further 4 days in rickettsial disease and 8-10 days in typhoid fever.

Child: Premature and full-term neonates: 25 mg/kg/day in 4 divided doses. Full-term infants >2 wk: 50 mg/kg/day in 4 divided doses. Children: 50 mg/kg/day in 4 divided doses increased to 100 mg/kg/day for meningitis or severe infections.

Elderly:

Renal impairment: Dose reduction may be required.

Hepatic impairment: Dose reduction may be required.

Ophthalmic

Ocular infections

Adult: Instill 1 drop of a 0.5% solution every 2 hr. Increase dosage interval upon improvement. To continue treatment for at least 48 hr after complete healing. Reduce dose once symptoms are controlled or apply a 1% ointment 3-4 times daily.

Renal impairment: Dose reduction may be required.

Hepatic impairment: Dose reduction may be required.

Otic/Aural

Otitis externa

Adult: Instill 2-3 drops of a 5% solution into the ear bid-tid.

Renal impairment: Dose reduction may be required.

Hepatic impairment: Dose reduction may be required.

Administration

Should be taken on an empty stomach. (Take on an empty stomach 1 hr before or 2 hr after meals.)

Contraindications

History of hypersensitivity or toxic reaction to the drug; pregnancy, lactation; porphyria; parenteral admin for minor infections or as prophylaxis; preexisting bone marrow

	History of hypersensitivity or toxic reaction to the drug; pregnancy, lactation; porphyria; parenteral admin for minor infections or as prophylaxis; preexisting bone marrow depression or blood dyscrasias.
Special Precautions	Impaired renal or hepatic function; premature and full-term neonates. Monitor plasma concentrations to avoid toxicity.
Adverse Drug Reactions	GI symptoms; bleeding; peripheral and optic neuritis, visual impairment, blindness; encephalopathy, confusion, delirium, mental depression, headache. Haemolysis in patients with G6PD deficiency. ophthalmic application: Hypersensitivity reactions including rashes, fever and angioedema. Ear drops: Ototoxicity. Potentially Fatal: Bone marrow suppression and irreversible aplastic anaemia. Neutropenia, thrombocytopenia. Grey baby syndrome. Rarely, anaphylaxis.
Drug Interactions	Decreased effects of iron and vitamin B ₁₂ in anaemic patients. Phenobarbitone and rifampin reduce efficacy of chloramphenicol. Impairs the action of oral contraceptives. Potentially Fatal: Increases the effect of oral anticoagulants, oral hypoglycaemic agents, phenytoin. Avoid concomitant administration with drugs that depress bone marrow function.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Ophthalmic: Refrigerate at 2-8°C. Do not freeze. Oral: Store at 15-25°C. Otic/Aural: Refrigerate at 2-8°C. Do not freeze.
Mechanism of Action	Chloramphenicol inhibits bacterial protein synthesis by binding to 50s subunit of the bacterial ribosome, thus preventing peptide bond formation by peptidyl transferase. It has both bacteriostatic and bactericidal action against H. influenzae, N. meningitidis and S. pneumoniae. Duration: Typhoid: 8-10 days; meningitis: 7-10 days; brain

	preventing peptide bond formation by peptidyl transferase. It has both bacteriostatic and bactericidal action against H. influenzae, N. meningitidis and S. pneumoniae. Duration: Typhoid: 8-10 days; meningitis: 7-10 days; brain abscess: Up to 4 wk. Absorption: Readily absorbed with peak plasma concentrations after 1 or 2 hr (oral). Distribution: Distributed widely into tissues and fluids, CSF (up to 50% even in the absence of meningitis), eye (aqueous and vitreous humours); crosses the placenta and enters the breast milk. Protein-binding: 60%. Metabolism: Hydrolysed to the free drug in the GI tract (palmitate); liver by conjugation with glucuronic acid, lungs and kidneys after parenteral admin (sodium succinate). Excretion: Via the urine (30% as unchanged before hydrolysis, 5-10% of an oral dose), via the bile (3%), via the faeces (1% as inactive form); 1.5-4 hr (elimination half-life).
CIMS Class	Chloramphenicols / Eye Anti-infectives & Antiseptics / Ear Anti-infectives & Antiseptics
ATC Classification	D06AX02 - chloramphenicol; Belongs to the class of other topical antibiotics used in the treatment of dermatological diseases. D10AF03 - chloramphenicol; Belongs to the class of topical anti-infective preparations used in the treatment of acne. G01AA05 - chloramphenicol; Belongs to the class of antibiotics. Used in the treatment of gynecological infections. J01BA01 - chloramphenicol; Belongs to the class of amphenicols. Used in the treatment of systemic infections. S01AA01 - chloramphenicol; Belongs to the class of antibiotics. Used in the treatment of eye infections. S02AA01 - chloramphenicol; Belongs to the class of anti-infectives used in the treatment of ear infections. S03AA08 - chloramphenicol; Belongs to the class of anti-infectives used in ophthalmologic and otologic preparations.

chlordiazepoxide

CIMS Class : (Anxiolytics)
chlordiazepoxide

P - Contraindicated in pregnancy
L - Contraindicated in lactation
Food **⚠** - Food interaction

related chlordiazepoxide information

Indication & Dosage	<i>Oral</i> Anxiety Adult: 30 mg daily in divided doses, up to 100 mg daily in severe conditions. Elderly: and debilitated patients: Dose reduction may be needed. <i>Oral</i> Muscle spasms Adult: 10-30 mg daily in divided doses. Elderly: and debilitated patients: Dose reduction may be needed. <i>Oral</i> Acute symptoms of alcohol withdrawal Adult: 25-100 mg daily repeated as necessary. Max dose: 300 mg daily. Elderly: and debilitated patients: Dose reduction may be needed. <i>Oral</i> Insomnia Adult: 10-30 mg before bedtime. Elderly: and debilitated patients: Dose reduction may be needed.

	Adult: 10-30 mg before bedtime. Elderly: and debilitated patients: Dose reduction may be needed. <i>Parenteral</i> Acute anxiety Adult: Initially, 50-100 mg followed by 25-50 mg 3-4 times daily if necessary. May be given via deep IM or slow IV inj. Elderly: and debilitated patients: Dose reduction may be needed. <i>Parenteral</i> Severe symptoms of alcohol withdrawal Adult: Initially, 50-100 mg, if necessary, repeat dose after 2-4 hr. May be given via deep IM or slow IV inj. Elderly: and debilitated patients: Dose reduction may be needed. <i>Intramuscular</i> Premedication before anaesthesia Adult: 50-100 mg given 1 hr before surgery. Elderly: and debilitated patients: Dose reduction may be needed.
Administration	May be taken with or without food.
Contraindications	Acute pulmonary insufficiency, resp depression, patients with marked neuromuscular resp weakness; hypersensitivity to benzodiazepines; chronic psychosis; porphyria; pregnancy and lactation.
Special Precautions	Alcohol; sedation, dependence. Elderly and debilitated patients. Liver or kidney dysfunction. Avoid prolonged usage.
Adverse Drug Reactions	Physical and psychological dependence; withdrawal syndrome; impairs psychomotor performance, aggression (in predisposed individuals esp in combination with alcohol); sedation; blood dyscrasias, jaundice, hepatic dysfunction. Potentially Fatal: May rarely cause hypoplastic or haemolytic anaemia.
Drug Interactions	Cimetidine increases serum conc of chlordiazepoxide. Potentiates action of major neuroleptics. Potentially Fatal: Alcohol potentiates CNS-depressant effect of chlordiazepoxide.

	Cimetidine increases serum conc of chlordiazepoxide. Potentiates action of major neuroleptics. Potentially Fatal: Alcohol potentiates CNS-depressant effect of chlordiazepoxide.
Food Interaction	Alcohol: additive CNS effects, grape juice may increase serum levels and toxicity
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intramuscular: Store at 25°C. Oral: Store at 15-25°C. Parenteral: Store at 25°C.
Mechanism of Action	Chlordiazepoxide enhances activity of the inhibitory transmitter GABA in different parts of CNS by increasing neuronal-membrane permeability to chloride ions resulting to hyperpolarisation and stabilisation. It has some muscle relaxant and anticonvulsant activity. Absorption: Almost complete (oral); peak plasma concentrations after 1-2 hrs. Distribution: Crosses the placenta, diffuses into CSF, enters breast milk. Protein-binding: 96% Metabolism: Hepatic; converted to desmethyldiazepam. Excretion: Urine (as unchanged drug and metabolites; faeces (conjugated metabolites); 5-30 hrs (elimination half-life).
CIMS Class	Anxiolytics
ATC Classification	N05BA02 - chlordiazepoxide; Belongs to the class of benzodiazepine derivatives anxiolytics. Used in the management of anxiety, agitation or tension.

chlordiazepoxide + clidinium bromide

CIMS Class : (Antispasmodics)
chlordiazepoxide + clidinium bromide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related chlordiazepoxide + clidinium bromide information

Indication & Dosage	<i>Oral</i> Irritable bowel syndrome Adult: Each capsule containing chlordiazepoxide 5 mg and clidinium 2.5 mg: 1-2 capsule 3-4 times a day, before meals and at bedtime. Elderly: Minimal effective dose.
Administration	Should be taken on an empty stomach. (Take ½-1 hr before meals.)
Contraindications	Hypersensitivity, myasthenia gravis, pregnancy and lactation, glaucoma, obstructive uropathy, GI obstruction, paralytic ileus, unstable CVS status, acute hemorrhage, acute resp conditions.
Special Precautions	Driving, hazardous work, elderly, renal disease, hepatic disease, hypertension, CVS disease, ulcerative colitis, hernia, reflux esophagitis, elderly and debilitated, autonomic neuropathy.
Adverse Drug Reactions	Mouth dryness, blurring, hesitancy and urgency in micturition, constipation, rise in body temperature, heat stroke, tachycardia, mydriasis, headache, nervousness, drowsiness, weakness, nausea, aggression, dependence, mild skin rashes and impaired psychomotor performance. Potentially Fatal: Severe hypersensitive reaction, hemolytic

	stroke, tachycardia, myoniasis, headache, nervousness, drowsiness, weakness, nausea, aggression, dependence, mild skin rashes and impaired psychomotor performance. Potentially Fatal: Severe hypersensitive reaction, hemolytic anemia (rarely).
Drug Interactions	Cimetidine increases T1/2 of chlordiazepoxide. Absorption of chlordiazepoxide enhanced by metoclopramide and aluminum hydroxide. Chlordiazepoxide absorption hindered by Mg trisilicate, morphine and pethidine. Clidinium faces additive anticholinergic effects with antidepressants, quinidine and some antihistamines. Potentially Fatal: Alcohol potentiates chlordiazepoxide and concurrent use of both can be potentially dangerous.
Storage	Oral: Store at 25°C.
Mechanism of Action	Chlordiazepoxide exerts anxiolytic effect by stimulating the GABA receptor-complex activity. Clidinium is an anticholinergic agent. This combination can control some emotional and somatic factors in GI disease.
CIMS Class	Antispasmodics
ATC Classification	N05BA02 - chlordiazepoxide; Belongs to the class of benzodiazepine derivatives anxiolytics. Used in the management of anxiety, agitation or tension.

chlorhexidine

CIMS Class : (Mouth/Throat Preparations)
chlorhexidine

Lab ✖ - Lab interference

related chlorhexidine information

Indication & Dosage	<i>Mouth/Throat</i> Gingivitis, Oral hygiene Adult: Rinse mouth with 10 ml of a 0.2% soln for 1 minute bid-tid.
Contraindications	Brain, meninges, middle ear or sensitive tissues.
Special Precautions	Avoid contact with eyes except when dilute solutions are used.
Adverse Drug Reactions	Skin sensitivity; irritation of conjunctiva, mucosal irritation; reversible brown staining of the teeth; tongue discoloration; parotid gland swelling.
Lab Interference	Interferes with stix tests for proteinuria.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters). Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies

	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Chlorhexidine, is a very potent, cationic chemoprophylactic agent. It has a broad-spectrum action, and is more effective against gm+ve than gm-ve bacteria. It acts by binding to negatively charged bacterial cell wall thereby disrupting membrane integrity and affecting its functions. In high concentrations, chlorhexidine is bactericidal. Absorption: Poor (oral, topical).
CIMS Class	Mouth/Throat Preparations
ATC Classification	A01AB03 - chlorhexidine; Belongs to the class of local antiinfective and antiseptic preparations. Used in the treatment of diseases of the mouth. B05CA02 - chlorhexidine; Belongs to the class of antiinfectives used as irrigating solutions. D08AC02 - chlorhexidine; Belongs to the class of biguanide and amidine antiseptics. Used in the treatment of dermatological diseases. D09AA12 - chlorhexidine; Belongs to the class of ointment dressings with antiinfectives. Used in treatment of wounds. R02AA05 - chlorhexidine; Belongs to the class of antiseptics used in throat preparations. S01AX09 - chlorhexidine; Belongs to the class of other antiinfectives. Used in the treatment of eye infections. S02AA09 - chlorhexidine; Belongs to the class of antiinfectives used in the treatment of ear infections. S03AA04 - chlorhexidine; Belongs to the class of antiinfectives used in ophthalmologic and otologic preparations.

chloroquine

CIMS Class : (Antimalarials) , (Disease-Modifying Anti-Rheumatic Drugs (DMARDs)) , (Antiamoebics)
chloroquine

P - Caution when used during pregnancy

L - Caution when used during lactation

related chloroquine information

Indication & Dosage

Oral

Acute malaria

Adult: As base: Initially, 600 mg followed by 300 mg 6-8 hr later on day 1. On days 2 and 3, single doses of 300 mg/day.

Child: Initially, 10 mg base/kg (max 600 mg base) followed by 5 mg base/kg (max 300 mg base) after 6 hrs. Single doses of 5 mg base/kg on days 2 and 3.

Elderly:

Oral

Prophylaxis of malaria

Adult: As base: 300 mg once wkly, starting 1 wk before exposure, continuing throughout on a wkly basis and for at least 4 wk after exposure.

Child: 5 mg/kg weekly.

Oral

Discoid and systemic lupus erythematosus

Adult: As base: Initially, 150 mg once daily, reduce gradually after maximal response. Max dose: 2.5 mg/kg daily.

Child: 3 mg/kg daily.

Elderly:

Oral

Hepatic amoebiasis

	Child: 3 mg/kg daily. Elderly: Oral Hepatic amoebiasis Adult: As base: 600 mg daily for 2 days then 300 mg daily for 2 or 3 wk given with emetine or dehydroemetine. Child: 6 mg/kg daily. Max dose: 300 mg daily. Oral Rheumatoid arthritis Adult: As base: 150 mg daily. Max: 2.5 mg/kg daily. Discontinue treatment if there is no improvement after 6 mth. Child: Up to 3 mg/kg/day. Discontinue treatment if there is no improvement after 6 mth. Renal impairment: May need to reduce dose in prolonged treatment. Intravenous Severe and complicated malaria Adult: As base: 25 mg/kg given in several infusions over 30-32 hr at a slow rate. May start on oral therapy once patient is able to tolerate oral doses.
Administration	Should be taken with food.
Overdosage	Symptoms include headache, drowsiness, visual disturbances, nausea and vomiting, CV collapse, shock and convulsions followed by sudden and early respiratory and cardiac arrest. ECG may reveal atrial standstill, nodal rhythm, prolonged intraventricular conduction time and progressive bradycardia leading to ventricular fibrillation and/or arrest. Treatment is symptomatic and should be prompt with immediate evacuation of the stomach by emesis or gastric lavage. Finely powdered, activated charcoal may be used within 30 min after ingestion of the antimalarial to reduce intestinal absorption of the drug. To be effective, the dose of activated charcoal should be at least five times the estimated dose of chloroquine ingested.
Contraindications	Hypersensitivity, known or suspected resistant <i>P. falciparum</i> infection, porphyria, retinal damage, concurrent hepatotoxic drugs.

Special Precautions	Psoriasis, diseases of the haematopoietic or CNS systems, myasthenia gravis, hepatic or renal impairment, G6PD deficiency, epilepsy, childn. Pregnancy and lactation. Slow infusion is used upon IV admin to prevent cardiotoxicity.
Adverse Drug Reactions	Retinopathy, hair loss, photosensitivity, tinnitus, myopathy (long-term therapy). Psychosis, seizures, leucopenia and rarely aplastic anaemia, hepatitis, GI upsets, dizziness, hypokalaemia, headache, pruritus, urticaria, difficulty in visual accommodation. Potentially Fatal: Cardiac and respiratory arrest, CV collapse, convulsions, coma.
Drug Interactions	Concomitant therapy with phenylbutazone predisposes to dermatitis, antagonises effect of neostigmine and pyridostigmine, reduces bioavailability of ampicillin. Cimetidine inhibits metabolism of chloroquine raising plasma levels. Potentially Fatal: Increased risks of inducing ventricular arrhythmias with halofantrine or other arrhythmogenic drugs eg, amiodarone. Increased risk of convulsions with mefloquine. Antacids reduce absorption of chloroquine hence admin should be separated by 4 hrs. Rarely Stevens-Johnson syndrome, when administered with pyrimethamine/sulphadoxine. Increased toxicity with quinacrine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 15-30°C. Oral: Store at 15-30°C.
Mechanism of Action	Chloroquine is used for malarial prophylaxis (as a suppressive) and in managing acute attacks of malaria. It is highly active against erythrocytic forms of <i>P. vivax</i> , <i>P. malariae</i> and <i>P. falciparum</i> . It influences Hb digestion by

	Chloroquine is used for malarial prophylaxis (as a suppressive) and in managing acute attacks of malaria. It is highly active against erythrocytic forms of <i>P. vivax</i>, <i>P. malariae</i> and <i>P. falciparum</i>. It influences Hb digestion by increasing intravesicular pH in malaria parasite cells and interferes with the nucleoprotein synthesis of the patient. It is also effective in extra intestinal amoebiasis. In RA chloroquine and more effectively hydroxychloroquine have a disease-modifying effect. Absorption: Rapid and complete (oral); rapid (IM/SC). Distribution: Widely distributed; high concentrations in kidneys, liver, lungs and spleen; crosses the placenta; enters breast milk. Metabolism: Extensively hepatic; converted to monodesethylchloroquine. Excretion: Urine (as unchanged drug and metabolite).
CIMS Class	Antimalarials / Disease-Modifying Anti-Rheumatic Drugs (DMARDs) / Antiamoebics
ATC Classification	P01BA01 - chloroquine; Belongs to the class of aminoquinoline antimalarials. Used in the management of malarial infections.

chlorphenamine

CIMS Class : (Antihistamines & Antiallergics)
chlorphenamine

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ∇ - Food interaction

related chlorphenamine information

Indication & Dosage

Oral

Allergic conditions

Adult: 4 mg every 4-6 hr. Max: 24 mg daily.

Child: 1-2 yr: 1 mg bid, 2-5 yr: 1 mg every 4-6 hr, 6-12 yr: 2 mg every 4-6 hr. Max: 6 mg daily (1-5 yr); 12 mg daily (6-12 yr).

Parenteral

Adjunct in the emergency treatment of anaphylactic shock

Adult: 10-20 mg IM, SC, or slow IV inj over 1 min. Max dose: 40 mg daily.

Child: 87.5 mcg/kg SC 4 times daily

Incompatibility: Incompatible with calcium chloride, kanamycin sulfate, noradrenaline acid tartrate, pentobarbital sodium and meglumine adipiodone.

Incompatibility: Incompatible with calcium chloride, kanamycin sulfate, noradrenaline acid tartrate, pentobarbital sodium and meglumine adipiodone.

Administration

May be taken with or without food.

Contraindications

Hypersensitivity, neonates.

Special Precautions	Elderly, pylori duodenal obstruction, angle-closure glaucoma, urinary retention, prostatic hyperplasia, epilepsy, renal and hepatic impairment. May affect performance of skilled tasks. BPH, bladder neck obstruction, hypertension. Pregnancy, lactation.
Adverse Drug Reactions	CNS depression, sedation, drowsiness, lassitude, dizziness. GI upsets, anorexia, or increased appetite, epigastric pain, blurring of vision, dysuria, dryness of mouth, tightness in chest, hypotension, muscular weakness, tinnitus, euphoria, headache, paradoxical CNS stimulation. Potentially Fatal: CV collapse and respiratory failure.
Drug Interactions	Potentiates sedative effect of psychotropic drugs e.g. barbiturates, hypnotics, opioid analgesics, anxiolytics and antipsychotics. Interaction with alcohol could be dangerous (sedation/excitation).
Food Interaction	Reduced bioavailability
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store below 25°C. Parenteral: Store below 25°C.
Mechanism of Action	Chlorphenamine is an H ₁ -receptor antagonist which competitively blocks H ₁ -receptor sites on tissues. Duration: 4-6 hr. Absorption: Absorbed relatively slowly from the GI tract (oral); peak plasma concentrations after 2.5-6 hr. Distribution: Widely distributed; CNS. Protein-binding: 70%. Metabolism: Extensive; converted to desmethyl- and didesmethylchlorphenamine. Excretion: Via urine (as unchanged drug and metabolites).

CIMS Class	Antihistamines & Antiallergics
ATC Classification	R06AB04 - chlorphenamine; Belongs to the class of substituted alkylamines used as systemic antihistamines.

chlorpromazine

CIMS Class : (Antipsychotics) , (Antiemetics)
chlorpromazine

P - Caution when used during pregnancy

L - Contraindicated in lactation

related chlorpromazine information

Indication & Dosage

Oral

Intractable hiccup

Adult: Initially, 25-50 mg 3-4 times daily for 2-3 days; if unresponsive, may admin 25-50 mg via IM inj. If still necessary, 25-50 mg in 500-1000 ml of normal saline may be given via slow IV infusion.

Child: 1-12 yr: 500 mcg/kg every 4-6 hr. Max: >5 yr: 75 mg daily; 1-5 yr: 40 mg daily.

Elderly: Initially, $\frac{1}{3}$ - $\frac{1}{2}$ the normal adult dose.

Oral

Psychoses

Adult: 25 mg tid; may be given as a single 75 mg dose at night. Maintenance: 25-100 mg tid increased to =1 g daily as required in psychotic patients.

Child: 1-12 yr: 500 mcg/kg every 4-6 hr. Max: >5 yr: 75 mg daily; 1-5 yr: 40 mg daily.

Elderly: Initially, $\frac{1}{3}$ - $\frac{1}{2}$ the normal adult dose.

Intramuscular

Psychoses

Adult: 25-50 mg repeated every 6-8 hr. Substitute with oral therapy as soon as possible.

Child: 1-12 yr: 500 mcg/kg every 4-6 hr. Max: >5 yr: 75 mg daily; 1-5 yr: 40 mg daily.

	Adult: 25-50 mg repeated every 6-8 hr. Substitute with oral therapy as soon as possible. Child: 1-12 yr: 500 mcg/kg every 4-6 hr. Max: >5 yr: 75 mg daily; 1-5 yr: 40 mg daily. Elderly: Initially, $\frac{1}{3}$-$\frac{1}{2}$ the normal adult dose. <i>Intramuscular</i> Nausea and vomiting Adult: Initially, 25 mg via IM inj, followed by 25-50 mg every 3-4 hr until vomiting stops. Child: 1-12 yr: 500 mcg/kg every 4-6 hr. Max: >5 yr: 75 mg daily; 1-5 yr: 40 mg daily. Elderly: Initially, $\frac{1}{3}$-$\frac{1}{2}$ the normal adult dose. <i>Rectal</i> Psychoses Adult: 100 mg every 6-8 hr as suppositories.
Administration	May be taken with or without food. (May be taken w/ meals to reduce GI discomfort.)
Overdosage	Symptoms include somnolence, coma, hypotension and extrapyramidal symptoms. Other possible manifestations include agitation and restlessness, convulsions, fever, autonomic reactions such as dry mouth and ileus, EKG changes and cardiac arrhythmias. Treatment is symptomatic and supportive. Early gastric lavage may be helpful. Observe patient and maintain an open airway.
Contraindications	Hypersensitivity; preexisting CNS depression, coma, bone-marrow suppression; phaeochromocytoma; lactation.
Special Precautions	Parkinson's disease; CV disease; renal or hepatic impairment; cerebrovascular and respiratory disease; jaundice; DM; hypothyroidism; paralytic ileus; prostatic hyperplasia or urinary retention; epilepsy or history of seizures; myasthenia gravis; pregnancy; elderly (especially with dementia), and debilitated patients. Avoid direct sunlight.
Adverse Drug Reactions	Tardive dyskinesia (on long-term therapy). Involuntary movements of extremities may also occur. Dry mouth, constipation, urinary retention, mydriasis, agitation, insomnia, depression and convulsions; postural hypotension, ECG changes. Allergic skin reaction, amenorrhoea, gynaecomastia, weight gain. Hyperglycaemia and raised

	constipation, urinary retention, mydriasis, agitation, insomnia, depression and convulsions; postural hypotension, ECG changes. Allergic skin reaction, amenorrhoea, gynaecomastia, weight gain. Hyperglycaemia and raised serum cholesterol. Potentially Fatal: Agranulocytosis. Instantaneous deaths associated with ventricular tachyarrhythmias. Marked elevation of body temperature with heat stroke. Neuroleptic malignant syndrome, extrapyramidal dysfunction.
Drug Interactions	Potential of anticholinergic effects of antiparkinson agents and TCAs may lead to an anticholinergic crisis. Additive orthostatic hypotensive effect in combination with MAOIs. Reverses antihypertensive effect of guanethidine, methyldopa and clonidine. Potentially Fatal: Additive depressant effect with sedatives, hypnotics, antihistamines, general anaesthetics, opiates and alcohol.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intramuscular: Store at 15-30°C. Oral: Store at 15-30°C.
Mechanism of Action	Chlorpromazine is a neuroleptic that acts by blocking the postsynaptic dopamine receptor in the mesolimbic dopaminergic system and inhibits the release of hypothalamic and hypophyseal hormones. It has antiemetic, serotonin-blocking, and weak antihistaminic properties and slight ganglion-blocking activity. Onset: 15 min (IM); 30-60 min (oral). Absorption: Readily but sometimes erratically absorbed from the GI tract (oral); peak plasma concentrations after 2-4 hr. Distribution: Widely distributed; crosses the blood-brain barrier and placenta; enters breast milk. Metabolism: Extensively hepatic by hydroxylation and conjugation with glucuronic acid, N-oxidation, oxidation of a

	barrier and placenta; enters breast milk. Metabolism: Extensively hepatic by hydroxylation and conjugation with glucuronic acid, N-oxidation, oxidation of a sulfur atom and dealkylation. Excretion: Urine and faeces (as active and inactive metabolites); 30 hr (elimination half-life).
CIMS Class	Antipsychotics / Antiemetics
ATC Classification	N05AA01 - chlorpromazine; Belongs to the class of phenothiazine antipsychotics with aliphatic side-chain. Used in the management of psychosis.

chlortalidone

CIMS Class : (Diuretics)
chlortalidone

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related chlortalidone information

Indication & Dosage	<i>Oral</i> Hypertension Adult: 25 mg daily given alone or with other antihypertensives, increased to 50 mg daily if necessary. Child: 2 mg/kg/day or on alternate days. <i>Oral</i> Oedema Adult: Initially, 25-50 mg daily up to 100-200 mg daily in severe cases. Maintenance: 25-50 mg daily or on alternate days. <i>Oral</i> Diabetes insipidus Adult: Initially, 100 mg bid reduced gradually. Maintenance: 50 mg daily.
Contraindications	Severe renal impairment or anuria. Severe hepatic impairment, addison's disease, preexisting hypercalcaemia, asthma; hypersensitivity; severe allergy. Pregnancy and lactation.
Special Precautions	Existing fluid and electrolyte disturbances, hepatic cirrhosis, severe heart failure, hyperuricaemia, mild to moderate renal impairment. Elderly. Monitor fluid and electrolyte balance. Kidney or liver disease; diabetes; gout; hyperlipidaemia and ventricular extra systoles.

	severe heart failure, hyperuricaemia, mild to moderate renal impairment. Elderly. Monitor fluid and electrolyte balance. Kidney or liver disease; diabetes; gout; hyperlipidaemia and ventricular extra systoles.
Adverse Drug Reactions	Dry mouth, thirst, weakness, lethargy, drowsiness, restlessness, seizures, oliguria, hypotension, fatigue, muscle cramps and GI disturbances, nausea, vomiting, constipation, diarrhoea, anorexia. Diabetes and gout may be precipitated. Impotence. Raised blood levels of glucose, urates, lipids and calcium. Reduced levels of K and magnesium. Raised CPK levels. Potentially Fatal: Rare. Severe hyponatraemia and idiosyncratic hypersensitivity.
Drug Interactions	NSAIDs antagonise hypotensive action. Suppresses action of oral anticoagulants due to reduced prothrombin activity. Increased risk of hypokalaemia when corticosteroids are given concurrently. Potentially Fatal: Potentiates bone marrow suppression caused by anticancer drugs. Diuretic-induced vol depletion can potentiate aminoglycoside nephrotoxicity. Impairs action of oral hypoglycaemic agents. Enhances digitalis toxicity due to hypokalaemia. vol depletion enhances lithium toxicity, conversely, sudden withdrawal of diuretics may result in subtherapeutic levels of circulating lithium. Prolonged paralysis with tubocurarine due to hypokalaemia.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). if used in pregnancy-induced hypertension. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for

	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Chlortalidone is an oral, long acting antihypertensive/diuretic. It is a monosulfamyl diuretic that acts by enhancing the excretion of sodium and chloride ions, and water by interfering with the transport of sodium ions across the renal tubular epithelium. Their primary site of action appears to be at the cortical diluting segment in the nephron of the loop of Henle. Onset: 2 hr. Duration: 48-72 hr. Absorption: Erratic absorption from the GI tract (oral). Distribution: Binds to red blood cells; crosses the placenta and enters breast milk. Protein-binding: Weak. Excretion: Urine (as unchanged drug); 40-60 hr (elimination half-life).
CIMS Class	Diuretics
ATC Classification	C03BA04 - chlortalidone; Belongs to the class of low-ceiling sulfonamide diuretics. Used to promote excretion of urine.

chlorzoxazone

CIMS Class : (Muscle Relaxants)
chlorzoxazone

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food **⚠** - Food interaction

related chlorzoxazone information

Indication & Dosage	<i>Oral</i> Painful muscle spasm associated with musculoskeletal conditions Adult: Initially, 500 mg 3-4 times daily, may subsequently reduce to 250 mg 3-4 times daily. Max: 750 mg 3-4 times daily.
Administration	Should be taken with food.
Contraindications	Hypersensitivity. Liver disease. Porphyria. Lactation.
Special Precautions	Pregnancy, known allergies. Tasks requiring mental alertness may be impaired. Monitor liver function.
Adverse Drug Reactions	Drowsiness, dizziness, lightheadedness, headache, excitement, restlessness, GI disturbances, irritability, sensitivity reactions (skin rash). Jaundice, liver damage reported. Orange or reddish-purple urine. Potentially Fatal: Anaphylactoid reactions, angioedema, fatal hepatocellular toxicity.
Food Interaction	Additive CNS effects when taken with alcohol.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal

	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Chlorzoxazone acts at the level of the spinal cord and subcortical areas of the brain where it inhibits multisynaptic areas involved in producing and maintaining skeletal muscle spasm of varied etiology, thus relieving painful musculoskeletal conditions. It also has sedative property. Onset: 1 hr. Duration: 3-4 hr. Absorption: Completely absorbed from the GI tract (oral); peak plasma concentrations after 1-2 hr. Metabolism: Hepatic; yielding 6-hydroxychlorzoxazone. Excretion: Via urine (mainly as glucuronide); 1 hr (elimination half-life).
CIMS Class	Muscle Relaxants
ATC Classification	M03BB03 - chlorzoxazone; Belongs to the class of oxazol, thiazine, and triazine derivative agents used as centrally-acting muscle relaxants.

cholecalciferol

CIMS Class : (Vitamins A, D & E)
cholecalciferol

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related cholecalciferol information

Indication & Dosage	<i>Oral</i> Nutritional deficiency Adult: 10 mcg (400 units) daily. May also be given via IM inj. <i>Oral</i> Deficiency due to malabsorption states or liver diseases Adult: Up to 1 mg (40 000 units) daily. May also be given via IM inj. <i>Oral</i> Hypocalcaemia caused by hypoparathyroidism Adult: Up to 5 mg (200 000 units) daily. May also be given via IM inj.
Contraindications	Hypercalcaemia. Evidence of vitamin D toxicity.
Special Precautions	Excessive intake may lead to development of hyperphosphataemia or hypercalcaemia. Infants, renal impairment or calculi, heart disease. Monitor plasma phosphate & calcium level. Pregnancy, lactation.
Adverse Drug Reactions	Hyperphosphataemia or hypercalcaemia (in excessive intake). Associated effects of hypercalcaemia include hypercalciuria, ectopic calcification, & renal & CV damage.
Drug Interactions	Increased risk of hypercalcaemia if given with thiazide

Drug Interactions	Increased risk of hypercalcaemia if given with thiazide diuretics, calcium or phosphate. Antiepileptics (e.g. carbamazepine, phenobarbitone, phenytoin & primidone) may increase vitamin D requirements. Rifampicin & isoniazid may reduce efficacy of vitamin D. Corticosteroids may counteract the effect of vitamin D. Digoxin or any cardiac glycoside. Reduced absorption when taken with cholestyramine, colestipol, mineral oil, orlistat. Ketoconazole.
Food Interaction	Olestra (fat substitute).
Lab Interference	Interfere with Zlatkis-Zak reaction causing a falsely increased serum cholesterol determination.
Mechanism of Action	Vit D may have anti-osteoporotic, immunomodulatory, anticarcinogenic, antipsoriatic, antioxidant & mood-modulatory activities. Along with parathyroid hormone & calcitonin, regulate serum calcium conc. Onset: Slow. Duration: Relatively prolonged duration of action. Absorption: Well absorbed from the GI tract. Presence of bile is essential for adequate intestinal absorption. Hence absorption may be decreased in patients with decreased fat absorption. Distribution: Bound to a specific α-globulin. Can be stored in adipose & muscle tissue for long periods of time. Slowly released from storage sites & skin where it is formed in the presence of sunlight or uv light. May distribute into breast milk. Metabolism: Hydroxylated in the liver by the enzyme vitamin D 25-hydroxylase to form 25-hydroxycholecalciferol (calcifediol). Further hydroxylated in the kidneys by the enzyme vitamin D1-hydroxylase to form the active metabolites 1,25-dihydroxycholecalciferol (calcitriol). Further metabolism also occurs in the kidneys, including the formation of the 1,24,25-trihydroxy derivatives. Excretion: Mainly in the bile & faeces with only small amounts appearing in urine.

	metabolism also occurs in the kidneys, including the formation of the 1,24,25-trihydroxy derivatives. Excretion: Mainly in the bile & faeces with only small amounts appearing in urine.
CIMS Class	Vitamins A, D & E
ATC Classification	A11CC05 - colecalciferol; Belongs to the class of vitamin D and analogues. Used as dietary supplements.

choline salicylate

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs)) , (Mouth/Throat Preparations)
choline salicylate

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ✖ - Lab interference

related choline salicylate information

Indication & Dosage	<i>Oral</i> Pain and fever Adult: 435-870 mg every 4 hr when required. <i>Oral</i> Rheumatic disorders Adult: 4.8-7.2 g daily in divided doses. <i>Buccal</i> Mouth lesions Adult: Apply 8.7% gel on affected area.
Contraindications	Haemophilia, haemorrhagic disorders, gout, history of hypersensitivity to salicylates. Severe renal or hepatic impairment; childn <12 yrs. Pregnancy and lactation.
Special Precautions	Peptic ulcers, erosive gastritis; asthma, allergic disorders; renal and hepatic impairment; dehydrated patients; uncontrolled hypertension; elderly.
Adverse Drug Reactions	GI disorders, fatigue, hypersensitivity reactions, skin eruptions, haemolytic anaemia, weakness, dyspnoea; local irritation (rectally); Reye's syndrome. Potentially Fatal: Paroxysmal bronchospasm; hepatotoxicity; renal impairment; thrombocytopenia, iron-deficiency anaemia, occult bleeding, leukopenia; mild

	irritation (rectally); Reye's syndrome. Potentially Fatal: Paroxysmal bronchospasm; hepatotoxicity; renal impairment; thrombocytopenia, iron-deficiency anaemia, occult bleeding, leukopenia; mild chronic salicylate intoxication.
Drug Interactions	Increased toxicity of warfarin. Antacids may reduce salicylate effects. Increased risk of GI bleeding when used with corticosteroids.
Lab Interference	Interfere with thyroid function test.
Mechanism of Action	Choline salicylate alleviates pain by inhibition of prostaglandin synthesis and reduce fever by acting on the hypothalamus heat-regulating center. It also blocks the generation of impulses. Onset: 1-2 hr.
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs) / Mouth/Throat Preparations
ATC Classification	N02BA03 - choline salicylate; Belongs to the class of salicylic acids and derivatives agents. Used to relieve pain and fever.

chorionic gonadotrophin

CIMS Class : (Trophic Hormones & Related Synthetic Drugs)
chorionic gonadotrophin

P - Caution when used during pregnancy

L - Contraindicated in lactation

related chorionic gonadotrophin information

related chorionic gonadotrophin information	
Indication & Dosage	<i>Intramuscular</i> Prepubertal cryptorchidism in males Adult: 500-4000 u injected 3 times wkly. Treatment should continue for 1-2 mth after testicular descent. Child: <i>Intramuscular</i> Male infertility due to hypogonadotrophic hypogonadism Adult: 500-4000 u injected 2-3 times wkly. Child: <i>Intramuscular</i> Anovulatory infertility Adult: Single dose of 5000-10,000 u. Up to 3 repeated injections of up to 5000 u each may be given within the following 9 days to prevent corpus luteum insufficiency. <i>Intramuscular</i> Delayed puberty associated with hypogonadism in males Adult: Male: Initially, 500-1500 u twice a wk titrated against plasma-testosterone concentration.
Contraindications	Hypersensitivity; precocious puberty, prostatic carcinoma or other androgenic dependent neoplasm. Pregnancy and lactation.

	Hypersensitivity; precocious puberty, prostatic carcinoma or other androgenic dependent neoplasm. Pregnancy and lactation.
Special Precautions	Discontinue therapy if signs of precocious puberty are seen in patients treated for cryptorchidism. Patients with cardiac or renal disease, epilepsy, migraine or asthma.
Adverse Drug Reactions	Headache, irritability, restlessness, depression, fatigue, oedema; precocious puberty, gynaecomastia; pain at Inj site; enlargement of preexisting ovarian cysts and possible rupture; arterial thromboembolism; shock; abdominal pain. Potentially Fatal: Ovarian hyperstimulation syndrome (OHSS).
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Mechanism of Action	Chorionic Gonadotrophin is a polypeptide hormone produced by the human placenta. It stimulates the production of gonadal steroid hormones by inducing interstitial cells (Leydig cells) of the testis to produce androgens and the corpus luteum of the ovary to produce progesterone. Absorption: Peak concentrations after 6 hrs (IM). Distribution: Mainly in the gonads. Excretion: Via the urine (10-12% of IM dose within 24 hrs). Elimination half-life: 6-11 hrs (initial phase), 23-38 hrs (terminal phase).
CIMS Class	Trophic Hormones & Related Synthetic Drugs
ATC Classification	G03GA01 - chorionic gonadotrophin; Belongs to the class of gonadotropins. Used as ovulation stimulants.

chymotrypsin

CIMS Class : (Anti-inflammatory Enzymes) , (Other Eye Preparations)
chymotrypsin

related chymotrypsin information

Indication & Dosage	<i>Intraocular</i> Enzymatic zonulysis for intracapsular lens extraction Adult: Irrigate the posterior chamber with 1-2 mL of a 1:5000 diluted soln (150 N.F.u/mL). Then irrigate with at least 2 mL of the unused portion of the diluent 2-4 min after procedure.
Contraindications	Hypersensitivity. High vitreous pressure & a gaping incisional wound, congenital cataracts, patients < 20 yr due to probable lens-vitreous adhesion not responsive to a-chymotrypsin lysis.
Adverse Drug Reactions	IM: Occasionally, severe allergic reactions. Ophthalmological: Increased intraocular pressure, corneal oedema, striation & moderate uveitis.
Mechanism of Action	Chymotrypsin is a proteolytic enzyme obtained by the activation of chymotrypsinogen extracted from the pancreas of beef that has been used in ophthalmology for the dissection of the zonule of the lens, thus facilitating intracapsular cataract extraction & reducing trauma to the eye. It has also been given for its anti-inflammatory actions eg, in soft-tissue inflammation & oedema.
CIMS Class	Anti-inflammatory Enzymes / Other Eye Preparations
ATC Classification	B06AA04 - chymotrypsin; Belongs to the class of enzymes used as hematological agent. S01KX01 - chymotrypsin; Belongs to the class of other

B06AA04 - chymotrypsin; Belongs to the class of enzymes used as hematological agent.

S01KX01 - chymotrypsin; Belongs to the class of other agents used as ophthalmologic surgical aids.

ciclopirox

CIMS Class : (Psoriasis, Seborrhea & Ichthyosis Preparations) , (Topical Antifungals & Antiparasites)
ciclopirox

P - Caution when used during pregnancy

L - Caution when used during lactation

related ciclopirox information

Indication & Dosage	<i>Topical/Cutaneous</i> Seborrhoeic dermatitis Adult: As a 1% (ciclopirox base) shampoo: Apply twice wkly. <i>Topical/Cutaneous</i> Nail fungal infections Adult: As 8% (ciclopirox base) lacquer: Apply onto the affected nails once daily. <i>Topical/Cutaneous</i> Skin fungal infections Adult: As 0.77% (ciclopirox base) cream/gel/suspension/solution/powder: Apply onto affected areas bid.
Contraindications	Hypersensitivity; occlusive wrappings/dressings.
Special Precautions	Children <10 yr; pregnancy, lactation. Avoid contact with eyes. For external use only.
Adverse Drug Reactions	Pruritus, burning sensation; headache, rash, irritation, dryness.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled

	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Ciclopirox has a wide spectrum of antifungal activity and some antibacterial activity. Inhibits most Candida, Epidermophyton, Microsporum, Trichophyton species and M. furfur by inhibiting transport of essential elements in fungal cells, thus disrupting DNA, RNA and protein synthesis. Absorption: <2% through intact skin (topical). Distribution: To epidermis, corium (dermis), including hair, hair follicles and sebaceous glands. Protein-binding: 94-98%. Excretion: Urine, faeces (small amounts). Elimination half-life: 1.7 hr (solution); 5.5 hr (gel).
CIMS Class	Psoriasis, Seborrhea & Ichthyosis Preparations / Topical Antifungals & Antiparasites
ATC Classification	D01AE14 - ciclopirox; Belongs to the class of other antifungals for topical use. Used in the treatment of fungal infection. G01AX12 - ciclopirox; Belongs to the class of other anti-infectives and antiseptics. Used in the treatment of gynecological infections.

ciclosporin

CIMS Class : (Immunosuppressants)
ciclosporin

P - Caution when used during pregnancy

L - Contraindicated in lactation

related ciclosporin information

Indication & Dosage

Oral

Immunosuppression in organ transplantation

Adult: Initially, 10-15 mg/kg/day, starting 4-12 hr before procedure and continued for 1-2 wk; usual maintenance: 2-6 mg/kg/day. Lower doses may be used when combined with other immunosuppressants.

Oral

Psoriasis

Adult: Initially, 2.5 mg/kg/day, in 2 divided doses. Reduce to lowest effective dose once remission is achieved. Stop treatment if there is no sufficient improvement to max dose within 6 wk. Max: 5 mg/kg/day.

Oral

Severe atopic dermatitis

Adult: Initially, 2.5 mg/kg/day, in 2 divided doses. Reduce to lowest effective dose once remission is achieved. Stop treatment if there is no sufficient improvement to max dose within 6 wk. Max: 5 mg/kg/day.

Oral

Rheumatoid arthritis

Adult: 2.5 mg/kg/day, in 2 divided doses. Treatment should continue for 6-8 wk. If response is insufficient, may increase dose gradually. Max: 4 mg/kg/day.

Oral

Nephrotic syndrome

Adult: 5 mg/kg daily, given in 2 divided doses.

	max. 4 mg/kg/day. Oral Nephrotic syndrome Adult: 5 mg/kg daily, given in 2 divided doses. Child: 6 mg/kg daily, given in 2 divided doses. Intravenous Prophylaxis of graft rejection in bone marrow transplantation Adult: Initially, 3-5 mg/kg/day starting on the day before transplantation and continue for up to 2 wk or until oral therapy can be initiated at a maintenance of 12.5 mg/kg/day. Continue maintenance dose for at least 3-6 mth. Intravenous Immunosuppression in organ transplantation Adult: Initially: 5-6 mg/kg/day as a single dose, infuse dose over 2-6 hr. Switch to an oral dosage form as soon as possible.
Overdosage	Transient hepatotoxicity and nephrotoxicity may occur. General supportive measures and symptomatic treatment may be used in cases of overdosage.
Contraindications	Hypersensitivity; malignant neoplasms; uncontrolled hypertension; psoriasis; lactation.
Special Precautions	Renal and hepatic impairment; hyperuricaemia; anaphylaxis; history of allergic reactions; pregnancy; monitor BP, serum electrolytes, renal and hepatic function.
Adverse Drug Reactions	Hypertension; hepatotoxicity; tremor; paraesthesia, hypertrichosis, facial oedema, acne; gingival hypertrophy; hyperkalaemia, fluid retention; increased susceptibility to infections; GI symptoms. Potentially Fatal: Nephrotoxicity; convulsions.
Drug Interactions	Increased ciclosporin level by diltiazem, doxycycline, erythromycin, ketoconazole, methylprednisolone (high doses), nifedipine, verapamil, oral contraceptives. Drugs which reduce ciclosporin level are carbamazepine, isoniazid, phenobarbitone, phenytoin and rifampicin. Increased risk of convulsion when used concurrently with high-dose methylprednisolone. Potentially Fatal: Additive nephrotoxicity when used with aminoglycosides, amphotericin B, ciprofloxacin, colchicine, melphalan, co-trimoxazole and NSAIDs.
Storage	Intravenous: Store at 25°C. Oral: Store at 25°C.

	Intravenous: Store at 25°C. Oral: Store at 25°C.
Mechanism of Action	Ciclosporin is a strong immunosuppressant that acts mainly on the helper T-cells. It inhibits the activation of calcineurin and production of interleukin-2, thus reducing cell-mediated immune response. Absorption: Incompletely and variably absorbed from the GI tract (oral). Distribution: Widely distributed; crosses the placenta and enters breast milk. Protein-binding: 90%. Metabolism: Hepatic: Extensive. Excretion: In faeces via the bile; 5-20 hr (elimination half-life), more rapid in children.
CIMS Class	Immunosuppressants
ATC Classification	L04AD01 - ciclosporin; S01XA18 - ciclosporin;

cilostazol

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
cilostazol

P - Caution when used during pregnancy

L - Caution when used during lactation

related cilostazol information

Indication & Dosage	<i>Oral</i> Peripheral vascular disease Adult: 100 mg bid. May reduce dose in patients taking enzyme inhibitors concurrently.
Administration	Should be taken on an empty stomach. (Take at least ½ hr before or 2 hr after meals.)
Overdosage	Symptoms include: severe headache, diarrhoea, hypotension, tachycardia, and possibly cardiac arrhythmias. Careful observation and supportive treatment are recommended.
Contraindications	Heart failure; known predisposition to bleeding; history of ventricular arrhythmias; QT interval prolongation; severe renal impairment; moderate to severe hepatic impairment.
Special Precautions	Congestive heart disease. Concurrent therapy with clopidogrel has not been studied for safety or efficacy. Pregnancy and lactation.
Adverse Drug Reactions	Headache, dizziness, palpitations, diarrhoea, abnormal stools; pain, infection; peripheral oedema, nausea, vomiting, other cardiac arrhythmias, chest pain, rhinitis, pharyngitis, ecchymosis and skin rash.
Drug Interactions	Co-admin with drugs that affect CYP3A4 (erythromycin, other macrolides, diltiazem) or CYP2C19 (omeprazole) may

	Co-admin with drugs that affect CYP3A4 (erythromycin, other macrolides, diltiazem) or CYP2C19 (omeprazole) may influence the pharmacokinetics of cilostazol.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 25°C.
Mechanism of Action	Cilostazol is a reversible, selective inhibitor of phosphodiesterase-III (PDE-III), thereby suppressing cyclic adenosine monophosphate (cAMP) degradation. Increase in cAMP in platelets and blood vessels leads to inhibition of platelet aggregation and vasodilation. Cilostazol also inhibits adenosine uptake into cells, which augments the cAMP-elevating effect of PDE-III inhibition. Absorption: Absorbed from the GI tract after oral admin. Distribution: 95-98% bound to plasma proteins. Metabolism: Extensively metabolised hepatically by CYP450 isoenzymes, mainly CYP3A4. Excretion: Mainly excreted in the urine, remainder excreted in the faeces.
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)

cimetidine

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants)
cimetidine

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food ∇ - Food interaction

related cimetidine information

Indication & Dosage

Oral

Benign gastric and duodenal ulceration

Adult: Initially, 800 mg as a single daily dose given at bedtime for at least 4 wk for duodenal ulcers and 6 wk for gastric ulcers. Maintenance: 400 mg once daily at bedtime or bid.

CrCl (ml/min)	Dosage Recommendation
30-50	200 mg 4 times daily.
15-30	200 mg tid.
0-15	200 mg bid.

Oral

Stress ulceration of upper gastrointestinal tract

Adult: 200-400 mg every 4-6 hr.

CrCl (ml/min)	Dosage Recommendation
30-50	200 mg 4 times daily.
15-30	200 mg tid.
0-15	200 mg bid.

Oral

Prophylaxis of acid aspiration during general anaesthesia

Adult: 400 mg is given orally 90-120 minutes before

Oral

Prophylaxis of acid aspiration during general anaesthesia

Adult: 400 mg is given orally 90-120 minutes before induction of anaesthesia or at the start of labour and up to 400 mg may be given every 4 hr if necessary.

CrCl (ml/min)	Dosage Recommendation
30-50	200 mg 4 times daily.
15-30	200 mg tid.
0-15	200 mg bid.

Oral

Gastro-oesophageal reflux disease

Adult: 400 mg 4 times daily or 800 mg bid for 4-8 wk.

CrCl (ml/min)	Dosage Recommendation
30-50	200 mg 4 times daily.
15-30	200 mg tid.
0-15	200 mg bid.

Oral

Zollinger-Ellison syndrome

Adult: 300-400 mg 4 times daily, increase dose if necessary.

CrCl (ml/min)	Dosage Recommendation
30-50	200 mg 4 times daily.
15-30	200 mg tid.
0-15	200 mg bid.

Oral

Non-ulcer dyspepsia

Adult: Up to 200 mg 4 times daily.

CrCl (ml/min)	Dosage Recommendation
30-50	200 mg 4 times daily.
15-30	200 mg tid.
0-15	200 mg bid.

Oral

Prophylaxis of nocturnal heartburn

Adult: 100 mg at night.

CrCl (ml/min)	Dosage Recommendation
30-50	200 mg 4 times daily.
15-30	200 mg tid.

	Adult: 200 mg at night.	
	0-15	200 mg bid.
	<i>Oral</i> Pancreatic insufficiency Adult: 800-1600 mg daily in 4 divided doses, to be taken 60-90 minutes before meals.	
	CrCl (ml/min)	Dosage Recommendation
	30-50	200 mg 4 times daily.
	15-30	200 mg tid.
	0-15	200 mg bid.
	<i>Intravenous</i> Stress ulceration of upper gastrointestinal tract Adult: 200 mg every 4-6 hr.	
Administration	Should be taken with food.	
Overdosage	Overdosage may lead to respiratory failure and tachycardia that may be controlled by assisted respiration and admin of a β -blocker.	
Contraindications	Hypersensitivity, lactation.	
Special Precautions	Impaired renal and hepatic function. Age >50 yr; CV impairment. Pregnancy.	
Adverse Drug Reactions	Diarrhoea, dizziness, tiredness, rash, headache, CNS disturbances, arthralgia, myalgia, gynaecomastia, alopecia, blood dyscrasias, nephritis, hepatitis, pancreatitis, granulocytopenia, hypersensitivity reactions.	
Drug Interactions	Absorption reduced by antacids. May potentiate anticoagulants, phenytoin, theophylline, benzodiazepines, β -blockers, lidocaine. Procainamide clearance is reduced. Reduced absorption of ketoconazole and itraconazole. May enhance gastric mucosal irritation when taken with ethanol. Avoid concurrent use with clopidogrel.	
Food Interaction	Absorption delayed.	
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not	

Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Cimetidine competitively inhibits histamine at H₂-receptors of the gastric parietal cells resulting in decreased gastric acid secretion, gastric volume and hydrogen ion concentration. It is a potent inhibitor of metabolism in the hepatic mixed-function oxidase systems. It is also used in patients with pancreatic insufficiency to reduce the breakdown of pancreatic enzyme supplements. Onset: 1 hr. Duration: 4-6 hr. Absorption: Readily absorbed from the GI tract; peak plasma concentrations after 1-3 hr. Food delays the rate and slightly decreases extent of absorption. Distribution: Widely distributed in the body; crosses the placental barrier and appears in breast milk. Protein-binding: 20%. Metabolism: Partially hepatic; converted to the sulfoxide and to hydroxymethylcimetidine. Excretion: Urine (as unchanged); 2 hr (elimination half-life).
CIMS Class	Antacids, Antireflux Agents & Antiulcerants
ATC Classification	A02BA01 - cimetidine; Belongs to the class of H ₂ -receptor antagonists. Used in the treatment of peptic ulcer and gastro-oesophageal reflux disease (GERD).

cinnarizine

CIMS Class : (Peripheral Vasodilators & Cerebral Activators) , (Antivertigo Drugs)
cinnarizine

P - Caution when used during pregnancy

L - Caution when used during lactation

related cinnarizine information

Indication & Dosage	<i>Oral</i> Peripheral vascular disease Adult: 75 mg bid or tid. Elderly: <i>Oral</i> Motion sickness Adult: 30 mg taken 2 hr before travel and 15 mg every 8 hr during the journey if necessary. Child: 5-12 yr: $\frac{1}{2}$ of adult dose. <i>Oral</i> Cerebrovascular disorders Adult: 75 mg 1-3 times daily. <i>Oral</i> Vertigo and vestibular disorders Adult: 30 mg tid. Child: 5-12 yr: $\frac{1}{2}$ of adult dose.
Administration	Should be taken with food.
Contraindications	Proven hypersensitivity to the drug. Parkinson's disease. Childn and neonates.
Special Precautions	Hypotension; pregnancy; lactation; elderly. May impair ability to drive or operate machineries.

Adverse Drug Reactions	Extrapyramidal symptoms sometimes associated with severe depression. Drowsiness, headache, GI upsets, unsteadiness, headache; rarely skin and hypersensitivity reactions, dry mouth, blurred vision, urinary difficulty or retention, constipation and increased gastric reflux, fatigue. Hypolipidaemic effect.
Drug Interactions	CNS depressant effect enhanced with alcohol. Action potentiated by domperidone.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Cinnarizine has calcium-channel blocking activity selective for arterial smooth muscle. It also has some antihistamine activity. Cinnarizine acts as a labyrinthine sedative. It also improves microcirculation by reducing ischaemia-induced blood viscosity. Absorption: Absorbed from the GIT (oral); peak plasma concentrations after 2-4 hrs. Excretion: Via faeces (as unchanged drug), via urine (as metabolites); 3-6 hrs (elimination half-life).
CIMS Class	Peripheral Vasodilators & Cerebral Activators / Antivertigo Drugs
ATC Classification	N07CA02 - cinnarizine; Belongs to the class of preparations used in the treatment of vertigo.

cinnarizine + domperidone

CIMS Class : (Antiemetics)
cinnarizine + domperidone

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ∇ - Food interaction

related cinnarizine + domperidone information

Indication & Dosage	<i>Oral</i> Motion sickness Adult: Each tab contains cinnarizine 20 mg and domperidone 15 mg: 1 tab taken 1-2 hr before travel and 1 tab every 6 hr during journey if necessary.
Contraindications	Hypersensitivity. Parkinson's disease. GI haemorrhage, obstruction and perforation, patients with prolactin releasing pituitary hormone or chronic admin or for prophylaxis of postoperative nausea and vomiting. Neonates, children.
Special Precautions	Hypotension. May impair ability to drive or operate machinery. Pheochromocytoma; renal or hepatic impairment; risk of cardiac arrhythmias and hypokalaemia if administered IV. Pregnancy, lactation; elderly.
Adverse Drug Reactions	Extrapyramidal symptoms sometimes associated with severe depression. Drowsiness, headache, GI upsets, unsteadiness, headache; rarely skin and hypersensitivity reactions, dry mouth, thickened resp depression, blurred vision, urinary difficulty or retention, constipation and increased gastric reflux, fatigue. Hypolipidaemic effect, extrapyramidal reactions, galactorrhoea, gynaecomastia; lassitude, decreased libido, skin rash, itch.

	reflux, fatigue. Hypolipidaemic effect, extrapyramidal reactions, galactorrhoea, gynaecomastia; lassitude, decreased libido, skin rash, itch. Potentially Fatal: Convulsions, arrhythmias and cardiac arrest, dysrhythmias in patients with CVS disease or hypokalaemia, patients on cancer chemotherapy. Seizures, hypertensive crisis in patients with pheochromocytoma.
Drug Interactions	CNS depressant effect of cinnarizine is enhanced with alcohol. Domperidone reduces absorption of oral digoxin. It increases absorption of aspirin, paracetamol and oral diazepam. Enhances CNS depression by phenothiazine. Antimuscarinic agents and opioids antagonise GI effects. Prolongs suxamethonium-induced neuromuscular blockade.
Food Interaction	Delayed absorption but higher bioavailability due to reduced first-pass metabolism in gut wall.
Mechanism of Action	Cinnarizine has Ca channel blocking activity selective for arterial smooth muscles. It has some antihistamine activity. Cinnarizine acts as a labyrinthine sedative. It also improves microcirculation by reducing ischaemia-induced blood viscosity. Domperidone is a peripheral dopamine-receptor blocker. It increases both the oesophageal peristalsis and the lower oesophageal sphincter pressure. It also increases gastric motility and peristalsis, and enhances gastroduodenal coordination, thus facilitating gastric emptying and decreasing small bowel transit time.
CIMS Class	Antiemetics
ATC Classification	A03FA03 - domperidone; Belongs to the class of propulsives. Used in the treatment of functional gastrointestinal disorders. N07CA02 - cinnarizine; Belongs to the class of preparations used in the treatment of vertigo.

Gastroenteritis

Adult: 250-750 mg bid depending on the severity and nature of infection.

Child: 5-15 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Oral

Infected animal bites

Adult: 250-750 mg bid depending on the severity and nature of infection.

Child: 5-15 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Oral

Anthrax

Adult: 250-750 mg bid depending on the severity and nature of infection.

Oral

Anthrax

Adult: 250-750 mg bid depending on the severity and nature of infection.

Child: 5-15 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Oral

Brucellosis

Adult: 250-750 mg bid depending on the severity and nature of infection.

Child: 5-15 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Oral

Skin infections

Adult: 250-750 mg bid depending on the severity and nature of infection.

Child: 5-15 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Oral

Septicaemia

Adult: 250-750 mg bid depending on the severity and nature of infection.

Child: 5-15 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Oral

Peritonitis

Adult: 250-750 mg bid depending on the severity and nature of infection.

Child: 5-15 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Oral

Lower respiratory tract infections

Adult: 250-750 mg bid depending on the severity and nature of infection.

Child: 5-15 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Oral

Legionnaire's disease

Adult: 250-750 mg bid depending on the severity and nature of infection.

Oral

Legionnaire's disease

Adult: 250-750 mg bid depending on the severity and nature of infection.

Child: 5-15 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Oral

Infections in immunocompromised patients

Adult: 250-750 mg bid depending on the severity and nature of infection.

Child: 5-15 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Oral

Bone and joint infections

Adult: 250-750 mg bid depending on the severity and nature of infection.

Child: 5-15 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Oral

Biliary tract infections

Adult: 250-750 mg bid depending on the severity and nature of infection.

Child: 5-15 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Oral

Chanroid

Adult: 250-750 mg bid depending on the severity and nature of infection.

Child: 5-15 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Oral

Acute uncomplicated cystitis

Adult: 100 mg bid for 3 days.

Renal impairment: Dosing adjustments may be needed.

Oral

Gonorrhoea

Adult: 250-500 mg as a single dose.

Renal impairment: Dosing adjustments may be needed.

Oral

Acute exacerbations of cystic fibrosis

Adult: 250-500 mg as a single dose.

Renal impairment: Dosing adjustments may be needed.

Oral

Acute exacerbations of cystic fibrosis

Adult: Associated with *P. aeruginosa* infection: 20 mg/kg bid.

Max: 750 mg bid.

Child: Associated with *P. aeruginosa* infection: >5 yr: 20 mg/kg bid. Max: 750 mg bid.

Renal impairment: Dosing adjustments may be needed.

Oral

Prophylaxis of meningococcal meningitis

Adult: 500 mg as a single dose.

Renal impairment: Dosing adjustments may be needed.

Oral

Prophylaxis of surgical infections

Adult: 750 mg as a single dose 60-90 minutes before procedure.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Susceptible infections

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Urinary tract infections

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Typhoid and paratyphoid fever

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Cat scratch disease

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Typhus

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Typhus

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Q fever

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Septicaemia

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Skin infections

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Peritonitis

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Gastroenteritis

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Brucellosis

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Infected animal bites

Adult: 100-400 mg bid infused over 30-60 minutes.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Infected animal bites

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Anthrax

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Bone and joint infections

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Biliary tract infections

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Infections in immunocompromised patients

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Lower respiratory tract infections

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Legionnaire's disease

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Chanroid

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Intravenous

Chanroid

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Spotted fever

Adult: 100-400 mg bid infused over 30-60 minutes.

Child: 4-8 mg/kg bid.

Renal impairment: Dosing adjustments may be needed.

Intravenous

Pseudomonal lung infections in cystic fibrosis

Adult: 400 mg bid. Max: 400 mg tid.

Child: >5 yr old: 10 mg/kg tid infused over 60 min. Max: 400 mg tid.

Renal impairment: Dosing adjustments may be needed.

Ophthalmic

Superficial ophthalmic infections

Adult: Apply 0.3% solution every 15 minutes for 6 hr then every 30 minutes on the 1st day, then apply every hr on the 2nd day and every 4 hr on the 3rd-14th day of treatment. Treatment should not exceed 21 days.

Elderly:

Otic/Aural

Otitis externa

Adult: As a 0.2 or 0.3% solution: Instil 4 drops bid into the affected ear(s) for 7 days. Usually used in combination with a corticosteroid.

Otic/Aural

Otitis media

Adult: As a 0.2 or 0.3% solution: Instil 4 drops bid into the affected ear(s) for 7 days. Usually used in combination with a corticosteroid.

Administration

May be taken with or without food. (May be taken w/ meals to minimise GI discomfort. Do not take w/ antacids, Fe or dairy products.)

Overdosage

Overdosage may lead to reversible renal toxicity. May empty stomach by inducing vomiting or by gastric lavage. Monitor renal function and maintain adequate hydration. Careful

	Overdosage may lead to reversible renal toxicity. May empty stomach by inducing vomiting or by gastric lavage. Monitor renal function and maintain adequate hydration. Careful observation and supportive treatment, including admin of magnesium or calcium containing antacids which can reduce the absorption of ciprofloxacin are recommended.
Contraindications	Hypersensitivity. Not to be used concurrently with tizanidine. Avoid exposure to strong sunlight or sun lamps during treatment.
Special Precautions	Epilepsy, history of CNS disorders; severe renal or hepatic dysfunction; G6PD deficiency; maintain adequate hydration; myasthaenia gravis. Caution when used in patients with QT prolongation or risk factors e.g. bradycardia, pre-existing cardiac disease or uncorrected electrolyte disturbances. Discontinue treatment if patients experience tendon pain, inflammation or rupture. Avoid usage in methicillin-resistant staphylococcus aureus (MRSA) infections due to high level of resistance. May impair ability to drive or operate machinery. Safety and efficacy have not been established in pregnant and lactating women. Not to be used in children <18 yr; except where benefit clearly exceeds risk.
Adverse Drug Reactions	GI disturbances; headache, tremor, confusion, convulsions; rashes; joint pain; phototoxicity. Transient increases in serum creatinine. Haematological, hepatic and renal disturbances. Vasculitis, pseudomembranous colitis and tachycardia. Phototoxicity. Potentially Fatal: Anaphylactoid reaction; cardiopulmonary arrest.
Drug Interactions	Decreased absorption with concurrent sucralfate, magnesium-aluminum antacids, calcium, iron, zinc and multivitamins. Increased methotrexate and caffeine levels when taken concurrently with ciprofloxacin. Probenecid reduces renal clearance of ciprofloxacin. Potentiates oral anticoagulants and glibenclamide. Concurrent use with corticosteroids may increase tendon rupture. Concurrent use with ciclosporin may cause transient increases in serum creatinine. CNS excitation may occur with concurrent admin of quinolones

	and glibenclamide. Concurrent use with corticosteroids may increase tendon rupture. Concurrent use with ciclosporin may cause transient increases in serum creatinine. CNS excitation may occur with concurrent admin of quinolones and NSAIDs. Serum concentrations of theophylline are markedly elevated when co-administered with ciprofloxacin; monitor serum levels of theophylline. Potentially Fatal: Concurrent use with tizanidine can cause marked elevation in serum levels of tizanidine; avoid concurrent usage.
Food Interaction	Food decreases rate but not the extent of absorption.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 5-25°C. Ophthalmic: Store at 2-25°C. Oral: Store at 25°C.
Mechanism of Action	Ciprofloxacin promotes breakage of double-stranded DNA in susceptible organisms and inhibits DNA gyrase, which is essential in reproduction of bacterial DNA. Absorption: Rapidly and well absorbed from the GI tract with peak plasma concentrations after 2 hr (oral); may be delayed by the presence of food. Distribution: Bile (high concentrations), CSF (10% of those in plasma in the absence of meningitis); crosses the placenta and enters the breast milk. Protein-binding: 20-40%. Metabolism: Converted to oxociprofloxacin, sulfociprofloxacin and other active metabolites. Excretion: Mainly via the urine by active tubular secretion and glomerular filtration (as oxociprofloxacin and 15% metabolites, 40% unchanged after oral dose; 70% as unchanged, 10% as metabolites after IV dose); hepatic, biliary and transluminal secretion (non-renal excretion). Via the faeces (as sulfociprofloxacin; 35% after oral dose, 15% after IV dose); 3.5-4.5 hr (elimination half-life). Removed by haemodialysis and peritoneal dialysis (small amounts).

	the faeces (as sulfociprofloxacin; 35% after oral dose, 15% after IV dose); 3.5-4.5 hr (elimination half-life). Removed by haemodialysis and peritoneal dialysis (small amounts).
CIMS Class	Quinolones / Eye Anti-infectives & Antiseptics / Ear Anti-infectives & Antiseptics
ATC Classification	J01MA02 - ciprofloxacin; Belongs to the class of quinolones, fluoroquinolone. Used in the treatment of systemic infections. S01AX13 - ciprofloxacin; Belongs to the class of other anti-infectives. Used in the treatment of eye infections. S02AA15 - ciprofloxacin; S03AA07 - ciprofloxacin; Belongs to the class of anti-infectives used in ophthalmologic and otologic preparations.

ciprofloxacin + tinidazole

CIMS Class : (Antibacterial Combinations) , (Antidiarrheals)
ciprofloxacin + tinidazole

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food $\times$ - Food interaction

related ciprofloxacin + tinidazole information

Indication & Dosage	<i>Oral</i> Gynaecological infections, Intra-abdominal infections, Prophylaxis of surgical infections, Respiratory tract infections Adult: As tablet containing ciprofloxacin (mg)/tinidazole (mg): 500/600, 250/300. Usually 1 tablet bid for 5-10 days depending on severity and response.
Overdosage	Unabsorbed drug may be removed by gastric lavage or induced emesis. Haemodialysis or peritoneal dialysis may be useful in removing ciprofloxacin, especially if the renal function is impaired.
Contraindications	Hypersensitivity, patients with a history of blood dyscrasias.
Special Precautions	Renal impairment, history of seizures; ensure adequate hydration & urinary output; avoid alcohol ingestion. Not recommended for use in lactation and pregnancy. Not recommended for children. Patients with CNS disorders. Inadequate water intake during treatment may cause crystalluria.
Adverse Drug Reactions	Nausea, headache, vomiting, fatigue, abdominal pain, depression, dyspepsia, constipation, dry mouth, sometimes diarrhea, metallic taste, urticaria, erythema & rashes; rarely

	Nausea, headache, vomiting, fatigue, abdominal pain, depression, dyspepsia, constipation, dry mouth, sometimes diarrhea, metallic taste, urticaria, erythema & rashes; rarely convulsions & hematological changes. Potentially Fatal: Severe hypersensitivity reaction (rarely).
Drug Interactions	Antacids, sucralfate, calcium, Fe & Zn prep reduce absorption of ciprofloxacin. Concurrent use with ciclosporin may lead to transient increases in serum creatinine levels. Increases plasma levels and elimination half-life of theophylline; potentiates oral anticoagulant effects; disulfiram-like effect with alcohol. May affect metabolism of caffeine resulting in reduced clearance of caffeine.
Food Interaction	Milk and food may reduce rate but not extent of absorption of ciprofloxacin.
Mechanism of Action	Ciprofloxacin is bactericidal against enteropathogens like <i>Shigella</i>, <i>Salmonella</i>, <i>E coli</i>, <i>C jejuni</i>, <i>Vibrio cholerae</i> etc. It acts by inhibition of DNA synthesis. Tinidazole is a potent anaerobicicide. It is also effective against <i>Entameba</i> & <i>Giardia</i>. It acts by damaging DNA strands. This combination has the advantage of being effective against both bacteria & protozoa. <i>Entameba</i> requires normal faecal flora for its survival; ciprofloxacin kills the pathogenic intestinal bacteria & alters intestinal flora, & tinidazole directly eradicates <i>Entameba</i>. This combination can also be used in other systemic infections caused by susceptible organisms.
CIMS Class	Antibacterial Combinations / Antidiarrheals
ATC Classification	J01MA02 - ciprofloxacin; Belongs to the class of quinolones, fluoroquinolone. Used in the treatment of systemic infections. J01XD02 - tinidazole; Belongs to the class of imidazole derivative antibacterials. Used in the treatment of systemic infections. P01AB02 - tinidazole; Belongs to the class of nitroimidazole derivatives antiprotozoals. Used in the treatment amoebiasis and other protozoal diseases. S01AX13 - ciprofloxacin; Belongs to the class of other anti-infectives. Used in the treatment of eye infections. S02AA15 - ciprofloxacin;

and other protozoal diseases.

S01AX13 - ciprofloxacin; Belongs to the class of other anti-infectives. Used in the treatment of eye infections.

S02AA15 - ciprofloxacin;

S03AA07 - ciprofloxacin; Belongs to the class of anti-infectives used in ophthalmologic and otologic preparations.

cisapride

CIMS Class : (GIT Regulators, Antiflatulents & Anti-inflammatories)
cisapride

P - Contraindicated in pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related cisapride information

Indication & Dosage	<i>Oral</i> Non ulcer dyspepsia, Gastro-oesophageal reflux disease, Disorders associated with reduced gastrointestinal motility Adult: 5-10 mg 3-4 times daily. Max: 40 mg/day. Renal impairment: Reduce initial dose in patients with renal impairment. Hepatic impairment: Reduce dose to ½ in patients with hepatic impairment.
Administration	Should be taken on an empty stomach. (Take 15 mins before meals. Avoid grapefruit juice.)
Contraindications	Hypersensitivity. GI haemorrhage, obstruction or perforation; patients on oral or parenteral azole antifungals; erythromycin, clarithromycin and troleandomycin. Premature neonates with gestational age <3 mth. History of irregular heart beat, abnormal ECG, heart disease, pulmonary disease, dehydration or persistent vomiting. Pregnancy.

	gestational age =3 mth. History of irregular heart beat, abnormal ECG, heart disease, pulmonary disease, dehydration or persistent vomiting. Pregnancy.
Special Precautions	Elderly; renal or hepatic impairment. Patients in whom increase in GI motility could be harmful. Lactation.
Adverse Drug Reactions	Abdominal cramps, borborygmi and loose stools (transient); rarely require discontinuation of therapy. Headache and lightheadedness (rare). Hypersensitivity, convulsions, frequent urination.
Drug Interactions	Sedative effects of benzodiazepines and alcohol may be enhanced. Prothrombin time in patients on anticoagulants may be increased. Effect antagonised by anticholinergic drugs. Avoid cisapride with antiallergics, antibacterials, antidepressants, antifungals, antinauseants, antipsychotics and protease-inhibitors. Cisapride increases the GI absorption of cimetidine and ranitidine. Grapefruit juice increases bioavailability of cisapride, avoid concomitant use.
Food Interaction	Food increases the bioavailability.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store below 25°C.
Mechanism of Action	Cisapride increases GI motility by enhancing the release of acetylcholine at the myenteric plexuses in the gut plain muscle. It increases lower oesophageal sphincter pressure, shortens gastric transit time, reduces oesophageal reflux and facilitates healing of oesophageal ulcers. It also increases small intestine activity. Onset: 30-60 minutes.

	facilitates healing of oesophageal ulcers. It also increases small intestine activity. Onset: 30-60 minutes. Duration: 7-10 hr. Absorption: Readily absorbed in the GI tract; peak plasma concentrations after 1-2 hr (oral). Distribution: Enters breast milk (small amounts); protein-binding: 98%. Metabolism: Extensively hepatic; converted to norcisapride. Excretion: Urine and faeces (as metabolites); 10 hr (elimination half-life).
CIMS Class	GIT Regulators, Antiflatulents & Anti-inflammatories
ATC Classification	A03FA02 - cisapride; Belongs to the class of propulsives. Used in the treatment of functional gastrointestinal disorders.

cisplatin

CIMS Class : (Cytotoxic Chemotherapy)
cisplatin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related cisplatin information

Indication & Dosage

Intravenous

Metastatic ovarian cancer

Adult: As monotherapy: 100 mg/m² per cycle, given as a single dose infused in 0.9% sodium chloride or glucose once every 4 wk. For combination therapy with cyclophosphamide: 75-100 mg/m² on day 1 of every 4-wk cycle.

Child:

Renal impairment: Dose adjustment may be needed.

Intravenous

Metastatic testicular tumours

Adult: 20 mg/m² BSA daily for 5 days per cycle.

Renal impairment: Dose adjustment may be needed.

Intravenous

Advanced bladder cancer

Adult: 50-70 mg/m² per cycle once every 3-4 wk, depending on the extent of prior exposure to radiation and/or chemotherapy treatment. An initial dose of 50 mg/m² every 4 wk may be used in heavily pre-treated

	70 mg/m² per cycle once every 4 weeks, depending on the extent of prior exposure to radiation and/or chemotherapy treatment. An initial dose of 50 mg/m² every 4 wk may be used in heavily pre-treated patients. Renal impairment: Dose adjustment may be needed. Incompatibility: Y-site incompatibility: Thiotepa, cefepime, amphotericin B, amifostine, piperacillin/tazobactam, cholesteryl sulfate complex. Admixture incompatibility: Mesna, thiotepa, fluorouracil.
Overdosage	Acute overdosage may result in kidney failure, liver failure, deafness, ocular toxicity, significant myelosuppression, intractable nausea and vomiting and/or neuritis. Death may also occur following overdosage. Treatment should include general supportive measures.
Contraindications	Patients with severe renal or auditory disorder, known hypersensitivity, severe bone marrow suppression, peripheral neuropathy, pregnancy, lactation.
Special Precautions	Patients with renal or hepatic disorder, myelosuppression. Monitor renal, neurological and auditory function. Perform blood counts regularly. Maintain adequate hydration before and 24 hr after admin to minimise nephrotoxicity.
Adverse Drug Reactions	Severe nausea and vomiting. Serious toxic effects on the kidneys, bone marrows and ears. Hypomagnesaemia, hypocalcaemia, hyperuricaemia. Peripheral neuropathies, papilloedema, optic neuritis, seizures. Ototoxicity (children) manifested as tinnitus, loss of hearing, deafness or vestibular toxicity. Potentially Fatal: Rarely, renal damage due to inadequate hydration during therapy. Very rarely life-threatening myelosuppression. Anaphylactoid reactions (rare) and

	Potentially Fatal: Rarely, renal damage due to inadequate hydration during therapy. Very rarely life-threatening myelosuppression. Anaphylactoid reactions (rare) and cardiac abnormalities.
Drug Interactions	Synergistic with 5-fluorouracil and etoposide. Efficacy increased and toxicity reduced when combined with radioprotecting agent WR 2721. At doses =100 mg, cisplatin is an ideal drug to combine with other cytotoxic drugs; unlike other antineoplastic drugs, it causes little myelosuppression. Potentially Fatal: Potentiates nephrotoxicity with aminoglycosides. Increased toxicity when combined with other cytotoxic drugs.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 15-25°C.
Mechanism of Action	Cisplatin modifies cell cycle by interfering with DNA structure and function. Effects are most prominent during the S phase but cells are killed at all stages. Cisplatin synergises with other anticancer drugs e.g. fluorouracil. It has a narrow therapeutic margin and is highly toxic. Absorption: Well absorbed (intraperitoneal). Distribution: Concentrated in the liver, kidneys, large and small intestines; poor penetration into the CNS. Excretion: Urine. Elimination half-life: 25-49 min (initial), 58-73 hr (terminal).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01XA01 - cisplatin; Belongs to the class of platinum-containing antineoplastic agents. Used in the

citalopram

CIMS Class : (Antidepressants)
citalopram

P - Caution when used during pregnancy
L - Contraindicated in lactation

related citalopram information

Indication & Dosage	<i>Oral</i> Depression Adult: Initially, 20 mg daily, increased to 40 mg once daily after at least 1 wk or 60 mg daily if necessary. Hepatic impairment: Recommended dose: 20 mg daily. <i>Oral</i> Depressive phase of bipolar disorder Adult: Initially, 20 mg daily, increased to 40 mg once daily after at least 1 wk or 60 mg daily if necessary. Hepatic impairment: Recommended dose: 20 mg daily. <i>Oral</i> Panic disorder with or without agoraphobia Adult: Initially, 10 mg daily, increased to 20 mg daily after 1 wk. Max: 60 mg daily. Hepatic impairment: Recommended dose: 20 mg daily.
Administration	May be taken with or without food.
Overdosage	Symptoms include dizziness, sweating, nausea, vomiting, tremor, somnolence and sinus tachycardia. In rare cases,

	Symptoms include dizziness, sweating, nausea, vomiting, tremor, somnolence and sinus tachycardia. In rare cases, amnesia, confusion, coma, convulsions, hyperventilation, cyanosis, rhabdomyolysis and ECG changes may occur. Treatment includes maintaining airway to ensure adequate ventilation and oxygenation. Gastric evacuation by lavage and use of activated charcoal should be considered. Careful observation and cardiac and vital sign monitoring are recommended, along with general symptomatic and supportive care.
Contraindications	Hypersensitivity, concomitant admin with MAOIs or within 14 days of discontinuing MAOI treatment; children and adolescents <18 yr; treatment of depressive illness; lactation.
Special Precautions	Gradual discontinuation of treatment if patient enters into manic phase; pregnancy. Increased risk of hyponatraemia and SIADH. May reduce convulsant threshold thus, citalopram should be used with care in epileptic patients.
Adverse Drug Reactions	Increased sweating, headache, tremor, fatigue, asthenia, dizziness, abnormal accommodation, somnolence, insomnia, agitation, nervousness, nausea, dry mouth, constipation, diarrhoea, palpitation, rash, pruritus, abnormal vision, decreased libido, anxiety, increased appetite, anorexia, apathy, impotence, suicide attempt, confusion, yawning, dyspepsia, vomiting, abdominal pain, flatulence, increased saliva, weight decrease or increase, postural hypotension, tachycardia, rhinitis, ejaculation failure, fatigue, extrapyramidal disorders. Potentially Fatal: Increased risk of suicidal thinking and behaviour especially in child and adolescents. Monitor closely for signs of clinical worsening, suicidality or unusual

	Potentially Fatal: Increased risk of suicidal thinking and behaviour especially in child and adolescents. Monitor closely for signs of clinical worsening, suicidality or unusual changes in behaviour.
Drug Interactions	Do not start MAOI therapy until at least 2 wk after SSRIs withdrawal; serotonergic effects are suspected to be enhanced by SSRIs. May increase anticoagulant effect when used with warfarin.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 25°C.
Mechanism of Action	Citalopram is a selective serotonin re-uptake inhibitor, with little or no effect on noradrenaline, dopamine and ? aminobutyric acid (GABA) re-uptake. It has no or very low affinity for 5-HT_{1A}, 5-HT₂, D₁ and D₂ receptors, α₁, α₂, β-adrenoceptors, histamine H₁, muscarine, cholinergic, benzodiazepine and opioid receptors. Absorption: Readily absorbed from the GI tract (oral); peak plasma concentrations after 2-4 hr. Distribution: Widely distributed; enters breast milk (small amounts). Protein-binding: Low. Metabolism: Undergoes demethylation, deamination and oxidation to active and inactive metabolites. Excretion: Urine (as unchanged drug); 33 hr (elimination half-life).
CIMS Class	Antidepressants
ATC Classification	N06AB04 - citalopram; Belongs to the class of selective serotonin reuptake inhibitors. Used in the management of

Oral

Respiratory tract infections

Adult: 250 mg bid increased to 500 mg bid for severe infections if necessary for 7-14 days.

Child: 7.5 mg/kg bid for 5-10 days.

CrCl (ml/min)	Dosage Recommendation
<30	Half the dosage or double dosing interval.

Oral

Mycobacterium avium complex infections

Adult: 500 mg bid in combination with other antimycobacterials.

Child: 7.5 mg/kg bid; to be used with other antimycobacterials. May increase dose to 15 mg/kg (max 500 mg) bid.

CrCl (ml/min)	Dosage Recommendation
<30	Half the dosage or double dosing interval.

Oral

Leprosy

Adult: 500 mg daily as part of an alternative multidrug therapy.

CrCl (ml/min)	Dosage Recommendation
<30	Half the dosage or double dosing interval.

Oral

Eradication of *H. pylori* associated with peptic ulcer disease

Adult: 500 mg bid; given in combination with another antibacterial and either a proton pump inhibitor or H₂-receptor antagonist for 7-14 days.

Child: ≥1 yr: 7.5 mg/kg bid; may be given with another antibacterial and a proton pump inhibitor for 7 days.

CrCl (ml/min)	Dosage Recommendation
---------------	-----------------------

1/2 receptor antagonist for 7-14 days.

Child: =1 yr: 7.5 mg/kg bid; may be given with another antibacterial and a proton pump inhibitor for 7 days.

CrCl (ml/min)	Dosage Recommendation
<30	Half the dosage or double dosing interval.

Intravenous

Susceptible infections

Adult: 500 mg bid for 2-5 days. Dose to be infused over 60 minutes in a 0.2% solution; revert to oral therapy whenever possible.

Child: 1 mth–12 yr: 7.5 mg/kg every 12 hr. Dose to be given via infusion into proximal vein.

CrCl (ml/min)	Dosage Recommendation
<30	Half the dosage or double dosing interval.

Intravenous

Respiratory tract infections

Adult: 500 mg bid for 2-5 days. Dose to be infused over 60 minutes in a 0.2% solution; revert to oral therapy whenever possible.

Child: 1 mth–12 yr: 7.5 mg/kg every 12 hr. Dose to be given via infusion into proximal vein.

CrCl (ml/min)	Dosage Recommendation
<30	Half the dosage or double dosing interval.

Intravenous

Skin and soft tissue infections

Adult: 500 mg bid for 2-5 days. Dose to be infused over 60 minutes in a 0.2% solution; revert to oral therapy whenever possible.

Child: 1 mth–12 yr: 7.5 mg/kg every 12 hr. Dose to be given via infusion into proximal vein.

CrCl (ml/min)	Dosage Recommendation
<30	Half the dosage or double dosing interval.

	Child: 1 mth–12 yr: 7.5 mg/kg every 12 hr. Dose to be given via infusion into proximal vein. <30 Half the dosage or double dosing interval.	
Administration	Standard release tab: May be taken with or without food. Oral susp: May be taken with or without food. XL & MR tab: Should be taken with food. (Swallow whole, do not chew/crush.)	
Overdosage	GI symptoms e.g. abdominal pain, vomiting, nausea and diarrhoea. Prompt elimination of unabsorbed drug and supportive treatment should be instituted. Haemodialysis or peritoneal dialysis not expected to be helpful.	
Contraindications	Hypersensitivity. Patients receiving terfenadine, astemizole, pimozone, cisapride and ergot derivatives. Pregnancy; history of acute porphyria.	
Special Precautions	Renal and hepatic impairment; macrolide cross-resistance; lactation, children.	
Adverse Drug Reactions	GI upset, glossitis, stomatitis, altered taste; headache, dizziness, hallucinations, insomnia, other CNS effects; rash; hepatic dysfunction, Potentially Fatal: Pseudomembranous colitis, anaphylaxis, Stevens-Johnson syndrome.	
Drug Interactions	May potentiate oral anticoagulant action. May elevate serum digoxin concentration. Potentially Fatal: Increases plasma concentrations of terfenadine or astemizole. Increases the risk of ventricular arrhythmias in patients with preexisting cardiac diseases.	
Food Interaction	Food may interfere with absorption though not clinically significant.	
Pregnancy Category (US)		

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 15-25°C.
Mechanism of Action	Clarithromycin inhibits protein synthesis by binding to 50s ribosomal subunits of susceptible organisms. It has activity against susceptible streptococci and staphylococci as well as other species including B. catarrhalis, L. spp, C. trachomatis and U. urealyticum. Absorption: Rapidly absorbed from the GI tract (oral). Distribution: Widely distributed (concentrations exceed those in serum); enters the breast milk. Metabolism: Hepatic (extensive); converted to 14-hydroxyclearithromycin and other metabolites. Excretion: Via the bile into the faeces; via the urine (20-30% as unchanged, 10-15% as 14-hydroxyclearithromycin and other metabolites).3-4 hr and 5-7 hr (elimination half-life)
CIMS Class	Macrolides
ATC Classification	J01FA09 - clarithromycin; Belongs to the class of macrolides. Used in the treatment of systemic infections.

clemastine

CIMS Class : (Antihistamines & Antiallergics)
clemastine

P - Caution when used during pregnancy

L - Contraindicated in lactation

related clemastine information

Indication & Dosage

Oral

Allergic conditions

Adult: 1 mg bid. Up to 6 g daily for urticaria and angioedema.

Child: 6-12 yr: 0.5-1 mg bid; 3-6 yr: 0.5 mg bid; 1-3 yr: 0.25-0.5 mg bid.

Parenteral

Prophylaxis of acute allergic conditions

Adult: 2 mg/day via IV inj.

Child: 25 mcg/kg IM in 2 divided doses.

Parenteral

Acute allergic reactions

Adult: 4 mg IM or slow IV inj daily.

Administration

May be taken with or without food. (May be taken w/ meals to reduce GI discomfort.)

Overdosage

CNS depression to stimulation with atropine-like signs and symptoms: dry mouth, fixed dilated pupils, flushing and GI symptoms. Empty stomach by inducing vomiting with water

	CNS depression to stimulation with atropine-like signs and symptoms: dry mouth, fixed dilated pupils, flushing and GI symptoms. Empty stomach by inducing vomiting with water or milk or gastric lavage with isotonic and 1/2 isotonic saline. Saline cathartics, such as milk of magnesia, draw water into the bowel by osmosis and help in rapid dilution of bowel content. Stimulants should not be used. Hypotension may be treated with vasopressors.
Contraindications	Hypersensitivity; narrow-angle glaucoma; neonates, lactation; porphyria.
Special Precautions	Tasks requiring mental alertness; bladder neck obstruction; CV disease; stenosing peptic ulcer; increased intraocular pressure; hyperthyroidism; symptomatic prostate cancer; elderly, pregnancy.
Adverse Drug Reactions	Drowsiness, CNS depression, dizziness, sedation; diarrhoea, nausea, vomiting; blurred vision, thickened respiratory secretions; tinnitus.
Drug Interactions	Antagonises effects of cholinergic agents and neuroleptics. Potentially Fatal: Severe sedation and CNS depression may occur when used concomitantly with alcohol or other CNS depressants.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store below 25°C. Parenteral: Store below 25°C.
Mechanism of Action	Clemastine competitively blocks H ₁ -receptors sites on effector cells of the GI tract, blood vessels and respiratory tract.

	Clemastine competitively blocks H₁-receptors sites on effector cells of the GI tract, blood vessels and respiratory tract. Absorption: Rapidly and almost completely absorbed from the GI tract (oral); peak plasma concentrations after 2-4 hr. Excretion: Via urine (as unchanged drug and metabolites); 21 hr (elimination half-life).
CIMS Class	Antihistamines & Antiallergics
ATC Classification	D04AA14 - clemastine; Belongs to the class of topical antihistamines used in the treatment of pruritus. R06AA04 - clemastine; Belongs to the class of aminoalkyl ethers used as systemic antihistamines.

***clemastine information:**

clindamycin

CIMS Class : (Other Antibiotics) , (Preparations for Vaginal Conditions) , (Acne Treatment Preparations)
clindamycin

P - Caution when used during pregnancy

L - Caution when used during lactation

Food α - Food interaction

related clindamycin information

Indication & Dosage	<i>Oral</i>
	Severe anaerobic infections
	Adult: 150-300 mg every 6 hr. May increase to 450 mg every 6 hr in more severe infections. Max: 1.8 g/day.
	Child: 3-6 mg/kg every 6 hr. Children weighing <10 kg should receive at least 37.5 mg every 8 hr.
	Renal impairment: Severe: dosage adjustment may be needed.
	Hepatic impairment: Severe: dosage adjustment may be needed.
	<i>Oral</i>
	Prophylaxis of endocarditis
	Adult: 600 mg 1 hr before dental procedure. 300 mg may be given via IV inj (over at least 10 minutes) for high-risk patients undergoing dental procedures involving general anaesthesia.
	Renal impairment: Severe: dosage adjustment may be

patients undergoing dental procedures involving general anaesthesia.

Renal impairment: Severe: dosage adjustment may be needed.

Hepatic impairment: Severe: dosage adjustment may be needed.

Intravenous

Severe anaerobic infections

Adult: 0.6-2.7 g daily in divided doses, increased to 4.8 g daily in very severe infections.

Child: >1 mth: 15-40 mg/kg daily in divided doses. A min dose of 300 mg daily should be given regardless of body weight.

Renal impairment: Severe: dosage adjustment may be needed.

Hepatic impairment: Severe: dosage adjustment may be needed.

Intravenous

Toxic shock syndrome

Adult: 900 mg every 8 hr, in combination with penicillin G or ceftriaxone.

Hepatic impairment: Severe: dosage adjustment may be needed.

Intravenous

Pelvic inflammatory disease

Adult: 900 mg every 8 hr. To be used with gentamicin.

Hepatic impairment: Severe: dosage adjustment may be needed.

Topical/Cutaneous

Acne

Adult: As 1% preparation: Apply a thin layer onto affected area bid.

Renal impairment: Severe: dosage adjustment may be

	Adult: As 1% preparation: Apply a thin layer onto affected area bid. Renal impairment: Severe: dosage adjustment may be needed. <i>Vaginal</i> Bacterial vaginosis Adult: As pessary or 2% cream: 100 mg once nightly for 3-7 days. Renal impairment: Severe: dosage adjustment may be needed. Hepatic impairment: Severe: dosage adjustment may be needed.
Administration	Cap: May be taken with or without food. (Swallow whole w/ a full glass of water & in an upright position.) Granules: Should be taken with food.
Overdosage	Dialysis or peritoneal dialysis unlikely to be helpful.
Contraindications	Hypersensitivity.
Special Precautions	Renal and hepatic diseases; pregnancy and lactation; GI disease; elderly, females, neonates, atopic patients. Regular monitoring of blood counts, liver and kidney functions.
Adverse Drug Reactions	Diarrhoea, nausea, vomiting, abdominal pain; erythema multiforme, contact dermatitis, exfoliative and vesicular dermatitis, urticaria; eosinophilia; local irritation, thrombophlebitis. Potentially Fatal: Gasping syndrome (neonates); pseudomembranous colitis.
Drug Interactions	Antagonises effects of parasympathetics. Potentially Fatal: Respiratory depression with neuromuscular blockers.
Food Interaction	May reduce rate of absorption.

Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Store at 20-25°C. Oral: Store at 20-25°C. Topical/Cutaneous: Store at 20-25°C. Vaginal: Store at 20-25°C.
Mechanism of Action	Clindamycin inhibits protein synthesis by reversibly binding to the 50S subunit of the ribosomal thus blocking the transpeptidation or translocation reactions of susceptible organisms resulting to stunted cell growth. Absorption: 90% absorbed from the GI tract (oral), absorbed from the skin (topical), systemically (intravaginal); rate of absorption may be reduced by the presence of food. Distribution: Body tissues and fluids (wide), bone, bile (high concentrations), leukocytes, macrophages; crosses the placenta and enters breast milk. Protein-binding: >90% Metabolism: Hepatic; converted to N-demethyl and sulfoxide metabolites and some inactive metabolites. Excretion: Via urine (10% as active drug or metabolites), via faeces (4% as inactive metabolites); 2-3 hr (elimination half-life), may be prolonged in preterm neonates and severe renal impairment.
CIMS Class	Other Antibiotics / Preparations for Vaginal Conditions / Acne Treatment Preparations
ATC Classification	D10AF01 - clindamycin; Belongs to the class of topical antiinfective preparations used in the treatment of acne.

D10AF01 - clindamycin; Belongs to the class of topical antiinfective preparations used in the treatment of acne.

G01AA10 - clindamycin; Belongs to the class of antibiotics. Used in the treatment of gynecological infections.

J01FF01 - clindamycin; Belongs to the class of lincosamides. Used in the treatment of systemic infections.

clioquinol

CIMS Class : (Topical Antibiotics)
clioquinol

related clioquinol information

Indication & Dosage	<i>Topical/Cutaneous</i> Skin fungal infections Adult: Apply 3% cream or ointment 2-4 times daily onto affected areas (cleansed and dried thoroughly). Treatment continued for 4 wk for athlete's foot or ringworm and for 2 wk when treating jock itch.
Contraindications	Hypersensitivity; child <2 yr. Do not apply on eczematous or broken skin and perforated tympanic membrane.
Special Precautions	Can stain fabric and skin. Avoid contact with eyes; avoid prolonged use. Not effective in the treatment of fungal infections of the scalp or nails. Discontinue if local irritation, rash, sensitivity occur.
Adverse Drug Reactions	Severe irritation or hypersensitivity. Cross-sensitivity with other halogenated hydroxyquinolines. May discolour fair hair. Potentially Fatal: May cause severe neurotoxicity.
Mechanism of Action	Clioquinol is a halogenated hydroxyquinoline with antibacterial and antifungal activity.
CIMS Class	Topical Antibiotics

	Topical Antibiotics
ATC Classification	D08AH30 - clioquinol; Belongs to the class of quinolone derivative antiseptics. Used in the treatment of dermatological diseases. D09AA10 - clioquinol; Belongs to the class of ointment dressings with antiinfectives. Used in treatment of wounds. G01AC02 - clioquinol; Belongs to the class of quinolone derivative antiinfectives. Used in the treatment of gynecological infections. P01AA02 - clioquinol; Belongs to the class of hydroxyquinoline derivatives antiprotozoals. Used in the treatment amoebiasis and other protozoal diseases. S02AA05 - clioquinol; Belongs to the class of antiinfectives used in the treatment of ear infections.

clobazam

CIMS Class : (Anxiolytics) , (Anticonvulsants)
clobazam

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related clobazam information

Indication & Dosage	<i>Oral</i> Short-term management of anxiety, Adjunct in epilepsy Adult: 20-30 mg as a single dose at night or as daily divided doses, increased to 60 mg/day in severe conditions. Child: 3-12 yr: 125 mcg/kg bid increased every 5 days. Usual maintenance dose: 250 mcg/kg bid. Max: 500 mcg/kg bid. Elderly: or debilitated patients: 10-20 mg daily. Renal impairment: Dose adjustment may be needed. Hepatic impairment: Dose adjustment may be needed.
Administration	May be taken with or without food.
Overdosage	Drowsiness, mental confusion, lethargy, ataxia, hypotonia, hypotension, respiratory depression, coma and very rarely death. Treatment includes emptying stomach by inducing vomiting (if within 1 hr) or gastric lavage. Activated charcoal may be used to reduce absorption. Monitor respiratory and CV functions. Flumazenil may be given if necessary. Forced diuresis or haemodialysis unlikely to be effective.
Contraindications	Hypersensitivity; history of drug dependence; myasthenia

Contraindications	Hypersensitivity; history of drug dependence; myasthaenia gravis; pregnancy (1 st trimester), lactation; serious liver damage; sleep apnoea syndrome; impaired respiratory function.
Special Precautions	May impair ability to perform skilled tasks and hazardous activities; elderly; renal or hepatic impairment; alcoholics; obesity; withdrawal should be gradual.
Adverse Drug Reactions	Constipation, anorexia, nausea; dizziness, fine tremors; worsening of respiratory symptoms in predisposed individuals; ataxia, drowsiness, headache, confusion; loss of libido, motor dysfunction; dependence; visual disturbances and weight gain. Potentially Fatal: Respiratory depression.
Drug Interactions	Increased hepatic clearance of clobazam when administered with phenytoin, phenobarbital or carbamazepine. Cimetidine may increase levels of clobazam. Potentially Fatal: Concurrent alcohol, hypnotics and sedative antidepressants can potentiate CNS side effects of clobazam.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Clobazam binds to one or more specific GABA receptors at several sites within the CNS including the limbic system and reticular formation. Increased permeability of neuronal membrane to chloride ions results in GABA's inhibitory effect leading to hyperpolarisation and stabilisation. Absorption: Well absorbed from the GI tract (oral); peak plasma concentrations after 1-4 hr. Distribution: Rapidly crosses the blood-brain barrier. Protein-binding: 85%.

	plasma concentrations after 1-4 hr. Distribution: Rapidly crosses the blood-brain barrier. Protein-binding: 85%. Metabolism: Hepatic by demethylation and hydroxylation. Excretion: Urine (as unchanged drug and metabolites); 18-42 hr (elimination half-life).
CIMS Class	Anxiolytics / Anticonvulsants
ATC Classification	N05BA09 - clobazam; Belongs to the class of benzodiazepine derivatives anxiolytics. Used in the management of anxiety, agitation or tension.

clobetasol

CIMS Class : (Topical Corticosteroids)
clobetasol

P - Caution when used during pregnancy
L - Caution when used during lactation

related clobetasol information

Indication & Dosage	<i>Topical/Cutaneous</i> Corticosteroid-responsive dermatoses Adult: As propionate: Apply 0.05% cream/ointment onto affected area twice daily. Elderly: Initiate with lower dose. Renal impairment: Initiate with lower dose. Hepatic impairment: Initiate with lower dose.
Contraindications	Childn <12 yrs. Long-term treatment of ulcerative conditions, rosacea, pruritus; presence of acute infections. Hypersensitivity.
Special Precautions	Heart failure, recent myocardial infarction, hypertension; diabetes mellitus; epilepsy; glaucoma; hypothyroidism; hepatic failure, renal impairment; psychoses; childn and elderly. Should not enter eyes. If infection exists, treat with specific anti-infectives. Pregnancy, lactation.
Adverse Drug Reactions	Perioral dermatitis, striae esp in flexures. Dermal and epidermal atrophy esp on the face, steroid purpura. Potentially Fatal: Prolonged usage of large amount of

	Perioral dermatitis, striae esp in flexures. Dermal and epidermal atrophy esp on the face, steroid purpura. Potentially Fatal: Prolonged usage of large amount of clobetasol propionate can lead to sufficient systemic levels to produce adrenal suppression, Cushing's syndrome, diabetes and hypertension.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Topical/Cutaneous: Store below 25°C.
Mechanism of Action	Clobetasol is a very potent corticosteroid used in short-term treatment of various inflammatory skin conditions.
CIMS Class	Topical Corticosteroids
ATC Classification	D07AD01 - clobetasol; Belongs to the class of very potent (group IV) corticosteroids. Used in the treatment of dermatological diseases.

clobetasone

CIMS Class : (Eye Corticosteroids) , (Topical Corticosteroids)
clobetasone

P - Contraindicated in pregnancy

related clobetasone information

Indication & Dosage

Ophthalmic

Inflammatory eye disorders

Adult: As eye drops containing 0.1%.

Topical/Cutaneous

Corticosteroid-responsive dermatoses

Adult: Use as 0.05% cream or ointment to be applied thinly once or bid on affected areas.

Contraindications

Pregnancy (in high doses). Presence of acute infections. Treatment of rosacea; leg ulcers; acne vulgaris; widespread plaque psoriasis. Child <1 yr.

Special Precautions

May be absorbed in sufficient amounts to cause systemic effects when applied topically to large areas, broken skin or under occlusive dressings. Peptic ulcer, osteoporosis, psychoses or severe psychoneuroses. Not to be used indiscriminately for pruritus. CHF or hypertension. Diabetes mellitus, epilepsy, glaucoma, infectious diseases, ocular herpes simplex, chronic renal failure and uraemia. Active or doubtfully quiescent tuberculosis. Local treatment of eye disorders. Elderly. Prolonged use on the face.

	herpes simplex, chronic renal failure and uraemia. Active or doubtfully quiescent tuberculosis. Local treatment of eye disorders. Elderly. Prolonged use on the face.
Adverse Drug Reactions	Delayed wound healing. Corneal ulcers, raised IOP and reduced visual function (topical application). Na and water retention. Increased excretion of potassium. Ca and phosphorus mobilization with osteoporosis and spontaneous fractures. Increased insulin requirements of diabetics. Increased liability to infection. Infections may be masked. Acute adrenal insufficiency. Growth retardation in child. Cushingoid symptoms. Amenorrhoea, hyperhidrosis, skin thinning, CNS effects, intracranial hypertension, acute pancreatitis, aseptic necrosis of bone.
Drug Interactions	Live vaccines. Barbiturates, carbamazepine, phenytoin, primidone or rifampicin; thiazide or furosemide. NSAIDs. Anticoagulants. Salicylates. Antimuscarinics.
Mechanism of Action	Clobetasone is a corticosteroid with glucocorticoid activity for the treatment of various skin disorders.
CIMS Class	Eye Corticosteroids / Topical Corticosteroids
ATC Classification	D07AB01 - clobetasone; Belongs to the class of moderately potent (group II) corticosteroids. Used in the treatment of dermatological diseases. S01BA09 - clobetasone; Belongs to the class of corticosteroids. Used in the treatment of inflammation of the eye.

clofazimine

CIMS Class : (Antileprotics)
clofazimine

P - Caution when used during pregnancy

L - Contraindicated in lactation

related clofazimine information

Indication & Dosage

Oral

Multibacillary leprosy

Adult: 300 mg clofazimine with 600 mg rifampicin, both given once a mth together with daily doses of 50 mg clofazimine and 100 mg dapsone for 12 mth.

Child: 10-14 yr: 150 mg clofazimine with 450 mg rifampicin and 50 mg dapsone once a mth, taken with 50 mg dapsone daily and 50 mg clofazimine on alternate days. Treatment is given for 12 mth.

Oral

Erythema nodosum leprosum (Type 2)

Adult: Treatment depends on severity. 100-200 mg daily for up to 3 mth. Doses >200 mg daily are not recommended. Gradually taper the dose to 100 mg daily as soon as the reactive episode is controlled. In general, continue with basic antileprosy treatment.

Oral

Dapsone-resistant leprosy

Adult: 100 mg daily with 1 or more other antileprosy drugs

	basic antileprosy treatment. <i>Oral</i> Dapsone-resistant leprosy Adult: 100 mg daily with 1 or more other antileprosy drugs for 3 yr, then continue as a monotherapy at 100 mg daily.
Administration	Should be taken with food.
Overdosage	In cases of acute overdosage, empty the stomach by inducing emesis or by gastric lavage, and initiate supportive and symptomatic treatment.
Contraindications	Hypersensitivity. Lactation.
Special Precautions	Pregnancy. Patients with GI symptoms.
Adverse Drug Reactions	Red-brownish black discolouration of skin especially areas exposed to sunlight, hair, sweat, sputum, urine, faeces. Rash, pruritus, photosensitivity, diarrhoea, nausea, abdominal pain, vomiting, weight loss, headache, drowsiness, dizziness, taste disorders, dryness of the skin, ichthyosis, decreased tear and sweat production. Potentially Fatal: Crystal depletion in the wall of small bowel mesenteric lymph nodes, liver and spleen. Severe abdominal symptoms including bowel obstruction, GI bleeding and splenic infarction.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store below 30°C.
Mechanism of Action	Clofazamine inhibits mycobacterial growth by binding preferentially to mycobacterial DNA. It also has some anti-inflammatory activity. Absorption: About 45-70% of the dose is absorbed from

preferentially to mycobacterial DNA. It also has some anti-inflammatory activity.

Absorption: About 45-70% of the dose is absorbed from the GI tract (oral); increased absorption when taken as microcrystalline formulations or after food.

Distribution: Lipophilic; body tissues, reticuloendothelial cells, body organs and tissues; crosses the placenta and enters breast milk.

Excretion: Via faeces (as unchanged), via urine (1% as unchanged drug and metabolites), sebaceous and sweat glands.

CIMS Class	Antileprotics
ATC Classification	J04BA01 - clofazimine; Belongs to the class of drugs used in the treatment of lepra.

clomifene

CIMS Class : (Trophic Hormones & Related Synthetic Drugs)
clomifene

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related clomifene information

Indication & Dosage

Oral

Anovulatory infertility

Adult: 50 mg daily for 5 days starting on the 5th day of menstrual cycle or at any time if there is amenorrhoea. If ovulation does not occur, a 2nd course of 100 mg for 5 days may be used commencing as early as 30 days after the previous therapy. Further treatment may not be recommended if pregnancy has not occurred after a total of 6 treatment cycles.

Overdosage

Nausea, vomiting, vasomotor flushes, blurred vision, spots or flashes, scotomata, ovarian enlargement with pelvic or abdominal pain. GI decontamination in addition to supportive measures.

Contraindications

Hypersensitivity; abnormal bleeding; pregnancy, lactation; liver dysfunction; uncontrolled thyroid or adrenal dysfunction, patient with an organic intracranial lesions such as pituitary tumor.

	liver dysfunction; uncontrolled thyroid or adrenal dysfunction, patient with an organic intracranial lesions such as pituitary tumor.
Special Precautions	Polycystic ovaries, evaluate presence of ovarian cyst before each cycle treatment. Uterine fibroids; visual disturbances may develop which will impair ability to drive or operate machinery.
Adverse Drug Reactions	Ovarian enlargement; abdominal pain and bloating; blurred vision; hot flushes; breast discomfort; depression; multiple or ectopic pregnancies; weight gain, nausea, vomiting; endometriosis; headache, convulsions, dizziness, fatigue, vertigo, insomnia; rash.
Drug Interactions	Decreased response with danazol.
Lab Interference	Clomifene may increase serum levels of thyroxine and thyroxine-binding globulin (TBG).
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Clomifene inhibits the negative feedback mechanisms of oestrogens in the hypothalamus and pituitary which stimulates the secretion of pituitary gonadotrophic hormones resulting in stimulation of ovulation. Absorption: Absorbed as citrate in the GI tract (oral). Metabolism: Hepatic; undergoes enterohepatic recycling. Excretion: Via the urine and bile; via the faeces (as unchanged drug and metabolites). 5-7 days (elimination half-life).

CIMS Class	Trophic Hormones & Related Synthetic Drugs
ATC Classification	G03GB02 - clomifene; Belongs to the class of synthetic agents used as ovulation stimulants.

clomipramine

CIMS Class : (Antidepressants)
clomipramine

P - Caution when used during pregnancy

L - Caution when used during lactation

related clomipramine information

Indication & Dosage

Oral

Adjunct for cataplexy associated with narcolepsy

Adult: Initially, 10 mg daily gradually increased to 10-75 mg daily.

Elderly: Dose reduction may be needed.

Max Dosage:

Oral

Phobias

Adult: Initially, 25 mg daily, gradually increased to 100-150 mg daily over 2 wk. Max: 250 mg daily.

Child: ≥10 yr: Initially, 25 mg daily, increased gradually over 2 wk. Max: 3 mg/kg/day or 100 mg daily, whichever is smaller. Give in divided doses. Once titrated, dose may be given as a single dose at bedtime.

Elderly: Initially, 10 mg daily.

Oral

Obsessive compulsive disorder

Adult: Initially, 25 mg daily, gradually increased to 100-150 mg daily over 2 wk. Max: 250 mg daily.

Obsessive compulsive disorder

Adult: Initially, 25 mg daily, gradually increased to 100-150 mg daily over 2 wk. Max: 250 mg daily.

Child: =10 yr: Initially, 25 mg daily, increased gradually over 2 wk. Max: 3 mg/kg/day or 100 mg daily, whichever is smaller. Give in divided doses. Once titrated, dose may be given as a single dose at bedtime.

Elderly: Initially, 10 mg daily.

Oral

Panic disorder

Adult: Initially, 25 mg daily, gradually increased to 100-150 mg daily over 2 wk. Max: 250 mg daily.

Child: =10 yr: Initially, 25 mg daily, increased gradually over 2 wk. Max: 3 mg/kg/day or 100 mg daily, whichever is smaller. Give in divided doses. Once titrated, dose may be given as a single dose at bedtime.

Elderly: Initially, 10 mg daily.

Oral

Depression

Adult: Initially, 10 mg daily; may increase gradually to 30-150 mg daily if needed. Up to 250 mg daily or more may be required in more severe cases.

Elderly: Initially, 10 mg daily; may increase gradually over 10 days to 30-75 mg daily.

Max Dosage: 100-150 mg daily.

Intramuscular

Depression

Adult: Initially, 25-50 mg daily, may increase dose gradually. Max: 100-150 mg daily. Substitute with oral dosage as soon as possible.

Elderly: Initially, 10 mg daily gradually increased to 30-75 mg if necessary.

	as possible. Elderly: Initially, 10 mg daily gradually increased to 30-75 mg if necessary. <i>Intramuscular</i> Obsessive compulsive disorder Adult: Initially, 25-50 mg daily, may increase dose gradually. Max: 100-150 mg daily. Substitute with oral dosage as soon as possible. Elderly: Initially, 10 mg daily gradually increased to 30-75 mg if necessary. <i>Intravenous</i> Obsessive compulsive disorder Adult: Initially, 50-75 mg diluted in 250-500 ml of 0.9% sodium chloride or 5% glucose infused over 1.5-3 hr. Substitute with oral therapy when a satisfactory response has been achieved. The initial oral dose can be double the max parenteral dose; adjust subsequently according to response. <i>Intravenous</i> Depression Adult: Initially, 50-75 mg diluted in 250-500 ml of 0.9% sodium chloride or 5% glucose infused over 1.5-3 hr. Substitute with oral therapy when a satisfactory response has been achieved. The initial oral dose can be double the max parenteral dose; adjust subsequently according to response.
Administration	Should be taken with food.
Overdosage	Initial CNS stimulation followed by severe CNS depression. Cardiac dysrhythmias, severe hypotension, convulsions, changes in the electrocardiogram, particularly in QRS axis or width, drowsiness, stupor, ataxia, restlessness, agitation, delirium, severe sweating, hyperactive reflexes, muscle rigidity, athetoid and choreiform movements. Respiratory depression, cyanosis, shock, vomiting, hyperpyrexia,

	delirium, severe sweating, hyperactive reflexes, muscle rigidity, athetoid and choreiform movements. Respiratory depression, cyanosis, shock, vomiting, hyperpyrexia, mydriasis, and oliguria or anuria may also be present. Gastric lavage or induction of emesis with ipecac syrup, preferably accompanied by the instillation of activated charcoal. A minimum of 6 hr of observation with cardiac monitoring, blood pressure and respiratory function and look out for signs of CNS or respiratory depression, hypotension, cardiac dysrhythmias and/or conduction blocks, and seizures is necessary. If signs of toxicity occur at any time during this period, extended monitoring is required. Treatment is symptomatic and supportive. Plasma concentrations should not guide management of the patient. Peritoneal dialysis and hemodialysis are not effective in removing the drugs as it is highly protein bound. V diazepam to be used with caution for treatment of seizures.
Contraindications	Hypersensitivity. Concomitant use of MAOIs; recovery phase following MI, heartblock or other arrhythmias; mania; childn.
Special Precautions	Cardiovascular insufficiency; narrow-angle glaucoma; urinary retention; history of epilepsy; renal or hepatic dysfunction; electroconvulsive therapy; hypotension; hyperthyroidism or concomitant treatment with thyroid preparations; suicidal tendencies; surgery; pregnancy and lactation; tasks requiring mental alertness; elderly; avoid abrupt withdrawal.
Adverse Drug Reactions	Dryness of mouth; disturbances in micturition; drowsiness, increased sweating; sexual dysfunction; confusion, paraesthesia, ataxia, tremors; extrapyramidal symptoms; tinnitus, dizziness, fatigue, headache; wt gain esp in women; gynaecomastia and galactorrhoea. Potentially Fatal: Death, rare (except in patients with preexisting significant heart block and patients on MAOI

	gynaecomastia and galactorrhoea. Potentially Fatal: Death, rare (except in patients with preexisting significant heart block and patients on MAOI therapy). Induction of mania in individuals with underlying manic-depressive illness or worsening of psychoses in already psychotic individuals.
Drug Interactions	Barbiturates increase metabolism of tricyclic antidepressants; conversely cimetidine, guanethidine, haloperidol and phenothiazines block the tricyclic metabolism. CNS effects of alcohol enhanced. Potentially Fatal: If clomipramine is to be substituted for MAOIs, at least 3 wk should elapse after discontinuing MAOIs. Risk of hypertension and arrhythmias if co-administered with adrenaline and noradrenaline.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intramuscular: Store below 30°C. Intravenous: Store below 30°C. Oral: Store below 30°C.
Mechanism of Action	Clomipramine is a potent inhibitor of serotonin re-uptake in the brain. Significant antagonism at cholinergic and α_1-receptors. Weak antagonism at dopamine receptors. It has also antidepressant, sedative and anticholinergic effects. Absorption: Readily absorbed from the GIT (oral). Distribution: Widely distributed; crosses the placenta; enters breast milk. Protein-binding: Extensive. Metabolism: Extensively hepatic by hydroxylation and N-oxidation. Excretion: Urine (as metabolites); faeces (remaining dose).

	Metabolism: Extensively hepatic by hydroxylation and N-oxidation. Excretion: Urine (as metabolites); faeces (remaining dose). Elimination half-life: 21 hrs (clomipramine); 36 hrs (desmethylclomipramine).
CIMS Class	Antidepressants
ATC Classification	N06AA04 - clomipramine; Belongs to the class of non-selective monoamine reuptake inhibitors. Used in the management of depression.

clonazepam

CIMS Class : (Anxiolytics) , (Anticonvulsants)
clonazepam

P - Caution when used during pregnancy

L - Caution when used during lactation

related clonazepam information

Indication & Dosage

Oral

Epilepsy

Adult: Initially, 1 mg given at night for 4 nights, gradually increased over 2-4 wk. Maintenance: 4-8 mg daily. Max: 20 mg/day

Child: 1-5 yr: 250 mcg daily; 5-12 yr: 500 mcg daily.

Maintenance (given in 2-4 divided doses): Infants: 0.5-1 mg daily; 1-5 yr: 1-3 mg daily; 5-12 yr: 3-6 mg daily. Max: 200 mcg/kg/day

Elderly: Initially, 500 mcg at night for 4 nights, may gradually increase over 2-4 wk.

Hepatic impairment: Dose reduction may be needed.

Oral

Panic disorder

Adult: Initially, 250 mcg bid, increased after 3 days up to 1 mg daily. Max: 4 mg daily.

Hepatic impairment: Dose reduction may be needed.

Intravenous

Emergency management of status epilepticus

	mg daily. max. 4 mg daily. Hepatic impairment: Dose reduction may be needed. <i>Intravenous</i> Emergency management of status epilepticus Adult: 1 mg as inj or infusion given over at least 2 min, repeated if necessary. Child: and infants: 500 mcg as inj or infusion given over at least 2 min, repeated if necessary. Hepatic impairment: Dose reduction may be needed.
Administration	May be taken with or without food.
Overdosage	Somnolence, confusion, ataxia, diminished reflexes or coma. Treatment is symptomatic and supportive. Flumazenil, a benzodiazepine antagonist, may be used in the management of benzodiazepine overdosage after weighing the benefits and risks. Emesis or gastric lavage may be performed followed by activated charcoal and saline cathartic to remove any remaining drug. Monitor patient's heart rate, blood pressure, and respiration. Dialysis is of no known value in clonazepam overdosage.
Contraindications	Hypersensitivity to benzodiazepines, acute pulmonary insufficiency, acute narrow angle glaucoma.
Special Precautions	Neonates, chronic pulmonary insufficiency, hepatic/renal dysfunction, porphyria, elderly; pregnancy and lactation.
Adverse Drug Reactions	Drowsiness, fatigue, muscular hypotonia, coordination disturbances, dizziness, vertigo, anorexia, visual disturbances, libido changes. Potentially Fatal: Salivary or bronchial hypersecretion leading to respiratory problems (children). May produce diminished reflexes or coma. Rarely, blood dyscrasias.
Drug Interactions	Carbamazepine, phenobarbitone or phenytoin may accelerate clonazepam metabolism. Potentially Fatal: Increased sedative effect with alcohol,

	Carbamazepine, phenobarbitone or phenytoin may accelerate clonazepam metabolism. Potentially Fatal: Increased sedative effect with alcohol, general anaesthetics and TCAs.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 25°C. Oral: Store at 25°C.
Mechanism of Action	Clonazepam is an effective anticonvulsant. It raises the threshold for propagation of seizure activity and prevents generalisation of focal or local activity. Clinically, it improves focal epilepsy and generalised seizures. It is also believed to enhance the activity of GABA, and acts as anxiolytic. Absorption: Well absorbed from the GI tract (oral); peak plasma concentrations after 4 hr. Distribution: Crosses the placenta; enters breast milk. Protein-binding: 86%. Metabolism: Extensively hepatic; converted to 7-aminoclonazepam. Excretion: Urine (as free or conjugated metabolites); 20-40 hr (elimination half-life).
CIMS Class	Anxiolytics / Anticonvulsants
ATC Classification	N03AE01 - clonazepam; Belongs to the class of benzodiazepine derivatives antiepileptic. Used in the management of epilepsy.

clonidine

CIMS Class : (Other Antihypertensives)
clonidine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related clonidine information

Indication & Dosage

Oral

Hypertension

Adult: Initially, 50-100 mcg tid. As modified-release preparation: 50-100 mcg once or twice daily. Max: 2400 mcg daily.

Child: 2–18 yr: Initially 0.5–1 mcg/kg tid, increase gradually if necessary. Max: 25 mcg/kg daily in divided doses (not exceeding 1.2 mg daily).

Renal impairment: Supplemental doses after haemodialysis are not necessary.

CrCl (ml/min)	Dosage Recommendation
<10	50-75% of usual dose.

Oral

Prophylaxis of migraine

Adult: 50 mcg bid increased to 75 mcg bid if no remission after 2 wk.

Renal impairment: Supplemental doses after haemodialysis

Adult: 50 mcg bid increased to 75 mcg bid if no remission after 2 wk.

Renal impairment: Supplemental doses after haemodialysis are not necessary.

CrCl (ml/min)	Dosage Recommendation
<10	50-75% of usual dose

Oral

Menopausal flushing

Adult: 50 mcg bid increased to 75 mcg bid if no remission after 2 wk.

Renal impairment: Supplemental doses after haemodialysis are not necessary.

CrCl (ml/min)	Dosage Recommendation
<10	50-75% of usual dose

Transdermal

Hypertension

Adult: Apply a patch once wkly, delivering 100-300 mcg of clonidine base daily at a constant rate.

Renal impairment: Supplemental doses after haemodialysis are not necessary.

CrCl (ml/min)	Dosage Recommendation
<10	50-75% of usual dose.

Intravenous

Hypertensive crisis

Adult: 150-300 mcg by slow inj over 10-15 min. Max: 750 mcg over 24 hr.

Child: 2–18 yr: 2–6 mcg/kg as a single dose. Max: 300 mcg.

Renal impairment: Supplemental doses after haemodialysis are not necessary.

CrCl (ml/min)	Dosage Recommendation
<10	50-75% of usual dose.

	are not necessary.	
	<i>Epidural</i> Severe cancer pain Adult: Initially, 30 mcg/hr as continuous infusion in combination with an opioid, adjusted according to patient's response.	
Administration	May be taken with or without food.	
Overdosage	Symptoms include profound hypotension, transient hypertension, weakness, vomiting, irritability, diminished or absent reflexes, tiredness, somnolence, drowsiness, deep sedation, irritability, skin pallor, hypothermia, decreased or irregular heart rate, dry mouth, constricted pupils with poor reaction to light, respiratory depression, hypoventilation, dysrhythmias, apnoea, coma, and seizures. May be treated by gastric lavage using activated charcoal and/or cathartic agents. Treatment is usually supportive and symptomatic, with an adequate airway established and maintained since respiratory depression or apnoea may follow. Supportive care may include atropine sulfate for bradycardia, IV fluids and/or vasopressor agents for hypotension, and vasodilators (IV furosemide, diazoxide or phentolamine) for hypertension. Naloxone may be useful for the management of respiratory depression, hypotension, and/or coma. Monitor BP for paradoxical hypertension. Seizures may be controlled with IV benzodiazepine (e.g. diazepam). Haemodialysis is of limited value as only 5% of circulating drug is removed.	
Contraindications	Hypersensitivity. Disorders of cardiac pacemaker activity and conduction. Pregnancy and lactation.	
Special Precautions	Withdraw gradually, renal impairment, tasks that require	

Special Precautions	Withdraw gradually, renal impairment, tasks that require mental alertness. Cerebrovascular disease, ischaemic heart disease, MI. IV inj should be administered slowly. Occlusive peripheral vascular disorders, history of depression.
Adverse Drug Reactions	Dry mouth, drowsiness, dizziness, headache, constipation, impotence, vivid dreams, urinary retention; dry, itching, burning sensation in the eye; fluid or electrolyte imbalance, GI upset, paralytic ileus, orthostatic hypotension, weakness, sedation, pruritus, myalgia, urticaria, nausea, insomnia, arrhythmias, agitation. Reduced GI motility at times may cause paralytic ileus. Potentially Fatal: Transient hypertension or profound hypotension, respiratory depression, convulsion. Clonidine withdrawal syndrome could be life threatening. Bradycardia, coma and disturbances in conduction (in individuals with preexisting diseases of SA/AV nodes, overdose or on digitalis).
Drug Interactions	Hypotensive action may be potentiated by diuretics and vasodilators. Effects of clonidine antagonised by TCAs and centrally-acting alpha-blockers. May enhance toxicity due to digitalis, lithium. May antagonise oral hypoglycaemics. Potentially Fatal: Hypnosedatives, antihistamines and alcohol may cause excessive drowsiness in patients on clonidine. Withdrawal of clonidine in patients receiving noncardioselective β-blockers may result in rebound BP. Acute severe hypotension following concomitant administration of clonidine and chlorpromazine or haloperidol.
Lab Interference	Transient abnormalities in liver function tests.
Pregnancy Category (US FDA)	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Epidural: Store below 30°C. Intravenous: Store below 30°C. Oral: Store below 30°C. Transdermal: Store below 30°C.
Mechanism of Action	Clonidine stimulates alpha-2 receptors in brain stem which results in reduced sympathetic outflow from the CNS and a decrease in peripheral resistance leading to reduced BP and pulse rate. It does not alter normal haemodynamic response to exercise at recommended dosages. Onset: 2-3 days (transdermal). Duration: Maintained for 8 hr after removal of system (transdermal). Absorption: Well absorbed from the GI tract (oral); peak plasma concentrations after 3-5 hr. Absorbed from the skin (transdermal). Distribution: 20-40% protein bound. Metabolism: Hepatic: 50% of the dose. Excretion: Via urine within 24 hr (as 40-60% as unchanged drug), via faeces (20% of the dose); 6-24 hr (elimination half-life), prolonged to 41 hr in renal impairment.
CIMS Class	Other Antihypertensives
ATC Classification	C02AC01 - clonidine; Belongs to the class of imidazoline receptor agonists, centrally-acting antiadrenergic agents. Used in the treatment of hypertension. N02CX02 - clonidine; Belongs to the class of other preparations used to relieve migraine.

Used in the treatment of hypertension.

N02CX02 - clonidine; Belongs to the class of other preparations used to relieve migraine.

S01EA04 - clonidine; Belongs to the class of sympathomimetics used in glaucoma therapy.

clopamide

CIMS Class : (Diuretics)
clopamide

P - Caution when used during pregnancy
L - Caution when used during lactation

related clopamide information

Indication & Dosage	<i>Oral</i> Oedema Adult: 10-40 mg daily or on alternate days, reduce frequency for maintenance. <i>Oral</i> Hypertension Adult: 5-10 mg daily alone or in conjunction with other antihypertensives.
Contraindications	Severe hepatic or renal impairment; anuria; Addison's disease; hypercalcaemia.
Special Precautions	Fluid and electrolyte disturbances; hepatic cirrhosis; gout; diabetes mellitus. Elderly; severe heart failure; renal or hepatic impairment. Monitor blood glucose concentrations in patients taking antidiabetics. Pregnancy and lactation.
Adverse Drug Reactions	Electrolyte imbalance; hyperglycaemia; gout; dry mouth; thirst; weakness; muscle pain and cramp; seizures; hypotension; GI disturbances; anorexia; sialadenitis; headache; impotence; yellow vision; hypersensitivity

	thirst; weakness; muscle pain and cramp; seizures; hypotension; GI disturbances; anorexia; sialadenitis; headache; impotence; yellow vision; hypersensitivity reactions; cholestatic jaundice; pancreatitis; blood dyscrasias; glycosuria; dizziness; photosensitivity reactions, postural hypotension, paraesthesia.
Drug Interactions	Digitalis glycosides; drugs that prolong QT interval; other antihypertensives; competitive muscle relaxants; pressor amines; corticosteroids, corticotrophin; β_2 -agonists, α -blockers; ACE inhibitors; NSAIDs; alcohol, barbiturates; opioids; lithium; allopurinol; tetracyclines; carbenoxolone; hypoglycaemics.
Storage	Oral: Store below 30°C.
Mechanism of Action	Clopamide reduces the reabsorption of electrolytes from the renal tubules, hence increasing the excretion of Na and chloride ions and consequently of water. It also reduces the glomerular filtration rate. Onset: 1-2 hrs. Duration: Up to 24 hrs.
CIMS Class	Diuretics
ATC Classification	C03BA03 - clopamide; Belongs to the class of low-ceiling sulfonamide diuretics. Used to promote excretion of urine.

clopidogrel

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
clopidogrel

P - Caution when used during pregnancy

L - Contraindicated in lactation

related clopidogrel information

Indication & Dosage

Oral

Prophylaxis of thromboembolic disorders

Adult: 75 mg once daily.

CrCl (ml/min)	Dosage Recommendation
5-15	Use with caution.

Hepatic impairment: Severe hepatic impairment: Use with caution.

Oral

Acute coronary syndrome

Adult: For ST-elevation myocardial infarction: In combination with aspirin: 75 mg once daily. Patients $\geq$ 75 yr old may be given a loading dose of 300 mg. Continue treatment for up to 28 days. For unstable angina, non-ST-elevation myocardial infarction: Initial: 300 mg loading dose, followed by 75 mg once daily (with aspirin 75-325 mg once daily).

Administration

May be taken with or without food.

Overdosage

Prolonged bleeding time and subsequent bleeding complications. If quick reversal is required, platelet transfusion may be considered.

	Prolonged bleeding time and subsequent bleeding complications. If quick reversal is required, platelet transfusion may be considered.
Contraindications	Hypersensitivity. Active pathological bleeding. admin within 7 days after MI and ischaemic stroke, coagulation disorders. Lactation.
Special Precautions	Patients at risk of increased bleeding from trauma, surgery, or other pathological conditions; ulcer; renal and hepatic impairment; history of bleeding or haemostatic disorders. Pregnancy.
Adverse Drug Reactions	Dyspepsia, abdominal pain, nausea, vomiting, flatulence, constipation, gastritis, gastric and duodenal ulcers. GI upset, diarrhoea, paraesthesia, vertigo, headache, dizziness, pruritus and rashes. Potentially Fatal: Bleeding disorders including GI and intracranial haemorrhage. Blood dyscrasias.
Drug Interactions	Co-admin with NSAIDs may increase the risk of stomach and intestinal bleeding. High-dose clopidogrel may lead to increased warfarin levels thus increasing the risk of bleeding. High-dose clopidogrel may also inhibit P450 (2C9), thus interfering with the metabolism of phenytoin, tamoxifen, torasemide, fluvastatin and some NSAIDs. Avoid concurrent use of drugs that inhibit CYP2C19, including omeprazole, esomeprazole, cimetidine, fluconazole, ketoconazole, voriconazole, etravirine, felbamate, fluoxetine, fluvoxamine and ticlopidine.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a

	demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 25°C.
Mechanism of Action	Clopidogrel inhibits adenosine diphosphate (ADP) from binding to its receptor sites on the platelets and subsequent activation of glycoprotein GP IIb/IIIa complex thus preventing fibrinogen binding, platelet adhesion and aggregation. Absorption: Rapidly but incompletely absorbed from the GI tract (oral). Distribution: Protein-binding: Extensive. Metabolism: Hepatic: Extensive; converted to inactive carboxylic acid derivative and thiol derivative (active). Excretion: Via urine and faeces (as metabolites and unchanged drug).
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC Classification	B01AC04 - clopidogrel; Belongs to the class of platelet aggregation inhibitors excluding heparin. Used in the treatment of thrombosis.

clotrimazole

CIMS Class : (Preparations for Vaginal Conditions) , (Ear Anti-infectives & Antiseptics) , (Topical Antifungals & Antiparasites) , (Antifungals)
clotrimazole

P - Caution when used during pregnancy

L - Caution when used during lactation

related clotrimazole information

Indication & Dosage

Oral

Oropharyngeal candidiasis

Adult: Per lozenge contains 10 mg clotrimazole: Suck 1 lozenge 5 times daily for 14 days. For prevention in patients receiving immunosuppressant therapy: 1 lozenge tid for the immunosuppressant treatment duration.

Otic/Aural

Fungal otitis externa

Adult: Apply 1% solution to affected area.

Topical/Cutaneous

Skin fungal infections

Adult: Apply a 1% cream/lotion/solution bid-tid for 2-4 wk, may be used with a 1% powder to prevent reinfection.

Vaginal

Vulvovaginal candidiasis

Adult: As pessary: 100 mg daily for 6 days, 200 mg daily for 3 days or 500 mg as a single dose; alternatively, apply 1, 2 or 10% cream.

	Adult: As pessary: 100 mg daily for 6 days, 200 mg daily for 3 days or 500 mg as a single dose; alternatively, apply 1, 2 or 10% cream.
Contraindications	Hypersensitivity.
Special Precautions	Avoid contact with eyes upon topical application. Childn <3 yrs. Pregnancy, lactation.
Adverse Drug Reactions	Topical: Erythema, stinging, irritation; hypersensitivity reactions; contact dermatitis. Oral: GI disturbances, dysuria, mental depression, elevated liver enzymes.
Drug Interactions	Antagonism with polyene antibiotics.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store below 30°C. Otic/Aural: Store below 30°C. Topical/Cutaneous: Store below 30°C. Vaginal: Store below 30°C.
Mechanism of Action	Clotrimazole is a broad-spectrum antifungal which binds to phospholipids in the cell membrane altering cell wall permeability causing a loss in essential intracellular elements. Absorption: Negligible through intact skin (topical); 3-10% (vaginal). Metabolism: Hepatic; converted to inactive metabolites. Excretion: Urine, faeces (as metabolites).
CIMS Class	Preparations for Vaginal Conditions / Ear Anti-infectives & Antiseptics / Topical Antifungals & Antiparasites /Antifungals
ATC Classification	A01AB18 - clotrimazole; Belongs to the class of local antiinfective and antiseptic preparations. Used in the

A01AB18 - clotrimazole; Belongs to the class of local antiinfective and antiseptic preparations. Used in the treatment of diseases of the mouth.

D01AC01 - clotrimazole; Belongs to the class of imidazole and triazole derivatives for topical use. Used in the treatment of fungal infection.

G01AF02 - clotrimazole; Belongs to the class of imidazole derivative antiinfectives. Used in the treatment of gynecological infections.

cloxacillin

CIMS Class : (Penicillins)
cloxacillin

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related cloxacillin information

Indication & Dosage	<i>Oral</i> Staphylococcal infections resistant to benzylpenicillin Adult: 250-500 mg 4 times daily. Child: 50-100 mg/kg in divided doses every 6 hr. Incompatibility: Incompatible with aminoglycosides and a number of other antimicrobials.
Administration	Should be taken on an empty stomach. (Take on an empty stomach 1 hr before or 2 hr after meals.)
Contraindications	Hypersensitivity to penicillins.
Special Precautions	Renal impairment; pregnancy and lactation. Porphyria.
Adverse Drug Reactions	Neutropenia, agranulocytosis; GI upsets; rash. Sore mouth or tongue. Black hairy tongue. Potentially Fatal: Neuromuscular hypersensitivity; pseudomembranous colitis; anaphylaxis.
Drug Interactions	Co-admin of probenecid or disulfiram may result in higher

Drug Interactions	Co-admin of probenecid or disulfiram may result in higher cloxacillin concentration. Chloramphenicol and tetracycline antagonise bactericidal effect of penicillins. Potentially Fatal: Increased hypoprothrombinaemic effects of oral anticoagulants.
Food Interaction	Delayed absorption in the presence of food.
Lab Interference	Interferes with urinary glucose tests using cupric sulfate. False-positive results in urine and serum protein, uric acid and urinary steroid tests.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Cloxacillin is resistant to degradation by penicillinases. It is particularly useful against penicillinase-producing staphylococci. Highly active against <i>S aureus</i>, <i>S pyogenes</i>, <i>S viridans</i> and <i>S pneumoniae</i>. Absorption: Incompletely absorbed from the GI tract with peak plasma concentrations after 1-2 hr (oral); may be reduced in the presence of food. Completely absorbed with peak plasma concentrations after 30 min (IM). Distribution: Pleural and synovial fluids and bone (therapeutic concentrations), CSF (small amounts except when the meninges are inflamed; crosses the placenta and enters the breast milk. Protein-binding: 94% Metabolism: Minimal metabolism.

	when the meninges are inflamed; crosses the placenta and enters the breast milk. Protein-binding: 94% Metabolism: Minimal metabolism. Excretion: Via the urine by glomerular filtration and renal tubular secretion (35% of an oral dose); via the bile (Up to 10%). Not removed by dialysis; 0.5-1 hr (elimination half-life).
CIMS Class	Penicillins
ATC Classification	J01CF02 - cloxacillin; Belongs to the class of beta-lactamase resistant penicillins. Used in the treatment of systemic infections.

clozapine

CIMS Class : (Antipsychotics)
clozapine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related clozapine information

Indication & Dosage

Oral

Schizophrenia

Adult: 12.5 mg 1-2 times on day 1 followed by 25 mg 1-2 times on day 2, increased gradually in increments of 25-50 mg up to a daily dose of 300 mg within 14-21 days.

Subsequent increments of 50-100 mg may be made 1-2 times wkly. Usual dose: 200-450 mg/day. Max: 900 mg/day.

Elderly: Initially, 12.5 mg on day 1 increased subsequently by increments of 25 mg.

Renal impairment: Mild-moderate renal impairment: use with caution. Severe impairment: contra-indicated.

Hepatic impairment: Use with caution and avoid in symptomatic or progressive liver disease or hepatic failure.

Oral

Psychoses in Parkinson's disease

Adult: Initially, 12.5 mg once daily at night, increased in steps of 12.5 mg up to 2 times each wk, not >50 mg/day at the end of the 2nd wk. Usual dose: 25-37.5 mg daily. Max: 100 mg daily.

	Administer initially, 250 mg once daily at night, increased in steps of 12.5 mg up to 2 times each wk, not >50 mg/day at the end of the 2nd wk. Usual dose: 25-37.5 mg daily. Max: 100 mg daily. Renal impairment: Mild-moderate renal impairment: use with caution. Severe impairment: contra-indicated. Hepatic impairment: Use with caution and avoid in symptomatic or progressive liver disease or hepatic failure.
Administration	May be taken with or without food.
Overdosage	Altered states of consciousness, including drowsiness, delirium, coma, tachycardia, hypotension, respiratory depression or failure, hypersalivation. Aspiration pneumonia, cardiac arrhythmias, seizures have also been reported. Emesis or gastric lavage, followed by activated charcoal to reduce adsorption. Treatment is symptomatic and supportive with monitoring of cardiac and vital signs. Continue monitoring for several days because of risk of delayed effects. Avoid use of epinephrine and derivatives when treating hypotension and quinidine and procainamide when treating cardiac arrhythmia. Forced diuresis, dialysis, haemoperfusion and exchange transfusion unlikely to be of benefit.
Contraindications	History of bone marrow disorders including agranulocytosis, circulatory collapse, alcoholic or toxic psychosis, drug intoxication, uncontrolled epilepsy, severe renal, hepatic or cardiac disease; paralytic ileus. Pregnancy and lactation.
Special Precautions	Leucocyte counts should be monitored regularly and for at least 4 wk after treatment discontinuation. Renal, hepatic or cardiac impairment; prostatic enlargement, narrow-angle glaucoma; elderly; immobilised patients
Adverse Drug Reactions	Drowsiness, dizziness, headache; nausea, vomiting, constipation; anxiety, confusion, fatigue, transient fever.

	Drowsiness, dizziness, headache; nausea, vomiting, constipation; anxiety, confusion, fatigue, transient fever. Rarely, dysphagia, acute pancreatitis, cholestatic jaundice; orthostatic hypotension, tachycardia; seizures; hypersalivation. Potentially Fatal: Rarely, thromboembolism. Reversible neutropenia which may progress to a potentially fatal agranulocytosis. Fatal myocarditis.
Drug Interactions	Reduced plasma concentrations with concomitant use of phenytoin. May enhance the central effects of MAOIs. Potentially Fatal: Concurrent use with bone marrow suppressants e.g. carbamazepine, co-trimoxazole, chloramphenicol, penicillamine, sulfonamides, antineoplastics or pyrazolone analgesics; long-acting depot antipsychotics.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store below 25°C.
Mechanism of Action	Clozapine has relatively weak dopamine receptor-blocking activity at D₁, D₂, D₃ and D₅ receptors but has high affinity for the D₄ receptor. It has also blocking effects on serotonin, α-adrenergic histamine H₁ and cholinergic receptors. Absorption: Absorbed well from the GI tract (oral); peak plasma concentrations after 2.5 hr. Distribution: Protein-binding: 95%. Metabolism: Hepatic; N-demethylation and N-oxidation by cytochrome P-450 isoenzyme CYP1A2.

	Distribution: Protein-binding: 95%. Metabolism: Hepatic; N-demethylation and N-oxidation by cytochrome P-450 isoenzyme CYP1A2. Excretion: Via urine and faeces (as metabolites and trace amounts of unchanged drug); 12 hr (elimination half-life)
CIMS Class	Antipsychotics
ATC Classification	N05AH02 - clozapine; Belongs to the class of diazepines, oxazepines and thiazepines antipsychotics. Used in the management of psychosis.

coal tar

CIMS Class : (Psoriasis, Seborrhea & Ichthyosis Preparations)
coal tar

related coal tar information

Indication & Dosage	<i>Topical/Cutaneous</i> Dandruff Adult: As shampoo containing 5% alcoholic extract of coal tar: Wet hair, rub shampoo onto hair and scalp, rinse thoroughly. Repeat procedure, massaging the scalp for several minutes and rinse thoroughly. Child: As shampoo containing 5% alcoholic extract of coal tar: Wet hair, rub shampoo onto hair and scalp, rinse thoroughly. Repeat procedure, massaging the scalp for several minutes and rinse thoroughly. Elderly: As shampoo containing 5% alcoholic extract of coal tar: Wet hair, rub shampoo onto hair and scalp, rinse thoroughly. Repeat procedure, massaging the scalp for several minutes and rinse thoroughly. <i>Topical/Cutaneous</i> Seborrhoeic dermatitis Adult: As shampoo containing 5% alcoholic extract of coal tar: Wet hair, rub shampoo onto hair and scalp, rinse thoroughly. Repeat procedure, massaging the scalp for several minutes and rinse thoroughly.
---------------------	---

	tar: Wet hair, rub shampoo onto hair and scalp, rinse thoroughly. Repeat procedure, massaging the scalp for several minutes and rinse thoroughly. Child: As shampoo containing 5% alcoholic extract of coal tar: Wet hair, rub shampoo onto hair and scalp, rinse thoroughly. Repeat procedure, massaging the scalp for several minutes and rinse thoroughly. Elderly: As shampoo containing 5% alcoholic extract of coal tar: Wet hair, rub shampoo onto hair and scalp, rinse thoroughly. Repeat procedure, massaging the scalp for several minutes and rinse thoroughly. <i>Topical/Cutaneous</i> Subacute and chronic psoriasis Adult: As emulsion containing 40% w/v distilled coal tar: Add 30 ml to a standard bath of warm water, soak for 5 minutes and pat dry. Child: As emulsion containing 40% w/v distilled coal tar: Add 30 ml to a standard bath of warm water, soak for 5 minutes and pat dry. Elderly: As emulsion containing 40% w/v distilled coal tar: Add 30 ml to a standard bath of warm water, soak for 5 minutes and pat dry. <i>Topical/Cutaneous</i> Psoriasis of skin and scalp Adult: As a 1% w/w alcoholic extract of prepared coal tar emulsion: Apply a thin layer 2-3 times daily to affected areas, massage gently and leave to dry. Child: > 12 yr: As a 1% w/w alcoholic extract of prepared coal tar emulsion: Apply a thin layer 2-3 times daily to affected areas, massage gently and leave to dry.
Contraindications	Application to inflamed or broken skin.
Special Precautions	Use with caution on the face, near eyes and mucous

Special Precautions	Use with caution on the face, near eyes and mucous membranes. Do not apply to genital or rectal areas. Avoid use in patient with exacerbation of psoriasis. Avoid exposure to direct sunlight and sunlamps for at least 24-72 hr after application. May stain clothes and hair. If undergoing Goeckerman treatment, all coal tar preparation should be removed from skin before exposure to radiation. Pregnancy and lactation.
Adverse Drug Reactions	Skin irritation and acne-like skin eruptions. Photosensitivity.
Storage	Topical/Cutaneous: Store below 25°C.
Mechanism of Action	Coal tar has antipruritic, keratoplastic and keratolytic properties. It slows down excessive epidermal cell turnover and is often used topically either alone or in combination with other drugs (e.g. salicylic acid, sulfur) in conditions such as dandruff, seborrheic dermatitis or psoriasis.
CIMS Class	Psoriasis, Seborrhea & Ichthyosis Preparations

codeine

CIMS Class : (Cough & Cold Preparations) , (Analgesics (Opioid))
codeine

P - Contraindicated in pregnancy
L - Caution when used during lactation

related codeine information

Indication & Dosage

Oral

Mild to moderate pain

Adult: 30-60 mg every 4 hr. Max: 240 mg daily.

Child: 1-12 yr: 500 mcg/kg 4-6 times daily.

Renal impairment: Dose adjustment may be needed.

Hepatic impairment: Dose adjustment may be needed.

Oral

Cough suppressant

Adult: 15-30 mg 3-4 times daily. Max: 240 mg/day.

Child: 1-5 yr: 3 mg; 5-12 yr: 7.5-15 mg. Doses to be taken 3-4 times daily.

Renal impairment: Dose adjustment may be needed.

Hepatic impairment: Dose adjustment may be needed.

Oral

Acute diarrhoea

Adult: 30 mg 3-4 times daily.

Renal impairment: Dose adjustment may be needed.

Hepatic impairment: Dose adjustment may be needed.

Parenteral

	Adult: 30-60 mg 4-6 times daily. Renal impairment: Dose adjustment may be needed. Hepatic impairment: Dose adjustment may be needed. <i>Parenteral</i> Mild to moderate pain Adult: IV/IM/SC: 30-60 mg every 4 hr. Max: 240 mg/day. Child: IM/SC: 1-12 yr: 500 mcg/kg 4-6 times daily. Renal impairment: Dose adjustment may be needed. Hepatic impairment: Dose adjustment may be needed.
Administration	May be taken with or without food.
Overdosage	CNS depression ranging from stupor to coma, respiratory depression which may progress to Cheyne-Stokes respiration, cyanosis, miosis, hypothermia, flaccid skeletal muscles, bradycardia and hypotension. Maintain an adequate, patent airway, using assisted or controlled respiration and oxygen as needed. Supportive and symptomatic treatment Parenteral naloxone may be given after weighing benefits versus risk of acute withdrawal syndrome in physically dependent patients. If respiratory depression is associated with muscular rigidity, admin of a neuromuscular blocking agent may help assist or control respiration. Gastric lavage may be effective many hr after drug ingestion since pylorospasm produced result in retention of the drug in the stomach for an extended period of time.
Contraindications	Respiratory depression, obstructive airway disease, asthma. Acute alcoholism, convulsive disorders, head injuries, comatose patients, raised intracranial pressure. Pregnancy (prolonged use or high doses at term).
Special Precautions	Hypothyroidism, adrenocortical insufficiency; asthma, impaired hepatic or renal function, prostatic hyperplasia, hypotension, shock, inflammatory or obstructive bowel

	Hypothyroidism, adrenocortical insufficiency; asthma, impaired hepatic or renal function, prostatic hyperplasia, hypotension, shock, inflammatory or obstructive bowel disorders, myasthenia gravis. Infants, neonates; Reduce dose in elderly or debilitated patients. May impair ability to drive or operate machinery. Lactation.
Adverse Drug Reactions	Dependence, withdrawal symptoms; nausea, vomiting, constipation; drowsiness, confusion; difficulty in micturition, ureteric or biliary spasms, urinary retention; dry mouth, dizziness, sweating, facial flushing, headache, vertigo, bradycardia, tachycardia, palpitations, orthostatic hypotension, hypothermia, restlessness, mood changes, decreased libido or potency, hallucination, miosis; raised intracranial pressure, muscle rigidity. Potentially Fatal: Respiratory depression and hypotension, with circulatory failure and deepening coma (larger doses). Convulsions (especially in children and infants). Rhabdomyolysis.
Drug Interactions	Enhanced depressant effects with alcohol, anaesthetics, anxiolytics, hypnotics, TCAs, antipsychotics. Possible CNS depression or excitation with MAOIs. May alter effects of other compounds e.g. cyclizine, mexiletine, cisapride, metoclopramide and domperidone.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. if used for prolonged periods or in high doses at term.

	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 15-30°C. Parenteral: Store at 15-30°C.
Mechanism of Action	Codeine provides relief by blocking the ascending pain pathways by binding to opiate receptors found in the CNS. It also helps suppress cough by direct action in the medulla. Onset: Oral: 0.5-1 hr. IM: 10-30 min. Duration: 4-6 hr. Absorption: Oral and rectal: Adequate. Distribution: Crosses placenta and enters breast milk. Metabolism: Hepatic by O- and N-demethylation to morphine (active), norcodeine and other metabolites including normorphine and hydrocodone. Excretion: In the urine, mainly as conjugates with glucuronic acid. Plasma half-life: about 3-4 hr.
CIMS Class	Cough & Cold Preparations / Analgesics (Opioid)
ATC Classification	R05DA04 - codeine; Belongs to the class of cough suppressants, opium alkaloids and derivatives. Used in the treatment of dry cough.

co-dergocrine mesylate

CIMS Class : (Peripheral Vasodilators & Cerebral Activators)
co-dergocrine mesylate

P - Caution when used during pregnancy

related co-dergocrine mesylate information

Indication & Dosage	<i>Oral</i> Mild to moderate dementia Adult: 3-4.5 mg daily. May also be given via sublingual admin.
Contraindications	Hypersensitivity.
Special Precautions	Pregnancy. Severe bradycardia.
Adverse Drug Reactions	Abdominal cramps, nausea, vomiting, headache, blurred vision, skin rashes, nasal congestion, flushing of the skin, dizziness, orthostatic hypotension, bradycardia.
Storage	Oral: Store below 25°C.
Mechanism of Action	Co-dergocrine mesylate is a complex of 4 hydrogenated ergot alkaloids. It acts at the central synapsi causing dopaminergic and serotonergic actions while reducing noradrenergic activity in the limbic and other areas. Age-related symptoms and signs such as loss of recent memory, confusion, poor concentration, disorientation, apathy, depression, difficulty in self-care and unsociability are improved.

	memory, confusion, poor concentration, disorientation, apathy, depression, difficulty in self-care and unsociability are improved. Absorption: Oral: Rapidly absorbed from the GI tract; plasma levels peak about 1-2 hr after a dose. Distribution: 81% bound to plasma proteins. Metabolism: Extensive first-pass effect. Excretion: Mainly in bile via the faeces, via urine (small amounts); elimination $T_{1/2}$ (biphasic): 1.5-2.5 hr (α-phase), 13-15 hr (β-phase).
CIMS Class	Peripheral Vasodilators & Cerebral Activators
ATC Classification	C04AE04 - dihydroergocristine; Belongs to the class of ergot alkaloids. Used as peripheral vasodilators.

colchicine

CIMS Class : (Hyperuricemia & Gout Preparations)
colchicine

P - Contraindicated in pregnancy
L - Caution when used during lactation

related colchicine information

Indication & Dosage

Oral

Acute gout

Adult: Initial dose: 1 mg, reduce to 0.5 mg every 2-3 hr until pain relief is achieved or GI toxicity occurs. Course may be repeated after at least 3 drug-free days. Max dose: 6 mg/course.

Renal impairment: Not exceeding 600 mcg daily in patients with CrCl =50 ml/min.

Oral

Prophylaxis of recurrent gouty arthritis

Adult: 0.5-0.6 mg once daily. Up to 1.8 mg daily may be required in some patients. Dosage range: 0.6 mg every other day to 0.6 mg tid.

Renal impairment: Not exceeding 600 mcg daily in patients with CrCl =50 ml/min.

Hepatic impairment: Severe: Contra-indicated.

Intravenous

Acute gout

Adult: 1 or 2 mg over 2-5 minutes. May give additional doses

Hepatic impairment: Severe: Contra-indicated.

Intravenous

Acute gout

Adult: 1 or 2 mg over 2-5 minutes. May give additional doses of 0.5-1 mg every 6 hr up to a total of not more than 4 mg/24 hr. Once the max dose has been reached, further doses should not be given via any route for at least 7 days.

Renal impairment: Not to be given to patients undergoing haemodialysis.

CrCl (ml/min)	Dosage Recommendation
10-50	Reduce dose by 50%.
<10	Avoid use.

Hepatic impairment: IV dose should be reduced by at least 50%.

Incompatibility: 5% dextrose injection, bacteriostatic 0.9% sodium chloride injection.

Administration

Should be taken with food.

Overdosage

Symptoms include nausea, anorexia, abdominal pain, vomiting, dehydration, paralytic ileus, muscular weakness, severe bloody diarrhoea, stomatitis, arthralgia, malaise, hypocalcaemia, fever, rashes, renal damage, hepatomegaly and liver tenderness with elevated liver enzymes, shock and CV collapse (due to extreme vascular damage), bone marrow depression, respiratory depression. Mental confusion, delirium, and seizures may occur. No specific antidote for colchicine poisoning although colchicine-specific Fab fragments prepared from goat antiserum (not commercially available) have been used in the potentially life-threatening colchicine toxicity to increase urinary excretion. Gastric lavage or emesis followed by activated charcoal if orally ingested. Treatment is symptomatic and supportive. Abdominal pain may be relieved by atropine or

	excretion. Gastric lavage or emesis followed by activated charcoal if orally ingested. Treatment is symptomatic and supportive. Abdominal pain may be relieved by atropine or morphine. Filgrastim has been used in the treatment of pancytopenia resulting from colchicine toxicity.
Contraindications	Hypersensitivity; blood dyscrasias, severe renal impairment, pregnancy, debilitated patients; SC/IM admin.
Special Precautions	Elderly; GI disease. Cardiac, renal and hepatic impairment; prolonged therapy not recommended; lactation.
Adverse Drug Reactions	Nausea, vomiting and abdominal pain; diarrhoea, GI haemorrhage, rashes, renal and hepatic damage in excessive doses. Rarely peripheral neuritis, myopathy, alopecia and with chronic therapy blood disorders like agranulocytosis, aplastic anaemia.
Drug Interactions	Reversible malabsorption of vitamin B₁₂ may occur because of ileal mucosal function alteration. Response to CNS depressants and sympathomimetics may increase when used concurrently with colchicine. Increased risk of myopathy when used concurrently with simvastatin. Potentially Fatal: With ciclosporin, increased risk of nephrotoxicity and myotoxicity. Risk of colchicine toxicity when used with macrolides.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store below 30°C. Oral: Store below 30°C.
Mechanism of Action	Colchicine, a phenanthrene derivative, exerts its effect by reducing the inflammatory response to the deposited urate crystals and also by diminishing phagocytosis in joints. It inhibits lactic acid production by leucocytes, thereby

	reducing the inflammatory response to the deposited urate crystals and also by diminishing phagocytosis in joints. It inhibits lactic acid production by leucocytes, thereby interrupting urate deposition and inflammatory response that sustains the acute gout attack. Absorption: Peak plasma concentrations after 2 hr (oral). Distribution: Leucocytes, kidneys, liver and spleen (high concentrations). Protein-binding: 10-31%. Metabolism: Partially hepatic via deacetylation. Excretion: Faeces and urine. Elimination half-life: 12-30 min (adult), 45 min (renal disease).
CIMS Class	Hyperuricemia & Gout Preparations
ATC Classification	M04AC01 - colchicine; Belongs to the class of preparations with no effect on uric acid metabolism. Used in the treatment of gout.

colistin sulfate

CIMS Class : (Other Antibiotics)
colistin sulfate

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related colistin sulfate information

Indication & Dosage

Oral

Gastrointestinal infections

Adult: As sulfate: 1.5-3 million units tid.

Child: As sulfate: 15-30 kg: 0.75-1.5 million units tid; <15 kg: 0.25-0.5 million units tid.

Oral

Bowel sterilisation

Adult: As sulfate: 1.5-3 million units tid.

Child: As sulfate: 15-30 kg: 0.75-1.5 million units tid; <15 kg: 0.25-0.5 million units tid.

Parenteral

Bowel sterilisation

Adult: As colistimethate sodium: 6 million units by IM or slow IV inj/infusion given daily in 3 divided doses. Max: 6 million units in 24 hr.

Child: As colistimethate sodium: >60 kg: 6 million units/day given in 3 divided doses. =60 kg: 50,000 units/kg/day in 3 divided doses. Max: 75,000 units/kg/day.

CrCl (ml/min) | **Dosage Recommendation**

Child: As colistimethate sodium: >60 kg: 6 million units/day given in 3 divided doses. =60 kg: 50,000 units/kg/day in 3 divided doses. Max: 75,000 units/kg/day.

CrCl (ml/min)	Dosage Recommendation
20-50	1-2 million units every 8 hr.
10-20	1 million units every 12-18 hr.
<10	1 million units every 18-24 hr

Parenteral

Gastrointestinal infections

Adult: As colistimethate sodium: 6 million units by IM or slow IV inj/infusion given daily in 3 divided doses. Max: 6 million units in 24 hr.

Child: As colistimethate sodium: >60 kg: 6 million units/day given in 3 divided doses. =60 kg: 50,000 units/kg/day in 3 divided doses. Max: 75,000 units/kg/day.

CrCl (ml/min)	Dosage Recommendation
20-50	1-2 million units every 8 hr.
10-20	1 million units every 12-18 hr.
<10	1 million units every 18-24 hr

Inhalation

Adjunct to systemic antimicrobial therapy in respiratory infections

Adult: As colistimethate sodium: 1-2 million units bid-tid. Max: 2 million units tid for up to 3 mth in frequent recurrent infections. 1-2 million units bid may be used for long-term therapy.

Child: As colistimethate sodium: <2 yr: 0.5-1 million units bid; =2 yr: 1-2 million units bid, up to 2 million units tid for frequent recurrent infections.

Incompatibility: Incompatibility has been reported with various drugs including other antibacterials.

Overdosage

Neuromuscular blockade that can lead to muscular

Overdosage	Neuromuscular blockade that can lead to muscular weakness, apnoea, possible respiratory arrest and acute renal failure. There is no specific antidote. Treatment is supportive. Measures to increase the rate of elimination, e.g. mannitol diuresis, prolonged haemodialysis or peritoneal dialysis may be used.
Contraindications	Hypersensitivity. Anuria; porphyria; myasthenia gravis. Pregnancy and lactation.
Special Precautions	Preexisting renal impairment; disorders of neuromuscular transmission. Monitor serum creatinine and BUN regularly while on treatment.
Adverse Drug Reactions	Superinfection; renal damage; visual disturbances; GI disturbances, dizziness, nausea, vomiting; confusion, peripheral neuropathy; respiratory insufficiency and muscle weakness. Potentially Fatal: Acute tubular necrosis, neurotoxicity; nephrotoxicity. The neuromuscular blockade is potentially fatal, when associated with use of curariform muscle relaxants.
Drug Interactions	Potentiates chloramphenicol and trimethoprim. Potentially Fatal: Potentiates action of curariform muscle relaxants. Potentiates nephrotoxicity of aminoglycosides and cephalothin.
Mechanism of Action	Colistin sulfate is a polymyxin antibiotic which is active against aerobic gram-negative bacteria including most enterobacteria except <i>Proteus</i>, <i>Providentia</i> and <i>Serratia</i>. Susceptible organisms include <i>P. aeruginosa</i>, <i>Legionella</i> spp, <i>H. influenzae</i>, <i>Acinetobacter</i>, <i>V. cholera</i>, <i>Salmonella</i>, <i>Shigella</i> and <i>Pasteurella</i>.. Colistin sulfate is used orally while

	Susceptible organisms include P. aeruginosa, Legionella spp, H. influenzae, Acinetobacter, V. cholera, Salmonella, Shigella and Pasteurella.. Colistin sulfate is used orally while colistimethate sodium is used parenterally or via inhalational route. Absorption: Poorly absorbed from the GI tract (oral); unabsorbed (skin); peak plasma concentrations after 2-3 hr (IM). Distribution: Reversibly bound to body tissues; diffuses across the placenta but negligible into the CSF except in infants. Enters breast milk. Excretion: More rapid in children than in adults; diminished in patients with renal impairment.
CIMS Class	Other Antibiotics

crotamiton

CIMS Class : (Topical Antifungals & Antiparasites)
crotamiton

P - Caution when used during pregnancy

related crotamiton information

Indication & Dosage	<i>Topical/Cutaneous</i> Scabies Adult: Apply a 10% cream/lotion to the whole body from below the chin after 1st bathing and drying. A 2nd application is done after 24 hr. May need to use once daily for up to 5 days for it to be effective. Max Dosage: Once daily for 5 days. <i>Topical/Cutaneous</i> Pruritic skin disorders Adult: Apply a 10% cream/lotion bid/tid onto the skin. Child: <3 yr: Apply a 10% cream/lotion onto the skin once daily.
Overdosage	No information is available on overdosage following topical application. Oral ingestion of the drug may cause burning sensation of the mouth, irritation of the buccal, esophageal, and gastric mucosa, nausea, vomiting and abdominal pain. No known specific antidote. Empty stomach by emesis or gastric lavage followed by symptomatic treatment.
Contraindications	Hypersensitivity; acute exudative dermatitis. Application to

Contraindications	Hypersensitivity; acute exudative dermatitis. Application to the eye, mouth, other mucous membranes or on excoriated skin.
Special Precautions	For external use only. Pregnancy.
Adverse Drug Reactions	Nausea, vomiting and abdominal pain. Topical: Pruritus, contact dermatitis, rash, irritation, warm sensation.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Topical/Cutaneous: Store at 15-30°C.
Mechanism of Action	Crotamiton has scabicial and antipruritic action against <i>Sarcoptes scabiei</i> . It is an effective pediculocide as well.
CIMS Class	Topical Antifungals & Antiparasites

cyclandelate

CIMS Class : (Peripheral Vasodilators & Cerebral Activators)
cyclandelate

related cyclandelate information

Indication & Dosage	<i>Oral</i> Cerebrovascular disorders, Peripheral vascular disease <i>Adult:</i> Initial: Up to 2 g daily. Maintenance: 800-1200 mg daily. <i>Max Dosage:</i> 2 g daily in divided doses.
Contraindications	Acute phase of cerebrovascular accidents.
Special Precautions	Severe obliterative coronary artery disease; cerebrovascular disease.
Adverse Drug Reactions	Flushes, GI upset, nausea, tingling, tachycardia, sweating, dizziness, headache.
Mechanism of Action	Cyclandelate is a vasodilator more potent than papaverine. It has direct action on the plain muscle and there is no effect on the adrenergic tone.
CIMS Class	Peripheral Vasodilators & Cerebral Activators
ATC Classification	C04AX01 - cyclandelate; Belongs to the class of other agents used as peripheral vasodilators.

cyclopentolate

CIMS Class : (Mydriatic Drugs)
cyclopentolate

P - Caution when used during pregnancy

L - Caution when used during lactation

related cyclopentolate information

Indication & Dosage

Ophthalmic

Mydriasis and cycloplegia for diagnosis

Adult: As hydrochloride: Instill 1 drop of a 0.5% solution into the affected eye/s repeated after 5-15 minutes. Deeply pigmented eyes are more resistant to pupillary dilatation and may require the use of 1% solution.

Child: Instill 1-2 drops of a 1% solution repeated after 5-15 minutes. Infants =3 mth: Not recommended.

Ophthalmic

Iritis

Adult: As hydrochloride: Instill 1-2 drops of a 0.5% soln up to 4 times daily into the affected eye/s.

Ophthalmic

Uveitis

Adult: As hydrochloride: Instill 1-2 drops of a 0.5% soln up to 4 times daily into the affected eye/s.

Overdosage

Physical weakness, nausea, lightheadedness, changes in emotional state, unprovoked weeping, loss of equilibrium and tachycardia. Spontaneous recovery occurred within 1

	Physical weakness, nausea, lightheadedness, changes in emotional state, unprovoked weeping, loss of equilibrium and tachycardia. Spontaneous recovery occurred within 1 hr to several days.
Contraindications	Narrow-angle glaucoma.
Special Precautions	Intraocular pressure. May impair ability to drive for 1-2 hrs after mydriasis. Childn, elderly. Pregnancy, lactation.
Adverse Drug Reactions	Local irritation, hyperaemia, oedema and conjunctivitis, increased IOP (may precipitate narrow-angle glaucoma), systemic anticholinergic effects, severe CNS disturbances in child (rare).
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Ophthalmic: Store at 15-25°C.
Mechanism of Action	Cyclopentolate is an anticholinergic. It produces dilatation of the pupil and paralysis of accommodation. Has a shorter duration of action than atropine.
CIMS Class	Mydriatic Drugs
ATC Classification	S01FA04 - cyclopentolate; Belongs to the class of anticholinergics used in the treatment of mydriasis and cyclopegia.

***cyclopentolate information:**

cyclophosphamide

CIMS Class : (Cytotoxic Chemotherapy)
cyclophosphamide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related cyclophosphamide information

Indication & Dosage

Oral

As part of the conditioning regimen in patients undergoing bone marrow transplantation

Adult: 60 mg/kg daily for 2 days.

Oral

Malignancies

Adult: Low-dose regimen: 2-6 mg/kg wkly in divided dose.

May also be given as a single IV dose.

Intravenous

Malignancies

Adult: Moderate dose regimen: 10-15 mg/kg wkly; high dose regimen: 20-40 mg/kg every 10-20 days. Dosage may vary depending on the disease state, patient's condition, state of the bone marrow and whether it is used as a single agent or in combination regimens.

Administration

Should be taken on an empty stomach. (Preferably taken on an empty stomach, but may be taken w/ meals to minimise GI irritation. Ensure adequate fluid intake. Swallow whole.)

	Should be taken on an empty stomach. (Preferably taken on an empty stomach, but may be taken w/ meals to minimise GI irritation. Ensure adequate fluid intake. Swallow whole.)
Overdosage	Symptoms are mainly extensions of adverse reactions, especially severe leukopenia, thrombocytopenia and cardiotoxicity. Impairment of water excretion with hyponatremia, weight gain, and inappropriately concentrated urine has been reported. Treatment is supportive and there is no known specific antidote. Although cyclophosphamide theoretically is dialyzable, no studies have been done.
Contraindications	Bladder haemorrhage. Patients with bone-marrow aplasia, acute infection, drug- or radiation-induced urothelial toxicity. Porphyria. Pregnancy and lactation.
Special Precautions	Blood disorders. Elderly or debilitated patients. Diabetic patients. Renal or hepatic impairment or who have gone adrenalectomy. Previous treatment with x-ray or cytotoxic agents. Monitor haematological profile and presence of RBCs in urine regularly. Maintain adequate hydration and frequent micturition to reduce the risk of cystitis.
Adverse Drug Reactions	Congestive heart failure; leucopenia; poor wound healing; anorexia. Nausea, vomiting; alopecia; oral mucosal ulceration; thrombocytopenia, anaemia; nonhaemorrhagic cystitis and/or fibrosis of the bladder; gonadal suppression, ovarian or skin and nail pigmentation, dermatitis, jaundice. Potentially Fatal: Myelosuppression; haemorrhagic cystitis; interstitial pulmonary fibrosis; tachyarrhythmias and intractable heart failure (high doses). Increased risk of developing acute leukaemias.
Drug Interactions	Chronic high-dose administration of phenobarbital can increase the metabolism and leukopenic activity of cyclophosphamide. Doxorubicin and daunorubicin increase risk of cardiotoxicity. Allopurinol may increase risk of bone

	increase the metabolism and leukopaenic activity of cyclophosphamide. Doxorubicin and daunorubicin increase risk of cardiotoxicity. Allopurinol may increase risk of bone marrow toxicity while chloramphenicol may increase the serum $T_{1/2}$ of cyclophosphamide. Potentially Fatal: Serious toxicity when combined with other myelotoxic drugs or radiotherapy.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store below 25°C. Oral: Store below 25°C.
Mechanism of Action	Cyclophosphamide is a prodrug which is converted in the body to the active metabolites. It acts at any stage of the cell cycle but its main action is blockage at the G2 stage. It arrests cell division by alkylating the DNA in a dose-dependent manner. It also exerts immunosuppressive effects possibly due to a cytotoxic effect on lymphocytes. Absorption: Well absorbed from the GI tract (oral). Distribution: Widely distributed; crosses the blood-brain barrier and placenta; enters breast milk. Metabolism: Hepatic; converted to 4-hydroxycyclophosphamide and aldophosphamide. Excretion: Urine (as metabolites and unchanged drug).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01AA01 - cyclophosphamide; Belongs to the class of alkylating agents, nitrogen mustard analogues. Used in the treatment of cancer.

cycloserine

CIMS Class : (Anti-TB Agents)
cycloserine

P - Caution when used during pregnancy
L - Caution when used during lactation

related cycloserine information

Indication & Dosage	<i>Oral</i> Tuberculosis Adult: As 2nd line drug: In combination with other drugs: Initially, 250 mg bid for 2 wk, increased to 0.5-1 g daily in divided doses. Max: 1 g daily. Adjust dose by monitoring plasma concentrations. Child: As 2nd line drug: 2-12 yr: 5 mg/kg bid; 12-18 yr: 250 mg bid for 2 wk then adjusted to a max dose of 1 g daily. Adjust doses according to blood concentrations and response. Renal impairment: Mild-moderate: Dose reduction may be needed. Severe: Avoid.
Administration	May be taken with or without food. (May be taken after meals if GI discomfort occurs.)
Overdosage	Headache, vertigo, confusion, drowsiness, hyperirritability, paresthesias, dysarthria, and psychosis, paresis, seizure and coma. Treatment is symptomatic and supportive. Emesis or gastric lavage and the use of charcoal may help to remove

	paresthesias, dysarthria, and psychosis, paresis, seizure and coma. Treatment is symptomatic and supportive. Emesis or gastric lavage and the use of charcoal may help to remove unabsorbed drug. Monitor patient's vital signs, blood gases and serum electrolytes. Neurotoxic effects may be treated and/or prevented by administering 200–300 mg of pyridoxine hydrochloride daily. Haemodialysis may enhance elimination of cycloserine from the body.
Contraindications	Severe renal impairment, porphyria, depression, epilepsy, severe anxiety, psychosis, chronic alcoholism, hypersensitivity.
Special Precautions	Discontinue or reduce dose if allergic skin reactions or CNS toxicity occurs; monitor haematological, renal and hepatic function; Blood levels should be determined wkly for renally impaired patients or if dose exceeds 500 mg/day or if there are signs of neurological toxicity. Pregnancy and lactation.
Adverse Drug Reactions	Headache, dizziness, anxiety, confusion, irritability, paraesthesia, speech difficulties, photosensitivity, vertigo, drowsiness, tremor, psychosis, depression; rashes; megaloblastic anaemia; changes in liver function tests. Potentially Fatal: Convulsions (dose related).
Drug Interactions	Concurrent usage with other antituberculosis drugs may lead to vitamin B₁₂ and/or folic acid deficiency, megaloblastic and sideroblastic anemia. Potentially Fatal: Inhibits phenytoin metabolism and may increase risk of epileptic seizures. Alcohol increases risk of convulsions. Increased CNS toxicity with isoniazid and ethionamide.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or

	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store below 25°C.
Mechanism of Action	Cycloserine interferes with bacterial cell wall synthesis by competing with D-alanine for incorporation into the cell wall and competitive antagonist of the racemase enzyme. It is a second-line antituberculous drug effective against M. tuberculosis. It is also active against other mycobacteria eg, M. fortuitum, M. kansasii and M. malmoense. Absorption: Readily absorbed from the GI tract (oral); peak plasma concentrations after 3-4 hr. Distribution: Body tissues and fluids (wide), CSF, breast milk, crosses the placenta (concentrations near maternal serum). Excretion: Via urine by glomerular filtration (as unchanged); 10 hr (elimination half-life).
CIMS Class	Anti-TB Agents
ATC Classification	J04AB01 - cycloserine; Belongs to the class of antibiotics. Used in the treatment of tuberculosis.

cyproheptadine

CIMS Class : (Antihistamines & Antiallergics) , (Appetite Enhancers)
cyproheptadine

P - Caution when used during pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related cyproheptadine information

Indication & Dosage

Oral

Allergic conditions

Adult: As HCl: 4 mg tid adjusted as necessary. Usual dose range: 12-16 mg daily in 3-4 divided doses. Up to 32 mg daily may be used in some cases.

Child: As HCl: 2-6 yr: 2 mg tid (max: 12 mg daily); 7-14 yr: 4 mg bid-tid (max: 16 mg daily).

Elderly:

Oral

Treatment and prophylaxis of migraine and other vascular headaches

Adult: As HCl: 4 mg, may repeat 30 minutes later. Not to exceed 8 mg within a 4-6-hr period. Maintenance dose: 4 mg every 4-6 hr.

Administration

May be taken with or without food. (May be taken w/ meals to reduce GI discomfort.)

Overdosage

Symptoms may vary from CNS depression or stimulation to

	Symptoms may vary from CNS depression or stimulation to convulsions, respiratory and cardiac arrest and death, especially in infants and children. Atropine-like and GI symptoms may also occur. Treatment is supportive and symptomatic. Emesis or gastric lavage, followed by activated charcoal to reduce drug absorption. Saline cathartics may be useful as they dilute bowel content quickly by osmosis.
Contraindications	Narrow-angle glaucoma; acute asthmatic attack; bladder neck obstruction; stenosing peptic ulcer; GIT obstruction; MAOIs therapy; hypersensitivity; neonates, lactation.
Special Precautions	Elderly; epilepsy; tasks requiring mental alertness; symptomatic prostate hypertrophy; epilepsy; alcoholism; pregnancy.
Adverse Drug Reactions	Slight to moderate drowsiness, fatigue; dry mouth, GI upsets, nausea; appetite increase, wt gain and impaired alertness.
Drug Interactions	Masks ototoxicity produced by aminoglycosides and antibiotics. Potentially Fatal: Potentiate CNS depressant actions of alcohol, barbiturates, sedatives, opioid analgesics and neuroleptics. Additive antimuscarinic action with MAOIs, atropine and tricyclic antidepressants.
Lab Interference	Suppression of diagnostic antigen skin test results and false-positive serum TCA screen.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in

	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-25°C.
Mechanism of Action	Cyproheptadine is a sedating antihistamine with antimuscarinic, serotonin-antagonist and calcium-channel blocking properties. It competes for H₁-receptor sites on effector cells in the GIT, blood vessels and resp tract. It is used as an appetite stimulant in some countries. Absorption: Absorbed from the GIT (oral). Metabolism: Completely hepatic. Excretion: Via urine (as conjugates); via faeces.
CIMS Class	Antihistamines & Antiallergics / Appetite Enhancers
ATC Classification	R06AX02 - cyproheptadine; Belongs to the class of other agents used as systemic antihistamines.

cytarabine

CIMS Class : (Cytotoxic Chemotherapy)
cytarabine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related cytarabine information

Indication & Dosage

Parenteral

Induction and maintenance of remission in acute leukaemias

Adult: 100 mg/m² BSA bid by rapid IV inj or 100 mg/m² BSA daily by continuous IV infusion. Continue treatment for 5-10 days depending on therapeutic response and toxicity. Maintenance: 1-1.5 mg/kg 1-2 times wkly via IV or SC admin. For refractory disease: High dose regimen is used: Up to 3 g/m² BSA every 12 hr for up to 6 days, given as an IV infusion over at least 1 hr.

Child: 100 mg/m² BSA bid by rapid inj or 100 mg/m² BSA daily by continuous infusion given for 5-10 days.

Intrathecal

Leukaemic meningitis

Adult: 10-30 mg/m² BSA every 2-4 days. For lymphomatous meningitis: 50 mg every 2 wk for 5 doses, then every 4 wk for 5 doses.

Overdosage

Overdose of IV (unencapsulated) cytarabine have been reported to cause excessive toxicity, including irreversible

	Overdose of IV (unencapsulated) cytarabine have been reported to cause excessive toxicity, including irreversible CNS toxicity and death while overdosage of liposomal cytarabine have been associated with severe chemical arachnoiditis, including encephalopathy. Treatment is supportive and directed at maintaining vital functions There is no known antidote. Exchange of CSF with isotonic saline solution may be performed for cytarabine given intrathecally.
Contraindications	Hypersensitivity; pregnancy and lactation.
Special Precautions	Hepatic and renal dysfunction, severe infections, preexisting drug-induced bone marrow suppression. Monitor WBC, platelet counts and blood uric acid frequently. Assess renal and hepatic function periodically.
Adverse Drug Reactions	Dementia, GI disturbances, hepatic and renal dysfunction, neurotoxicity, rashes, oral and anal ulceration, GI haemorrhage, oesophagitis, conjunctivitis, flu-like syndrome, anaphylactoid reactions. Potentially Fatal: Convulsions. Cerebellar dysfunction, respiratory distress syndrome, GI perforation, bone marrow suppression.
Drug Interactions	May reduce efficacy of gentamicin, digoxin and flucytosine. Potentially Fatal: Potentiates bone marrow depression with radiotherapy and other myelotoxic drugs.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intrathecal: Soln for inj: Store at 15-30°C. Powd for inj: Store at 25°C. Parenteral: Soln for inj: Store at 15-30°C.

	Intrathecal: Soln for inj: Store at 15-30°C. Powd for inj: Store at 25°C. Parenteral: Soln for inj: Store at 15-30°C. Powd for inj: Store at 25°C.
Mechanism of Action	Cytarabine acts by interfering with DNA synthesis specifically at the S-phase of the cell cycle. It is a potent myelosuppressant and requires careful haematological monitoring during its use. It also has antiviral property. Absorption: Poorly absorbed from the GI tract due to rapid deamination (oral). Distribution: Crosses the placenta and blood-brain barrier. Metabolism: Phosphorylation followed by deamination in the liver and kidneys. Excretion: Urine (as inactive metabolites and unchanged drug). Elimination half-life: Initial: 10 min (IV inj), terminal: 1-3 hr (IV inj), 3.5 hr (infusion), 100-263 hr (intrathecal).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01BC01 - cytarabine; Belongs to the class of antimetabolites, pyrimidine analogues. Used in the treatment of cancer.

dacarbazine

CIMS Class : (Cytotoxic Chemotherapy)
dacarbazine

P - Caution when used during pregnancy

L - Caution when used during lactation

related dacarbazine information

Indication & Dosage

Intravenous

Metastatic melanoma

Adult: 2-4.5 mg/kg daily for 10 days, repeat at 4-wk intervals or 200-250 mg/m² BSA daily for 5 days, repeat at 3-wk intervals or 850 mg/m² BSA by infusion, repeat at 3-wk intervals.

Intravenous

Hodgkin's disease

Adult: 150 mg/m² BSA daily for 5 days, repeat every 4 wk or 375 mg/m² BSA every 15 days in combination with other agents.

Intravenous

Soft tissue sarcoma

Adult: 250 mg/m² BSA daily for 5 days repeated every 3 wk. Usually given with doxorubicin.

Incompatibility: Incompatible with hydrocortisone sodium succinate, L-cysteine, sodium hydrogen carbonate and concentrated heparin (25 mg/ml).

	Incompatibility: Incompatible with hydrocortisone sodium succinate, L-cysteine, sodium hydrogen carbonate and concentrated heparin (25 mg/ml).
Overdosage	Severe bone marrow suppression and eventually, bone marrow aplasia which may be delayed by up to two wk. It can take 4 wk to reach nadir of leucocytes and thrombocytes. Treatment is supportive with long term careful haematological monitoring. There is no known antidote for dacarbazine overdose.
Contraindications	Bone marrow suppression; hypersensitivity.
Special Precautions	Hepatic or renal impairment. Pregnancy, lactation.
Adverse Drug Reactions	Leucopenia, thrombocytopenia, anorexia, nausea, diarrhoea, vomiting; flu-like syndrome, myalgia, malaise, facial flushing, paraesthesia, skin reactions, rashes; alopecia, photosensitivity reactions. Potentially Fatal: Myelosuppression; hepatotoxicity, anaphylaxis.
Drug Interactions	Impairs immune response to vaccines; possible infection after admin of live vaccines. Effect increased by CYP1A2 inhibitors e.g. amiodarone, ciprofloxacin, fluvoxamine, ketoconazole, lomefloxacin, ofloxacin and rofecoxib. Effect decreased by CYP1A2 inducers e.g. aminoglutethimide, carbamazepine, phenobarbital and rifampicin.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 2-8°C.
Mechanism of	The exact mechanism of action is still unclear but it appears

Mechanism of Action	The exact mechanism of action is still unclear but it appears to form methylcarbonium ions that attack nucleophilic groups by attaching to the 7-position of guanine on DNA. It also cross-links DNA strands leading to inhibition of DNA, RNA and protein synthesis. Absorption: Poorly absorbed from the GI tract (oral). Distribution: Crosses the blood-brain barrier; localised in the liver. Protein-binding: 5%. Metabolism: Extensively hepatic. Excretion: Urine (as unchanged drug). Elimination half-life: 20 min (initial), 5 hr (terminal).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01AX04 - dacarbazine; Belongs to the class of other alkylating agents. Used in the treatment of cancer.

daclizumab

CIMS Class : (Immunosuppressants)
daclizumab

P - Contraindicated in pregnancy
L - Caution when used during lactation

related daclizumab information

Indication & Dosage	<i>Intravenous</i> Prophylaxis of acute graft rejection in renal transplantation Adult: As part of an immunosuppressive regimen: 1 mg/kg over 15 minutes within 24 hr before surgery. Repeat at 2-wkly intervals for a total of 5 doses. Child: 1-18 yr: 1 mg/kg over 15 minutes within 24 hr before surgery. Repeat at 2-wk intervals for a total of 5 doses. Reconstitution: Dilute 25 mg of daclizumab in 50 ml of sterile 0.9% sodium chloride solution before IV admin. Incompatibility: Do not infuse with other medications through the same IV line or mix with other medications.
Contraindications	Hypersensitivity.
Special Precautions	Caution when used in patients who have previous exposure to daclizumab. Increased risk for infectious complications and secondary malignancies. Pregnancy, lactation.
Adverse Drug	Diarrhoea, constipation, dyspepsia, fever, postoperative

Adverse Drug Reactions	Diarrhoea, constipation, dyspepsia, fever, postoperative pain, pruritus, respiratory tract infection, urinary tract infection, vomiting, chest pain, oedema, hyper-/hypotension, tachycardia, thrombosis, dizziness, fatigue, fever, headache, insomnia, pain, post-traumatic pain, tremor, dysuria, bleeding, oliguria, renal tubular necrosis, cough, dyspnoea, pulmonary oedema, back pain and musculoskeletal pain. Potentially Fatal: Severe acute hypersensitivity reactions.
Drug Interactions	Increased risk of mortality when used with anti-lymphocyte antibody therapy.
Storage	Intravenous: Should be administered within 4 hr of preparation if stored at room temperature.
Mechanism of Action	Daclizumab is a humanised monoclonal murine antibody that acts as an interleukin-2 receptor antagonist. It binds to the α-chain (CD25) of the interleukin-2 receptor on the surface of activated T-lymphocytes. Excretion: Terminal elimination half-life: 11-38 days.
CIMS Class	Immunosuppressants
ATC Classification	L04AC01 - daclizumab;

dactinomycin

CIMS Class : (Cytotoxic Chemotherapy)
dactinomycin

P - Caution when used during pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related dactinomycin information

Indication & Dosage

Intravenous

Wilm's tumour

Adult: 15 mcg/kg/day or 400-600 mcg/m² BSA/day for 5 days.

Child: >6 mth: 15 mcg/kg/day or 400-600 mcg/m² BSA/day.

To be given for 5 days per 2-wk cycle.

Intravenous

Ewing's sarcoma

Adult: 15 mcg/kg/day or 400-600 mcg/m² BSA/day for 5 days.

Child: >6 mth: 15 mcg/kg/day or 400-600 mcg/m² BSA/day.

To be given for 5 days per 2-wk cycle.

Intravenous

Childhood rhabdomyosarcoma

Adult: 15 mcg/kg/day or 400-600 mcg/m² BSA/day for 5 days.

Child: >6 mth: 15 mcg/kg/day or 400-600 mcg/m² BSA/day.

To be given for 5 days per 2-wk cycle.

	days. Child: >6 mth: 15 mcg/kg/day or 400-600 mcg/m² BSA/day. To be given for 5 days per 2-wk cycle. <i>Intravenous</i> Gestational trophoblastic tumours Adult: 12 mcg/kg/day for 5 days as a single agent or 500 mcg/day on days 1 and 2 of combination regimens. <i>Intravenous</i> Metastatic nonseminomatous testicular cancer Adult: 1 mg/m² on day 1 of combination regimens. Reconstitution: Reconstitute with sterile water for inj without preservatives under aseptic conditions because preservatives may cause precipitation. Incompatibility: Y-site incompatibility: Filgrastim.
Overdosage	Nausea, vomiting, diarrhoea, mucositis, GI ulceration, skin disorders (e.g. exanthema, desquamation and epidermolysis), severe haematopoietic depression, veno-occlusive disease, acute renal failure and death. Treatment of toxicity is mainly symptomatic and supportive. Monitor skin and mucous membrane integrity, renal, hepatic and bone marrow functions frequently.
Contraindications	Infection with chicken pox or herpes zoster; hypersensitivity; infants <12 mth. Lactation.
Special Precautions	Admin drug with care to avoid extravasation. GI toxicity and bone marrow suppression has been reported when given with x-ray therapy. Increased risk of hepatomegaly and elevated SGOT levels when administering within 2 mth of irradiation for the treatment of right-sided Wilms' tumor. Discontinue drug if stomatitis, diarrhoea or severe haematopoietic depression results, until patient recovers. Monitor renal, hepatic and bone marrow functions regularly.

	irradiation for the treatment of right-sided Wilms' tumor. Discontinue drug if stomatitis, diarrhoea or severe haematopoietic depression results, until patient recovers. Monitor renal, hepatic and bone marrow functions regularly. Pregnancy.
Adverse Drug Reactions	Cheilitis, dysphagia, oesophagitis, ulcerative stomatitis, pharyngitis; anorexia, nausea, vomiting, abdominal pain, diarrhoea, GI tract ulceration; liver toxicity including ascites, hepatomegaly, hepatitis, LFT abnormalities; anaemia, agranulocytosis, leukopenia, thrombocytopenia, pancytopenia, reticulopenia, alopecia; skin eruptions, acne, flare-up of erythema or increased pigmentation of previously irradiated skin. If extravasation occurs during IV use, it leads to severe damage of soft tissues. Malaise, fatigue, lethargy, fever, myalgia, proctitis and hypocalcaemia. Potentially Fatal: Veno-occlusive disease (primarily hepatic) may result in fatality especially in children <48 mth.
Lab Interference	Dactinomycin may interfere with bioassay procedures for the determination of antibacterial drug levels.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 25°C.
Mechanism of Action	Dactinomycin binds to the guanine portion of DNA forming a complex which interferes with DNA and RNA synthesis as well as protein synthesis. It may also enhance the cytotoxic effects of radiotherapy. Distribution: Rapidly distributed with high concentrations in bone marrow and nucleated cells. Metabolism: Minimal metabolism.

	Distribution: Rapidly distributed with high concentrations in bone marrow and nucleated cells. Metabolism: Minimal metabolism. Excretion: Slowly excreted in urine and bile. Plasma half-life: about 36 hr.
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01DA01 - dactinomycin; Belongs to the class of cytotoxic antibiotics, actinomycines. Used in the treatment of cancer.

dalteparin sodium

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
dalteparin sodium

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related dalteparin sodium information

Indication & Dosage

Subcutaneous

Pulmonary embolism

Adult: 200 units/kg daily as a single dose or in 2 divided doses in high-risk patients. Max: 18,000 units daily.

Subcutaneous

Deep vein thrombosis

Adult: 200 units/kg daily as a single dose or in 2 divided doses in high-risk patients. Max: 18,000 units daily.

Subcutaneous

Prophylaxis of venous thromboembolism during surgical procedures

Adult: High-risk thrombosis: 2500 units given 1-2 hr before and 8-12 hr after the procedure followed by 5000 units daily. May continue dosage for up to 5 wk following hip replacement therapy. Moderate-risk thrombosis: 2500 units given 1-2 hr before the procedure followed by 2500 units once daily for 5-7 days or until the patient is fully ambulant.

Subcutaneous

	given 1-2 hr before the procedure followed by 2500 units once daily for 5-7 days or until the patient is fully ambulant. <i>Subcutaneous</i> Unstable angina Adult: 120 units/kg every 12 hr continued for 5-8 days with concomitant low-dose of aspirin. Max: 10,000 units every 12 hr. Max Dosage: 10,000 u every 12 hrs. <i>Intravenous</i> Prophylaxis of clotting in extracorporeal circulation in haemodialysis or haemofiltration Adult: 30-40 units/kg via IV inj, followed by an IV infusion of 10-15 units/kg/hr. A single dose of 5000 units may be given for haemodialysis or haemofiltration session lasting <4 hr. For patients at high risk of bleeding complications or who are in acute renal failure: 5-10 units/kg via IV inj followed by an infusion of 4-5 units/kg/hr.
Overdosage	Prolongation of the aPTT. Prolonged clotting time induced by dalteparin may be neutralised by protamine, but the anti-Factor Xa activity is only neutralised to about 25-50%. As protamine has an inhibitory effect on primary haemostasis, it should be used only in an emergency. 1 mg of protamine inhibits the effect of 100 IU (anti-Factor Xa) of dalteparin.
Contraindications	Hypersensitivity. Active major bleeding, severe coagulation disorders; lumbar puncture; sympathetic block; brain, spinal cord, eye or ear surgery; severe hypertension.
Special Precautions	Preexisting thrombocytopenia, recent childbirth, DM, subacute bacterial endocarditis, pericarditis, recent lumbar puncture, vasculitis. Monitor coagulation time. Hepatic or renal dysfunction; high doses; osteoporosis; familial antithrombin III deficiency; elderly; children; platelet count

	subacute bacterial endocarditis, pericarditis, recent lumbar puncture, vasculitis. Monitor coagulation time. Hepatic or renal dysfunction; high doses; osteoporosis; familial antithrombin III deficiency; elderly; children; platelet count and stool occult blood test recommended during treatment; GI ulceration. Pregnancy and lactation.
Adverse Drug Reactions	Hypersensitivity reactions; thrombocytopenia; inj site pain and tenderness; ecchymoses; haematoma. Prolonged use may lead to alopecia and osteoporosis Potentially Fatal: Severe haemorrhage.
Drug Interactions	Increased risk of hyperkalaemia when used with potassium sparing drugs such as ACE inhibitors. Potentially Fatal: Oral anticoagulants, platelet inhibitors and NSAIDs may increase risk of haemorrhage.
Lab Interference	Dalteparin-induced transaminases may interfere with interpretation of LFT results and diagnosis of MI, liver disease and pulmonary embolism.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Store below 25°C. Subcutaneous: Store below 25°C.
Mechanism of Action	Dalteparin sodium is a low molecular weight heparin analogue which inhibits factor Xa more than factor IIa (thrombin). Absorption: Almost completely absorbed from the GI tract (oral); peak plasma concentrations after 4 hr. Excretion: Via kidneys; prolonged in renal impairment. Elimination half-life: 2 hr (IV), 3-5 hr (SC).

	(oral); peak plasma concentrations after 4 hr. Excretion: Via kidneys; prolonged in renal impairment. Elimination half-life: 2 hr (IV), 3-5 hr (SC).
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)

danazol

CIMS Class : (Androgens & Related Synthetic Drugs)
danazol

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related danazol information

Indication & Dosage

Oral

Endometriosis

Adult: 200-800 mg daily in 2 divided doses adjusted according to response, for 3-6 mth or if necessary, up to 9 mth.

Oral

Benign breast disorders

Adult: Initially, 100-400 mg daily in 2 divided doses adjusted according to response and continued for 3-6 mth.

Oral

Gynaecomastia

Adult: Male adolescents: Initially, 200 mg daily, may increase to 400 mg daily after 2 mth if no response occurs; adult men: Initial: 400 mg daily in up to 4 divided doses.

Usual treatment duration: 6 mth.

Child: Male adolescents: Initially, 200 mg daily increased to 400 mg after 2 mth if no response occurs. Treatment usually up to 6 months.

	Child: Male adolescents: Initially, 200 mg daily increased to 400 mg after 2 mth if no response occurs. Treatment usually up to 6 months. <i>Oral</i> Hereditary angioedema Adult: Initially, 200 mg bid-tid reduced thereafter according to patient's response. <i>Oral</i> Preoperative thinning of the endometrium Adult: 400-800 mg daily, in up to 4 divided doses for 3-6 wk. <i>Oral</i> Menorrhagia Adult: 200 mg once daily. Review treatment 3 mth later.
Administration	May be taken with or without food. (Take consistently either always w/ or always without meals.)
Contraindications	Hypersensitivity, pregnancy, lactation, porphyria, thromboembolic disorders; undiagnosed genital bleeding, markedly impaired renal, cardiac or hepatic dysfunction.
Special Precautions	Epilepsy, migraine; cardiac, hepatic, renal disorders. Severe hypertension, diabetes, polycythaemia, history of thrombosis; children.
Adverse Drug Reactions	Oedema, wt gain, sweating, acne, hirsutism, flushing, oily skin or hair, deepening of the voice, clitoral hypertrophy, amenorrhoea, hepatic dysfunction, CNS or GI disturbances, benign intracranial hypertension, reduction in breast size, visual disturbances, elevated LFT values. Potentially Fatal: Thromboembolic events and fatal strokes have been reported.
Drug Interactions	Increased serum levels of ciclosporin, warfarin, carbamazepine and tacrolimus. Potentially Fatal: Increased incidence of insulin resistance

	Increased serum levels of ciclosporin, warfarin, carbamazepine and tacrolimus. Potentially Fatal: Increased incidence of insulin resistance in diabetic patients.
Food Interaction	Increased conc with high fat meal.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Mechanism of Action	Danazol suppresses the pituitary-ovarian axis by reducing the release of follicle-stimulating hormone and luteinizing hormone. This causes the regression and atrophy of endometrial tissue, decreases growth rate of abnormal breast tissue and reduces attacks in hereditary angioedema. Onset: Approximately 4 wk. Absorption: Absorbed from the GI tract (oral); absorption increases if taken with food. Metabolism: Hepatic (extensive); converted to 2-hydroxymethylethisterone. Excretion: Via the urine.
CIMS Class	Androgens & Related Synthetic Drugs
ATC Classification	G03XA01 - danazol; Belongs to the class of antigonadotropins and similar agents. Used as other hormone preparations.

dapsone

CIMS Class : (Antileprotics) , (Acne Treatment Preparations)
dapsone

P - Caution when used during pregnancy

L - Caution when used during lactation

related dapsone information

Indication & Dosage

Oral

Primary and secondary prophylaxis of *Pneumocystis (carinii) jiroveci* pneumonia

Adult: 50 mg daily, with pyrimethamine 50 mg once wkly.
Alternatively, 100 mg with pyrimethamine 50 mg twice wkly.
Child: 1 mth-18 yr: 2 mg/kg daily (max: 100 mg daily) or 4 mg/kg wkly (max: 200 mg wkly).

Oral

Multibacillary leprosy

Adult: 100 mg daily with clofazimine 50 mg daily, together with rifampicin 600 mg and clofazimine 300 mg once a mth for 12 mth. <35 kg: dapsone dose: 1-2 mg/kg/day.
Child: and child 10-14 yr old: daily doses of dapsone 50 mg, or 1 to 2 mg/kg if their body-weight is low

Oral

Paucibacillary leprosy

Adult: 100 mg daily with 600 mg rifampicin once a mth, both given for 6 mth.
Child: Reduce dose as for multibacillary leprosy.

Multibacillary leprosy

Adult: 100 mg daily with 600 mg rifampicin once a mth, both given for 6 mth.

Child: Reduce dose as for multibacillary leprosy.

Oral

Dermatitis herpetiformis

Adult: Initially, 50 mg daily increased gradually to 300 mg daily if required.

Topical/Cutaneous

Acne

Adult: = 12 yr: As 5% gel: Apply a pea-sized amount thinly to the affected area bid, after washing and patting dry the skin with a clean towel. Rub the gel in, gently and completely, and wash hands after application. Reassess if no improvement after 12 wk.

Administration

Should be taken with food.

Overdosage

Symptoms: nausea, vomiting, hyperexcitability (within a few min to up to 24 hr later), methemoglobin-induced depression, haemolysis (7-14 days after ingestion), seizures and severe cyanosis. Treatment: activated charcoal (20g four times daily) and haemolysis may enhance elimination of dapsone and its monoacetyl derivative. For patients without G6PD deficiency, methemoglobinemia may be treated with methylene blue 1-2 mg/kg given by slow IV injection (repeated if methemoglobin reaccumulates) or in less severe cases, 3-5 mg/kg every 4-6 hr orally.

Contraindications

Hypersensitivity. Severe anaemia, porphyria.

Special Precautions

G6PD deficiency, methaemoglobin or Hb M. Perform regular blood counts and monitor liver function regularly. Pregnancy and lactation.

Adverse Drug Reactions

Anaemia, peripheral neuropathy, haemolysis and methaemoglobinaemia (dose-related), nephrotic syndrome,

	Anaemia, peripheral neuropathy, haemolysis and methaemoglobinaemia (dose-related), nephrotic syndrome, psychological changes, hepatitis. Others: Nausea, vomiting, anorexia, headache, maculopapular rash, toxic epidermal necrolysis, Stevens-Johnson syndrome. Topical: Dryness, redness, oiliness and peeling at application site. Potentially Fatal: Agranulocytosis, serious cutaneous hypersensitivity reactions, exfoliative dermatitis.
Drug Interactions	Decreased serum conc of dapsone when used with rifampicin. Increased plasma conc with probenecid, trimethoprim. Antagonize clofazimine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C. Topical/Cutaneous: Store at 15-30°C. Protect from light.
Mechanism of Action	Dapsone inhibits folic acid synthesis by preventing normal bacterial utilization of PABA (PABA). Absorption: Completely absorbed from the GI tract (oral); peak plasma concentrations after 2-8 hr. Distribution: Saliva, crosses the placenta and enters breast milk. Protein-binding: 50-80% (plasma proteins); 100% (monoacetylated metabolite). Metabolism: Acetylated to monoacetyldapsone (major metabolite and other mono and diacetyl derivatives); hydroxylation (to hydroxylamine dapsone); undergoes enterohepatic recycling. Excretion: Via urine (20% as unchanged drug).

	hydroxylation (to hydroxylamine dapsone); undergoes enterohepatic recycling. Excretion: Via urine (20% as unchanged drug).
CIMS Class	Antileprotics / Acne Treatment Preparations
ATC Classification	J04BA02 - dapsone; Belongs to the class of drugs used in the treatment of lepra.

daunorubicin

CIMS Class : (Cytotoxic Chemotherapy)
daunorubicin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related daunorubicin information

Indication & Dosage	<i>Intravenous</i> Acute leukaemias Adult: 30-45 mg/m² BSA daily on days 1-3 of the induction course and days 1 and 2 for the subsequent courses. Admin as a solution in 0.9% sodium chloride into a fast-running infusion of sodium chloride or glucose. May repeat course 3-6 wk later. Max (total cumulative dose): 550 mg/m² in patients without risk factors for cardiotoxicity and 400 mg/m² in patients who have received chest radiotherapy. Child: For acute lymphoblastic leukaemia: 25 mg/m² BSA once wkly in combination with other regimens. <2 yr old or BSA <0.5 m²: 1 mg/kg once wkly. Max (total cumulative dose): 300 mg/m² and in children <2 yr: 10 mg/kg. Renal impairment: Based on serum-creatinine concentrations: 105-265 micromoles/l: 75% of the usual dose; >265 micromoles/l: 50% of the usual dose. Hepatic impairment: Based on serum bilirubin concentrations of 12-30 mcg/ml: 75% of the usual dose; >30 mcg/ml: 50% of the usual dose.

	dose, >265 micromoles/l: 50% of the usual dose. Hepatic impairment: Based on serum bilirubin concentrations of 12-30 mcg/ml: 75% of the usual dose; >30 mcg/ml: 50% of the usual dose. <i>Intravenous</i> AIDS-related Kaposi's sarcoma Adult: As the liposomal formulation: Initially, 40 mg/m² once every 2 wk, diluted in glucose 5% to a concentration of 0.2-1 mg/ml and given over 30-60 minutes. May continue for as long as disease control can be maintained. Renal impairment: Based on serum-creatinine concentrations: 105-265 micromoles/l: 75% of the usual dose; >265 micromoles/l: 50% of the usual dose. Hepatic impairment: Based on serum bilirubin concentrations of 12-30 mcg/ml: 75% of the usual dose; >30 mcg/ml: 50% of the usual dose. Incompatibility: Incompatible with heparin sodium and dexamethasone sodium phosphate solution.
Overdosage	Severe myelosuppression, cardiotoxicity with or without transient reversible ECG changes leading to CHF. Treatment is supportive and symptomatic.
Contraindications	Heart failure. Pregnancy, lactation.
Special Precautions	Regular blood count and ECG monitoring; elderly, children. Hepatic or renal impairment may increase risk of toxicity. Pre-existing cardiac disease and previous treatment with doxorubicin. Myocardial toxicity leading to potentially fatal congestive heart failure may occur during therapy or mth to yr after therapy cessation. Incidence of myocardial toxicity increases after total cumulative dose exceeds 400-550 mg/m² in adults, 300 mg/m² in children >2 yr, or 10 mg/kg in children <2 yr. Risk of severe myelosuppression leading to infection or haemorrhage.

	increases after total cumulative dose exceeds 400-550 mg/m² in adults, 300 mg/m² in children >2 yr, or 10 mg/kg in children <2 yr. Risk of severe myelosuppression leading to infection or haemorrhage.
Adverse Drug Reactions	GI disturbances; stomatitis; alopecia and dermatological reactions. Extravasation of daunorubicin may cause severe local tissue necrosis damaging surrounding muscles, tendons and nerves. IV infusion, back pain, flushing and chest tightness. Potentially Fatal: Bone marrow suppression, cardiac toxicity, cardiomyopathy and congestive heart failure.
Drug Interactions	Increased risk of cardiotoxicity when used with cyclophosphamide. Increased risk of hepatic toxicity when used with hepatotoxic drugs e.g. high-dose methotrexate. Potentially Fatal: Immunisation with live vaccines is not recommended. Concurrent radiation may lead to increased radiation reaction.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Powder for inj: Store at 15-25°C. Solution for inj & liposomal inj: Refrigerate at 2-8°C. Do not freeze.
Mechanism of Action	Daunorubicin forms a stable complex with DNA and interferes with the nucleic acid synthesis. It is a cell-cycle nonspecific agent, but its cytotoxic effects are mostly marked in the S-phase. It also has immunosuppressant and antibacterial effects. Distribution: Body tissues; crosses the placenta; enters breast milk. Metabolism: Hepatic; converted to daunorubicinol.

	Distribution: Body tissues; crosses the placenta; enters breast milk. Metabolism: Hepatic; converted to daunorubicinol. Excretion: Urine (as active form). Elimination half-life: 18.5 hr (daunorubicin), 26.7 hr (active metabolite).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01DB02 - daunorubicin; Belongs to the class of cytotoxic antibiotics, anthracyclines and related substances. Used in the treatment of cancer.

***daunorubicin information:**

deferiprone

CIMS Class : (Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence)
deferiprone

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related deferiprone information

Indication & Dosage	<i>Oral</i> Iron overload in patients with thalassaemia Adult: 25 mg/kg tid. Doses >100 mg/kg daily are not recommended. Child: >6 yr: 25 mg/kg tid.
Administration	May be taken with or without food.
Contraindications	Agranulocytosis, pregnancy and lactation.
Special Precautions	Hepatic and renal impairment. Neutropenia, monitor neutrophil count wkly and discontinue treatment if neutropenia develops. Limited experience in children 6-10 yr.
Adverse Drug Reactions	Musculoskeletal and joint pain; GI disturbances; red-brown discoloration of urine; transient liver enzyme abnormalities; zinc deficiency; neutropenia and agranulocytosis.
Drug Interactions	Avoid using deferiprone with aluminium-containing antacids as it can chelates trivalent metal ions.
Storage	Oral: Store below 30°C.

Storage	Oral: Store below 30°C.
Mechanism of Action	Deferiprone is an orally effective iron-chelating agent. It is being used when desferrioxamine is unsuitable or contraindicated. Absorption: Rapidly absorbed from the GI tract after oral admin. Metabolism: Metabolised to an inactive glucuronide metabolite. Excretion: Excreted mainly in the urine. Elimination half-life: about 2-3 hr.
CIMS Class	Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence
ATC Classification	V03AC02 - deferiprone; Belongs to the class of iron chelating agents. Used in iron overload.

***deferiprone information:**

deferiprone further details are available in official CIMS India

deferoxamine

CIMS Class : (Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence)
deferoxamine

P - Caution when used during pregnancy

Lab - Lab interference

related deferoxamine information

Indication & Dosage

Parenteral

Acute iron poisoning

Adult: Initial dose: 15 mg/kg/hr by slow IV infusion, reducing after 4-6 hr so that the total dose does not exceed 80 mg/kg in 24 hr. It can also be given via IM Inj as a single dose of 2 g.

Child: Given via IM injection: 1 g as a single dose.

Renal impairment: Use with caution.

Intravenous

Aluminum overload

Adult: Patients with end-stage renal failure, hemodialysis or hemofiltration patients: 5 mg/kg once a wk by slow infusion during the last hr of the dialysis session or 5 hr before the session in more severe cases. For patients on peritoneal dialysis: 5 mg/kg once a wk (via slow IV infusion/SC/IM/intraperitoneally) should be given before the final exchange of the day.

Renal impairment: Use with caution.

infusion/SC/IM/intraperitoneally) should be given before the final exchange of the day.

Renal impairment: Use with caution.

Parenteral

Chronic iron overload

Adult: Initially, 500 mg via IV/SC infusion (usually given over 8-12 hr or in some patients, 24 hr). Usual effective dose range: 20-60 mg/kg daily. Admin 3-7 times a wk depending on extent of iron overload. If given via IM inj, initial dose: 0.5-1 g daily as 1 or 2 injections; maintenance dose is determined by response.

Renal impairment: Use with caution.

Intramuscular

Diagnosis of iron storage disease

Adult: 500 mg as a single dose. To estimate the excretion of Fe in urine over the next 6 hr. An excretion of >1 g suggests Fe storage disease and >1.5 g suggests a pathological cause.

Renal impairment: Use with caution.

Intravenous

Diagnosis of aluminum overload

Adult: 5 mg/kg given via slow IV during the last hr of the dialysis session. Increase in serum aluminium conc above baseline >150 ng/ml (measured at the start of the next dialysis session) suggests aluminium overload.

Renal impairment: Use with caution.

Reconstitution: IV: Add 5 ml of sterile water for Inj to each 500 mg vial or 20 ml of sterile water for Inj to each 2 g vial. This results in a 10% solution. This can then be added to saline, glucose or Ringer's lactate solution to be used as an infusion. IM: Add 2 ml of sterile water for Inj to each 500 mg vial or 8 ml of sterile water for Inj to each 2 g vial.

	THIS results in a 10% solution. THIS can then be added to saline, glucose or Ringer's lactate solution to be used as an infusion. IM: Add 2 ml of sterile water for Inj to each 500 mg vial or 8 ml of sterile water for Inj to each 2 g vial. Incompatibility: Incompatible with heparin.
Overdosage	Symptoms: Hypotension, tachycardia, GI disturbances, transient loss of vision, aphasia, agitation, headache, nausea, pallor, CNS depression, coma, bradycardia and acute renal failure. There is no antidote and treatment is symptomatic. Haemodialysis is helpful in drug removal.
Contraindications	Severe renal disease or anuria.
Special Precautions	Impaired renal function; may color the urine reddish-brown, exacerbate aluminum-related encephalopathy and precipitate seizure (prophylactic with antiepileptic if at risk); susceptible to infection; monitor urinary excretion of iron, ophthalmological, audiological and cardiac function examinations; pregnancy.
Adverse Drug Reactions	Rapid IV injection: Flushing, urticaria, hypotension and shock. SC or IM injection: Local pain. Prolonged SC: Pruritus, erythema and swelling. GI disorders, dysuria, fever, allergic skin rashes, tachycardia, cardiac arrhythmias, convulsions and leg cramps; visual disturbances, cataract formation, hearing loss; may retard growth in very young childn. Pulmonary syndrome with high IV doses.
Drug Interactions	Increased risk of neurological symptoms when used concurrently with phenothiazines. Ascorbic acid improves Fe excretion but it should not be given during the 1st mth of starting deferoxamine treatment as it may worsen Fe toxicity. May affect imaging results if given together with gallium-67.
Lab Interference	Interferes with test for total iron-binding capacity and colorimetric Fe assays.

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intramuscular: Before reconstitution, store below 25°C (77°F). After reconstitution: May store at room temperature for 7 days; protect from light. Do not refrigerate reconstituted solution. Intravenous: Before reconstitution, store below 25°C (77°F). After reconstitution: May store at room temperature for 7 days; protect from light. Do not refrigerate reconstituted solution. Parenteral: Before reconstitution, store below 25°C (77°F). After reconstitution: May store at room temperature for 7 days; protect from light. Do not refrigerate reconstituted solution.
Mechanism of Action	Deferoxamine has a high affinity for ferric iron and forms chelates or stable water-soluble complexes with iron and other trivalent metal ions eg, aluminum. It removes free and bound iron from haemosiderin and ferritin, increasing the excretion of iron in urine and bile. Absorption: Poorly absorbed from the GI tract. Metabolism: Metabolised mainly in the plasma. Excretion: Chelates with metal ions, which are then excreted in the urine.
CIMS Class	Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence
ATC Classification	V03AC01 - deferoxamine; Belongs to the class of iron chelating agents. Used in iron poisoning.

deflazacort

CIMS Class : (Corticosteroid Hormones)
deflazacort

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related deflazacort information

Indication & Dosage

Oral

Allergic and inflammatory disorders

Adult: Initially, up to 120 mg daily. Maintenance: 3-18 mg/day.

Child: 0.25-1.5 mg/kg/day given on alternate days.

Hepatic impairment: Dose reductions may be needed.

Contraindications

Systemic infection; live virus vaccines in those receiving immunosuppressive doses.

Special Precautions

Adrenal suppression and infection, child, adolescents, elderly, history of TB and steroid myopathy, hypertension, recent MI, CHF, liver failure, renal impairment, DM and glaucoma (including family history), osteoporosis, corneal perforation, severe affective disorders, epilepsy, peptic ulcer, hypothyroidism, pregnancy and lactation.

Adverse Drug Reactions

GI disturbances, musculoskeletal, endocrine, neuropsychiatric, ophthalmic, fluid and electrolyte disturbances; susceptible to infection, impaired healing,

	GI disturbances, musculoskeletal, endocrine, neuropsychiatric, ophthalmic, fluid and electrolyte disturbances; susceptible to infection, impaired healing, hypersensitivity, skin atrophy, striae, telangiectasia, acne, myocardial rupture following recent MI, thromboembolism.
Drug Interactions	Antacids, ACE inhibitors, acetazolamide, adrenergic neuron blockers, antidiabetics, aspirin, barbiturate, β -blockers, calcium-channel blockers, carbamazepine, carbenoxolone, cardiac glycosides, clonidine, coumarins, diazoxide, diuretics, erythromycin, hydralazine, ketoconazole, methotrexate, methyldopa, mifepristone, minoxidil, moxonidine, nitrates, nitroprusside, NSAIDs, oestrogens, phenytoin, primidone, rifamycins, ritonavir, somatropin, β_2 sympathomimetics, theophylline, vaccines.
Food Interaction	Salad and vegetable diet including alcohol may affect anticoagulant control.
Mechanism of Action	Deflazacort, derived from prednisolone, is a corticosteroid with mainly glucocorticoid activity. An anti-inflammatory dose of 6 mg deflazacort is equiv to 5 mg prednisolone.
CIMS Class	Corticosteroid Hormones
ATC Classification	H02AB13 - deflazacort; Belongs to the class of glucocorticoids. Used in systemic corticosteroid preparations.

demeclocycline

CIMS Class : (Tetracyclines)
demeclocycline

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related demeclocycline information

Indication & Dosage

Oral

Susceptible infections

Adult: 150 mg four times daily or 300 mg bid.

Child: >8 yr: 7-13 mg/kg daily divided every 6-12 hr.

Renal impairment: Dose adjustments or increase in frequency may be needed.

Hepatic impairment: Dose adjustments or increase in frequency may be needed. Max: 1 g daily.

Oral

Atypical pneumonia

Adult: 300 mg tid.

Renal impairment: Dose adjustments or increase in frequency may be needed.

Hepatic impairment: Dose adjustments or increase in frequency may be needed. Max: 1 g daily.

Oral

Chronic hyponatraemia associated with syndrome of

	frequency may be needed. Max: 1 g daily. <i>Oral</i> Chronic hyponatraemia associated with syndrome of inappropriate antidiuretic hormone secretion (SIADH) Adult: Initial dose: 900-1200 mg/day in divided doses. Maintenance dose: 600-900 mg/day in divided doses. Renal impairment: Dose adjustments or increase in frequency may be needed. Hepatic impairment: Dose adjustments or increase in frequency may be needed. Max: 1 g daily.
Administration	Should be taken on an empty stomach. (Take w/ a full glass of water on an empty stomach at least 1 hr before or 2 hr after meals.)
Overdosage	Treatment is symptomatic and supportive. Haemodialysis or peritoneal dialysis unlikely to be helpful.
Contraindications	Hypersensitivity. Pregnancy and lactation.
Special Precautions	Children <12 yr; SLE; renal or hepatic disease.
Adverse Drug Reactions	Photosensitivity. Reversible nephrogenic diabetes insipidus. Permanent staining of teeth; nausea; rash; GI upsets; dysphagia; enterocolitis; anogenital inflammation (moniliasis). Hypersensitivity; haemolytic anaemia, thrombocytopenia, neutropenia and eosinophilia; raised blood urea and liver enzymes. Potentially Fatal: Anaphylaxis (rare).
Drug Interactions	Antacids, milk, calcium, magnesium and iron preparations reduce absorption. Diuresis induced by amiloride and metolazone may be enhanced. May reduce efficacy of oral contraceptives when used concurrently.
Food Interaction	Milk and milk products reduce absorption.
Lab Interference	May interfere with urinary urobilinogen estimation.

	May interfere with urinary urobilinogen estimation.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store below 25°C.
Mechanism of Action	Demeclocycline binds to 30s ribosomal subunit causing an inhibition in protein synthesis of susceptible bacteria. Absorption: 60-80% of an oral dose is absorbed from the GI tract. Excretion: Elimination half-life: about 12 hr.
CIMS Class	Tetracyclines
ATC Classification	D06AA01 - demeclocycline; Belongs to the class of topical tetracycline and derivatives agents used in the treatment of dermatological diseases. J01AA01 - demeclocycline; Belongs to the class of tetracyclines. Used in the treatment of systemic infections.

dequalinium

CIMS Class : (Mouth/Throat Preparations)
dequalinium

related dequalinium information

Indication & Dosage	<i>Mouth/Throat</i> Minor infections of the mouth and throat <i>Adult:</i> Per lozenge contains 250 mcg dequalinium: Suck 1 lozenge, repeat as needed.
Special Precautions	Safety in pregnancy and lactation has not been established.
Adverse Drug Reactions	Allergy and sore tongue.
Mechanism of Action	Dequalinium is a bisquanternary quinolinium antiseptic which kills many gram-positive and gram-negative bacteria. It is also active against fungi.
CIMS Class	Mouth/Throat Preparations
ATC Classification	D08AH01 - dequalinium; Belongs to the class of quinolone derivative antiseptics. Used in the treatment of dermatological diseases. G01AC05 - dequalinium; Belongs to the class of quinolone derivative antiinfectives. Used in the treatment of gynecological infections. R02AA02 - dequalinium; Belongs to the class of antiseptics used in throat preparations.

desloratadine

CIMS Class : (Antihistamines & Antiallergics)
desloratadine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related desloratadine information

Indication & Dosage	<i>Oral</i> Allergic conditions Adult: 5 mg once daily. Child: =12 yr: 5 mg once daily; 6-11 yr: 2.5 mg; 1-5 yr: 1.25 mg; 6-11 mth: 1 mg. Doses to be taken once daily. Renal impairment: Initially, 5 mg every other day. Hepatic impairment: Initially, 5 mg every other day.
Administration	May be taken with or without food.
Overdosage	Treatment is symptomatic and supportive. Standard measures to reduce absorption to be adopted. Haemodialysis unlikely to be useful.
Contraindications	Hypersensitivity.
Special Precautions	Severe renal or hepatic failure; children <6 mth, elderly, epilepsy, pregnancy and lactation.
Adverse Drug Reactions	Headache, fatigue, somnolence, dizziness; nausea, dyspepsia; xerostomia, dysmenorrhoea; pharyngitis.
Storage	Oral: Store below 30°C.

	Oral: Store below 30°C.
Mechanism of Action	Desloratadine is a long-acting, tricyclic, non-sedating, selective peripheral histamine H₁-receptor antagonist which inhibits the release of pro-inflammatory mediators from human mast cells and basophils. Absorption: Peak plasma concentrations after 3 hr (oral). Distribution: Protein-binding: 82-87%. Metabolism: Hepatic; converted to 3-hydroxydesloratadine. Excretion: Via urine and faeces (as metabolites).
CIMS Class	Antihistamines & Antiallergics
ATC Classification	R06AX27 - desloratadine; Belongs to the class of other agents used as systemic antihistamines.

desmopressin

CIMS Class : (Antidiuretics)
desmopressin

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related desmopressin information

Indication & Dosage

Oral

Cranial diabetes insipidus

Adult: Initially, 100 mcg tid adjusted according to response.

Maintenance: 100-200 mcg tid, up to 100-1200 mcg daily.

Child: Initially, 100 mcg tid adjusted according to response.

Maintenance: 100-200 mcg tid, up to 100-1200 mcg daily.

Oral

Primary nocturnal enuresis

Adult: 200-400 mcg at bedtime.

Child: $\geq$ 5 yr: 200-400 mcg at bedtime.

Nasal

Cranial diabetes insipidus

Adult: 10-40 mcg daily as a single or divided doses.

Child: 3 mth-12 yr: 5-30 mcg daily.

Nasal

Diagnosis of diabetes insipidus

Adult: 20 mcg as a single dose.

Child: 20 mcg as a single dose.

Diagnosis of diabetes insipidus

Adult: 20 mcg as a single dose.

Child: 20 mcg as a single dose.

Nasal

Renal function testing

Adult: 40 mcg as a single dose.

Child: 1-15 yr: 20 mcg and infants: 10 mcg. To be given as a single dose.

Nasal

Primary nocturnal enuresis

Adult: 20-40 mcg at bedtime.

Child: ≥5 yr: 20-40 mcg at bedtime.

Nasal

Nocturia associated with multiple sclerosis

Adult: 10-20 mcg at bedtime.

Nasal

Type I Von Willebrand's disease

Adult: 300 mcg; <50 kg: 150 mcg. Should be given within 2 hr before the surgery.

Parenteral

Cranial diabetes insipidus

Adult: 1-4 mcg daily IM, SC or IV.

Child: 0.4 mcg IM, SC, or IV.

Parenteral

Diagnosis of diabetes insipidus

Adult: 2 mcg as a single dose via SC/IM.

Child: 2 mcg SC/IM.

Parenteral

Renal function testing

Adult: 2 mcg given as SC or IM inj.

Child: Infants: 0.4 mcg; children: 2 mcg. Dose to be given as SC or IM inj.

	Adult: 2 mcg given as SC or IM inj. Child: Infants: 0.4 mcg; children: 2 mcg. Dose to be given as SC or IM inj. <i>Intravenous</i> Type I Von Willebrand's disease Adult: 0.3-0.4 mcg/kg by slow infusion over 15-30 min before surgery. <i>Intravenous</i> Testing of fibrinolytic response Adult: 0.4 mcg/kg infused over 20 min. Child: 0.4 mcg/kg infused over 20 min.
Administration	May be taken with or without food.
Contraindications	Hypersensitivity. Impaired renal function (CrCl <50 ml/min). Decompensated cardiac failure with ongoing diuretic treatment.
Special Precautions	Not to be used in the treatment of Type IIb von Willebrand's disease and nephrogenic diabetes insipidus. Fluid intake restricted to a min and only to satisfy thirst for 8 hr after admin (particularly in the very young and the elderly). Nasal route avoided in patients with nasal mucosal diseases. Caution in CV diseases, oedema states, impairment, hypertension, elderly, cystic fibrosis, fluid and electrolyte imbalance, thrombotic disease; infants and young children. Inj not recommended for infants <3 mth for bleeding disorders. Pregnancy and lactation.
Adverse Drug Reactions	Nausea, transient headache; nasal congestion, rhinitis; flushing; mild abdominal cramps; epistaxis; sore throat, cough, stuffiness; allergic reactions, inj site pain, erythema, swelling, BP changes and thrombotic events in predisposed individuals. Potentially Fatal: Water intoxication and dilutional hyponatraemia.

	individuals. Potentially Fatal: Water intoxication and dilutional hyponatraemia.
Drug Interactions	Drugs that may potentiate antidiuretic effect of desmopressin: chlorpropamide, clofibrate, carbamazepine, fludrocortisone, urea, or TCAs. Drugs that may decrease antidiuretic effect of desmopressin: lithium, heparin, demeclocycline, noradrenaline, and alcohol. Caution when using with other vasopressors.
Lab Interference	Cross-reacts with some antisera raised against arginine vasopressin and oxytocin, but as these assays are rarely performed in clinical practice, it has little significance.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Refrigerate at 2-8°C. Nasal: Refrigerate at 2-8°C. Oral: Store at 20-25°C. Parenteral: Refrigerate at 2-8°C.
Mechanism of Action	Desmopressin increases the cellular permeability of the collecting ducts causing an increased water reabsorption, smooth muscle constriction. It also stimulates factor VIII and plasminogen activation activity in blood. Absorption: Absorbed from the nasal mucosa (intranasal), absorbed in sufficient amounts from the GI tract to produce therapeutic effects at high doses (oral). Metabolism: Largely destroyed in the GI tract. Excretion: Elimination $T_{1/2}$ (biphasic): 8 min (initial phase), 75 min (terminal phase).

	Metabolism: Largely destroyed in the GI tract. Excretion: Elimination T _{1/2} (biphasic): 8 min (initial phase), 75 min (terminal phase).
CIMS Class	Antidiuretics
ATC Classification	H01BA02 - desmopressin; Belongs to the class of vasopressin and analogues. Used in posterior pituitary lobe hormone preparations.

***desmopressin information:**

dexamethasone

CIMS Class : (Corticosteroid Hormones) , (Eye Corticosteroids) , (Topical Corticosteroids)
dexamethasone

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related dexamethasone information

Indication & Dosage	<i>Oral</i>
	Anti-inflammatory
	Adult: 0.75-9 mg daily in 2-4 divided doses; may also be given via IM/IV admin.
	Child: 1 mth–18 yr: 10–100 mcg/kg daily in 1–2 divided doses via oral admin, adjusted according to response; up to 300 micrograms/kg daily may be used in emergency situations.
	<i>Oral</i>
	As a screening test for Cushing's syndrome
	Adult: 0.5 mg every 6 hr for 48 hr after determining baseline 24-hr urinary 17-hydroxycorticosteroid (17-OHCS) concentrations. During the second 24 hr of dexamethasone admin, urine is collected and analysed for 17-OHCS.
	Alternatively, after a baseline plasma cortisol determination, 1 mg may be given at 11 pm and plasma cortisol determined at 8 am the next morning. Plasma cortisol and urinary output of

Alternatively, after a baseline plasma cortisol determination, 1 mg may be given at 11 pm and plasma cortisol determined at 8 am the next morning. Plasma cortisol and urinary output of 17-OHCS are depressed after dexamethasone admin in normal individuals but remain at basal levels in patients with Cushing's syndrome.

Oral

Acute exacerbations in multiple sclerosis

Adult: 30 mg daily for 1 wk followed by 4-12 mg daily for 1 mth.

Child: 1 mth–12 yr: 100–400 mcg/kg daily in 1–2 divided doses; 12–18 yr: Initially 0.5–24 mg daily. Max. 24 mg daily.

Parenteral

Cerebral oedema caused by malignancy

Adult: As phosphate: 10 mg IV followed by 4 mg IM every 6 hr until response is achieved, usually after 12-24 hr. May reduce dosage after 2-4 days then gradually discontinued over 5-7 days. In severe cases, an initial dose of 50 mg IV may be given on day 1, with 8 mg every 2 hr, reduced gradually over 7-13 days. Maintenance dose: 2 mg 2-3 times daily.

Child: As phosphate: <35 kg: Initially 20 mg, then 4 mg every 3 hr for 3 days, then 4 mg every 6 hr for 1 day, then 2 mg every 6 hr for 4 days, then decrease by 1 mg daily. >35 kg: Initially 25 mg, then 4 mg every 2 hr for 3 days, then 4 mg every 4 hr for 1 day, then 4 mg every 6 hr for 4 days, then decrease by 2 mg daily. Doses are given via IV inj.

Intra-articular

Inflammatory joint diseases

Adult: 0.8-4 mg depending on the size of the affected joint. For soft-tissue inj, 2-6 mg may be used. May repeat inj every 3-5 days to every 2-3 wk.

Intravenous

... mg depending on the size of the affected joint.

For soft-tissue inj, 2-6 mg may be used. May repeat inj every 3-5 days to every 2-3 wk.

Intravenous

Unresponsive shock

Adult: As phosphate: Initially, 40 mg or 1-6 mg/kg as a single IV inj, may repeat every 2-6 hr. Continue high-dose treatment only until patient's condition has stabilised and not to be continued beyond 48–72 hr.

Intravenous

Bacterial meningitis

Adult: 0.15 mg/kg 4 times daily, to be given 10-20 min before or with the 1st dose of anti-infective treatment. Treatment should be given for the first 2-4 days of the anti-infective treatment.

Child: As phosphate: 2 mth–18 yr: 150 mcg/kg every 6 hr for 4 days, starting before or with 1st dose of antibacterial treatment.

Intravenous

Prophylaxis of nausea and vomiting associated with cytotoxic therapy

Adult: Prevention: 10-20 mg 15-30 minutes before admin of chemotherapy on each treatment day. For continuous infusion regimen: 10 mg every 12 hr on each treatment day. For mildly emetogenic regimen: 4 mg every 4-6 hr.

Ophthalmic

Ocular inflammation

Adult: As 0.1% suspension: Apply 1-2 drops into the affected eye/s 4-6 times daily in mild disease, up to hrly admin in more severe disease. As 0.05% ointment: Apply 0.5-1 inch ribbon of ointment into the conjunctival sac(s) up to 4 times daily. Reduce to once daily dosing once condition has improved.

Administration

Should be taken with food.

Administration	Should be taken with food.
Overdosage	Treatment is supportive and symptomatic. In acute overdosage, gastric lavage or emesis may be used.
Contraindications	Hypersensitivity; active untreated infections; ophthalmic use in viral, fungal disease of the eye.
Special Precautions	Patients with hypothyroidism; cirrhosis, hypertension, CHF, ulcerative colitis, thromboembolic disorders, osteoporosis, glaucoma, cataracts or TB of the eye, diabetes, peptic ulcer. Monitor blood glucose levels in diabetics and coagulation indices in patients on warfarin. Elderly, children and adolescent; pregnancy and lactation.
Adverse Drug Reactions	Growth retardation, osteoporosis, peptic ulcer, glaucoma and subcapsular cataracts, vertebral compression fractures. Cushing-like features, pancreatic dysfunction and pancreatitis, GI upsets, increased appetite, increased fragility of the skin. Increased susceptibility to infection. Topical application: Dermal atrophy, local irritation, folliculitis, delayed wound healing, systemic absorption and toxicity with occlusive dressing on application to large areas of the body and broken skin. Topical application to eye: Corneal ulcers, glaucoma and reduced visual ability. Inhalation: Hoarseness, candidiasis of mouth and throat. Intra-articular inj: Aseptic necrosis of bone and joint damage. Potentially Fatal: HPA suppression; CV collapse on rapid IV admin.
Drug Interactions	Increased risk of hypokalaemia when used concurrently with potassium-depleting drugs such as amphotericinB and loop diuretics. Reduces efficacy of isoniazid, salicylates, vaccines and toxoids. Increased activity of dexamethasone

	potassium-depleting drugs such as amphotericinB and loop diuretics. Reduces efficacy of isoniazid, salicylates, vaccines and toxoids. Increased activity of dexamethasone and cyclosporin when used together. Concurrent use with aspirin or ethanol may lead to increased GI side effects. Potentially Fatal: Reduced efficacy in combination with ephedrine, cholestyramine, phenytoin, phenobarbitaland rifampicin.
Food Interaction	Dexamethasone interferes with calcium absorption. Limit caffeine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 1st trimester Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intra-articular: Store at 15-30°C. Intravenous: Store at 15-30°C. Ophthalmic: Store at 15-30°C. Oral:Store at 15-30°C. Parenteral: Store at 15-30°C.
Mechanism of Action	Dexamethasone is a synthetic glucocorticoid which decreases inflammation by inhibiting the migration of leukocytes and reversal of increased capillary permeability. It suppresses normal immune response. Onset: As acetate: Prompt. Duration: 72 hr.

	suppresses normal immune response. Onset: As acetate: Prompt. Duration: 72 hr. Absorption: Readily absorbed from the GI tract (Oral). Distribution: Readily crosses the placenta. Protein binding: About 77%. Metabolism: Hepatic. Excretion: Via urine (65% of the dose within 24 hr). Half-life: About 190 min.
CIMS Class	Corticosteroid Hormones / Eye Corticosteroids / Topical Corticosteroids
ATC Classification	A01AC02 - dexamethasone; Belongs to the class of local corticosteroid preparations. Used in the treatment of diseases of the mouth. C05AA09 - dexamethasone; Belongs to the class of products containing corticosteroids for topical use. Used in the treatment of hemorrhoids. D07AB19 - dexamethasone; Belongs to the class of moderately potent (group II) corticosteroids. Used in the treatment of dermatological diseases. D07XB05 - dexamethasone; Belongs to the class of moderately potent (group II) corticosteroids in other combinations. Used in the treatment of dermatological diseases. D10AA03 - dexamethasone; Belongs to the class of topical corticosteroids used in the treatment of acne. H02AB02 - dexamethasone; Belongs to the class of glucocorticoids. Used in systemic corticosteroid preparations. R01AD03 - dexamethasone; Belongs to the class of topical corticosteroids used as nasal decongestants. S01BA01 - dexamethasone; Belongs to the class of corticosteroids. Used in the treatment of inflammation of the

corticosteroids used as nasal decongestants.

S01BA01 - dexamethasone; Belongs to the class of corticosteroids. Used in the treatment of inflammation of the eye.

S01CB01 - dexamethasone; Belongs to the class of corticosteroids/antiinfectives/mydriatics combinations. Used in the treatment of eye diseases.

S02BA06 - dexamethasone; Belongs to the class of corticosteroids used in the treatment of inflammation of the ear.

S03BA01 - dexamethasone; Belongs to the class of corticosteroids used in ophthalmologic and otologic preparations.

dexchlorpheniramine

CIMS Class : (Antihistamines & Antiallergics)
dexchlorpheniramine

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related dexchlorpheniramine information

Indication & Dosage	<i>Oral</i> Allergic conditions Adult: 2 mg every 4-6 hr. Child: 2-5 yr: 0.5 mg; 6-12 yr: 1 mg, dose to be taken every 4-6 hr. Max Dosage: Adult: 12 mg daily. Child 6-12 yrs: 6 mg daily; 2-5 yrs: 3 mg daily.
Administration	May be taken with or without food.
Contraindications	Premature infants or full-term neonates.
Special Precautions	Pregnancy; lactation; severe CV disorders; asthma. May impair ability to drive or operate machinery. Angle-closure glaucoma, urinary retention, prostatic hypertrophy, pyloroduodenal obstruction; renal and hepatic impairment; elderly; epilepsy.
Adverse Drug Reactions	Exfoliative dermatitis. Sedation; antimuscarinic effects, CNS depression and disturbances; occasionally, paradoxical CNS stimulation; psychomotor impairment; headache;

	Exfoliative dermatitis. Sedation; antimuscarinic effects, CNS depression and disturbances; occasionally, paradoxical CNS stimulation; psychomotor impairment; headache; palpitations and arrhythmias; convulsions, sweating, myalgia, paraesthesias, extrapyramidal symptoms, tremor; sleep and GI disturbances. Rarely, hypersensitivity reactions and blood disorders; tinnitus, hypotension; hair loss. Injections may cause transient hypotension or CNS stimulation and irritation.
Drug Interactions	CNS depressants eg, alcohol, barbiturates, hypnotics, opioid analgesics; anxiolytic sedatives and neuroleptics; other antimuscarinics; MAOIs; betahistine; ototoxic drugs.
Lab Interference	May interfere with skin testing.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Dexchlorpheniramine is the dextrorotatory isomer of chlorpheniramine and has approximately twice its activity by wt.
CIMS Class	Antihistamines & Antiallergics
ATC Classification	R06AB02 - dexchlorpheniramine; Belongs to the class of substituted alkylamines used as systemic antihistamines.

dexibuprofen

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
dexibuprofen

P - Contraindicated in pregnancy

Food $\square$ - Food interaction

related dexibuprofen information

Indication & Dosage	<i>Oral</i> Pain and inflammation associated with musculoskeletal and joint disorders, Dysmenorrhoea Adult: 600-900 mg daily in 2-3 divided doses. May increase to 1200 mg daily for patients with acute conditions or exacerbations. Max Dosage: 400 mg/dose and 1200 mg/day. Renal impairment: Dose reduction is recommended. Hepatic impairment: Dose reduction is recommended.
Contraindications	Hypersensitivity to aspirin or NSAIDs; active or suspected GI ulcer or history of recurrent GI ulcer; GI bleeding or other active bleedings or bleeding disorders; active Crohn's disease or ulcerative colitis; haemorrhagic diathesis and other coagulation disorders, or patients receiving anticoagulant therapy; severe heart failure, renal or hepatic impairment; child <18 yrs; pregnancy (third trimester).
Special Precautions	History of bronchial asthma; renal or hepatic disorders; bleeding disorders; CV disease; elderly; lactation.

	History of bronchial asthma; renal or hepatic disorders; bleeding disorders; CV disease; elderly; lactation.
Adverse Drug Reactions	GI bleeding, heartburn, epigastric pain; dyspepsia, peptic ulcer; nausea, vomiting, diarrhoea; jaundice, hepatitis; rash; thrombocytopaenia; visual disturbances; tinnitus; depression; fatigue, headache, dizziness, vertigo.
Drug Interactions	Avoid concomitant use with anticoagulants, other NSAIDs and salicylates. Increases risk of methotrexate and lithium toxicity.
Food Interaction	Decreased peak serum levels if taken with food but no effect on the extent of absorption.
Storage	Oral: Store at or below 25°C.
Mechanism of Action	Dexibuprofen is a NSAID. It acts by inhibition of cyclo-oxygenase, which is involved in prostaglandin synthesis.
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AE14 - dexibuprofen; Belongs to the class of propionic acid derivatives of non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism.

dextromethorphan

CIMS Class : (Cough & Cold Preparations)
dextromethorphan

P - Caution when used during pregnancy

related dextromethorphan information

Indication & Dosage

Oral

Cough suppressant

Adult: 10-20 mg every 4 hr, or 30 mg every 6-8 hr.

Extended-release oral suspension: 60 mg bid. Max: 120 mg/day.

Child: 6-12 yr: 5-10 mg every 4 hr or 15 mg every 6-8 hr;

2-6 yr: 2.5-5 mg every 4 hr or 7.5 mg every 6-8 hr; up to 2 yr:

Individualised dosage. Extended release oral suspension:

6-12 yr: 30 mg bid; 2-6 yr: 15 mg bid. Max: 6-12 yr: 60 mg/day; 2-6 yr: 30 mg/day.

Administration

May be taken with or without food.

Overdosage

Symptoms: In mild overdose, tachycardia, hypertension, vomiting, mydriasis, diaphoresis, nystagmus, euphoria, loss of motor coordination, and giggling; in moderate intoxication, in addition to those listed above, hallucinations and a plodding ataxic gait; in severely intoxication, agitation or somnolence. Management: treatment is symptomatic and supportive. Naloxone may be useful in reversing toxicity.

Contraindications

Patients at risk of developing resp failure. During an acute

Contraindications	Patients at risk of developing resp failure. During an acute attack. Patients receiving MAOI or for 2 wk after discontinuing them. Persistent or chronic cough.
Special Precautions	3rd trimester of pregnancy; atopic childn; child <1 yr; sedated or debilitated patients; patients confined to supine position; history of asthma. Moderate to severe renal impairment; liver disease.
Adverse Drug Reactions	Dizziness, GI disturbances.
Drug Interactions	Tricyclic antidepressants (TCAs), antipsychotics, anxiolytics and hypnotics, cimetidine, ciprofloxacin, domperidone, metoclopramide, mexiletine, CYP2D6 inhibitors, ritonavir, alcohol. Potentially Fatal: Memantine, moclobemide.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Dextromethorphan, a derivative of levorphanol, is an antitussive agent. It has a central action on the cough center in the medulla. Onset: Oral: 30 minutes. Duration: Oral: Up to 6 hr. Absorption: Rapidly absorbed in the GI tract. Metabolism: Hepatically metabolised. Excretion: Excreted in the urine unchanged.
CIMS Class	Cough & Cold Preparations

	Cough & Cold Preparations
ATC Classification	R05DA09 - dextromethorphan; Belongs to the class of cough suppressants, opium alkaloids and derivatives. Used in the treatment of dry cough.

dextropropoxyphene

CIMS Class : (Analgesics (Opioid))
dextropropoxyphene

P - Contraindicated in pregnancy
L - Caution when used during lactation
Food ∇ - Food interaction

related dextropropoxyphene information

Indication & Dosage	<i>Oral</i> Mild to moderate pain Adult: As hydrochloride: 65 mg 3-4 times daily. As napsilate: 100 mg 3-4 times daily. Renal impairment: Dose reduction may be needed. Hepatic impairment: Dose reduction may be needed.
Administration	May be taken with or without food.
Overdosage	Symptoms: Coma, respiratory depression, circulatory collapse, pulmonary oedema, seizures, nephrogenic diabetes insipidus, ECG abnormalities. Death may occur as early within the 1st 15 minutes to 1 hr. Management: Intensive symptomatic and supportive therapy to be instituted immediately. IV naloxone may reverse intoxication. Induction of emesis or gastric lavage followed by activated charcoal helps to reduce absorption. Monitor blood gases, pH, electrolytes and ECG. Dialysis is unlikely to be useful.
Contraindications	Hypersensitivity, chronic resp diseases, porphyria,

	Hypersensitivity, chronic resp diseases, porphyria, pregnancy. Patients on MAOI treatment or within 2 wk of stopping treatment.
Special Precautions	Suicidal patients, hepatic or renal disease; lactation, elderly.
Adverse Drug Reactions	Dizziness, sedation, weakness; nausea, vomiting, constipation; rash, urticaria; visual disturbances; physiological dependence. Potentially Fatal: Convulsions in long-term therapy. Cardiac conduction abnormalities and arrhythmias; liver impairment.
Drug Interactions	Inhibits hepatic metabolism of benzodiazepines, β-blockers, carbamazepine, phenytoin and warfarin. Increased risk of toxicity when co-administered with ritonavir. Potential of depressant effects when used with alcohol or CNS depressants. Potentially Fatal: Accidental or intentional overdose fatal (especially if combined with alcohol, and analgesics e.g. paracetamol and aspirin).
Food Interaction	Absorption decreased.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Dextropropoxyphene is a relatively weak opioid analgesic which binds to mu- and kappa-receptors in order to block pain perception in the cerebral cortex. This results in inhibition of pain sensation flow into high centers. Absorption: Readily absorbed from the GI tract; napsilate form more slowly absorbed than the HCl (oral); peak plasma concentrations after 1-2 hr. Distribution: Concentrated in the liver, lungs and brain; crosses the placenta and small amounts enter breast milk. Protein-binding: 80%.

	Distribution: Concentrated in the liver, lungs and brain; crosses the placenta and small amounts enter breast milk. Protein-binding: 80%. Metabolism: Hepatic, to nordextropropoxyphene (norpropoxyphene); undergoes 1st-pass metabolism. Excretion: Urine (as metabolites). Elimination half-life: 6-12 hr (dextropropoxyphene), 30-36 hr (norpropoxyphene).
CIMS Class	Analgesics (Opioid)
ATC Classification	N02AC04 - dextropropoxyphene; Belongs to the class of diphenylpropylamine derivative opioids. Used to relieve pain.

dextrose

CIMS Class : (Miscellaneous) , (Intravenous & Other Sterile Solutions)
dextrose

P - Caution when used during pregnancy

related dextrose information

Indication & Dosage

Oral

Hypoglycaemia

Adult: 10-20 g as single dose; may repeat in 10 min if needed.

Child: >2 yr: 10-20 g as single dose; may repeat in 10 min if needed.

Intravenous

Hypoglycaemia

Adult: 10-25 g (40-100 ml of 25% solution or 20-50 ml of 50% solution). Doses may be repeated in severe cases.

Child: ≤6 mth: 0.25-0.5 g/kg/dose; >6 mth: 0.5-1 g/kg/dose.

Doses may be repeated in severe cases. Max: 25 g/dose.

Intravenous

Hyperkalaemia

Adult: 25-50 g combined with 10 units of regular insulin, administered over 30-60 minutes; may repeat if necessary.

Alternatively, 25 g combined with 5-10 units of regular insulin infused over 5 minutes; may repeat if necessary.

Child: and infants: 0.5-1 g/kg (using 25% or 50% solution) combined with regular insulin (1 unit for every 4-5 g dextrose

	Alternatively, 25 g combined with 5-10 units of regular insulin infused over 5 minutes; may repeat if necessary. Child: and infants: 0.5-1 g/kg (using 25% or 50% solution) combined with regular insulin (1 unit for every 4-5 g dextrose given); infuse over 2 hr, may repeat if necessary.
Overdosage	Reevaluate patient's condition and institute appropriate symptomatic treatment.
Contraindications	Known allergy to corn or corn products. Diabetic coma with hyperglycaemia. Use of hypertonic solutions in patients with intracranial or intraspinal haemorrhage. Patients with delirium tremens and dehydration. Anuria, hepatic coma, or glucose-galactose malabsorption syndrome.
Special Precautions	Overt or known subclinical DM. Patients with carbohydrate intolerance. IV admin of dextrose may result in hypokalaemia, hypophosphataemia and hypomagnesemia. Prolonged infusion of isotonic dextrose solutions may cause water intoxication. Production of insulin may be adversely affected by prolonged parenteral nutrition with dextrose solutions. Rapid admin of hypertonic dextrose solutions may result in hyperglycaemia and hyperosmolar syndrome. Monitor for signs of mental confusion or loss of consciousness. Monitor blood and urinary glucose regularly. Caution when used in very low birth weight infants. Abrupt withdrawal may lead to rebound hypoglycaemia. Risk of thrombosis when hypertonic (>10%) solutions are administered through peripheral veins. Caution when used parenterally in pregnant women.
Adverse Drug Reactions	Venous thrombosis, phlebitis, hypovolemia, hypervolemia, dehydration, oedema, fever, mental confusion, unconsciousness, hyperosmolar syndrome, hyperglycaemia, hypokalaemia, acidosis, hypophosphataemia, hypomagnesemia, polyuria, glycosuria, ketonuria, nausea,

	unconsciousness, hyperosmolar syndrome, hyperglycaemia, hypokalaemia, acidosis, hypophosphataemia, hypomagnesaemia, polyuria, glycosuria, ketonuria, nausea, diarrhoea, polydipsia, vein irritation, tissue necrosis, pulmonary oedema, tachypnoea.
Storage	Intravenous: Store at 25°C. Oral: Store at 25°C.
Mechanism of Action	Dextrose is a monosaccharide that is used as a source of calories and water for hydration. It helps to reduce loss of body protein and nitrogen. It also promotes glycogen deposition in the liver. When used with insulin, it stimulates the uptake of potassium by cells, especially in muscle tissue, thus lowering serum potassium levels. Absorption: Rapidly absorbed from the small intestine when taken orally. Metabolism: Metabolised to carbon dioxide and water.
CIMS Class	Miscellaneous / Intravenous & Other Sterile Solutions

Indication & Dosage

Oral

Severe anxiety

Adult: 2 mg tid. Max: 30 mg daily.

Elderly: Dose reduction may be required.

Renal impairment: Dosage adjustments may be needed.

Oral

Insomnia associated with anxiety

Adult: 5-15 mg at bedtime.

Child: and adolescents (12-18 yr): 1-5 mg at bedtime to control night terrors and sleepwalking.

Elderly: Dose reduction may be required.

Renal impairment: Dosage adjustments may be needed.

Oral

Premedication before anaesthesia

Adult: 5-20 mg given before general anaesthesia.

Child: 1 mth-18 yr: 200-300 mcg/kg, may be given 45-60 min beforehand. Max: 10 mg (up to 12 yr); 20 mg (up to 18 yr).

Adult: 5-20 mg given before general anaesthesia.

Child: 1 mth-18 yr: 200-300 mcg/kg, may be given 45-60 min beforehand. Max: 10 mg (up to 12 yr); 20 mg (up to 18 yr).

Elderly: Dose reduction may be required.

Renal impairment: Dosage adjustments may be needed.

Oral

Adjunct in seizures

Adult: 2-60 mg daily in divided doses.

Elderly: Dose reduction may be required.

Renal impairment: Dosage adjustments may be needed.

Oral

Muscle spasms

Adult: 2-15 mg daily in divided doses, may increase up to 60 mg daily in severe spastic disorders e.g.cerebral palsy.

Child: 1-12 mth: 250 mcg/kg; 1-5 yr: 2.5 mg; 5-12 year: 5 mg; 12-18 yr: 10 mg (max: 40 mg/day). Dose can be given twice daily.

Elderly: Dose reduction may be required.

Renal impairment: Dosage adjustments may be needed.

Oral

Alcohol withdrawal syndrome

Adult: 5-20 mg repeated after 2-4 hr if necessary.

Alternatively, 10 mg 3-4 times daily on the 1st day, reducing to 5 mg 3-4 times daily as required.

Elderly: Dose reduction may be required.

Renal impairment: Dosage adjustments may be needed.

Parenteral

Muscle spasms

Adult: 10 mg IM/IV repeated if necessary after 4 hr. Higher doses may be used in tetanus: 100-300 mcg/kg every 1-4 hr via IV inj; alternatively 3-10 mg/kg may be given over 24 hr by continuous IV infusion or by nasoduodenal tube using a suitable liquid oral dosage form.

doses may be used in tetanus: 100-300 mcg/kg every 1-4 hr via IV inj; alternatively 3-10 mg/kg may be given over 24 hr by continuous IV infusion or by nasoduodenal tube using a suitable liquid oral dosage form.

Child: ≤ 1 mth: Higher doses may be used in tetanus: 100-300 mcg/kg every 1-4 hr via IV inj; alternatively 3-10 mg/kg may be given over 24 hr by continuous IV infusion or by nasoduodenal tube using a suitable liquid oral dosage form.

Elderly: Dose reduction may be required.

Renal impairment: Dosage adjustments may be needed.

Intravenous

Premedication before anaesthesia

Adult: Usual dose: 100-200 mcg/kg.

Child: >1 mth: 100-200 mcg/kg. Max: 1 mth-12 yr: 5 mg/day; 12-18 yr: 20 mg/day.

Elderly: Dose reduction may be required.

Renal impairment: Dosage adjustments may be needed.

Parenteral

Alcohol withdrawal syndrome

Adult: 10-20 mg IM/IV if symptoms are severe and if delirium tremens has developed.

Elderly: Dose reduction may be required.

Renal impairment: Dosage adjustments may be needed.

Parenteral

Severe anxiety

Adult: Up to 10 mg may be used, repeat if needed after 4 hr. Dose can be given via IM or IV inj.

Renal impairment: Dosage adjustments may be needed.

Intravenous

Sedation in minor surgical and medical procedures

Adult: 10-20 mg given via IV inj over 2-4 min.

Child: ≤ 1 mth: 100-200 mcg/kg via IV inj over 2-4 min, to be

Sedation in minor surgical and medical procedures

Adult: 10-20 mg given via IV inj over 2-4 min.

Child: ≥1 mth: 100-200 mcg/kg via IV inj over 2-4 min, to be given immediately before the procedure. Max: 5 mg (up to 12 yr); 20 mg (up to 18 yr).

Renal impairment: Dosage adjustments may be needed.

Intravenous

Adjunct in seizures

Adult: 10-20 mg at a rate of 5 mg/min, repeat if needed after 30-60 min. Once the seizures have been controlled, up to 3 mg/kg may be given via slow IV infusion over 24 hr to prevent recurrence.

Child: 1 mth-12 yr: 300-400 mcg/kg over 3-5 min, repeat after 10 min if needed.

Renal impairment: Dosage adjustments may be needed.

Rectal

Severe anxiety

Adult: As rectal solution: 500 mcg/kg, repeated after 12 hr if necessary. As suppository: 10-30 mg.

Elderly: Dose reduction may be required.

Renal impairment: Dosage adjustments may be needed.

Rectal

Premedication before anaesthesia

Adult: As a rectal solution: 500 mcg/kg.

Child: As a rectal solution: Dose is based on age. 1-3 yr: 5 mg; 3-12 yr: 5-10 mg; 12-18 yr: 10 mg.

Elderly: Dose reduction may be required.

Renal impairment: Dosage adjustments may be needed.

Rectal

Adjunct in seizures

Adult: As rectal gel: 200-500 mcg/kg, repeated after 4-12 hr if necessary. Rectal solution may be appropriate for febrile

Adjunct in seizures

Adult: As rectal gel: 200-500 mcg/kg, repeated after 4-12 hr if necessary. Rectal solution may be appropriate for febrile convulsions, status epilepticus and convulsions due to poisoning; suppositories are not suitable due to slow absorption. Typical dose for rectal solution: 500 mcg/kg, repeated every 12 hr if needed; use other anticonvulsive measures is recommended if convulsions are not controlled by the 1st dose.

Child: >2 yr: As rectal gel: 200-500 mcg/kg, repeated after 4-12 hr if necessary. Rectal solution may be appropriate for febrile convulsions, status epilepticus and convulsions due to poisoning; suppositories are not suitable due to slow absorption. Typical rectal solution dose for children >10 kg: 500 mcg/kg, repeated every 12 hr if needed; recommended to use other anticonvulsive measures if convulsions are not controlled by the 1st dose.

Elderly: Dose reduction may be required.

Renal impairment: Dosage adjustments may be needed.

Rectal

Muscle spasms

Adult: As a rectal solution: 500 mcg/kg, repeat every 12 hr if needed.

Child: >10 kg: As a rectal solution: 500 mcg/kg, repeat every 12 hr if needed.

Elderly: Dose reduction may be required.

Renal impairment: Dosage adjustments may be needed.

Reconstitution: Do not mix IV product with other medications.

Incompatibility: Y-site incompatibility: Dexmedetomidine, diltiazem, fluconazole, foscarnet, gatifloxacin, heparin, heparin with hydrocortisone sodium succinate, hetastarch,

	Incompatibility: Y-site incompatibility: Dexmedetomidine, diltiazem, fluconazole, foscarnet, gatifloxacin, heparin, heparin with hydrocortisone sodium succinate, hetastarch, hydromorphone, potassium chloride, propofol, vecuronium, vitamin B complex with C, amphotericin B cholesteryl sulfate complex, atracurium, cefepime, linezolid, meropenem, pancuronium. Syringe incompatibility: Hydromorphone, nalbuphine, sufentanil, doxapram, glycopyrrolate, heparin. Admixture incompatibility: Furosemide, floxacillin, dobutamine, bleomycin, buprenorphine, doxorubicin, fluorouracil.
Administration	May be taken with or without food.
Overdosage	Symptoms: Somnolence, confusion, coma, diminished reflexes. Management: treatment is supportive and symptomatic. Gastric lavage may help to reduce absorption. As with the management of intentional overdosage with any drug, it should be borne in mind that multiple agents may have been ingested. Flumazenil may be used for the complete or partial reversal of the sedative effects of benzodiazepines. However, the prescriber should be aware of the risk of seizure associated with flumazenil treatment, especially in long-term benzodiazepine users and in cyclic antidepressant overdose. Refer to flumazenil full package insert before use. Dialysis is of limited value.
Contraindications	Hypersensitivity; myasthenia gravis, preexisting CNS depression or coma, respiratory depression; acute pulmonary insufficiency or sleep apnoea syndrome; severe hepatic impairment; acute narrow angle glaucoma; children <6 mth (oral); pregnancy and lactation.
Special Precautions	Impaired renal and hepatic function, respiratory disease, organic cerebral changes, elderly, psychotic patients,

	Impaired renal and hepatic function, respiratory disease, organic cerebral changes, elderly, psychotic patients, epileptics, history of alcohol or drug addiction, impaired gag reflex, obese patients. May cause CNS depression. Discontinue treatment if patient develops psychiatric and paradoxical reactions. Caution when used in patients with depression or anxiety associated with depression, especially if patient has suicidal risk. May increase risk of falls. Safety and efficacy of the inj have not been established in children <1 mth of age. Safety and efficacy of oral use have not been established in children <6 mth of age. Safety and efficacy of rectal gel have not been established in children <2 yr of age. Abrupt withdrawal or large dose reduction may cause rebound or withdrawal symptoms.
Adverse Drug Reactions	Psychological and physical dependence with withdrawal syndrome, fatigue, drowsiness, sedation, ataxia, vertigo, confusion, depression, GI disturbances, changes in salivation, amnesia, jaundice, paradoxical excitation, elevated liver enzyme values; muscle weakness, visual disturbances, headache, slurring of speech and dysarthria, mental changes, incontinence, constipation, hypotension, tachycardia, changes in libido, pain and thrombophlebitis at inj site (IV). Potentially Fatal: Respiratory and CNS depression, coma.
Drug Interactions	Increased clearance of diazepam when used with phenytoin, carbamazepine and phenobarbital. Reversible deterioration of parkinsonism may occur when given together with levodopa. Combination with lithium may produce hypothermia. May need to reduce dose of narcotics when used concurrently. Potentially Fatal: Phenothiazines, barbiturates, MAOIs

	produce hypothermia. May need to reduce dose of narcotics when used concurrently. Potentially Fatal: Phenothiazines, barbiturates, MAOIs potentiate action of diazepam. Additive CNS depressant effects with alcohol and CNS depressants or psychoactive medications. Mutual potentiation of action with analgesics, anaesthetics and some anticonvulsants.
Food Interaction	Grapefruit juice may increase serum levels and toxicity of diazepam. Levels may be reduced by St John's wort. Avoid valerian, kava kava, gotu kola and St John's wort.
Lab Interference	False-positive urinary glucose determinations.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 20-25°C. Oral: Store at 15-30°C. Parenteral: Store at 20-25°C. Rectal: Store below 25°C.
Mechanism of Action	Diazepam is a long-acting benzodiazepine with anticonvulsant, anxiolytic, sedative, muscle relaxant and amnestic properties. It increases neuronal membrane permeability to chloride ions by binding to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron within the CNS and enhancing the GABA inhibitory effects resulting in hyperpolarisation and stabilisation. Absorption: Readily and completely absorbed from the GI tract, peak plasma concentrations after 30-90 min (oral). Rapidly absorbed, peak plasma concentrations after 10-30 min (rectal). Distribution: Readily crosses the blood-brain barrier; redistributed into fat depots and tissues. Protein-binding:

	min (rectal). Distribution: Readily crosses the blood-brain barrier; redistributed into fat depots and tissues. Protein-binding: 98-99%. Metabolism: Extensively hepatic; converted to desmethyldiazepam, oxazepam and temazepam. Excretion: Urine (as free or conjugated metabolites). Elimination half-life: Rapid (initial), 1-2 days (terminal), 2-5 days (desmethyldiazepam).
CIMS Class	Anxiolytics / Anticonvulsants
ATC Classification	N05BA01 - diazepam; Belongs to the class of benzodiazepine derivatives anxiolytics. Used in the management of anxiety, agitation or tension.

diclofenac

CIMS Class : (Ophthalmic Decongestants, Anesthetics, Anti-inflammatories) , (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
diclofenac

P - Contraindicated in pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related diclofenac information

Indication &
Dosage

Oral

Bursitis

Adult: As sodium: 75-150 mg daily in divided doses. Max: 150 mg/day.

Hepatic impairment: Dose adjustment may be needed.

Oral

Pain and inflammation associated with musculoskeletal and joint disorders

Adult: As sodium: 75-150 mg daily in divided doses. Max: 150 mg/day.

Hepatic impairment: Dose adjustment may be needed.

Oral

Sprains

Adult: As sodium: 75-150 mg daily in divided doses. Max: 150 mg/day.

Hepatic impairment: Dose adjustment may be needed.

Oral

150 mg/day.

Hepatic impairment: Dose adjustment may be needed.

Oral

Tendinitis

Adult: As sodium: 75-150 mg daily in divided doses. Max: 150 mg/day.

Hepatic impairment: Dose adjustment may be needed.

Oral

Strains

Adult: As sodium: 75-150 mg daily in divided doses. Max: 150 mg/day.

Hepatic impairment: Dose adjustment may be needed.

Oral

Acute gout

Adult: As sodium: 75-150 mg daily in divided doses. Max: 150 mg/day.

Hepatic impairment: Dose adjustment may be needed.

Oral

Dysmenorrhoea

Adult: As sodium: 75-150 mg daily in divided doses. Max: 150 mg/day.

Hepatic impairment: Dose adjustment may be needed.

Oral

Migraine

Adult: As potassium: Initially, 50 mg taken at the 1st sign of an attack, an additional dose of 50 mg may be taken after 2 hr if symptoms persist. If needed, further doses of 50 mg may be taken every 4-6 hr. Max: 200 mg/day.

Hepatic impairment: Dose adjustment may be needed.

Intravenous

Postoperative pain

Adult: As sodium: 75 mg infusion in 5% glucose or 0.9% sodium chloride given over 30-120 minutes, may repeat after

Postoperative pain

Adult: As sodium: 75 mg infusion in 5% glucose or 0.9% sodium chloride given over 30-120 minutes, may repeat after 4-6 hr if necessary.

Hepatic impairment: Dose adjustment may be needed.

Intramuscular

Tendinitis

Adult: As sodium: 75 mg once daily, injected into the gluteal muscle, may increase to 75 mg bid in severe conditions.

Hepatic impairment: Dose adjustment may be needed.

Intramuscular

Strains

Adult: As sodium: 75 mg once daily, injected into the gluteal muscle, may increase to 75 mg bid in severe conditions.

Hepatic impairment: Dose adjustment may be needed.

Intramuscular

Sprains

Adult: As sodium: 75 mg once daily, injected into the gluteal muscle, may increase to 75 mg bid in severe conditions.

Hepatic impairment: Dose adjustment may be needed.

Intramuscular

Pain and inflammation associated with musculoskeletal and joint disorders

Adult: As sodium: 75 mg once daily, injected into the gluteal muscle, may increase to 75 mg bid in severe conditions.

Hepatic impairment: Dose adjustment may be needed.

Intramuscular

Bursitis

Adult: As sodium: 75 mg once daily, injected into the gluteal muscle, may increase to 75 mg bid in severe conditions.

Hepatic impairment: Dose adjustment may be needed.

Intramuscular

muscle, may increase to 75 mg bid in severe conditions.

Hepatic impairment: Dose adjustment may be needed.

Intramuscular

Acute gout

Adult: As sodium: 75 mg once daily, injected into the gluteal muscle, may increase to 75 mg bid in severe conditions.

Hepatic impairment: Dose adjustment may be needed.

Intramuscular

Dysmenorrhoea

Adult: As sodium: 75 mg once daily, injected into the gluteal muscle, may increase to 75 mg bid in severe conditions.

Hepatic impairment: Dose adjustment may be needed.

Intramuscular

Renal colic

Adult: As sodium: 75 mg, may repeat once after 30 minutes if needed. Max: 150 mg/day.

Hepatic impairment: Dose adjustment may be needed.

Intravenous

Prophylaxis of postoperative pain

Adult: As sodium: 25-50 mg infusion given after surgery over 15-60 minutes followed by 5 mg/hr. Max: 150 mg daily.

Hepatic impairment: Dose adjustment may be needed.

Ophthalmic

Postoperative ocular inflammation

Adult: As sodium (0.1% solution): Instill into the appropriate eye 4 times daily starting 24 hr after surgery for up to 28 days.

Ophthalmic

Prophylaxis of intra-operative miosis

Adult: As sodium (0.1% solution): Instill into the appropriate eye 4 times within 2 hr before surgery.

Ophthalmic

Post-photorefractive keratectomy pain

Adult: As sodium (0.1% solution): Instill into the appropriate eye 4 times within 2 hr before surgery.

Ophthalmic

Post-photorefractive keratectomy pain

Adult: As sodium (0.1% solution): Instill into the eye twice in the hr before surgery, then 1 drop twice at 5-minute intervals immediately after surgery, then every 2-5 hr while awake for up to 24 hr.

Ophthalmic

Seasonal allergic conjunctivitis

Adult: As sodium (0.1% solution): Instill 1 drop into the affected eye(s) up to 4 times daily.

Ophthalmic

Pain and discomfort after radial keratotomy

Adult: As sodium (0.1% solution): Instill 1 drop before surgery followed by 1 drop immediately after surgery, and then 1 drop 4 times daily for up to 2 days.

Ophthalmic

Control of inflammation after argon laser trabeculoplasty

Adult: As sodium (0.1% solution): Instill 1 drop 4 times during the 2 hr before procedure followed by 1 drop 4 times daily, up to 7 days after procedure.

Ophthalmic

Inflammation and discomfort after strabismus surgery

Adult: As sodium (0.1% solution): Instill 1 drop 4 times daily for the 1st wk; then tid in the 2nd wk, bid in the 3rd wk, and as required for the 4th wk.

Ophthalmic

Pain after accidental trauma

Adult: As sodium (0.1% solution): Instill 1 drop 4 times daily for up to 2 days.

Topical/Cutaneous

Local symptomatic relief of pain and inflammation

for up to 2 days.

Topical/Cutaneous

Local symptomatic relief of pain and inflammation

Adult: As sodium (1% gel): Apply onto affected area 3-4 times daily.

Hepatic impairment: Dose adjustment may be needed.

Topical/Cutaneous

Osteoarthritis

Adult: As sodium (1.6% solution): Apply in small amounts (20-40 drops) onto affected area 4 times daily.

Hepatic impairment: Dose adjustment may be needed.

Topical/Cutaneous

Actinic keratoses

Adult: As sodium (3% gel): Apply bid for 60-90 days.

Hepatic impairment: Dose adjustment may be needed.

Rectal

Postoperative pain

Adult: 75-150 mg daily, in divided doses (25 mg, 50 mg and 100 mg suppositories only). Max: 150 mg/day (inclusive of diclofenac administered through other routes).

Child: 6-12 yr: 1-2 mg/kg/day in divided doses (12.5 mg and 25 mg suppositories only) for max of 4 days.

Hepatic impairment: Dose adjustment may be needed.

Administration

Should be taken with food. (Take immediately after meals.)

Overdosage

Symptoms: Lethargy, drowsiness, nausea, vomiting, and epigastric pain, GI bleeding. Hypertension, acute renal failure, respiratory depression, anaphylactoid reactions and coma may occur rarely. Treatment in symptomatic and supportive. Emesis and/or activated charcoal and/or osmotic cathartic may reduce drug absorption if present within 4 hr of ingestion. Forced diuresis, alkalinisation of urine, haemodialysis, or haemoperfusion unlikely to be useful.

	cathartic may reduce drug absorption if present within 4 hr of ingestion. Forced diuresis, alkalinisation of urine, haemodialysis, or haemoperfusion unlikely to be useful.
Contraindications	Active peptic ulcer; hypersensitivity to diclofenac or other NSAIDs. Treatment of perioperative pain in CABG surgery. 3rd trimester of pregnancy. Topical: Not to be applied onto damaged or nonintact skin.
Special Precautions	History of GI ulceration; impaired cardiac, renal or hepatic function; hypertension; lactation. IV admin in patients with moderate or severe renal impairment; hypovolaemia or dehydration; asthma, porphyria. Monitor LFTs in patients on prolonged therapy. May prolong bleeding time; caution when used in patients with coagulation disorders or on anticoagulants. Prolonged therapy may increase risk of anaemia. 1st and 2nd trimester of pregnancy. Elderly, debilitated patients.
Adverse Drug Reactions	GI disturbances; headache, dizziness, rash; GI bleeding, peptic ulceration; abnormalities of kidney function. Pain and tissue damage at Inj site (IM); local irritation (rectal); transient burning and stinging (ophthalmic). Potentially Fatal: Stevens-Johnson syndrome, exfoliative dermatitis, toxic epidermal necrolysis.
Drug Interactions	Not to be given IV to patients who are receiving other NSAIDs or anticoagulants including low dose heparin. Renal function may be worsened when used with ciclosporin or triamterene. Altered absorption when given with sucralfate, colestyramine or colestipol. Ophthalmic application of diclofenac may reduce the efficacy of ophthalmic acetylcholine and carbachol. Increased risk of GI ulceration and bleeding when used with corticosteroids, aspirin or anticoagulants. Potentially Fatal: Increases blood levels

	ophthalmic acetylsalicylic acid and carbacanth. Increased risk of GI ulceration and bleeding when used with corticosteroids, aspirin or anticoagulants. Potentially Fatal: Increases blood levels of digoxin, lithium and methotrexate. Potentiate potassium-sparing diuretics.
Food Interaction	Slow absorption of enteric-coated tab when given with food.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). D in 3rd trimester or near delivery. Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intramuscular: Store at 15-30°C. Intravenous: Store at 15-30°C. Ophthalmic: Store at 15-30°C. Oral: Store at 15-30°C. Rectal: Store at 15-30°C. Topical/Cutaneous: Store at 15-30°C.
Mechanism of Action	Diclofenac has potent anti-inflammatory, analgesic and antipyretic actions. It inhibits the enzyme, cyclooxygenase, thus resulting in reduced synthesis of prostaglandin precursors. Absorption: Rapidly absorbed (oral solution, rectal suppository, IM); more slowly (enteric-coated tab).

	precursors. Absorption: Rapidly absorbed (oral solution, rectal suppository, IM); more slowly (enteric-coated tab). Distribution: Penetrates synovial fluid; enters breast milk (small amounts). Protein-binding: >99%. Metabolism: Extensively hepatic; converted to metabolites. Excretion: About 60% excreted in urine as glucuronide and sulfate conjugates; 35% in bile; 1-2 hr (elimination half-life).
CIMS Class	Ophthalmic Decongestants, Anesthetics, Anti-inflammatories / Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	D11AX18 - diclofenac; M01AB05 - diclofenac; Belongs to the class of acetic acid derivatives and related substances of non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism. M02AA15 - diclofenac; Belongs to the class of non-steroidal antiinflammatory preparations for topical use. Used in the treatment of joint and muscular pains. S01BC03 - diclofenac; Belongs to the class of non-steroidal antiinflammatory agents. Used in the treatment of inflammation of the eye.

diclofenac + paracetamol

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs)) , (Analgesics (Non-Opioid) & Antipyretics)
diclofenac + paracetamol

P - Caution when used during pregnancy

L - Caution when used during lactation

related diclofenac + paracetamol information

Indication & Dosage	<i>Oral</i> Pain and inflammation associated with musculoskeletal and joint disorders Adult: Per tablet contains diclofenac sodium 50 mg and paracetamol 500 mg. 1 tablet tid.
Contraindications	Hypersensitivity, active peptic ulcer or GI bleeding, history of allergic responses to aspirin or other NSAIDs, acute porphyria.
Special Precautions	Analgesic nephropathy, renal or hepatic impairment, hypertension, cardiac failure, bronchospasm, patients taking diuretics and elderly, lactation.
Adverse Drug Reactions	GI disturbances, nephrotic syndrome, epigastric pain, nausea, vomiting, diarrhoea, hepatitis, rash, pruritus, wheezing, bronchospasm, prolonged bleeding time. Potentially Fatal: Bleeding or perforation through peptic ulcer, rarely blood dyscrasia or anaphylaxis, acute renal failure.

	Potentially Fatal: Bleeding or perforation through peptic ulcer, rarely blood dyscrasia or anaphylaxis, acute renal failure.
Drug Interactions	Potentiates potassium-sparing diuretics. Reduced serum levels of salicylates. Potentially Fatal: Increased levels of lithium, digoxin and methotrexate.
Mechanism of Action	Diclofenac is a NSAID (NSAID). Paracetamol is an analgesic and antipyretic. When used together, the actions of paracetamol set in earlier and provides pain relief before the effects of diclofenac Na set in.
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs) / Analgesics (Non-Opioid) & Antipyretics
ATC Classification	D11AX18 - diclofenac; M01AB05 - diclofenac; Belongs to the class of acetic acid derivatives and related substances of non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism. M02AA15 - diclofenac; Belongs to the class of non-steroidal antiinflammatory preparations for topical use. Used in the treatment of joint and muscular pains. N02BE01 - paracetamol; Belongs to the class of anilide preparations. Used to relieve pain and fever. S01BC03 - diclofenac; Belongs to the class of non-steroidal antiinflammatory agents. Used in the treatment of inflammation of the eye.

dicycloverine hydrochloride

CIMS Class : (Antispasmodics)
dicycloverine hydrochloride

P - Caution when used during pregnancy

L - Contraindicated in lactation

related dicycloverine hydrochloride information

Indication & Dosage	<i>Oral</i> Gastrointestinal tract spasm Adult: 10-20 mg tid. Child: 2-12 yr: 10 mg tid; 6 mth-2 yr: 5-10 mg 3-4 times daily. Elderly: <i>Intramuscular</i> Gastrointestinal tract spasm Adult: 20 mg 4 times a day given only for 1-2 days. Replace with oral therapy as soon as possible.
Administration	Dicycloverine: May be taken with or without food. (May be taken before or after meals.)
Overdosage	Symptoms: headache, dizziness, nausea, dry mouth, difficulty in swallowing, dilated pupils and hot dry skin. Management: treatment is symptomatic. Reduce drug absorption by emetics or gastric lavage.
Contraindications	Intestinal obstruction; intestinal atony; myasthenia gravis; glaucoma; reflux oesophagitis; infants <6 mth; lactation.

	Intestinal obstruction; intestinal atony; myasthenia gravis; glaucoma; reflux oesophagitis; infants <6 mth; lactation.
Special Precautions	Hepatic or renal disease, urinary retention, paralytic ileus, hyperthyroidism, hypertension, congestive heart failure, cardiac tachyarrhythmia, children, elderly, pregnancy.
Adverse Drug Reactions	Difficulty in accommodation, exacerbation of glaucoma; tachycardia, palpitations, arrhythmias; urinary retention; restlessness; confusion, excitement, hallucination and delirium. Potentially Fatal: Respiratory arrest in infants <10 wk.
Drug Interactions	Antagonise the effect of drugs that affect GI motility e.g. metoclopramide. Absorption affected by concurrent admin with antacids.
Storage	Intramuscular: Store below 30°C. Oral: Store below 30°C.
Mechanism of Action	Dicycloverine HCl relieves smooth muscle spasm in the GI and urinary tract. This effect is partly due to antimuscarinic action and partly direct action on the smooth muscle.
CIMS Class	Antispasmodics
ATC Classification	A03AA07 - dicycloverine; Belongs to the class of synthetic anticholinergics, esters with tertiary amino group. Used in the treatment of functional bowel disorders.

didanosine

CIMS Class : (Antivirals)
didanosine

P - Caution when used during pregnancy

L - Contraindicated in lactation

Food ∇ - Food interaction

related didanosine information

Indication & Dosage

Oral

HIV infection

Adult: As tablet/capsule: ≥ 60 kg: 400 mg daily as a single dose or in 2 divided doses; < 60 kg: 250 mg daily as a single dose or in 2 divided doses.

Child: 2 wk-8 mth: 100 mg/m² bid; > 8 mth: 120 mg/m² bid. For chewable or dispersible tablets: > 3 mth: 240 mg/m² daily or 180 mg/m² daily if given with zidovudine; doses may be given in 1-2 divided doses. For enteric-coated capsules: > 6 yr: 240 mg/m² daily or 180 mg/m² daily if given with zidovudine.

Renal impairment: Dosage adjustments based on weight and creatinine clearance. Dose should preferably be admin after dialysis.

CrCl (ml/min)	Dosage Recommendation
30-59	≥ 60 kg: 200 mg daily as a single dose or in two equally divided doses (tablets); 100 mg bid (oral solution). < 60 kg: 150 mg daily as a single dose or in two equally divided doses (tablets); 10

	<table border="1"> <tr> <td data-bbox="482 71 628 216">30-59</td><td data-bbox="628 71 1350 216">=60 kg: 200 mg daily as a single dose or in two equally divided doses (tablets); 100 mg bid (oral solution). < 60 kg: 150 mg daily as a single dose or in two equally divided doses (tablets); 10</td></tr> <tr> <td data-bbox="482 216 628 331">10-29</td><td data-bbox="628 216 1350 331">=60 kg: 150 mg once daily (tablets); 167 mg once daily (oral solution). < 60 kg: 100 mg once daily (tablets or oral solution)</td></tr> <tr> <td data-bbox="482 331 628 447"><10</td><td data-bbox="628 331 1350 447">=60 kg: 100 mg once daily (tablets or oral solution). < 60 kg: 75 mg once daily (tablets); 100 mg once daily (oral solution).</td></tr> </table> Hepatic impairment: Dose adjustment may be needed.	30-59	=60 kg: 200 mg daily as a single dose or in two equally divided doses (tablets); 100 mg bid (oral solution). < 60 kg: 150 mg daily as a single dose or in two equally divided doses (tablets); 10	10-29	=60 kg: 150 mg once daily (tablets); 167 mg once daily (oral solution). < 60 kg: 100 mg once daily (tablets or oral solution)	<10	=60 kg: 100 mg once daily (tablets or oral solution). < 60 kg: 75 mg once daily (tablets); 100 mg once daily (oral solution).
30-59	=60 kg: 200 mg daily as a single dose or in two equally divided doses (tablets); 100 mg bid (oral solution). < 60 kg: 150 mg daily as a single dose or in two equally divided doses (tablets); 10						
10-29	=60 kg: 150 mg once daily (tablets); 167 mg once daily (oral solution). < 60 kg: 100 mg once daily (tablets or oral solution)						
<10	=60 kg: 100 mg once daily (tablets or oral solution). < 60 kg: 75 mg once daily (tablets); 100 mg once daily (oral solution).						
Administration	Should be taken on an empty stomach. (Take on an empty stomach ½ hr before or 2 hr after meals.)						
Overdosage	Symptoms: pancreatitis, peripheral neuropathy, hyperuricemia and hepatic dysfunction. Management: There is no known antidote. Empty stomach by inducing emesis or by gastric lavage. Treatment is supportive and symptomatic with careful monitoring of the patient. Haemodialysis may remove some of the drug while peritoneal dialysis is unlikely to be useful.						
Contraindications	Hypersensitivity; lactation.						
Special Precautions	History of pancreatitis and liver disease; pregnancy; impaired hepatic and renal function; peripheral neuropathy; hyperuricaemia. Half-yrly dilated retinal examinations are recommended. May be associated with the development of non-cirrhotic portal hypertension; monitor patients for the development of portal hypertension and oesophageal varices. Suspend use in patients with suspected pancreatitis and discontinue use in patients with confirmed pancreatitis. Suspend use in patients who develop clinical symptoms or signs with or without laboratory findings of lactic acidosis and severe hepatomegaly with steatosis. Consider usage discontinuation or interruption in patients with worsening liver disease. Patients may develop peripheral neuropathy, retinal changes and optic neuritis, immune reconstitution syndrome						

	severe hepatomegaly with steatosis. Consider usage discontinuation or interruption in patients with worsening liver disease. Patients may develop peripheral neuropathy, retinal changes and optic neuritis, immune reconstitution syndrome and redistribution/accumulation of body fat.
Adverse Drug Reactions	Pancreatitis; peripheral neuropathy; diarrhoea, nausea, vomiting, abdominal pain; headache, fatigue, rash, hyperuricaemia; hepatic failure; retinal depigmentation, neuritis.
Drug Interactions	Increased effect with allopurinol and ganciclovir; hydroxyurea; increased toxicity with ribavirin or tenofovir. Decreased effects of quinolones, tetracyclines, indinavir. Increased risk of pancreatitis when used with pentamidine, stavudine or co-trimoxazole. Increased risk of liver toxicity when used with other antiretroviral agents, hydroxyurea or ribavirin.
Food Interaction	Effect decreased by food.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Didanosine is a nucleoside reverse transcriptase inhibitor that inhibits DNA synthesis of retroviruses by competitive inhibition of reverse transcriptase and incorporation into viral DNA. Absorption: Rapidly hydrolysed in the gastric acid. Bioavailability ranges from 20-40%. Distribution: Plasma protein binding: <5%. Metabolism: Metabolised intracellularly to the active antiviral

	Bioavailability ranges from 20-40%. Distribution: Plasma protein binding: <5%. Metabolism: Metabolised intracellularly to the active antiviral metabolite dideoxyadenosine triphosphate. Excretion: Elimination half-life: About 1.5 hr.
CIMS Class	Antivirals
ATC Classification	J05AF02 - didanosine; Belongs to the class of nucleoside and nucleotide reverse transcriptase inhibitors. Used in the systemic treatment of viral infections.

diethylcarbamazine

CIMS Class : (Anthelmintics)
diethylcarbamazine

P - Contraindicated in pregnancy
L - Caution when used during lactation

related diethylcarbamazine information	
Indication & Dosage	<i>Oral</i> Loiasis Adult: Initially, 1 mg/kg daily, increased gradually to 6 mg/kg daily over 3 days then maintained for 3 wk. A corticosteroid may be given concurrently for the treatment of filarial infections.
	<i>Oral</i> Toxocariasis Adult: Initially, 1 mg/kg daily, increased gradually to 6 mg/kg daily over 3 days then maintained for 3 wk. A corticosteroid may be given concurrently for the treatment of filarial infections.
	<i>Oral</i> Filariasis Adult: Initially, 1 mg/kg daily, increased gradually to 6 mg/kg daily over 3 days then maintained for 3 wk. A corticosteroid may be given concurrently for the treatment of filarial infections.
	<i>Oral</i>

	daily over 3 days then maintained for 3 wk. A corticosteroid may be given concurrently for the treatment of filarial infections. <i>Oral</i> Prophylaxis of loiasis Adult: 300 mg wkly.
Contraindications	Pregnancy, hypersensitivity; lactation; infants, elderly or debilitated patients; impaired renal function; cardiac disease.
Special Precautions	Patients with poor health.
Adverse Drug Reactions	Fever, headache, vomiting, dizziness, drowsiness, nausea, chills. Potentially Fatal: Severe hypersensitivity reactions may occur especially in the treatment of onchocerciasis where rare Mazzotti reaction characterised by rash, itching, headache, muscle and joint pains, tachycardia, postural hypotension may start within 2 hr of drug administration. Encephalitis and retinal haemorrhage.
Storage	Oral: Store below 30°C.
Mechanism of Action	Diethylcarbamazine is an anthelmintic that is used in the treatment of lymphatic filariasis. It is active against the microfilariae and adult worms of <i>W. bancrofti</i>, <i>B. malayi</i>, <i>B. timori</i> and <i>Loa loa</i> but only against the microfilariae of <i>O. volvulus</i>. It is also used in treatment of toxocariasis. Repeated courses may be necessary. Absorption: Readily absorbed from the GI tract (oral); skin (topical); conjunctiva (optical). Distribution: Widely distributed in tissues. Excretion: Urine (as unchanged drug and N-oxide metabolite).
CIMS Class	Anthelmintics
ATC Classification	P02CB02 - diethylcarbamazine; Belongs to the class of

P02CB02 - diethylcarbamazine; Belongs to the class of piperazine and derivatives agents used as antinematodal.

digoxin

CIMS Class : (Cardiac Drugs)
digoxin

P - Caution when used during pregnancy

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related digoxin information

Indication & Dosage

Oral

Heart failure

Adult: Rapid digitalisation: Loading dose of 0.75-1.5 mg during the first 24-hr period as a single dose or in divided doses every 6 hr for less urgent or greater risk cases. For mild heart failure: Loading dose may not be required, 250 mcg 1-2 times daily. For patients with normal renal function, steady-state plasma concentrations are usually achieved in about 7 days. Usual maintenance: 125-250 mcg daily but may range from 62.5-500 mcg daily.

Child: Neonate <1.5 kg: Initial: 25 mcg/kg/day in 3 divided doses for 24 hr, then 4-6 mcg/kg/day in 1-2 divided doses; neonate 1.5-2.5 kg: Initial: 30 mcg/kg/day in 3 divided doses for 24 hr, then 4-6 mcg/kg/day in 1-2 divided doses; Neonate >2.5 kg and child 1 mth-2 yr: Initial: 45 mcg/kg/day in 3 divided doses for 24 hr, then 10 mcg/kg/day in 1-2 divided doses. 2-5 yr: Initial: 35 mcg/kg/day in 3 divided doses for 24 hr, then 10 mcg/kg/day in 1-2 divided doses. 5-10 yr: Initial:

divided doses for 24 hr, then 10 mcg/kg/day in 1-2 divided doses. 2-5 yr: Initial: 35 mcg/kg/day in 3 divided doses for 24 hr, then 10 mcg/kg/day in 1-2 divided doses. 5-10 yr: Initial: 25 mcg/kg/day (max: 750 mcg/day) in 3 divided doses for 24 hr, then 6 mcg/kg/day (max: 250 mcg/day) in 1-2 divided doses. 10-18 yr: Initial: 0.75-1.5 mg/day in 3 divided doses for 24 hr, then 62.5-750 mcg/day in 1-2 divided doses. Reduce doses if patient has been given cardiac glycoside in the preceding 2 wk.

Elderly: Lower doses are given.

Renal impairment: Dosage reductions may be needed.

Oral

Supraventricular arrhythmias

Adult: Rapid digitalisation: Loading dose of 0.75-1.5 mg during the first 24-hr period as a single dose or in divided doses every 6 hr for less urgent or greater risk cases. For mild heart failure: Loading dose may not be required, 250 mcg 1-2 times daily. For patients with normal renal function, steady-state plasma concentrations are usually achieved in about 7 days. Usual maintenance: 125-250 mcg daily but may range from 62.5-500 mcg daily.

Child: Neonate <1.5 kg: Initial: 25 mcg/kg/day in 3 divided doses for 24 hr, then 4-6 mcg/kg/day in 1-2 divided doses; neonate 1.5-2.5 kg: Initial: 30 mcg/kg/day in 3 divided doses for 24 hr, then 4-6 mcg/kg/day in 1-2 divided doses; Neonate >2.5 kg and child 1 mth-2 yr: Initial: 45 mcg/kg/day in 3 divided doses for 24 hr, then 10 mcg/kg/day in 1-2 divided doses. 2-5 yr: Initial: 35 mcg/kg/day in 3 divided doses for 24 hr, then 10 mcg/kg/day in 1-2 divided doses. 5-10 yr: Initial: 25 mcg/kg/day (max: 750 mcg/day) in 3 divided doses for 24 hr, then 6 mcg/kg/day (max: 250 mcg/day) in 1-2 divided doses. 10-18 yr: Initial: 0.75-1.5 mg/day in 3 divided doses

	25 mcg/kg/day (max: 750 mcg/day) in 3 divided doses for 24 hr, then 6 mcg/kg/day (max: 250 mcg/day) in 1-2 divided doses. 10-18 yr: Initial: 0.75-1.5 mg/day in 3 divided doses for 24 hr, then 62.5-750 mcg/day in 1-2 divided doses. Reduce doses if patient has been given cardiac glycoside in the preceding 2 wk. Elderly: Lower doses are given. Renal impairment: Dosage reductions may be needed. <i>Intravenous</i> Emergency heart failure Adult: For patients who have not received cardiac glycosides in the previous 2 wk. 0.5-1 mg by IV infusion as a single dose over at least 2 hr or in divided doses with each dose given over 10-20 minutes. Maintenance dose is usually given orally. Renal impairment: Dosage reductions may be needed. Reconstitution: Admin undiluted or diluted with a 4-fold or greater volume of Sterile Water for Injection, 0.9% Sodium Chloride Injection, or 5% Dextrose Injection. Incompatibility: Using less than a 4-fold volume of diluent could lead to precipitation of the digoxin.
Administration	May be taken with or without food.
Overdosage	Symptoms: Hyperkalaemia, cardiac arrhythmias and heart block. Management: Treatment is symptomatic and supportive. Reduce absorption by gastric lavage if present within 30 min of ingestion. Do not induce vomiting or attempt passage of a gastric tube if presented >2 hr after ingestion or already has toxic manifestations, as this may induce an acute vagal episode and worsen digitalis-related arrhythmias. Activated charcoal is helpful in reducing drug absorption. Monitor serum potassium levels and keep potassium levels

	vagal episode and worsen digitalis-related arrhythmias. Activated charcoal is helpful in reducing drug absorption. Monitor serum potassium levels and keep potassium levels between 4.0-5.5 mmol/l. Digoxin-specific antibody fragments (FAB) is a specific antidote for digoxin and may be used to reverse potentially life-threatening ventricular arrhythmias due to digoxin overdosage. Haemodialysis is unlikely to be useful.
Contraindications	Digitalis toxicity, ventricular tachycardia/fibrillation, obstructive cardiomyopathy. Arrhythmias due to accessory pathways (e.g. Wolff-Parkinson-White syndrome).
Special Precautions	Cardiac dysrhythmias, hypokalaemia, hypertension, IHD, hypercalcaemia, hypomagnesaemia, electroconversion, chronic cor pulmonale, aortic valve disease, acute myocarditis, congestive cardiomyopathies, constrictive pericarditis, heart block, elderly, renal impairment, abnormalities in thyroid function; pregnancy. IV digoxin can only be given to patients who have not received cardiac glycosides in the preceding 2 wk.
Adverse Drug Reactions	Extra beats, anorexia, nausea and vomiting. Diarrhoea in elderly, confusion, dizziness, drowsiness, restlessness, nervousness, agitation and amnesia, visual disturbances, gynaecomastia, local irritation (IM/SC inj), rapid IV admin may lead to vasoconstriction and transient hypertension. Potentially Fatal: Cardiac arrhythmias in combination with heart block.
Drug Interactions	Effectiveness reduced by phenytoin, neomycin, sulphasalazine, kaolin, pectin, antacids and in patients receiving radiotherapy. Metoclopramide may alter the absorption of solid dosage forms of digoxin. Blood levels increased by calcium channel blockers, spironolactone, quinidine and

	radiotherapy. Metoclopramide may alter the absorption of solid dosage forms of digoxin. Blood levels increased by calcium channel blockers, spironolactone, quinidine and calcium salts. Potentially Fatal: Electrolyte imbalances such as hypokalaemia and hypomagnesemia (e.g. admin of potassium-losing diuretics, corticosteroids) can increase the risk of cardiac toxicity.
Food Interaction	Absorption delayed.
Lab Interference	May increase conc of urinary 17-hydroxycorticosteroids.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 25°C. Oral: Store at 25°C.
Mechanism of Action	Digoxin is a cardiac glycoside which has positive inotropic activity characterized by an increase in the force of myocardial contraction. It also reduces the conductivity of the heart through the atrioventricular (AV) node. Digoxin also exerts direct action on vascular smooth muscle and indirect effects mediated primarily by the autonomic nervous system and an increase in vagal activity. Absorption: Absorption from the GI tract is variable. Distribution: Widely distributed in tissues, including the heart, brain, erythrocytes, and skeletal muscle. 20-30% bound to plasma proteins. Excretion: Excreted mainly unchanged.
CIMS Class	Cardiac Drugs
ATC Classification	C01AA05 - digoxin; Belongs to the class of digitalis glycosides. Used in the treatment of heart failure.

C01AA05 - digoxin; Belongs to the class of digitalis glycosides. Used in the treatment of heart failure.

diltiazem hydrochloride

CIMS Class : (Calcium Antagonists) , (Anti-Anginal Drugs)
diltiazem hydrochloride

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food α - Food interaction

related diltiazem hydrochloride information

Indication & Dosage

Oral

Angina pectoris

Adult: Initially, 60 mg tid, increased to 360 mg daily or up to 480 mg daily, if necessary.

Renal impairment: Dosage adjustment may be needed.

Initial dose of 120 mg daily, as a single dose or in 2 divided doses depending on the formulation and titrated carefully as required. Do not increase dose if the heart rate drops <50 beats/min.

Hepatic impairment: Dosage adjustment may be needed.

Initial dose of 120 mg daily, as a single dose or in 2 divided doses depending on the formulation and titrated carefully as required. Do not increase dose if the heart rate drops <50 beats/min.

Oral

Hypertension

Adult: Initially, 60-120 mg bid increased if needed. Max: 360 mg daily.

Hypertension

Adult: Initially, 60-120 mg bid increased if needed. Max: 360 mg daily.

Renal impairment: Dosage adjustment may be needed.

Initial dose of 120 mg daily, as a single dose or in 2 divided doses depending on the formulation and titrated carefully as required. Do not increase dose if the heart rate drops <50 beats/min.

Hepatic impairment: Dosage adjustment may be needed.

Initial dose of 120 mg daily, as a single dose or in 2 divided doses depending on the formulation and titrated carefully as required. Do not increase dose if the heart rate drops <50 beats/min.

Intravenous

Cardiac arrhythmias

Adult: Initially, 250 mcg/kg by bolus IV Inj over 2 mins, if necessary, after 15 min, may administer another dose of 350 mcg/kg. Individualsie subsequent doses. In patients with atrial fibrillation or flutter: 5-10 mg/hr infusion, increased in increments of 5 mg/hr up to a rate of 15 mg/hr continued for 24 hr.

Renal impairment: Dosage adjustment may be needed.

Hepatic impairment: Dosage adjustment may be needed.

Administration

Normal release prep: May be taken with or without food. (Admin instructions for modified release prep may vary according to brands, refer to lit.)

Overdosage

Symptoms: Altered mental status, shock, bradycardia, hypotension, ECG changes, arrhythmias, heart block, cardiac arrest and heart failure. Management: Treatment is supportive and symptomatic. Gastric lavage and administration of activated charcoal may help to reduce drug absorption. Haemodialysis and peritoneal unlikely to be

	supportive and symptomatic. Gastric lavage and administration of activated charcoal may help to reduce drug absorption. Haemodialysis and peritoneal unlikely to be useful. Charcoal haemoperfusion may be useful.
Contraindications	Sick-sinus syndrome; 2nd or 3rd ° AV block; porphyria. Severe congestive cardiac failure; marked bradycardia. Pregnancy and lactation.
Special Precautions	Elderly. Hepatic or renal impairment; impaired left ventricular function; prolonged AV periods; DM; hypotension. Avoid abrupt withdrawal and long-term use. Patients with sick-sinus syndrome, preexisting AV block, bradycardia and those taking beta-blockers or digitalis are at risk of developing AV block, bradycardia, asystole or sinus arrest.
Adverse Drug Reactions	Headache, ankle oedema, hypotension, dizziness, fatigue, flushing, nausea, GI discomfort, gingival hyperplasia, rashes, erythema multiforme, exfoliative dermatitis, photosensitivity, occasionally hepatitis. Potentially Fatal: AV block, bradycardia, asystole, sinus arrest.
Drug Interactions	Increases serum theophylline levels. Cimetidine may increase plasma concentrations of diltiazem. Concurrent use may lead to increased blood ciclosporin levels. Potentially Fatal: Increased depression of cardiac conduction with amiodarone, β-blockers, digoxin and mefloquine. May potentiate risk of bradycardia and conduction disturbance of propranolol and risk of neurotoxicity of lithium.
Food Interaction	Serum levels may be elevated if taken with food.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal

	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 15-30°C. Oral: Store at 15-30°C.
Mechanism of Action	Diltiazem relaxes coronary vascular smooth muscles by inhibiting influx of calcium ions during depolarisation of the vascular smooth muscles and myocardium. It increases myocardial O₂ delivery in patients with vasospastic angina and inhibits cardiac conduction, particularly at the SA and AV nodes. Absorption: Rapidly and almost completely absorbed from the GI tract (oral). Distribution: Enters breast milk. Protein-binding: 80%. Metabolism: Hepatic: Extensive first-pass effect; yields desacetyldiltiazem (possesses 25-50% of the activity of the parent drug). Excretion: Via urine (2-4% as unchanged and metabolites), via bile (remaining metabolites); 3-5 hr (elimination half-life).
CIMS Class	Calcium Antagonists / Anti-Anginal Drugs
ATC Classification	C08DB01 - diltiazem; Belongs to the class of selective benzothiazepine derivative calcium-channel blockers with direct cardiac effects. Used in the treatment of cardiovascular diseases.

dimenhydrinate

CIMS Class : (Antivertigo Drugs)
dimenhydrinate

P - Caution when used during pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related dimenhydrinate information

Indication & Dosage

Oral

Treatment and prophylaxis of motion sickness

Adult: 50-100 mg 3-4 times daily. For prevention of motion sickness, 1st dose to be given at least 30 minutes before traveling.

Child: 2-6 yr: 12.5-25 mg; 6-12 yr: 25-50 mg; Doses can be repeated every 6-8 hr. Max: 75 mg daily (2-6 yr) and 150 mg daily (6-12 yr).

Oral

Nausea and vertigo caused by Meniere's disease

Adult: 50-100 mg 3-4 times daily. For prevention of motion sickness, 1st dose to be given at least 30 minutes before traveling.

Child: 2-6 yr: 12.5-25 mg; 6-12 yr: 25-50 mg; Doses can be repeated every 6-8 hr. Max: 75 mg daily (2-6 yr) and 150 mg daily (6-12 yr).

Parenteral

Treatment and prophylaxis of motion sickness

	daily (6-12 yr). <i>Parenteral</i> Treatment and prophylaxis of motion sickness Adult: 50 mg in a 5% solution given IM or 0.5% slow IV inj given over 2 min. Child: 1.25 mg/kg IM or slow IV inj 4 times daily. Max: 300 mg/day. <i>Parenteral</i> Nausea and vertigo caused by Meniere's disease Adult: 50 mg in a 5% solution given IM or 0.5% slow IV inj given over 2 min. Child: 1.25 mg/kg IM or slow IV inj 4 times daily. Max: 300 mg/day.
Administration	May be taken with or without food.
Overdosage	Symptoms in children: dilated pupils, flushed face, excitation, hallucinations, confusion, ataxia, intermittent clonic convulsions, coma, cardiorespiratory collapse, and death. Symptoms may manifest up to 2 hr after ingestion and death may occur within 18 hr. Symptoms in adult: Difficulty in speech and swallowing, psychosis, sedation then CNS excitation, leading to a cycle of CNS excitation, seizures and postictal depression. Management: Treatment is symptomatic and supportive. Gastric lavage may be performed with an endotracheal tube with cuff inflated in place to prevent aspiration of gastric contents. Keep patient quiet to reduce CNS stimulation. Convulsions may be treated with diazepam in adults and phenobarbital in children.
Contraindications	Hypersensitivity to dimenhydrinate, porphyria. Neonates. Lactation.
Special Precautions	Angle-closure glaucoma, urinary retention, prostatic hyperplasia, pyloroduodenal obstruction, epilepsy. Elderly.

	Angle-closure glaucoma, urinary retention, prostatic hyperplasia, pyloroduodenal obstruction, epilepsy. Elderly. Tasks requiring mental alertness. Pregnancy.
Adverse Drug Reactions	Sedation, dry mouth, thickened respiratory tract secretions, tightness of chest, bradycardia followed by tachycardia and arrhythmias, blurred vision, urinary retention, constipation, GI disturbance, blood dyscrasias. Paradoxical CNS stimulation may occur in children and occasionally in adults.
Drug Interactions	Physically incompatible with aminophylline, hydrocortisone, phenothiazines and some barbiturates in solution. Potentially Fatal: Potentiates the sedative effects of CNS depressants including alcohol, barbiturates, opioid analgesics, sedatives and neuroleptics. MAOIs, atropine, TCAs enhance antimuscarinic effect. Masks ototoxicity produced by aminoglycoside antibiotics.
Lab Interference	May interfere with plasma theophylline estimation by radioimmunoassay.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store below 25°C. Parenteral: Store below 25°C.
Mechanism of Action	Dimenhydrinate is an antihistamine which also has antimuscarinic and central sedative action. It also exerts a depressant action on hyperstimulated labyrinthine function.
CIMS Class	Antivertigo Drugs

dimercaprol

CIMS Class : (Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence)
dimercaprol

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related dimercaprol information

Indication & Dosage	<i>Intramuscular</i> Heavy metal poisoning Adult: Initially 400-800 mg on the 1st day of treatment followed by 200-400 mg on the 2nd and 3rd days. Reduce to 100-200 mg on the 4th and subsequent days, all in divided doses. Advisable to give doses at 4 hrly intervals to minimise risk of adverse effects. Child: 1 mth–18 yr: 2.5–3 mg/kg every 4 hr for 2 days, 2–4 times on the 3rd day, then 1–2 times daily for 10 days or until recovery. Renal impairment: Use with caution, dosage adjustments may be needed. <i>Intramuscular</i> Adjunct in lead poisoning Adult: Initially 4 mg/kg followed by 3-4 mg/kg of dimercaprol concomitantly with sodium calcium edetate at 4 hrly intervals. Maintenance: 2-7 days.

	Adult: Initially 4 mg/kg followed by 3-4 mg/kg of dimercaprol concomitantly with sodium calcium edetate at 4 hrly intervals. Maintenance: 2-7 days. Renal impairment: Use with caution, dosage adjustments may be needed.
Overdosage	Symptoms: vomiting, convulsions and stupor within 30 minutes and subsiding within 6 hr following inj.
Contraindications	Iron, selenium, cadmium and organic mercury poisoning, hypersensitivity. Extensive hepatic failure; lactation.
Special Precautions	Renal damage, hypertension. G6PD deficiency. Elderly. Pregnancy and lactation.
Adverse Drug Reactions	Hypertension, tachycardia, malaise, salivation, lacrimation, sweating, tingling of extremities, local pain and abscess at inj site, CNS stimulation, nausea, vomiting, burning sensation of lips, mouth, throat and eyes, muscle and abdominal pain, headache, paraesthesia, fever. Potentially Fatal: Potentiation of toxicity of iron, selenium, tellurium, cadmium, exacerbation of hypertension, haemolytic crisis in patients with G6PD deficiency.
Drug Interactions	Drugs which acidify urine may impair the estimation of chelated dimercaprol. Potentially Fatal: Forms toxic complexes with iron, cadmium, selenium or uranium.
Lab Interference	Interferes with normal accumulation of iodine by the thyroid. Decreased I 131 thyroidal uptake values.
Mechanism of Action	Dimercaprol chelates heavy metals e.g. arsenic, gold, mercury, lead as well as antimony, bismuth, nickel and thallium by competing with endogenous sulfhydryl groups on enzymes. This chelation prevents or reverses any inhibition of sulfhydryl enzymes by the metallic poison and forms a complex readily secreted in the kidneys.

	enzymes. This chelation prevents or reverses any inhibition of sulfhydryl enzymes by the metallic poison and forms a complex readily secreted in the kidneys. Absorption: Peak plasma concentrations after 30-60 min (IM). Distribution: To all tissues including the brain. Metabolism: Rapidly hepatic; converted to inactive metabolites. Excretion: Urine and bile (as metabolites and dimercaprol-metal chelates); 4 hr (elimination half-life).
CIMS Class	Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence
ATC Classification	V03AB09 - dimercaprol; Belongs to the class of antidotes. Used in heavy metals poisoning.

dimeticone

CIMS Class : (Emollients & Skin Protectives)
dimeticone

related dimeticone information

Indication & Dosage	<i>Topical/Cutaneous</i> Head pediculosis Adult: A 4% solution is used for treatment. Child: >6 mth: A 4% solution is used for treatment. <i>Topical/Cutaneous</i> Skin protectant Adult: As cream containing dimeticone 22% w/w and benzalkonium chloride 0.1% w/w. Apply to the affected area several times a day as needed.
Adverse Drug Reactions	Rarely, redness, pain and irritation at the site of application.
Mechanism of Action	Dimeticone is water-repellent and is commonly found in topical barrier preparations which are used for protecting the skin against water-soluble irritants. It is also used to protect the skin against trauma due to incontinence or stoma discharge.
CIMS Class	Emollients & Skin Protectives

dinoprostone

CIMS Class : (Drugs Acting on the Uterus)
dinoprostone

P - Caution when used during pregnancy

related dinoprostone information

Indication & Dosage	<i>Extra-amniotic</i> Pregnancy termination in the 2nd trimester Adult: As 100 mcg/mL soln: Instill 1 mL through a suitable foley catheter followed by 1-2 mL at 2-hr intervals according to patient's response. <i>Vaginal</i> Cervical priming, induction and augmentation of labour Adult: As cervical gel: Apply 500 mcg in 2.5 mL preparation. May be repeated after 6 hr if necessary. Max: 1.5 mg/24 hr. <i>Vaginal</i> Labour induction Adult: As vaginal gel: 1 mg (or 2 mg for primigravid patients with unfavourable induction features) followed by another 1 or 2 mg after 6 hr if necessary. Max: 3 mg (or 4 mg in unfavourable primigravid patients). As pessary: Initially, 3 mg followed by a further 3 mg after 6-8 hr if necessary. Max: 6 mg.
Overdosage	Rigors, vomiting, severe abdominal pain, uterine hypercontractility and uterine hypertonus. Management:

	Rigors, vomiting, severe abdominal pain, uterine hypercontractility and uterine hypertonus. Management: conservative management may be sufficient in most cases. β-adrenergic drugs may be used as a treatment of hyperstimulation following admin for cervical ripening.
Contraindications	Hypersensitivity to prostaglandins. Patients in whom oxytocics are generally contraindicated. History of pelvic inflammatory disease; active cardiac, pulmonary, renal or hepatic disease.
Special Precautions	Raised intraocular pressure. Previous caesarean section; history of asthma, epilepsy, hepatic or renal dysfunction, cardiovascular disease; pregnancy.
Adverse Drug Reactions	Hypersensitivity reactions, nausea, vomiting, diarrhoea, abdominal pain; flushing, shivering, headache, dizziness; hypertension; convulsions, ECG changes, local tissue irritation, erythema; pyrexia, increased WBC. Uterine contractile abnormalities with or without foetal distress. Dosage >0.5 mg intracervically can cause hypertonic uterine contractions. Intra/extra-amniotic inj: Local infection, vomiting, diarrhoea, pyrexia, transient hypotension. Potentially Fatal: Sudden CV collapse due to accidental IV absorption and intra-amniotic inj. Uterine rupture, amniotic fluid embolism during labour. Foetal distress and death in rare cases.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Extra-amniotic: Cervical gel: Refrigerate at 2-8°C. Vag supp: Store in a freezer below -20°C. Vag insert: Store in a

	Extra-amniotic: Cervical gel: Refrigerate at 2-8°C. Vag supp: Store in a freezer below -20°C. Vag insert: Store in a freezer between -20°C & -10°C. Vaginal: Cervical gel: Refrigerate at 2-8°C. Vag supp: Store in a freezer below -20°C. Vag insert: Store in a freezer between -20°C & -10°C.
Mechanism of Action	Dinoprostone causes induction of uterine muscle contraction during pregnancy. It is both a vasoconstrictor and bronchodilator. The pattern of uterine contraction is similar to that in normal labour at term. It can also stimulate the smooth muscle of the GI tract. Onset: 10 min. Duration: 2-3 hr (vaginal supp). Absorption: Small amounts absorbed by the uterus. Distribution: Diffuses into the maternal blood. Metabolism: Hepatic, renal, spleen and other tissues: Rapid. Excretion: Urine; faeces (small amounts).
CIMS Class	Drugs Acting on the Uterus
ATC Classification	G02AD02 - dinoprostone; Belongs to the class of prostaglandins. Used to induce abortion or augment labour and to minimize blood loss from the placental site.

diphenhydramine

CIMS Class : (Antihistamines & Antiallergics)
diphenhydramine

P - Caution when used during pregnancy

L - Contraindicated in lactation

related diphenhydramine information

Indication & Dosage

Oral

Allergic conditions

Adult: As hydrochloride: 25-50 mg 3-4 times daily. Max: 300 mg/day.

Child: 6.25-25 mg 3-4 times daily, up to 5 mg/kg in divided doses. Max: 300 mg/day.

Oral

Treatment and prophylaxis of motion sickness

Adult: As diphenhydramine di (acefyllinate): Usual dose: 90-135 mg, may repeat if needed at intervals of at least 6 hr. Max: 540 mg daily. For prevention, dose to be given at least 30 min before travelling.

Parenteral

Allergic conditions

Adult: As hydrochloride: 10-50 mg as a 1% or 5% solution, up to 100 mg. Dose may be given via deep IM or IV inj. Not more than 400 mg in 24 hr.

Child: 5 mg/kg daily in 4 divided doses. Dose can be given via deep IM or IV inj. Max: 300 mg in 24 hr.

	up to 100 mg. Dose may be given via deep IM or IV inj. Not more than 400 mg in 24 hr. Child: 5 mg/kg daily in 4 divided doses. Dose can be given via deep IM or IV inj. Max: 300 mg in 24 hr.
Administration	May be taken with or without food.
Overdosage	Symptoms: Acute delirium with visual and auditory hallucinations, impaired consciousness, psychosis, seizures, antimuscarinic symptoms (e.g. mydriasis, tachycardia and tachyarrhythmias), rhabdomyolysis and respiratory failure.
Contraindications	Hypersensitivity ; neonates, lactation.
Special Precautions	Epilepsy; elderly; performing tasks which require mental alertness; angle-closure glaucoma; pyrodoodenal obstruction; urinary tract obstruction; hyperthyroidism; raised intraocular pressure; CV disease; acute asthma; pregnancy.
Adverse Drug Reactions	CNS depression, dizziness, headache, sedation; paradoxical stimulation in children; dryness of mouth, thickened respiratory secretion, blurring of vision, urinary retention; GI disturbances; blood dyscrasias.
Drug Interactions	Masks ototoxicity produced by aminoglycosides. Increases gastric degradation of levodopa and decreases its absorption by reduction of gastric emptying. Antagonises therapeutic effects of cholinergic agents e.g. tacrine, donepezil and neuroleptics. Valerian, St. John's wort, Kava Kava and gotu kola may increase CNS depression. Potentially Fatal: Potentiates CNS depression with alcohol, barbiturates, analgesics, sedatives and neuroleptics. Additive antimuscarinic action with MAOIs, atropine and TCAs.
Storage	Oral: Store at 15-25°C. Parenteral: Store at 15-25°C.
Mechanism of Action	Diphenhydramine blocks histamine H ₁ -receptors on effector cells of the GI tract, blood vessels and respiratory tract. It

	Diphenhydramine blocks histamine H₁-receptors on effector cells of the GI tract, blood vessels and respiratory tract. It also causes sedation and has some anticholinergic action. Absorption: Absorbed well from the GI tract (oral); peak plasma concentrations after 1-4 hr. Distribution: Widely distributed, CNS; crosses the placenta and enters breast milk. Protein-binding: Highly bound. Metabolism: Extensive first-pass metabolism. Excretion: Via urine (as metabolites, small amounts as unchanged drug); 1-4 hr (elimination half-life).
CIMS Class	Antihistamines & Antiallergics
ATC Classification	D04AA32 - diphenhydramine; Belongs to the class of topical antihistamines used in the treatment of pruritus. R06AA02 - diphenhydramine; Belongs to the class of aminoalkyl ethers used as systemic antihistamines.

dipyridamole

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
dipyridamole

P - Caution when used during pregnancy

L - Caution when used during lactation

related dipyridamole information

Indication & Dosage

Oral

Prophylaxis of thromboembolism following cardiac valve replacement

Adult: 300-600 mg/day in divided doses with an oral anticoagulant.

Child: 5 mg/kg/day in divided doses.

Oral

Secondary prophylaxis of stroke or transient ischaemic attack

Adult: As modified-release preparation: 200 mg bid, with or without aspirin.

Administration

Should be taken on an empty stomach. (Take on an empty stomach 1 hr before meals. May be taken w/ meals to reduce GI discomfort.)

Overdosage

Symptoms: warm feeling, flushes, sweating, restlessness, weakness, dizziness, hypotension and tachycardia.

Management: treatment is symptomatic. Empty stomach by gastric lavage. Haemodialysis unlikely to be useful.

	weakness, dizziness, hypotension and tachycardia. Management: treatment is symptomatic. Empty stomach by gastric lavage. Haemodialysis unlikely to be useful.
Contraindications	Hypersensitivity. Peptic ulcer.
Special Precautions	In patients with rapidly worsening angina, subvalvular aortic stenosis, haemodynamic instability associated with recent MI or coagulation disorders esp when given IV during myocardial imaging. Hypotension, unstable angina, aortic stenosis. Pregnancy and lactation. Safety and efficacy are not established in childn < 12 yrs.
Adverse Drug Reactions	GI disturbances, headache, dizziness, faintness, facial flushing, skin rash, liver dysfunction, angina. Large doses may lower BP. Potentially Fatal: Risk of worsening angina and cardiac arrhythmias when given IV.
Drug Interactions	Aminophylline may reverse vasodilatation effect. Useful combination with aspirin in prevention of thromboembolism. Efficacy reduced by concurrent admin of antacids. Concurrent use may increase the cardiotoxic effects of adenosine. Potentially Fatal: Potentiates effects of oral anticoagulants and antiarrhythmic agents.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store below 25°C.
Mechanism of Action	Dipyridamole causes an accumulation of adenosine, adenine nucleotides and cAMP by inhibiting the activity of adenosine deaminase and phosphodiesterase thus

	Dipyridamole causes an accumulation of adenosine, adenine nucleotides and cAMP by inhibiting the activity of adenosine deaminase and phosphodiesterase thus inhibiting platelet aggregation and may cause vasodilation. Absorption: Absorbed incompletely from the GIT (oral); peak plasma concentrations after 75 min. Distribution: Protein-binding: Highly bound. Metabolism: Hepatic; there is enterohepatic recirculation. Excretion: Via bile (as glucuronides); 10-12 hrs (elimination half-life).
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC Classification	B01AC07 - dipyridamole; Belongs to the class of platelet aggregation inhibitors excluding heparin. Used in the treatment of thrombosis.

dipyrrone

CIMS Class : (Analgesics (Non-Opioid) & Antipyretics)
dipyrrone

P - Caution when used during pregnancy

related dipyrrone information

Indication & Dosage	<i>Oral</i> Severe pain Adult: 0.5-4 g daily in divided doses.
Contraindications	Hypersensitivity, porphyria or congenital G6PD deficiency, bleeding disorders.
Special Precautions	Pregnancy, disorders of haematopoiesis.
Adverse Drug Reactions	Intolerance (skin, bronchial tract, etc.), gastric symptoms, allergic reactions. Potentially Fatal: Agranulocytosis, shock.
Drug Interactions	Ciclosporin levels decreased.
Mechanism of Action	It inhibits the synthesis of prostaglandins D and E resulting in analgesic, anti-inflammatory and antipyretic effects. It also has the potential for causing agranulocytosis. Absorption: Rapidly hydrolysed in gastric juice to active metabolite 4-methyl-amino-antipyrine. Distribution: Metabolites are distributed into breast milk. Excretion: Mostly excreted in the urine as metabolites.
CIMS Class	Analgesics (Non-Opioid) & Antipyretics

disopyramide

CIMS Class : (Cardiac Drugs)
disopyramide

P - Caution when used during pregnancy

L - Caution when used during lactation

related disopyramide information

Indication & Dosage

Oral

Supraventricular and ventricular arrhythmias

Adult: 300-800 mg daily in divided doses (as conventional capsules every 6 hr; as extended-release capsules every 12 hr), adjusted according to patient's response.

Child: 12-18 yr: 6-15 mg/kg daily; 4-12 yr: 10-15 mg/kg daily; 1-4 yr: 10-20 mg/kg daily; <1 yr: 10-30 mg/kg daily.

CrCl (ml/min)	Dosage Recommendation
>40	400 mg daily in divided doses.
30-40	100 mg every 8 hr; avoid modified release preparations.
15-30	100 mg every 12 hr; avoid modified release preparations.
<15	100 mg every 24 hr; avoid modified release preparations.

Hepatic impairment: 400 mg daily in divided doses. Liver cirrhosis: consider a therapeutic range 50% lower than in patients with normal hepatic function.

Intravenous

Supraventricular and ventricular arrhythmias

Adult: 2 mg/kg (max: 150 mg) by slow inj at a rate of =30

	patients with normal hepatic function. <i>Intravenous</i> Supraventricular and ventricular arrhythmias Adult: 2 mg/kg (max: 150 mg) by slow inj at a rate of =30 mg/min, followed by 200 mg by mouth immediately upon completion of inj and every 8 hr for 24 hr. If arrhythmia recurs, repeat IV inj but not exceeding 300 mg in the 1st hr and 800 mg in 24 hr. Alternatively, initial IV inj may be followed by IV infusion of 0.4 mg/kg/hr (or 20-30 mg/hr) Max: 800 mg daily. Renal impairment: Dose adjustments may be required. Hepatic impairment: Dose adjustments may be required.
Overdosage	Symptoms: Anticholinergic side effects, loss of consciousness, hypotension, respiratory arrest, episodes of apnoea, cardiac conduction disturbances, arrhythmias, bradycardia, CHF, asystole and seizures. Management: Fast and aggressive treatment needed even without any symptoms, as it can be fatal. Empty stomach by emesis or gastric lavage. Treatment is supportive with ECG monitoring. Haemodialysis or charcoal haemoperfusion (preferred) may be useful.
Contraindications	Patients with complete heart block; glaucoma; predisposition to urinary retention; myasthenia gravis. Sinus node disease in absence of pacemaker. Cardiomyopathy. Cardiogenic shock. Hypotension. Hypersensitivity. Children.
Special Precautions	Conduction disorders or uncompensated heart failure. Pregnancy and lactation. Renal and hepatic failure. Family history of glaucoma. Correct potassium deficiency.
Adverse Drug Reactions	Impotence, constipation, difficulty in micturition, dry mouth, blurred vision, nausea, bloating, abdominal pain, vomiting, diarrhoea, colic. Psychosis, depression, skin rashes, dizziness, fatigue, muscle weakness, headache, cholestatic

	blurred vision, nausea, bloating, abdominal pain, vomiting, diarrhoea, colic. Psychosis, depression, skin rashes, dizziness, fatigue, muscle weakness, headache, cholestatic jaundice, elevated liver enzymes, thrombocytopenia, agranulocytosis, ventricular tachycardia and fibrillation, heart failure, hypotension, conduction disturbances. Potentially Fatal: Urinary retention, severe cardiovascular depression if given as rapid IV inj. High risk of recurrence of failure in patients with history of congestive cardiac failure. Negative inotropic effect especially prominent in patients with cardiomyopathy, hypertension and uncompensated cardiac failure.
Drug Interactions	Avoid other Class I antiarrhythmics and other cardiac depressants including β-blockers except in life-threatening arrhythmias. Risk of worsening of arrhythmias, precipitation of new arrhythmias and ventricular fibrillation when used with other anti-arrhythmics. Reduced efficacy when co-admin with phenytoin. Potentially Fatal: Enhanced antimuscarinic effects with other antimuscarinic drugs. Potentiates negative chronotropic and inotropic effects of β-blockers and verapamil. Potentiates inhibitory effect on the conduction system produced by digitalis. Potentiates QT interval prolongation produced by TCAs and amiodarone.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store below 30°C. Oral: Store below 30°C.
Mechanism of Action	Disopyramide is a Ia antiarrhythmic agent which acts by decreasing myocardial excitability and conduction velocity. It

Mechanism of Action	Disopyramide is a Ia antiarrhythmic agent which acts by decreasing myocardial excitability and conduction velocity. It lengthens the effective refractory period of the atrium. It also possesses antimuscarinic and negative inotropic effects. Absorption: Readily and almost completely absorbed from the GI tract (oral); peak plasma concentrations after 0.5-3 hr. Distribution: Crosses the placenta and enters the breast milk. Protein-binding: 50-65%. Metabolism: Hepatic: Partial metabolism; converted to mono-N-dealkylated disopyramide (also has antiarrhythmic and antimuscarinic properties). Excretion: Mainly in the kidneys via urine (50% as unchanged, 20% as N-dealkylated metabolite and 10% as other metabolites; via the faeces (10% of the dose). 4-10 hr (elimination half-life); may be increased in cardiac failure, renal and hepatic impairment.
CIMS Class	Cardiac Drugs
ATC Classification	C01BA03 - disopyramide; Belongs to class Ia antiarrhythmics used in the treatment of arrhythmia.

disulfiram

CIMS Class : (Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence)
disulfiram

P - Caution when used during pregnancy
L - Caution when used during lactation

related disulfiram information

Indication & Dosage

Oral

Adjunct in chronic alcoholism

Adult: 800 mg as a single dose on the 1st day of treatment, reduce dose by 200 mg daily. Maintenance: 100-200 mg daily.

Administration

May be taken with or without food.

Contraindications

Hypersensitivity, CVS diseases; peripheral neuropathy, psychosis. Not to be used in patients with alcohol intoxication.

Special Precautions

Diabetes, epilepsy, hepatic/renal impairment, hypothyroidism, cerebral damage, elderly. Liver function and blood tests should be monitored regularly. Pregnancy and lactation.

Adverse Drug Reactions

Drowsiness, fatigue, lassitude, psychotic reactions, peripheral and optic neuropathies, hepatotoxicity, garlic-like or metallic after-taste, GI upset, body odour, bad breath, headache, impotence.

	peripheral and optic neuropathies, hepatotoxicity, garlic-like or metallic after-taste, GI upset, body odour, bad breath, headache, impotence. Potentially Fatal: Respiratory depression, CV collapse, arrhythmias, myocardial infarction, acute CHF, convulsions, sudden death.
Drug Interactions	Inhibits hepatic enzymes thus interferes with metabolism of other drugs; enhances anticoagulant effects of phenytoin and coumarin. Adverse CNS effects may be precipitated with concurrent metronidazole, INH or MAOI therapy. Tricyclic antidepressants exacerbate symptoms of disulfiram alcohol reaction. Potentially Fatal: Disulfiram alcohol interaction: Intense flushing of neck and face accompanied by heat and sweating, tachycardia, palpitation, dyspnoea, dizziness, headache, HTN initially and then hypotension; GI disturbances, exhaustion, convulsions and cardiopulmonary arrest.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Disulfiram inhibits aldehyde dehydrogenase, the oxidative enzyme of acetaldehyde, a metabolite of alcohol. The latter is accumulated in the blood, thus producing unpleasant symptoms of disulfiram-alcohol reaction when a patient has taken small amounts of alcohol. Onset: 12 hrs. Duration: 1-2 wk after last dose. Absorption: Rapidly absorbed from the GIT; peak plasma concentrations after 8-10 hrs (oral). Metabolism: Reduction to diethyldithiocarbamate by the glutathione reductase system in the erythrocytes. Excretion: Urine (as metabolites); exhaled gas (carbon disulphide).

	glutathione reductase system in the erythrocytes. Excretion: Urine (as metabolites); exhaled gas (carbon disulphide).
CIMS Class	Antidotes, Detoxifying Agents & Drugs Used in Substance Dependence
ATC Classification	N07BB01 - disulfiram; Belongs to the class of drugs used in the management of alcohol dependence. P03AA04 - disulfiram; Belongs to the class of sulfur-containing agents used as ectoparasiticides.

related divalproex sodium information

Indication & Dosage	<i>Oral</i> Primary generalised seizures Adult: Initially, 10-15 mg/kg/day in 2-4 divided doses, if necessary, increase at 5-10 mg/kg/wk. Max: 60 mg/kg/day. Child: ≥10 yr: Initially, 10-15 mg/kg/day in 2-4 divided doses, if necessary, increase at 5-10 mg/kg/wk. Max: 60 mg/kg/day. <i>Oral</i> Partial seizures Adult: Initially, 10-15 mg/kg/day in 2-4 divided doses, if necessary, increase at 5-10 mg/kg/wk. Max: 60 mg/kg/day. Child: ≥10 yr: Initially, 10-15 mg/kg/day in 2-4 divided doses, if necessary, increase at 5-10 mg/kg/wk. Max: 60 mg/kg/day. <i>Oral</i> Acute manic episodes of bipolar disorder Adult: Initially, 25 mg/kg once daily, may increase rapidly to achieve optimal response at the lowest therapeutic dose. Max: 60 mg/kg/day.

	Acute manic episodes or bipolar disorder Adult: Initially, 25 mg/kg once daily, may increase rapidly to achieve optimal response at the lowest therapeutic dose. Max: 60 mg/kg/day. <i>Oral</i> Prophylaxis of migraine Adult: 500 mg once daily for 1 wk, may increase to 1000 mg once daily.
Administration	Should be taken with food.
Contraindications	Hepatic disease or severe hepatic impairment; porphyria. Pregnancy.
Special Precautions	Children <2 yr; congenital metabolic disorders; organic brain disease or severe seizure disorders; HIV infection; renal impairment; lactation. Monitor liver function before and during the 1st 6 mth of therapy. Monitor platelet function, signs of pancreatitis and SLE. Gradual withdrawal of valproate. May impair ability to drive or operate machinery. Increased risk of hyperammonaemic encephalopathy in patients with urea cycle disorders.
Adverse Drug Reactions	Behavioural/mood changes; hyperammonaemia; pancreatitis, thrombocytopenia. Abdominal cramps, anorexia, diarrhoea, hair loss, indigestion, nausea and vomiting; tremor; unusual weight loss or gain. Potentially Fatal: Hepatic failure, pancreatitis.
Drug Interactions	Felbamate increases valproate levels. Phenytoin, phenobarbitone and carbamazepine lower valproate levels. Increased risk of hepatotoxicity with hepatotoxic drugs. Potentially Fatal: Potentiates action of CNS depressants (barbiturates, primidone) and alcohol.
Food Interaction	Food may delay the extent of absorption. Divalproex may cause GI upset; take with large amount of water or food to

	Food may delay the extent of absorption. Divalproex may cause GI upset; take with large amount of water or food to decrease GI upset.
Lab Interference	False positive result for urine ketones. May alter the results of thyroid function tests.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Divalproex sodium dissociates to the valproate ion in the GI tract. It is thought to work by increasing brain concentrations of GABA which may also play an important role in the prevention of migraine attacks. Distribution: Plasma protein binding ranges from 10-18.5%. Metabolism: Almost entirely by liver.
CIMS Class	Antipsychotics / Antimigraine Preparations / Anticonvulsants

dobutamine

CIMS Class : (Cardiac Drugs)
dobutamine

P - Caution when used during pregnancy

related dobutamine information

Indication & Dosage

Intravenous

Acute heart failure

Adult: 2.5-10 mcg/kg, up to 0.5-40 mcg/kg according to patient's heart rate, cardiac output, BP and urine output.

Intravenous

Cardiac stress test

Adult: 5 mcg/kg/min for 8 min using a 1 mg/ml solution, dose is then increased at 5 mcg/kg/min until 20 mcg/kg/min, with each dose being infused for 8 min before the next increase. Monitor ECG and stop infusion if arrhythmias, marked ST segment depression or other adverse effects occur.

Overdosage

Symptoms may include anorexia, nausea, vomiting, tremor, anxiety, palpitations, headache, shortness of breath, and anginal and nonspecific chest pain. Treatment includes discontinuing drug admin, establishing an airway, ensuring oxygenation and ventilation. Initiate resuscitative measures immediately. Severe ventricular tachyarrhythmias may be treated with propranolol or lidocaine. Hypertension usually

	oxygenation and ventilation. Initiate resuscitative measures immediately. Severe ventricular tachyarrhythmias may be treated with propranolol or lidocaine. Hypertension usually responds to dose reduction or therapy discontinuation.
Contraindications	Hypersensitivity; idiopathic hypertrophic subaortic stenosis (IHSS).
Special Precautions	Correct hypovolaemia prior to treatment. Increased risk of rapid ventricular response in patients with atrial fibrillation. Insufficient data to determine the safety and efficacy of dobutamine use after acute MI. Elderly. Neonates. Pregnancy.
Adverse Drug Reactions	Increased heart rate and BP, ectopic beats, palpitation. Nausea, headache, chest pain, palpitation, dyspnoea, paraesthesia, leg cramps. Tissue necrosis at site of extravasation. Potentially Fatal: Cardiac arrhythmias, allergy (rare), MI and hypotension.
Drug Interactions	Increased cardiac output when used with nitroprusside. Increased vasopressor effect of dobutamine when used with bretylium, guanethidine, oxytocic drugs or TCAs.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Store at 15-30°C.
Mechanism of Action	Dobutamine increases contractility and heart rate by stimulating β -adrenergic receptors in the cardiac tissues. Absorption: Inactivated in the GI tract (oral). Metabolism: Converted to 3-O-methyldobutamine.

	stimulating β -adrenergic receptors in the cardiac tissues. Absorption: Inactivated in the GI tract (oral). Metabolism: Converted to 3-O-methyldobutamine. Excretion: Mainly via urine, via faeces (small amounts); 2 min (elimination half-life).
CIMS Class	Cardiac Drugs
ATC Classification	C01CA07 - dobutamine; Belongs to the class of adrenergic and dopaminergic cardiac stimulants excluding glycosides. Used in the treatment of heart failure.

docetaxel

CIMS Class : (Cytotoxic Chemotherapy)
docetaxel

P - Contraindicated in pregnancy
L - Caution when used during lactation

related docetaxel information

Indication & Dosage	<i>Intravenous</i> Breast cancer Adult: As a single agent: Initially, 60-100 mg/m² BSA by infusion once every 3 wk. In combination therapy: 75 mg/m² once every 3 wk. Hepatic impairment: ALT and/or AST >1.5 times the upper limit of normal (ULN), and alkaline phosphatase >2.5 times the ULN: Reduce dose from 100 mg/m² to 75 mg/m². Avoid in severe impairment. <i>Intravenous</i> Head and neck cancer Adult: 75 mg/m² BSA once every 3 wk. For gastric adenocarcinoma: Dose is given before cisplatin and fluorouracil. For head and neck cancer: Treatment is given for 3 cycles followed by chemoradiotherapy or 4 wk followed by radiotherapy alone. For prostatic cancer: May be given with oral prednisolone 5 mg bid continuously during treatment. Hepatic impairment: ALT and/or AST >1.5 times the upper

by radiotherapy alone. For prostatic cancer: May be given with oral prednisolone 5 mg bid continuously during treatment.

Hepatic impairment: ALT and/or AST >1.5 times the upper limit of normal (ULN), and alkaline phosphatase >2.5 times the ULN: : Reduce dose from 100 mg/m² to 75 mg/m². Avoid in severe impairment.

Intravenous

Non-small cell lung cancer

Adult: 75 mg/m² BSA once every 3 wk. For gastric adenocarcinoma: Dose is given before cisplatin and fluorouracil. For head and neck cancer: Treatment is given for 3 cycles followed by chemoradiotherapy or 4 wk followed by radiotherapy alone. For prostatic cancer: May be given with oral prednisolone 5 mg bid continuously during treatment.

Hepatic impairment: ALT and/or AST >1.5 times the upper limit of normal (ULN), and alkaline phosphatase >2.5 times the ULN: : Reduce dose from 100 mg/m² to 75 mg/m². Avoid in severe impairment.

Intravenous

Prostate cancer

Adult: 75 mg/m² BSA once every 3 wk. For gastric adenocarcinoma: Dose is given before cisplatin and fluorouracil. For head and neck cancer: Treatment is given for 3 cycles followed by chemoradiotherapy or 4 wk followed by radiotherapy alone. For prostatic cancer: May be given with oral prednisolone 5 mg bid continuously during treatment.

Hepatic impairment: ALT and/or AST >1.5 times the upper limit of normal (ULN), and alkaline phosphatase >2.5 times the ULN: : Reduce dose from 100 mg/m² to 75 mg/m². Avoid in severe impairment.

	limit of normal (ULN), and alkaline phosphatase >2.5 times the ULN: : Reduce dose from 100 mg/m² to 75 mg/m². Avoid in severe impairment. <i>Intravenous</i> Gastric adenocarcinoma Adult: 75 mg/m² BSA once every 3 wk. For gastric adenocarcinoma: Dose is given before cisplatin and fluorouracil. For head and neck cancer: Treatment is given for 3 cycles followed by chemoradiotherapy or 4 wk followed by radiotherapy alone. For prostatic cancer: May be given with oral prednisolone 5 mg bid continuously during treatment. Hepatic impairment: ALT and/or AST >1.5 times the upper limit of normal (ULN), and alkaline phosphatase >2.5 times the ULN: : Reduce dose from 100 mg/m² to 75 mg/m². Avoid in severe impairment.
Contraindications	Previous severe hypersensitivity reaction to docetaxel, the solvent or polysorbate 80. Severe neutropenia; pregnancy, severe liver impairment.
Special Precautions	Lactation. Hepatic impairment. Monitor liver blood function and blood counts regularly. Premedication with oral dexamethsaone at 16 mg daily for 3 days, starting one day before docetaxel treatment is recommended.
Adverse Drug Reactions	Erythematous patches, eruptions, scleroderma, onycholysis, alopoecia, nausea, vomiting, diarrhoea, stomatitis; increases in hepatic transaminases, bilirubin and alkaline phosphatase; mucositis, asthenia, arthralgia, myalgia, paroxysmal atrial tachycardia, atrial flutter, dysrrhythmia, hypertension and heart failure. Potentially Fatal: Neutropenia; fluid retention syndrome; anaemia.
Drug Interactions	Co-admin of drugs that induce, inhibit, or metabolised by

Drug Interactions	Co-admin of drugs that induce, inhibit, or metabolised by cytochrome P-450 isoenzyme may affect the metabolism of docetaxel. Potentially Fatal: Caution should be exercised during concomitant therapy with ciclosporin, terfenadine, ketoconazole, erythromycin and troleandomycin.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 2-25°C.
Mechanism of Action	Docetaxel disrupts the microtubular network in cells that is essential for vital mitotic and interphase cellular functions. It binds to the free tubulin and promotes the assembly of tubulin into stable microtubules while simultaneously inhibiting their disassembly, resulting in inhibition of mitosis. Distribution: Rapidly distributed throughout body tissues. Protein-binding: >95% Metabolism: Extensively hepatic. Excretion: Faeces (as metabolites), urine; 11 hr (elimination half-life).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01CD02 - docetaxel; Belongs to the class of plant alkaloids and other natural products, taxanes. Used in the treatment of cancer.

docusates

CIMS Class : (Laxatives, Purgatives)
docusates

P - Caution when used during pregnancy
L - Caution when used during lactation

related docusates information

Indication & Dosage	<i>Oral</i> Constipation Adult: As calcium: 240 mg. As sodium: 50-300 mg daily in divided doses, increased up to 500 mg daily. Child: 120 mg daily. <i>Rectal</i> Constipation Adult: 120-200 mg given as an enema.
Contraindications	Hypersensitivity; intestinal obstruction, undiagnosed abdominal pain; prolonged use. It should not be used to soften earwax when there is inflammation and/or eardrum perforation.
Special Precautions	Pregnancy, lactation, neonates; do not give with liqd paraffin; rectal prep not to be given if haemorrhoids or anal fissure present.
Adverse Drug Reactions	Diarrhoea, nausea, abdominal cramps, skin rash. Rectal: Anorectal pain or bleeding.
Storage	Oral: Store at 15-30°C. Rectal: Store at 15-30°C.

Storage	Oral: Store at 15-30°C. Rectal: Store at 15-30°C.
Mechanism of Action	Docusates are faecal softeners used mainly in the treatment of constipation. These anionic surfactants are considered to act primarily by increasing the penetration of fluid into the faeces. Onset: 12-72 hr. Absorption: Absorbed from the GI tract (oral). Distribution: Enters breast milk (as sodium). Excretion: Faeces
CIMS Class	Laxatives, Purgatives

domperidone

CIMS Class : (GIT Regulators, Antiflatulents & Anti-inflammatories) , (Antiemetics)
domperidone

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related domperidone information

Indication & Dosage

Oral

Nausea and vomiting

Adult: 10-20 mg every 4-8 hr. Max: 80 mg/day.

Child: >2 yr and >35 kg: 10-20 mg 3-4 times daily. Max: 80 mg daily.

Oral

Non ulcer dyspepsia

Adult: 10-20 mg tid and at night.

Oral

Migraine

Adult: 20 mg every 4 hr, in combination with paracetamol, as required. Max: 4 doses in 24 hr.

Rectal

Nausea and vomiting

Adult: 60 mg bid.

Child: 60 mg bid.

Max Dosage:

	Adult: 60 mg bid. Child: 60 mg bid. Max Dosage:
Administration	Should be taken on an empty stomach. (Take 15-30 mins before meals.)
Contraindications	Hypersensitivity. GI haemorrhage, obstruction and perforation, patients with prolactin releasing pituitary hormone, chronic admin or routine prophylaxis of postoperative nausea and vomiting.
Special Precautions	Phaeochromocytoma; children < 2 yr, elderly; renal or hepatic impairment. Risk of cardiac arrhythmias and hypokalaemia if administered IV. Pregnancy and lactation.
Adverse Drug Reactions	Drowsiness, extrapyramidal reactions, galactorrhoea, gynaecomastia; constipation or diarrhoea, lassitude, decreased libido, skin rash, itch. Potentially Fatal: Convulsions, arrhythmias and cardiac arrest, dysrhythmias in patients with CV disease or hypokalaemia, patients on cancer chemotherapy. Seizures; hypertensive crisis in patients with phaeochromocytoma.
Drug Interactions	Reduces absorption of digoxin. Increases absorption of aspirin, paracetamol and oral diazepam. Enhances CNS depression by phenothiazine. Antimuscarinic agents and opioids antagonise GI effects. May antagonise hypoprolactinaemic effect of drugs such as bromocriptine. Increased effects when used with CYP3A4 inhibitors such as erythromycin or ritonavir.
Food Interaction	Delayed absorption but higher bioavailability due to reduced first-pass metabolism in gut wall.
Storage	Oral: Store at 15-30°C. Rectal: Store at 15-30°C.
Mechanism of Action	Domperidone is a peripheral dopamine-receptor blocker. It increases oesophageal peristalsis, lower oesophageal

	Domperidone is a peripheral dopamine-receptor blocker. It increases oesophageal peristalsis, lower oesophageal sphincter pressure, gastric motility and peristalsis, thus facilitating gastric emptying and decreasing small bowel transit time. Onset: Oral: 30 min-1hr. Duration: Oral: 6-8 hr. Absorption: Peak plasma concentrations after 1 hr (rectal), 30 min (oral). Distribution: Enters breast milk (small amounts). Protein-binding: >90%. Metabolism: Extensively hepatic. Excretion: Urine (as metabolites), faeces (as unchanged drug); 7.5 hr (elimination half-life).
CIMS Class	GIT Regulators, Antiflatulents & Anti-inflammatories / Antiemetics
ATC Classification	A03FA03 - domperidone; Belongs to the class of propulsives. Used in the treatment of functional gastrointestinal disorders.

domperidone + paracetamol

CIMS Class : (Antimigraine Preparations)
domperidone + paracetamol

Food ⚠ - Food interaction

related domperidone + paracetamol information

related domperidone + paracetamol information	
Indication & Dosage	<i>Oral</i> Migraine Adult: 2 tab (20 mg domperidone/1000 mg paracetamol) at onset of migraine attack. Repeat up to every 4 hr if required. Max: 4 g paracetamol/day. Max Dosage: 8 tab (4 doses) in 24 hr.
Contraindications	Hypersensitivity. GI haemorrhage, obstruction and perforation, patients with prolactin releasing pituitary hormone or chronic admin or for prophylaxis of postoperative nausea and vomiting.
Special Precautions	Phaeochromocytoma; children, elderly; renal or hepatic impairment, risk of cardiac arrhythmias and hypokalaemia if administered IV. Pregnancy, lactation and alcohol-dependent patients.
Adverse Drug Reactions	Drowsiness, extrapyramidal reactions, galactorrhoea, gynaecomastia; constipation or diarrhoea, lassitude, decreased libido, nausea, allergic reactions, skin rashes, acute renal tubular necrosis. Potentially Fatal: Domperidone: convulsions, arrhythmias

	decreased libido, nausea, allergic reactions, skin rashes, acute renal tubular necrosis. Potentially Fatal: Domperidone: convulsions, arrhythmias and cardiac arrest, dysrhythmias in patients with CV disease or hypokalaemia, patients on cancer chemotherapy. Seizures, hypertensive crisis in patients with pheochromocytoma are seen. Paracetamol, very rare, blood dyscrasias (eg, thrombocytopaenia, leucopaenia, neutropaenia, agranulocytosis); liver damage are seen.
Drug Interactions	Domperidone reduces absorption of oral digoxin, increases absorption of aspirin and oral diazepam. Enhances CNS depression by phenothiazines. Antimuscarinic agents and opioids antagonise GI effects of domperidone. Paracetamol reduced absorption of cholestyramine within 1 hr of admin and accelerates absorption of metoclopramide. Potentially Fatal: Paracetamol increases the risk of liver damage in chronic alcoholics. Increased risk of toxicity with other hepatotoxic drugs or drugs which induce microsomal enzymes.
Food Interaction	Delayed absorption of domperidone but higher bioavailability due to reduced first-pass metabolism in gut wall. Decreased rate of absorption of paracetamol with food.
Mechanism of Action	Domperidone is a dopamine antagonist which works to prevent vomiting (symptom of migraine). Domperidone is given with paracetamol, an analgesic, for relief of migraine.
CIMS Class	Antimigraine Preparations
ATC Classification	A03FA03 - domperidone; Belongs to the class of propulsives. Used in the treatment of functional gastrointestinal disorders. N02BE01 - paracetamol; Belongs to the class of anilide

propulsives. Used in the treatment of functional gastrointestinal disorders.

N02BE01 - paracetamol; Belongs to the class of anilide preparations. Used to relieve pain and fever.

donepezil

CIMS Class : (Neurodegenerative Disease Drugs)
donepezil

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related donepezil information

Indication & Dosage

Oral

Mild to moderately severe dementia in Alzheimer's disease

Adult: Initially, 5 mg daily at bedtime, increase if necessary up to 10 mg once daily at bedtime after 4-6 wk.

Elderly: Initially, 5 mg daily at bedtime, increase if necessary up to 10 mg once daily at bedtime after 4-6 wk.

Administration

May be taken with or without food.

Overdosage

Overdose may result in cholinergic crisis; symptoms include severe nausea, vomiting, salivation, hypotension, bradycardia, resp depression, collapse and seizures. Muscle weakness may increase and death may occur if resp muscles are involved. Treatment includes supportive measures and use of tertiary anticholinergics (such as atropine).

Contraindications

Hypersensitivity.

Special

Caution when used in patients with sick sinus syndrome or

Special Precautions	Caution when used in patients with sick sinus syndrome or cardiac conduction abnormalities. May increase secretion of gastric acid; caution when used in patients at risk of ulcer disease. Patients with COPD, asthma, history of epilepsy, bladder obstruction, prostatic hypertrophy. May cause dose-related diarrhoea, nausea and/or vomiting which usually resolves after 1-3 wk. Safety and efficacy have not been established in children. Pregnancy, lactation.
Adverse Drug Reactions	Nausea, vomiting, anorexia, wt loss, diarrhoea, insomnia, fatigue, muscle cramps; headache and dizziness; syncope, bradycardia; convulsions; increased liver transaminases; sinoatrial and atrioventricular block; hallucinations, agitation and aggressive behavior; minor increases in plasma creatine kinase; potentially bladder outflow obstruction.
Drug Interactions	May increase the neurotoxic effect of antipsychotics. Concurrent use with systemic corticosteroids may increase the adverse effects of donepezil. May increase the neuromuscular-blocking effect of succinylcholine. May increase the adverse effects of cholinergic agonists. May increase the bradycardic effect of β -blockers.
Food Interaction	Ginkgo biloba may increase the adverse effects of donepezil.
Storage	Oral: Store below 30°C.
Mechanism of Action	Donepezil reversibly and noncompetitively inhibits centrally-active acetylcholinesterase. It is used for the symptomatic treatment of Alzheimer's disease. Absorption: Well absorbed in the GI tract. Plasma levels peak within 3-4 hr after oral admin. Distribution: Protein binding: About 95% (mainly albumin). Metabolism: Partially metabolised in the liver mainly by

	peak within 3-4 hr after oral admin. Distribution: Protein binding: About 95% (mainly albumin). Metabolism: Partially metabolised in the liver mainly by CYP3A4 to 4 major metabolites. Excretion: Elimination half-life: About 70 hr. Steady-state concentrations are achieved within 3 wk of treatment initiation.
CIMS Class	Neurodegenerative Disease Drugs
ATC Classification	N06DA02 - donepezil; Belongs to the class of anticholinesterases. Used in the management of dementia.

***donepezil information:**

dopamine

CIMS Class : (Cardiac Drugs)
dopamine

P - Caution when used during pregnancy

Lab α - Lab interference

related dopamine information

Indication & Dosage	<i>Intravenous</i> Acute heart failure Adult: As hydrochloride: Initially, 1-5 mcg/kg/min increased gradually by up to 5-10 mcg/kg/min according to the patient's BP, cardiac output and urine output. Up to 20-50 mcg/kg/min may be required in seriously ill patients.
Overdosage	Symptoms include excessive BP elevation. Treatment includes reducing rate of admin or temporarily discontinuing therapy until patient's condition stabilises. Usually, no additional remedial measures are needed as dopamine has short duration of action. In severe cases, short-acting α -adrenergic blocking agent, phentolamine, may be used.
Contraindications	Pheochromocytoma, uncorrected tachyarrhythmias, ventricular fibrillation. Hypersensitivity.
Special Precautions	Shock secondary to MI, history of peripheral vascular disease. Correct hypovolaemia before infusion. History of occlusive vascular disease e.g, atherosclerosis, Raynaud's disease, Buerger's disease, diabetic endarteritis;

	disease. Correct hypovolaemia before infusion. History of occlusive vascular disease e.g, atherosclerosis, Raynaud's disease, Buerger's disease, diabetic endarteritis; disproportionate increase in diastolic pressure. Pregnancy.
Adverse Drug Reactions	Nausea, vomiting, tachycardia, ectopic beats, palpitation, anginal pain, hypotension, vasoconstriction, bradycardia, hypertension, dyspnoea, headache, widened QRS complexes, azotaemia.
Drug Interactions	Cyclopropane and halogenated hydrocarbon anaesthetics may sensitise myocardium to dopamine and precipitate ventricular arrhythmias. MAO inhibitors prolong and increase dopamine effects. Ergots potentiate vasoconstriction action of dopamine. Alpha-blockers unmask dopamine's beta action.
Lab Interference	Suppresses pituitary secretion of thyroid-stimulating hormone, growth hormone and prolactin.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store below 30°C.
Mechanism of Action	Dopamine stimulates dopaminergic receptors at lower doses producing renal and mesenteric vasodilation while at higher doses stimulate both dopaminergic and β -adrenergic receptors producing cardiac stimulation and renal vasodilation. It increases heart rate and force of contraction. At low infusion rates vasodilatation occurs in the renal, mesenteric, coronary and cerebral beds. At higher rates vasoconstriction in skeletal muscles and a rise in BP. Absorption: Inactivated in the GI tract and body (oral).

	mesenteric, coronary and cerebral beds. At higher rates vasoconstriction in skeletal muscles and a rise in BP. Absorption: Inactivated in the GI tract and body (oral). Metabolism: Into dopamine-related products; converted to noradrenaline. Excretion: Eliminated as metabolic products of noradrenaline; 2 min (elimination half-life).
CIMS Class	Cardiac Drugs
ATC Classification	C01CA04 - dopamine; Belongs to the class of adrenergic and dopaminergic cardiac stimulants excluding glycosides. Used in the treatment of heart failure.

dorzolamide

CIMS Class : (Antiglaucoma Preparations)
dorzolamide

P - Caution when used during pregnancy

L - Contraindicated in lactation

related dorzolamide information

Indication & Dosage	<i>Ophthalmic</i> Ocular hypertension, Open-angle glaucoma Adult: As 2% eye drops: 1 drop tid; bid when used with a topical β -blocker.
Contraindications	Severe renal impairment; hypersensitivity; hyperchloraemic acidosis. Lactation.
Special Precautions	Hepatic impairment; systemic absorption following topical admin; history of renal calculi or intraocular surgery; chronic corneal defects; risk of choroidal detachment when used after filtration procedures.
Adverse Drug Reactions	Conjunctivitis; superficial punctate keratitis; ocular burning, stinging or itching; eyelid inflammation and crusting; blurred vision; lachrymation; anterior uveitis; transient myopia; corneal oedema; iridocyclitis; headache; dizziness; paraesthesia; asthenia; sinusitis; nausea; hypersensitivity reactions; bitter taste; epistaxis; urolithiasis; rhinitis.
Drug Interactions	Enhance effects of amphetamines, ephedrine, quinidine. Reduce effects of methenamine and its compounds.

	Enhance effects of amphetamines, ephedrine, quinidine. Reduce effects of methenamine and its compounds. Enhance antiepileptic-induced osteomalacia. Severe acidosis and increased CNS toxicity with aspirin. Increased excretion of lithium.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Ophthalmic: Store at 15-30°C.
Mechanism of Action	Dorzolamide is a carbonic anhydrase inhibitor that reduces formation of hydrogen and carbonate ions from CO₂ and water thereby reducing aqueous humor secretion, thus lowering intraocular pressure.
CIMS Class	Antiglaucoma Preparations
ATC Classification	S01EC03 - dorzolamide; Belongs to the class of carbonic anhydrase inhibitors used in the treatment of glaucoma and miosis.

dosulepin

CIMS Class : (Antidepressants)
dosulepin

P - Caution when used during pregnancy

L - Caution when used during lactation

related dosulepin information

Indication & Dosage	<i>Oral</i> Depression Adult: Initially, 25 mg tid, gradually increased to 50 mg tid if necessary, alternatively as a single dose at night. Up to 225 mg/day may be used in severe depression. Elderly: Initially, 50-75 mg daily.
Contraindications	Hypersensitivity, recent MI, neonates, heart block, cardiac arrhythmias, mania, alcohol, other CNS depressants, severe liver disease, prostate disease, children.
Special Precautions	Epilepsy, hypertension, glaucoma, urinary retention, gradual withdrawal, pregnancy, lactation, elderly.
Adverse Drug Reactions	Cholestatic jaundice, sexual dysfunction, exacerbation of psychotic manifestation, cardiac arrhythmias, hypotension, dry mouth, constipation, disturbance of accommodation, tachycardia, postural hypotension, drowsiness, tremors and skin rash. Withdrawal symptoms with abrupt cessation: Insomnia, irritability and excessive sweating. Potentially Fatal: Bone marrow depression, cardiac

	skin rash. Withdrawal symptoms with abrupt cessation: Insomnia, irritability and excessive sweating. Potentially Fatal: Bone marrow depression, cardiac arrhythmias and agranulocytosis, reports of ventricular fibrillation and renal failure.
Drug Interactions	Barbiturates reduce antidepressant effect of dosulepin. Raised serum concentrations with methylphenidate. Cigarette smoking enhances metabolism. Increased risk of ventricular arrhythmias when used with drugs that prolong QT interval. Potentially Fatal: Should not be given concurrently or within 14 days of stopping MAOIs. Potentiates catecholamines, sympathomimetics, narcotics and alcohol. Reduces hypotensive activity of bethanidine, guanethidine.
Mechanism of Action	Also known as dothiepin. It inhibits the neuronal re-uptake of noradrenaline in the CNS. Its antidepressant activity appears to be related with inhibition of monoamine neurotransmitter re-uptake. Absorption: Readily absorbed from the GI tract (oral). Distribution: Enters breast milk. Metabolism: Extensively hepatic via demethylation to desmethyldothiepin, S-oxidation. Excretion: Urine (as metabolites), faeces (small amounts). Elimination half-life: 14-24 hr (dosulepin), 23-46 hr (metabolites).
CIMS Class	Antidepressants
ATC Classification	N06AA16 - dosulepin; Belongs to the class of non-selective monoamine reuptake inhibitors. Used in the management of depression.

***dosulepin information:**

Note that there are some more drugs interacting with dosulepin

doxapram

CIMS Class : (Respiratory Stimulants)
doxapram

related doxapram information

Indication & Dosage	<i>Intravenous</i> Postoperative respiratory depression Adult: Initially, 0.5-1.5 mg/kg given via IV inj over at least 30 sec. May repeat hrly, if necessary. Alternatively, it can be given via IV infusion at an initial rate of 2-5 mg/minute, may reduce to 1-3 mg/minute according to patient's response. Max total: 4 mg/kg. <i>Intravenous</i> Acute respiratory failure Adult: 1.5-4 mg/minute by IV infusion.
Overdosage	Symptoms include hypertension, tachycardia, skeletal muscle hyperactivity, enhanced deep tendon reflexes, agitation, confusion, sweating, cough and dyspnoea. Monitor BP, pulse rate and deep tendon reflexes periodically. Management should be symptomatic.
Contraindications	Severe heart disease and hypertension; epilepsy, cerebral oedema, hyperthyroidism, ischaemic heart disease, acute severe asthma, convulsive disorders, phaeochromocytoma, cerebrovascular accident, head injury, physical obstruction of the airway.

	severe asthma, convulsive disorders, phaeochromocytoma, cerebrovascular accident, head injury, physical obstruction of the airway.
Special Precautions	Heart diseases, hepatic or renal impairment. Monitor BP, pulse rate and deep tendon reflexes. Rapid infusion may result in haemolysis. Protect and maintain adequate airway.
Adverse Drug Reactions	Dyspnoea and other respiratory problems. Muscle involvement may range from fasciculations to spasticity or seizures. Headache, dizziness, confusion, hyperactivity, hyperpyrexia particularly in the genital or perineal regions. Nausea, vomiting, diarrhoea, problems with urination. Alterations of BP and various arrhythmias. Thrombophlebitis following extravasation.
Drug Interactions	Pressor effects enhanced by sympathomimetics or MAOIs. Masks residual effects of muscle relaxants. Cardiac arrhythmias with anaesthetics known to sensitise the myocardium. Concurrent use with aminophylline may manifest agitation and increased skeletal muscle activity.
Storage	Intravenous: Store at 15-30°C.
Mechanism of Action	Doxapram is a central and respiratory stimulant which acts by stimulating the peripheral chemoreceptors and central respiratory centers. At higher doses, stimulation of the other parts of the brain and spinal cord occurs. Doxapram also has pressor action and may increase catecholamine release. It improves respiratory depression induced by opioids without affecting analgesia. Distribution: Rapidly distributed into the tissues after IV admin. Metabolism: Extensive first-pass effect after IV inj. Excretion: Metabolites and a small amount of unchanged drug are excreted via bile to the faeces.

	Metabolism: Extensive first-pass effect after IV inj. Excretion: Metabolites and a small amount of unchanged drug are excreted via bile to the faeces.
CIMS Class	Respiratory Stimulants
ATC Classification	R07AB01 - doxapram; Belongs to the class of respiratory stimulants. Used in treatment of respiratory diseases.

doxazosin

CIMS Class : (Other Antihypertensives) , (Drugs for Bladder & Prostate Disorders)
doxazosin

P - Caution when used during pregnancy
L - Caution when used during lactation

related doxazosin information

Indication & Dosage	<i>Oral</i> Hypertension Adult: As mesilate: Initially, 1 mg at bedtime increased after 1-2 wk according to response. Maintenance: 4 mg once daily. Max: 16 mg daily. <i>Oral</i> Benign prostatic hyperplasia Adult: As mesilate: Initially, 1 mg once daily at bedtime increased after 1-2 wk; monitor BP after 2-6 hr. Maintenance: 2-4 mg daily. Max: 8 mg daily.
Administration	May be taken with or without food.
Overdosage	Symptom of overdosage would include hypotension. IV fluid infusion may be used. Doxazosin is highly protein bound, thus dialysis would not be useful.
Contraindications	Known hypersensitivity to quinazolines.
Special Precautions	Renal or hepatic impairment. Prostatic carcinoma should be ruled out before starting therapy. Orthostatic hypotension

	Renal or hepatic impairment. Prostatic carcinoma should be ruled out before starting therapy. Orthostatic hypotension may occur at the initiation of therapy or when there is dose increase. Avoid driving or performing hazardous tasks for 24 hr after starting therapy or dose changes. Pregnancy and lactation.
Adverse Drug Reactions	Chest pain, fatigue, headache, influenza-like symptoms, pain, hypotension, palpitation, abdominal pain, diarrhoea, nausea, oedema, dizziness, dry mouth, somnolence, dyspnoea, respiratory disorders, vision abnormalities, impotence, urinary tract infection, increased sweating, anxiety, insomnia. Vertigo, orthostatic hypotension, arrhythmia, hypotension, arthralgia/arthritis, muscle weakness, myalgia, kinetic disorders, ataxia, hypertonia, muscle cramps, flushing, tinnitus, sexual dysfunction, rhinitis, epistaxis, polyuria, urinary incontinence, fatigue/malaise, face oedema.
Drug Interactions	Decreased hypotensive effect with NSAIDs. Increased hypotensive effect with β -blockers, diuretics, ACE inhibitors, calcium-channel blockers.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Doxazosin competitively blocks the α_1 -adrenoceptors on postsynaptic effector cells in arteriolar and venous vascular beds resulting in vasodilation of veins and decrease in total peripheral resistance and BP. Onset: 2-6 hr (oral). Duration: 24 hr.

	leads resulting in vasodilation of veins and decrease in total peripheral resistance and BP. Onset: 2-6 hr (oral). Duration: 24 hr. Absorption: Well absorbed from the GI tract; peak plasma concentrations after 2 hr (oral). Distribution: Protein-binding: Extensive. Metabolism: Extensively hepatic. Excretion: Faeces (small amounts as unchanged drug and as metabolites); 22 hr (elimination half-life); not removed by dialysis.
CIMS Class	Other Antihypertensives / Drugs for Bladder & Prostate Disorders
ATC Classification	C02CA04 - doxazosin; Belongs to the class of alpha-adrenoreceptor antagonists, peripherally-acting antiadrenergic agents. Used in the treatment of hypertension.

doxepin

CIMS Class : (Antidepressants)
doxepin

P - Caution when used during pregnancy
L - Contraindicated in lactation

related doxepin information

Indication & Dosage	<i>Oral</i> Depression Adult: As hydrochloride: Initially, 75 mg daily adjusted according to response; up to 300 mg daily in severely depressed patients; 25-50 mg daily in mildly affected patients. Total daily dose >100 mg should be given in divided doses. Child:
Administration	May be taken with or without food.
Contraindications	Hypersensitivity; mania, glaucoma, neonates (topical); lactation.
Special Precautions	Epilepsy, CV disease, pregnancy, history of urinary retention, glaucoma; gradual withdrawal. May impair ability to drive or operate machinery.
Adverse Drug Reactions	Drowsiness, dizziness, confusion, headache, dry mouth, constipation, blurring of vision, hypotension, tachycardia, rashes. Topical: Burning, stinging, scaling, oedema and dryness.

	constipation, blurring of vision, hypotension, tachycardia, rashes. Topical: Burning, stinging, scaling, oedema and dryness.
Drug Interactions	Methylphenidate may increase plasma doxepin levels. Potentially Fatal: Potentiates hypertensive action of sympathomimetics. Increased anticholinergic effects with MAOIs. Additive CNS effects with anticholinergics, CNS depressants and alcohol.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Doxepin inhibits serotonin and norepinephrine re-uptake by the presynaptic neuronal membrane increasing its synaptic conc in the CNS. Absorption: Readily absorbed from the GIT (oral). Distribution: Widely distributed; crosses the blood-brain barrier; enters breast milk. Protein-binding: Extensive. Metabolism: Extensively hepatic via demethylation to desmethyldoxepin, hydroxylation, N-oxidation. Excretion: Urine (as metabolites); 8-24 hrs (elimination half-life).
CIMS Class	Antidepressants
ATC Classification	N06AA12 - doxepin; Belongs to the class of non-selective monoamine reuptake inhibitors. Used in the management of depression.

doxofylline

CIMS Class : (Antiasthmatic & COPD Preparations)
doxofylline

P - Caution when used during pregnancy

L - Caution when used during lactation

related doxofylline information

Indication & Dosage	<i>Oral</i> Reversible airways obstruction Adult: Up to 1200 mg daily.
Mechanism of Action	Doxofylline is a theophylline derivative. Similarly, its mechanism of action is related to the inhibition of phosphodiesterase activities, resulting in bronchodilating effects.
CIMS Class	Antiasthmatic & COPD Preparations
ATC Classification	R03DA11 - doxofylline; Belongs to the class of other systemic drugs used in the treatment of obstructive airway diseases, xanthines.

doxorubicin

CIMS Class : (Cytotoxic Chemotherapy)
doxorubicin

P - Contraindicated in pregnancy
L - Contraindicated in lactation

related doxorubicin information

Indication & Dosage	<i>Intravenous</i> AIDS-related Kaposi's sarcoma Adult: As pegylated liposome: 20 mg/m² BSA infused over 30 min once every 2-3 wk. Hepatic impairment: Moderate impairment (serum-bilirubin: 12-30 mcg/mL): Half the normal dose; severe impairment (serum-bilirubin >30 mcg/mL): Quarter of the usual dose. <i>Intravenous</i> Ovarian carcinoma Adult: As pegylated liposome: 50 mg/m² BSA infused over 1 hr once every 4 wk. Hepatic impairment: Moderate impairment (serum-bilirubin: 12-30 mcg/mL): Half the normal dose; severe impairment (serum-bilirubin >30 mcg/mL): Quarter of the usual dose. <i>Intravenous</i> Metastatic breast cancer Adult: 60-75 mg/m² BSA once every 3 wk in combination with cyclophosphamide given as an infusion over 1 hr diluted in 0.9% sodium chloride or 5% glucose.

	metastatic breast cancer: Adult: 60-75 mg/m² BSA once every 3 wk in combination with cyclophosphamide given as an infusion over 1 hr diluted in 0.9% sodium chloride or 5% glucose. Hepatic impairment: Moderate impairment (serum-bilirubin: 12-30 mcg/mL): Half the normal dose; severe impairment (serum-bilirubin >30 mcg/mL): Quarter of the usual dose. <i>Irrigation</i> Local malignant neoplasms in the bladder Adult: 50 ml of a 1 mg/ml solution instilled into the bladder for 1 hr once a mth. Hepatic impairment: Moderate impairment (serum-bilirubin: 12-30 mcg/mL): Half the normal dose; severe impairment (serum-bilirubin >30 mcg/mL): Quarter of the usual dose.
Overdosage	Acute overdosage may increase the toxic effects of mucositis, leukopenia and thrombocytopenia. Treatment includes hospitalisation of the severely myelosuppressed patient, antimicrobials, platelet transfusions and symptomatic treatment of mucositis. Use of haemopoietic growth factor (G-CSF, GM-CSF) may be considered. Cumulative dosage increases risk of cardiomyopathy and resultant congestive heart failure which may be managed with digitalis preparations, diuretics, and after load reducers such as ACE inhibitors.
Contraindications	Cardiac disease, neonates, pregnancy and lactation, prior irradiation to mediastinum. IM/SC admin. Severe myelosuppression due to previous treatment with antitumour agents or radiotherapy.
Special Precautions	Elderly, children, hepatic impairment. Monitor blood counts and ECG.
Adverse Drug Reactions	Leucopenia, thrombocytopenia, nausea, vomiting, diarrhoea. Rarely facial flushing, rash, alopecia. Blurred vision,

	Leucopenia, thrombocytopenia, nausea, vomiting, diarrhoea. Rarely facial flushing, rash, alopecia. Blurred vision, headache, seizures, paraesthesia, confusion, malaise, lethargy, skin pigmentation. Potentially Fatal: Bone marrow suppression, cardiotoxicity.
Drug Interactions	Doxorubicin interacts with a number of other drugs e.g. antibiotics (aminoglycosides), steroids, aminophylline and propranolol. Potentially Fatal: Cholestasis induced by mercaptopurine may be potentiated by concurrent administration of the drug. Toxicity may be increased if streptozocin is given concurrently.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Powder for inj: Store at 15-30°C. Solution for inj & liposomal formulations: Refrigerate at 2-8°C. Do not freeze. Irrigation: Powder for inj: Store at 15-30°C. Solution for inj & liposomal formulations: Refrigerate at 2-8°C. Do not freeze.
Mechanism of Action	Doxorubicin is a cytotoxic anthracycline antibiotic. The cytotoxic action results from its binding to DNA and inhibition of nucleic acid synthesis. Doxorubicin has been shown to produce regression in a variety of disseminated malignancies. Absorption: Rapidly cleared from the blood after IV admin. Distribution: Distributed into tissues including lungs, liver, heart, spleen and kidneys (IV); crosses the placenta; enters breast milk.

	Distribution: Distributed into tissues including lungs, liver, heart, spleen and kidneys (IV); crosses the placenta; enters breast milk. Metabolism: Hepatic; rapidly converted to doxorubicinol. Excretion: Bile (as unchanged drug); 12 min, 3.3 hr, 30 hr (mean elimination half-lives).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01DB01 - doxorubicin; Belongs to the class of cytotoxic antibiotics, anthracyclines and related substances. Used in the treatment of cancer.

doxycycline

CIMS Class : (Tetracyclines) , (Acne Treatment Preparations)
doxycycline

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related doxycycline information

Indication & Dosage

Oral

Susceptible infections

Adult: 200 mg on day 1 followed by 100 mg once daily.

Maintain initial dose in severe infections.

Child: >8 yr and <45 kg: Initially, 4 mg/kg in 2 divided doses followed by 2 mg/kg daily.

Oral

Uncomplicated gonorrhoea

Adult: 100 mg bid for 7 days or a single dose of 300 mg followed by another dose repeated 1 hr later.

Oral

Syphilis

Adult: 200 or 400 mg daily in divided doses for 10-15 days.

Oral

Relapsing fever and louse-borne typhus

Adult: 100 or 200 mg as a single dose.

Oral

	Relapsing fever and louse-borne typhus Adult: 100 or 200 mg as a single dose. <i>Oral</i> Prophylaxis of scrub typhus Adult: 200 mg as a single dose. <i>Oral</i> Acne Adult: 50 mg daily for 6-12 wk. <i>Intravenous</i> Susceptible infections Adult: As hyclate: Initially, 200 mg on day 1 followed by 100 mg daily in a 0.1-1 mg/mL solution infused over 1-4 hr.
Administration	Should be taken with food. (Take w/ a full glass of water & remain upright for at least ½ hr. Avoid taking w/ dairy products.)
Overdosage	Symptomatic and supportive measures should be used. Dialysis may be of little value.
Contraindications	Children <8 yr; pregnancy, lactation; porphyria; hypersensitivity to tetracyclines; severe hepatic dysfunction; prolonged exposure to sunlight or tanning equipment.
Special Precautions	Impaired hepatic function; history or predisposition to oral candidiasis. Should be taken with at least a glass of water in an upright position to reduce the risk of oesophageal injury.
Adverse Drug Reactions	Permanent staining of teeth; rash, superinfection; nausea, GI upsets, glossitis; dysphagia; photosensitivity, hypersensitivity; haemolytic anaemia, thrombocytopenia, neutropenia and eosinophilia. Potentially Fatal: Anaphylaxis.
Drug Interactions	Reduction in absorption and bioavailability when used with antacids, calcium, magnesium and iron. Chronic ethanol ingestion reduces serum concentrations. Metabolism

	Reduction in absorption and bioavailability when used with antacids, calcium, magnesium and iron. Chronic ethanol ingestion reduces serum concentrations. Metabolism increased by hepatic enzyme inducers such as rifampicin, phenytoin and carbamazepine. May reduce the efficacy of oral contraceptives. Potentially Fatal: Increases digoxin toxicity and effects of oral anticoagulants.
Food Interaction	Serum levels may be slightly decreased if taken with food, milk, iron or calcium. Decreases absorption of calcium, magnesium, iron, zinc and amino acids.
Lab Interference	False elevations of urine catecholamine levels; false-negative urine-glucose test results.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 15-30°C. Oral: Store at 15-30°C.
Mechanism of Action	Doxycycline binds to 30S and 50S ribosomal subunits thus causing alterations on the cytoplasmic membrane of susceptible organisms. Absorption: Readily and almost completely absorbed from the GI tract (oral); peak plasma concentrations after 2 hr. Absorption not significantly affected by food. Distribution: Lipid-soluble; into body tissues and fluids. Protein-binding: 80-95%. Metabolism: Inactivated in the liver. Excretion: Via urine (40%, may be increased if urine is alkaline); 12-24 hr (elimination half-life).
CIMS Class	Tetracyclines / Acne Treatment Preparations
ATC Classification	A01AB22 - doxycycline; Belongs to the class of local

ATC Classification

A01AB22 - doxycycline; Belongs to the class of local antiinfective and antiseptic preparations. Used in the treatment of diseases of the mouth.

J01AA02 - doxycycline; Belongs to the class of tetracyclines. Used in the treatment of systemic infections.

doxylamine + pyridoxine

CIMS Class : (Antiemetics)
doxylamine + pyridoxine

L - Caution when used during lactation

related doxylamine + pyridoxine information

Indication & Dosage	<i>Oral</i> Pregnancy-associated nausea and vomiting Adult: Each tab contains doxylamine 10 mg and pyridoxine 10 mg: 2 tab at bedtime. In severe cases or in cases with nausea/vomiting during the day: increase dosage by 1 tab in morning and/or afternoon.
Contraindications	Severe liver disease; avoid alcohol; premature infants or full-term neonates.
Special Precautions	May impair ability to drive and operate machinery. Angle-closure glaucoma, urinary retention, prostatic hypertrophy or pyloroduodenal obstruction; epilepsy; hepatic impairment, elderly. Lactation.
Adverse Drug Reactions	Acute dystonic reactions and long-lasting impaired consciousness in child. CNS depression including slight drowsiness to deep sleep, lassitude, dizziness, incoordination. Headache, psychomotor impairment and antimuscarinic effects. Rarely rashes and hypersensitivity reactions, blood disorders, convulsions, sweating, myalgia, extrapyramidal effects, tremor, confusion, tinnitus,

	antimuscarinic effects. Rarely rashes and hypersensitivity reactions, blood disorders, convulsions, sweating, myalgia, extrapyramidal effects, tremor, confusion, tinnitus, hypotension, hair loss. Severe peripheral neuropathies with long-term admin of large doses of pyridoxine.
Drug Interactions	Doxylamine enhances effects of CNS depressants eg alcohol, barbiturates, hypnotics, opioid analgesics, anxiolytic sedatives and antipsychotics. Atropine, tricyclic antidepressants (TCAs), MAOIs. It can mask signs of ototoxicity caused by aminoglycosides. INH, penicillamine and OC require greater pyridoxine dose. Pyridoxine reduces the effects of levodopa, phenobarb and phenytoin.
Mechanism of Action	Doxylamine is an antihistamine derived from monoethanolamine possessing antimuscarinic and pronounced sedative effects. Pyridoxine is a precursor of pyridoxal, which functions in the metabolism of carbohydrates, proteins and fats. It is essential in Hb formation and GABA synthesis within the CNS. It also aids in the release of glycogen stored in the liver and muscles.
CIMS Class	Antiemetics
ATC Classification	R06AA09 - doxylamine; Belongs to the class of aminoalkyl ethers used as systemic antihistamines.

droperidol

CIMS Class : (Antipsychotics)
droperidol

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related droperidol information

Indication & Dosage

Parenteral

Postoperative nausea and vomiting

Adult: Max initial dose: 2.5 mg, may be given via IM/IV admin. Additional doses of 1.25 mg may be given if necessary.

Child: 2-12 yr: Max initial dose of 100 mcg/kg, may be given via IV/IM admin.

Elderly: Dose reduction may be necessary.

Overdosage

Symptoms may include QT prolongation and serious arrhythmias. In the presence of hypoventilation or apnea, oxygen may be used and respiration should be assisted or controlled as needed. Maintain a patent airway. The patient should be under careful observation for 24 hr; ensure adequate body warmth and fluid intake. Hypotension may occur as a result of hypovolemia, may be managed with appropriate parenteral fluid therapy.

Contraindications

Coma; CNS depression; pheochromocytoma; bone marrow

	Coma; CNS depression; phaeochromocytoma; bone marrow suppression. Patients at risk of arrhythmias, CV disorders, electrolyte imbalance, preexisting QT prolongation.
Special Precautions	Hepatic or renal impairment; history of jaundice; CV disease; DM; hyperthyroidism; Parkinson's disease; epilepsy, depression, myasthenia gravis; prostatic hypertrophy; severe respiratory disease; blood dyscrasias. May precipitate coma, affect driving. Pregnancy; lactation; elderly.
Adverse Drug Reactions	Dry mouth, constipation, micturition difficulty, blurred vision, mydriasis, delirium, agitation, catatonic-like states, insomnia, nightmares, depression, miosis, convulsions, nasal congestion. CV effects; hypersensitivity reactions, haematological disorders, extrapyramidal dysfunction. Amenorrhoea, galactorrhoea, gynaecomastia, weight gain and hyperglycaemia, and altered glucose tolerance. Pain and irritation at the Inj site. Post-op drowsiness.
Drug Interactions	Avoid concurrent use with drugs that may prolong QT interval e.g. certain antihistamines, antimalarials, calcium-channel blockers and antidepressants. May potentiate the action of other CNS depressants e.g. barbiturates, alcohol. Caution when using with drugs that may induce hypokalaemia or hypomagnesaemia.
Lab Interference	Minor abnormalities in liver function tests.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
	Parenteral: Store at 15-25°C.

Storage	Parenteral: Store at 15-25°C.
Mechanism of Action	Droperidol acts mainly at the subcortical levels and exhibits strong sedative effects. It inhibits sympathetic postganglionic α-adrenergic receptor binding sites. It also exhibits antiemetic but has no analgesic effects. Onset: 3-10 min. Duration: 2-4 hr.
CIMS Class	Antipsychotics
ATC Classification	N01AX01 - droperidol; Belongs to the class of other agents used as general anesthetics. N05AD08 - droperidol; Belongs to the class of butyrophenone derivatives antipsychotics. Used in the management of psychosis.

drotaverine

CIMS Class : (Antispasmodics)
drotaverine

P - Caution when used during pregnancy

L - Caution when used during lactation

related drotaverine information

Indication & Dosage	<i>Oral</i> Antispasmodic Adult: 40-80 mg tid. Child: 1-6 yr: 20 mg 3-4 times daily; >6 yr: 40 mg tid.
Administration	May be taken with or without food.
Contraindications	Severe renal/hepatic/cardiac dysfunction. Porphyria.
Special Precautions	Exercise caution in patients with renal/hepatic/cardiac dysfunction. Pregnancy, lactation.
Adverse Drug Reactions	Vertigo, nausea, vomiting, dry mouth.
Drug Interactions	May attenuate the action of levodopa. Concurrent use of analgesics, antimuscarinics or benzodiazepines. Additive beneficial effect with concurrent use of analgesics, antimuscarinics or benzodiazepines.
Mechanism of Action	Drotaverine has antispasmodic effect mediated via inhibition of phosphodiesterase-IV, specific for smooth muscle. It has a rapid and direct action on the smooth muscle. It acts to correct cyclic AMP and Ca imbalance at the spastic site,

	of phosphodiesterase-IV, specific for smooth muscle. It has a rapid and direct action on the smooth muscle. It acts to correct cyclic AMP and Ca imbalance at the spastic site, thereby relieving smooth muscle spasm and pain.
CIMS Class	Antispasmodics
ATC Classification	A03AD02 - drotaverine; Belongs to the class of papaverine and derivatives. Used in the treatment of functional bowel disorders.

duloxetine

CIMS Class : (Antidepressants)
duloxetine

P - Caution when used during pregnancy

L - Caution when used during lactation

related duloxetine information

Indication & Dosage

Oral

Depression

Adult: 20-30 mg bid or 60 mg once daily. Max: 60 mg daily.

Renal impairment: CrCl =30 ml/min: No adjustment needed. Avoid use in severe impairment.

Oral

Diabetic neuropathy

Adult: 60 mg once daily. Max: 120 mg daily.

Renal impairment: CrCl =30 ml/min: No adjustment needed. Avoid use in severe impairment.

Oral

Moderate to severe stress urinary incontinence in women

Adult: 40 mg bid.

Renal impairment: CrCl =30 ml/min: No adjustment needed. Avoid use in severe impairment.

Administration

May be taken with or without food. (Swallow whole, do not chew/crush.)

	May be taken with or without food. (Swallow whole, do not chew/crush.)
Overdosage	Signs and symptoms include serotonin syndrome, somnolence, vomiting and seizures. Treatment consists of general measures such as maintaining an adequate airway, oxygenation and ventilation. Monitor cardiac rhythm and vital signs. Induction of emesis is not recommended. Gastric lavage with appropriate airway protection, if needed, may be used if performed soon after ingestion or in symptomatic patients.
Contraindications	Uncontrolled narrow-angle glaucoma. Concomitant use or within 2 wk of MAOIs. Renal and hepatic impairment.
Special Precautions	Avoid alcohol and abrupt cessation. May impair ability to drive or engage in task requiring alertness. Increased risk of suicidal thinking and behaviour when used in children and adolescents. Pregnancy, lactation.
Adverse Drug Reactions	Nausea, dry mouth, constipation, decreased appetite, somnolence, fatigue, increased sweating.
Drug Interactions	Increased risk of hepatic toxicity in patients with substantial alcohol use. Increased risk of serotonin syndrome when used with 5HT₁ receptor agonists, MAOIs, lithium, tramadol or St John's wort. Avoid concurrent use with drugs that inhibit hepatic enzymes CYP1A2 and CYP2D6. Potentially Fatal: Avoid use with antiarrhythmics (amiodarone, quinidine), antipsychotics (chlorpromazine), TCAs (fluoxetine, fluvoxamine), azole antifungals, quinolones (ciprofloxacin), ciclosporin.
Mechanism of Action	It is a potent inhibitor of neuronal uptake of serotonin and norepinephrine and also a weak inhibitor of dopamine reuptake. Absorption: Well absorbed from the GI tract after oral

	It is a potent inhibitor of neuronal uptake of serotonin and norepinephrine and also a weak inhibitor of dopamine reuptake. Absorption: Well absorbed from the GI tract after oral admin. Distribution: About 96% bound to plasma proteins, mainly albumin and α_1-acid glycoprotein. Metabolism: Extensively metabolised by CYP1A2 and CYP2D6. Excretion: Mainly excreted in the urine; about 20% is excreted in the faeces. Elimination half-life: 8-17 hr.
CIMS Class	Antidepressants
ATC Classification	N06AX21 - duloxetine;

dutasteride

CIMS Class : (Drugs for Bladder & Prostate Disorders)
dutasteride

P - Contraindicated in pregnancy
Lab α - Lab interference

related dutasteride information

Indication & Dosage	<i>Oral</i> Benign prostatic hyperplasia Adult: 500 mcg daily (treatment for 6 mth may be required before benefit is obtained).
Administration	May be taken with or without food.
Overdosage	Treatment is symptomatic and supportive.
Contraindications	Severe liver impairment; pregnant women, children, adolescent.
Special Precautions	Excreted in semen therefore use of condom is recommended. Women of childbearing potential should avoid handling dutasteride capsules. Advisable to exclude other causes of benign prostatic hypertrophy (e.g. prostate cancer, infection) before initiating therapy.
Adverse Drug Reactions	Impotence; decreased libido; ejaculation disorders; breast tenderness and enlargement.
Drug Interactions	Concurrent use with CYP3A4 inhibitors such as diltiazem and verapamil may increase serum levels of dutasteride.

	Concurrent use with CYP3A4 inhibitors such as diltiazem and verapamil may increase serum levels of dutasteride.
Lab Interference	May interfere with interpretation of prostate-specific antigen test results.
Storage	Oral: Store at 25°C.
Mechanism of Action	Dutasteride has antiandrogenic properties. It inhibits 5α-reductase, thus preventing the conversion of testosterone to 5α-dihydrotestosterone which is the main androgen involved in causing prostate enlargement. Absorption: Absorbed from the GI tract, reaching peak serum concentration in 1-3 hr. Bioavailability: About 60%. Distribution: Highly bound to plasma proteins. Metabolism: Metabolised by CYP3A4 and CYP3A5. Excretion: Mainly excreted as metabolites in faeces. Elimination half-life: About 3-5 wk.
CIMS Class	Note that there are some more drugs for Bladder & Prostate Disorders
ATC Classification	G04CB02 - dutasteride; Belongs to the class of testosterone-5-alpha reductase inhibitors. Used in the treatment of benign prostatic hypertrophy.

dydrogesterone

CIMS Class : (Oestrogens & Progesterones & Related Synthetic Drugs)
dydrogesterone

P - Contraindicated in pregnancy
L - Caution when used during lactation
Lab α - Lab interference

related dydrogesterone information

Indication &
Dosage

Oral

Endometriosis

Adult: 10 mg bid-tid cyclically or continuously.

Oral

Recurrent miscarriage

Adult: 10 mg bid given cyclically until conception, then continuously until wk 20 of pregnancy, after which dose may be gradually reduced.

Oral

Menstrual disorders

Adult: 10 mg bid in a cyclical regimen.

Oral

Threatened miscarriage

Adult: Initially, 40 mg followed by 10 mg or more every 8 hr, continued for a wk after symptoms are relieved. Reduce dose gradually after that unless symptoms return.

Oral

Infertility

	gradually after that unless symptoms return. <i>Oral</i> Infertility Adult: 10 mg bid. <i>Oral</i> Endometrial protection during menopausal hormonal replacement therapy Adult: 10 mg 1-2 times daily in a cyclical regimen or 5 mg daily.
Administration	May be taken with or without food.
Contraindications	Hypersensitivity; pregnancy. Undiagnosed abnormal vag bleeding, thromboembolic disorders, history or existing cerebrovascular or coronary artery disease, missed or incomplete abortion, known or suspected carcinoma of the breast or genital organs, severe hepatic dysfunction, as a diagnostic test for pregnancy.
Special Precautions	Monitor closely for loss of vision, proptosis, diplopia, migraine, signs and symptoms of embolic disorders. CVD or renal impairment, epilepsy, asthma, other conditions which may be aggravated by fluid retention. Lactation.
Adverse Drug Reactions	Dizziness, nausea, headache, fatigue, emotional lability, irritability; abdominal pain and distention; musculoskeletal pain.
Drug Interactions	Carbamazepine, griseofulvin, phenobarbital, rifampicin enhances the clearance of progestogens.
Lab Interference	Altered serum-lipid profile and liver function tests.
Mechanism of Action	Dydrogesterone is a progestogen structurally related to progesterone. However, unlike progesterone, it does not induce an increase in temp nor inhibit ovulation and may be preferred over other progestational agents when contraceptive effect is not required. It does not have oestrogenic or androgenic properties. Absorption: Absorbed following buccal, rectal, and vag administration; rapidly absorbed following (IM).

	over other progestational agents when contraceptive effect is not required. It does not have oestrogenic or androgenic properties. Absorption: Absorbed following buccal, rectal, and vag administration; rapidly absorbed following (IM). Metabolism: Hepatic: Extensive first-pass effect. Excretion: Via urine (as sulfate and glucuronide conjugates).
CIMS Class	Oestrogens & Progesterones & Related Synthetic Drugs
ATC Classification	G03DB01 - dydrogesterone; Belongs to the class of pregnadien derivative progestogens used in progestogenic hormone preparations.

ebastine

CIMS Class : (Antihistamines & Antiallergics)
ebastine

P - Caution when used during pregnancy

L - Caution when used during lactation

related ebastine information

Indication & Dosage	<i>Oral</i> Allergic conditions Adult: 10-20 mg once daily. Child: >6 yr: 5 mg once daily.
Administration	May be taken with or without food.
Contraindications	Hypersensitivity, cardiac arrhythmias.
Special Precautions	Caution is advised when used in hepatic impairment, renal insufficiency, QTc interval prolongation. Pregnancy, lactation.
Adverse Drug Reactions	Headache, dry mouth, drowsiness, pharyngitis, abdominal pain, dyspepsia, asthenia, epistaxis, rhinitis, sinusitis, nausea, insomnia.
Drug Interactions	Concomitant use of ketoconazole, itraconazole, clarithromycin or erythromycin may increase plasma levels of ebastine and cause QTc interval prolongation.
Storage	Oral: Store below 25°C.
Mechanism of Action	Ebastine, a piperidine derivative, is a long-acting, nonsedating, second-generation histamine receptor

	Ebastine, a piperidine derivative, is a long-acting, nonsedating, second-generation histamine receptor antagonist that binds preferentially to peripheral H ₁ receptors. It is metabolised to active metabolite, carebastine. It has antihistaminic, antiallergic activity and prevents histamine-induced bronchoconstriction. It does not have significant sedative or antimuscarinic actions.
CIMS Class	Antihistamines & Antiallergics
ATC Classification	R06AX22 - ebastine; Belongs to the class of other agents used as systemic antihistamines.

efavirenz

P - Caution when used during pregnancy

L - Contraindicated in lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related efavirenz information

Indication & Dosage	<i>Oral</i> HIV infection Adult: Combined with other antiretrovirals: 600 mg once daily. Dosing at bedtime recommended during 1st 2-4 wk of therapy to improve tolerability. Child: Combined with other antiretrovirals: >3 yr, 10-14 kg: 200 mg; 15-19 kg: 250 mg; 20-24 kg: 300 mg; 25-32.4 kg: 350 mg; 32.5-39 kg: 400 mg; ≥40 kg: 600 mg. To be taken once daily.
Administration	Stocrin®: May be taken with or without food. Sustiva®: Should be taken on an empty stomach. (Take on an empty stomach, preferably at bedtime.)
Overdosage	Treatment is supportive. Activated charcoal may be used to remove unabsorbed drug. Dialysis may not be useful as drug is highly protein-bound.
Contraindications	Severe hepatic impairment; hypersensitivity; lactation.

	Severe hepatic impairment; hypersensitivity; lactation.
Special Precautions	Mild to moderate liver disease; renal impairment. Monitor liver enzymes and cholesterol. Discontinue if severe skin rash or fever develops; known or suspected hepatitis B or infection. History of mental illness or seizures; elderly. Pregnancy. Children.
Adverse Drug Reactions	Rash including Stevens-Johnson syndrome and erythema multiforme; CNS effects e.g. dizziness, headache, insomnia, somnolence, abnormal dreams, fatigue, impaired concentration. Nausea, less frequently, vomiting, diarrhoea, hepatitis, depression, anxiety, psychosis, amnesia and ataxia, stupor, vertigo, abdominal pain, hepatic failure, pancreatitis, convulsions, gynaecomastia, pruritus, blurred vision.
Drug Interactions	Hormonal contraceptives; antibacterial e.g. rifampicin, rifabutin, clarithromycin; enzyme inducers. St. John's wort may decrease serum level. Ethanol (hepatic and CNS adverse effects). Potentially Fatal: Life-threatening adverse effects when used with terfenadine, astemizole, cisapride, midazolam, triazolam and ergot alkaloids.
Food Interaction	High-fat meals increase absorption of efavirenz. Grapefruit juice inhibits its metabolism.
Lab Interference	False-positive results in some urinary cannabinoid tests. Raised liver enzymes and serum cholesterol values.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the

	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Efavirenz, a non-nucleoside reverse transcriptase inhibitor with activity against HIV, blocks the RNA-dependent and DNA-dependent polymerase activities including HIV replication. Absorption: Absorbed after oral doses; plasma concentrations peak after about 5 hr. Distribution: >99% bound to plasma proteins. Metabolism: Metabolised mainly by CYP3A4 and CYP2B6. Excretion: About 14-34% of a dose is excreted in the urine as metabolites, and 16-61% in the faeces.
CIMS Class	Antivirals
ATC Classification	J05AG03 - efavirenz; Belongs to the class of non-nucleoside reverse transcriptase inhibitors. Used in the systemic treatment of viral infections.

related enalapril information

Indication & Dosage

Oral

Hypertension

Adult: Initially, 5 mg at bedtime. Maintenance: 10-20 mg once daily increased up to 40 mg in divided doses in severe hypertension. Max: 40 mg/day.

Child: 80 mcg/kg once daily. Max: 5 mg/day.

Elderly: May initiate at lower doses at 2.5 mg daily.

Renal impairment: Initial dose should be halved.

Oral

Heart failure

Adult: Initially, 2.5 mg daily. Maintenance: 20 mg once daily as a single or in 2 divided doses, up to 40 mg daily in 2 divided doses.

Renal impairment: Initial dose should be halved.

Intravenous

Hypertension

Adult: 1.25 mg by slow inj over 5 minutes repeated every 6 hr if needed.

	Hypertension Adult: 1.25 mg by slow inj over 5 minutes repeated every 6 hr if needed. Renal impairment: Initial dose should be halved. Special Populations: Patients on diuretics: Initial dose should be halved.
Administration	May be taken with or without food.
Contraindications	Hypersensitivity. History of angioedema due to previous treatment with ACE inhibitors; bilateral renal artery stenosis. Pregnancy.
Special Precautions	Impaired renal function. Hyperkalaemia, hypovolaemia, collagen vascular disease, valvular stenosis, during or immediately before or after anaesthesia, unilateral renal artery stenosis. Hypotension due to volume depletion, diuretic therapy. Monitor WBC count. Lactation, children.
Adverse Drug Reactions	Initial hypotension may be severe and prolonged. Dizziness, headache, fatigue, persistent dry cough, abnormal taste, lassitude, rash, neutropenia, renal impairment or failure. Potentially Fatal: Angioedema.
Drug Interactions	Diuretics potentiate hypotensive action. May increase lithium levels. Other antihypertensives potentiate enalapril action. Potentially Fatal: Increased risk of bone marrow suppression when used with immunosuppressive drugs. Hyperkalaemia with potassium-sparing diuretics or potassium supplements especially in the presence of renal failure. Probenecid delays excretion. Potentiates analgesia and respiratory depression produced by morphine. NSAIDs may result in further deterioration of renal function.
Lab Interference	False-positive Coombs' test.

Lab Interference	False-positive Coombs' test.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store below 30°C. Oral: Store below 30°C.
Mechanism of Action	Enalapril is de-esterified into the active enalaprilat resulting in potent inhibition of ACE thus leading to reduced levels of angiotensin II and aldosterone. Clinically, BP is reduced, salt and water retention is corrected. Ventricular hypertrophy is reversed. Renal blood flow is increased but in patients with renal impairment there may be oliguria or acute renal failure. Absorption: 60% of dose is absorbed from the GI tract (oral); peak plasma concentrations after 1 hr (enalapril), 3-4 hr (enalaprilat). Distribution: Protein-binding: 50-60% (enalaprilat). Metabolism: Hepatic: Hydrolysed to enalaprilat. Excretion: Via urine (60% as enalaprilat and unchanged drug); via faeces (remaining dose); 11 hr (elimination half-life). Removed by haemodialysis and peritoneal dialysis.
CIMS Class	ACE Inhibitors

CIMS Class	ACE Inhibitors
ATC Classification	C09AA02 - enalapril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

enalapril + hydrochlorothiazide

CIMS Class : (Diuretics) , (ACE Inhibitors)
enalapril + hydrochlorothiazide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related enalapril + hydrochlorothiazide information

Indication & Dosage	<i>Oral</i> Hypertension Adult: Enalapril maleate-10mg+ Hydrochlorothiazide-25mg (tablets) 1/2-1 tab daily. Elderly: Cautious use <i>Oral</i> Chronic heart failure Adult: Enalapril maleate-10mg+ Hydrochlorothiazide-25mg (tablets) 1/2-1 tab daily. Elderly: Cautious use Special Populations: Cautious use with renal impairment.
Administration	May be taken with or without food.
Contraindications	Hypersensitivity, anuria, aortic stenosis, outflow obstruction, hepatic cirrhosis.
Special Precautions	Renal impairment, anaesthesia, concomitant K supplements and K - sparing diuretics, hypovolemic patients pregnancy,

	Renal impairment, anaesthesia, concomitant K supplements and K - sparing diuretics, hypovolemic patients pregnancy, lactation.
Adverse Drug Reactions	Syncope, chest pain, abdominal pain, orthostatic hypotension, palpitation, tachycardia, GI symptoms, insomnia, nervousness, paresthesia, vertigo, skin rash, dyspnoea, gout, arthralgia, tinnitus, decreased libido, cough. Potentially Fatal: NA.
Drug Interactions	Significant increase in serum K levels with K supplements and K sparing diuretics. Lithium toxicity in patients receiving lithium concomitantly. Alcohol, barbiturates, narcotics potentiate orthostatic hypotension. Dosage adjustment of antidiabetic drugs needed. Potentiation of action of other antihypertensives, corticosteroids, ACTH. Potentially Fatal: NA.
Food Interaction	Absorption and bioavailability of hydrochlorthiazide may be increased.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of	Enalapril is an ACE inhibitor, which reduces the levels of AT

Mechanism of Action	Enalapril is an ACE inhibitor, which reduces the levels of AT II and aldosterone. This action is potentiated by Na depletion which activates the renin-angiotensin-aldosterone system. Hydrochlorothiazide also eliminates the vol factor commonly occurring with long term use of vasodilators.
CIMS Class	Diuretics / ACE Inhibitors
ATC Classification	C03AA03 - hydrochlorothiazide; Belongs to the class of low-ceiling thiazide diuretics. Used to promote excretion of urine. C09AA02 - enalapril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

enoxaparin

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab - Lab interference

related enoxaparin information

Indication & Dosage

Subcutaneous

Prophylaxis of venous thromboembolism during surgical procedures

Adult: Low to moderate risk: 20 mg (2000 units) once daily with the 1st dose 2 hr pre-operatively. High risk: 40 mg (4000 units) once daily with the 1st dose 12 hr pre-operatively. Alternatively, 30 mg (3000 units) bid starting within 12-24 hr after the operation. After hip replacement surgery, continue treatment at 40 mg once daily for a further 3 wk. For immobilised patients, treatment should continue at 40 mg daily for at least 6 days or until patient becomes fully ambulant, up to a max of 14 days.

CrCl (ml/min)	Dosage Recommendation
<30	Reduce dose. Max: 1 mg/kg/day.

Subcutaneous

Deep vein thrombosis

Adult: 1 mg (100 units)/kg every 12 hr for 5 days and until

	<i>Subcutaneous</i>	
	Deep vein thrombosis	
	Adult: 1 mg (100 units)/kg every 12 hr for 5 days and until oral anticoagulation is established.	
	CrCl (ml/min)	Dosage Recommendation
	<30	Reduce dose. Max: 1 mg/kg/day.
	<i>Subcutaneous</i>	
	Prophylaxis of clotting in the extracorporeal circulation during haemodialysis	
	Adult: 1 mg/kg (100 units/kg) into the arterial line of the circuit at the beginning of the dialysis session. Give a further dose of 0.5-1 mg/kg (50-100 units/kg) if required. Reduce dose in patients at high risk of haemorrhage.	
	CrCl (ml/min)	Dosage Recommendation
	<30	Reduce dose. Max: 1 mg/kg/day.
	<i>Subcutaneous</i>	
	Unstable angina	
	Adult: 1 mg/kg (100 units/kg) every 12 hr for 2-8 days with low-dose aspirin.	
	CrCl (ml/min)	Dosage Recommendation
	<30	Reduce dose. Max: 1 mg/kg/day.
Contraindications	Hypersensitivity, acute bacterial endocarditis; major bleeding disorder, haemorrhagic stroke, drug-induced thrombocytopenia.	
Special Precautions	Renal or hepatic impairment, history of GI ulceration, uncontrolled hypertension, spinal or epidural anaesthesia; lactation and pregnancy; elderly. Periodic blood counts, platelet count and stool occult blood test recommended.	
Adverse Drug Reactions	Thrombocytopenia, mild bleeding, inj site irritation, pain and ecchymoses, hypersensitivity and erythema. Potentially Fatal: Haemorrhagic complications.	

	Thrombocytopenia, mild bleeding, inj site irritation, pain and ecchymoses, hypersensitivity and erythema. Potentially Fatal: Haemorrhagic complications.
Lab Interference	Elevation of transaminases may interfere with interpretation of LFT results and diagnosis of MI, liver disease and pulmonary emboli.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Subcutaneous: Store at 25°C.
Mechanism of Action	Enoxaparin is a low molecular weight heparin with anticoagulant properties. It acts by enhancing the inhibition rate of activated clotting factors including thrombin and factor Xa through its action on antithrombin III. Absorption: Rapidly and almost completely absorbed after SC inj with a bioavailability of about 100%. Metabolism: Metabolised hepatically. Excretion: Elimination half-life: 4-5 hr. Excreted in urine as unchanged drug and metabolites.
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC Classification	B01AB05 - enoxaparin; Belongs to the class of heparin group. Used in the treatment of thrombosis.

ephedrine

CIMS Class : (Vasoconstrictors)
ephedrine

P - Caution when used during pregnancy

L< - Contraindicated in lactation

related ephedrine information

Indication & Dosage	<i>Oral</i> Diabetic neuropathic oedema Adult: 30-60 mg tid. Child: <i>Intravenous</i> Reversal of spinal or epidural anaesthesia-induced hypotension Adult: 3-6 mg or up to 9 mg in a 3 mg/mL soln given as slow Inj repeated every 3-4 min, as needed. Max Dosage: 30 mg.
Administration	May be taken with or without food.
Contraindications	Hypersensitivity. Hypertension, thyrotoxicosis, BPH. Lactation.
Special Precautions	Ischaemic heart disease, hyperthyroidism, diabetes mellitus, hypertension, angle-closure glaucoma, renal impairment; prostatic enlargement; pregnancy, elderly.
Adverse Drug Reactions	Anxiety, tachycardia, tremor, dry mouth, hypertension, cardiac arrhythmias, impaired circulation to the extremities, nervousness, insomnia, palpitations. Difficulty in micturition in

	Anxiety, tachycardia, tremor, dry mouth, hypertension, cardiac arrhythmias, impaired circulation to the extremities, nervousness, insomnia, palpitations. Difficulty in micturition in patients with prostatic enlargement. Nasal drops: Local irritation, rebound nasal congestion and drug-induced rhinitis on prolonged use. Potentially Fatal: Delusions, hallucinations. Seen with hypersensitivity and overdose. Acute CNS and CVS stimulation presenting as vomiting, fever, hypertension, psychosis. Cardiac arrhythmias.
Drug Interactions	Reduces antihypertensive effect of bethanidine and guanethidine. May increase clearance of dexamethasone. Increased incidence of adverse effects when used with theophylline. Potentially Fatal: Severe HTN when combined with MAOIs or with 2 wk of discontinuance of MAOI treatment. Increased risk of arrhythmias with cardiac glycosides, quinidine or tricyclic antidepressants. Increased vasoconstriction or pressor effects with ergot alkaloids or oxytocin.
Storage	Intravenous: Store at 15-25°C. Oral: Store at 15-25°C.
Mechanism of Action	Ephedrine has both α- and β-adrenergic activity with pronounced stimulating effects on the CNS. It increases cardiac output, induces peripheral vasoconstriction, bronchodilation, reduces intestinal tone and motility, and relaxes the bladder while contracting the sphincter muscle. It also has stimulant action on the resp center and dilates the pupil without affecting light reflexes. Absorption: Readily and completely absorbed from the GIT (oral). Metabolism: Hepatic. Excretion: Via urine (largely as unchanged, small amounts

	(oral). Metabolism: Hepatic. Excretion: Via urine (largely as unchanged, small amounts of metabolites); 3-6 hrs (elimination half-life).
CIMS Class	Vasoconstrictors
ATC Classification	R01AA03 - ephedrine; Belongs to the class of topical sympathomimetic agents used as nasal decongestants. R01AB05 - ephedrine; Belongs to the class of topical sympathomimetic combination preparations, excluding corticosteroids. Used as nasal decongestants. R03CA02 - ephedrine; Belongs to the class of adrenergics for systemic use, alpha- and beta-adrenoreceptor agonists. Used in the treatment of obstructive airway diseases. S01FB02 - ephedrine; Belongs to the class of sympathomimetics used in the treatment of mydriasis and cyclopegia.

epinephrine

CIMS Class : (Cardiac Drugs) , (Antiglaucoma Preparations) , (Antiasthmatic & COPD Preparations)
epinephrine

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related epinephrine information

Indication & Dosage

Inhalation

Acute asthma

Adult: Spray: Aqueous solution with an adrenaline content equivalent to 1:100. Pressurised aerosols delivering metered doses equivalent to approximately 160-275 mcg: 1-2 inhalations, may repeat after 3 hr if necessary.

Parenteral

Acute asthma

Adult: As 1:1,000 aqueous solution: 0.3-0.5 ml (300-500 mcg). Dose may be given via IM or SC inj.

Child: As 1:1,000 aqueous solution: 0.01 ml/kg (10 mcg/kg). Max: 0.5 ml (500 mcg). Dose may be given via IM or SC inj.

Intravenous

Advanced cardiac life support

Adult: Initially, 1 mg (10 mL of a 1:10,000 solution), may repeat as often as every 2-3 minutes throughout the resuscitation process. May also be given via intraosseous

Adult: Initially, 1 mg (10 mL of a 1:10,000 solution), may repeat as often as every 2-3 minutes throughout the resuscitation process. May also be given via intraosseous route at the same dosage. For endotracheal doses: 2-3 times of the IV dose.

Child: Initially, 10 mcg/kg, may repeat as often as every 2-3 minutes throughout the resuscitation process. Endotracheal doses: 100 mcg/kg. Intraosseous doses are the same as IV doses.

Max Dosage: Intraosseous doses for adults and children are the same as IV doses.

Intravenous

Anaphylactic shock

Adult: 0.5 mg (5 mL of a 1:10,000 solution) given at a slow rate of 100 mcg/minute, stopping when a response is achieved.

Child: 10 mcg/kg. If autoinjectors are used, doses are based on body wt: 15-30 kg: 150 mcg and >30 kg: 300 mcg.

Intramuscular

Anaphylactic shock

Adult: As 1:1,000 solution: 500 mcg (0.5 ml), repeat every 5 minutes as needed until improvement occurs. For emergency self-admin (e.g. via autoinjector): A dose of 300 mcg (0.3 ml) may be used.

Child: Dose depends on age and weight. Usual dose: 10 mcg/kg.

Ophthalmic

Open-angle glaucoma

Adult: Instill 0.5%, 1% or 2% eye drops once or twice daily.

Ophthalmic

Ocular hypertension

Adult: Instill 0.5%, 1% or 2% eye drops once or twice daily.

Overdosage

Overdosage intravascular inj of epinephrine may cause

Overdosage	Overdosage intravascular inj of epinephrine may cause cerebral haemorrhage due to a sharp rise in BP. Fatalities may also result from pulmonary oedema because of peripheral vascular constriction together with cardiac stimulation.
Contraindications	Preexisting hypertension; occlusive vascular disease; angle-closure glaucoma (eye drops); hypersensitivity; cardiac arrhythmias or tachycardia. When used in addition to local anaesthetics: Procedures involving digits, ears, nose, penis or scrotum.
Special Precautions	CV diseases; hyperthyroidism; DM; Parkinson's disease; elderly; pregnancy, lactation.
Adverse Drug Reactions	CNS effects; GI disturbances; epigastric pain; CV disorders; difficulty in micturition with urinary retention; dyspnoea; hyperglycaemia; sweating; hypersalivation; weakness, tremors; coldness of extremities; hypokalaemia. Gangrene, tissue necrosis and sloughing (extravasation) when used in addition to local anaesthetics. Eye drops: Severe smarting, blurred vision, photophobia; naso-lachrymal ducts obstruction. Oedema, hyperaemia and inflammation of the eyes with repeated administration.
Drug Interactions	Halogenated inhalation anaesthetics; β - or α -blocking agents; methyldopa, guanethidine; drugs with vasoconstrictor and pressor effects; antihypertensives; adrenergic neuron blockers; potassium-depleting drugs; cardiac glycosides; ephedra, yohimbe. TCAs may induce hypertension and arrhythmia.
Lab Interference	Increase in bilirubin, catecholamines, glucose, uric acid.
Pregnancy	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Inhalation: Store at 25°C. Intramuscular: Store at 25°C. Intravenous: Store at 25°C. Ophthalmic: Store at 25°C. Parenteral: Store at 25°C.
Mechanism of Action	Epinephrine, an active principle of the adrenal medulla, is a direct-acting sympathomimetic. It stimulates α- and β-adrenergic receptors resulting in relaxation of smooth muscle of the bronchial tree, cardiac stimulation and dilation of skeletal muscle vasculature. It is frequently added to local anaesthetics to retard diffusion and limit absorption, to prolong the duration of effect and to lessen the danger of toxicity. Onset: SC: approx 5-10 min; inhalation: approx 1 min; conjunctival instillation: IOP declines approx 1 hr. Duration: Ocular effect: 12-24 hrs.
CIMS Class	Cardiac Drugs / Antiglaucoma Preparations / Antiasthmatic & COPD Preparations
ATC Classification	A01AD01 - epinephrine; Belongs to the class of other local agents. Used in the treatment of diseases of the mouth. B02BC09 - epinephrine; Belongs to the class of local hemostatics. Used in the treatment of hemorrhage. C01CA24 - epinephrine; Belongs to the class of adrenergic and dopaminergic cardiac stimulants excluding glycosides. Used in the treatment of heart failure. R01AA14 - epinephrine; Belongs to the class of topical

and dopaminergic cardiac stimulants excluding glycosides.

Used in the treatment of heart failure.

R01AA14 - epinephrine; Belongs to the class of topical sympathomimetic agents used as nasal decongestants.

R03AA01 - epinephrine; Belongs to the class of adrenergic inhalants, alpha- and beta-adrenoreceptor agonists. Used in the treatment of obstructive airway diseases.

S01EA01 - epinephrine; Belongs to the class of sympathomimetics used in glaucoma therapy.

related epirubicin information

Indication & Dosage

Intravenous

Acute leukaemias

Adult: As a single agent: 60-90 mg/m² every 3-4 wk. May divide dose over 2-3 days if desired. May admin as an inj over 3-5 minutes or as an infusion over up to 30 minutes. Max (total cumulative dose limit): 0.9-1 g/m². For palliative care: 12.5-25 mg/m² once wkly.

Hepatic impairment: Moderate liver dysfunction (serum bilirubin concentrations: 12-30 mcg/mL): Doses should be halved; severe liver impairment (serum bilirubin >30 mcg/mL): A quarter of the usual dose.

Intravenous

Solid tumours

Adult: As a single agent: 60-90 mg/m² every 3-4 wk. May divide dose over 2-3 days if desired. May admin as an inj over 3-5 minutes or as an infusion over up to 30 minutes. Max (total cumulative dose limit): 0.9-1 g/m². For palliative

divide dose over 2-3 days if desired. May admin as an inj over 3-5 minutes or as an infusion over up to 30 minutes. Max (total cumulative dose limit): $0.9-1 \text{ g/m}^2$. For palliative care: $12.5-25 \text{ mg/m}^2$ once wkly.

Hepatic impairment: Moderate liver dysfunction (serum bilirubin concentrations: $12-30 \text{ mcg/mL}$): Doses should be halved; severe liver impairment (serum bilirubin $>30 \text{ mcg/mL}$): A quarter of the usual dose.

Intravenous

Multiple myeloma

Adult: As a single agent: $60-90 \text{ mg/m}^2$ every 3-4 wk. May divide dose over 2-3 days if desired. May admin as an inj over 3-5 minutes or as an infusion over up to 30 minutes. Max (total cumulative dose limit): $0.9-1 \text{ g/m}^2$. For palliative care: $12.5-25 \text{ mg/m}^2$ once wkly.

Hepatic impairment: Moderate liver dysfunction (serum bilirubin concentrations: $12-30 \text{ mcg/mL}$): Doses should be halved; severe liver impairment (serum bilirubin $>30 \text{ mcg/mL}$): A quarter of the usual dose.

Intravenous

Lymphoma

Adult: As a single agent: $60-90 \text{ mg/m}^2$ every 3-4 wk. May divide dose over 2-3 days if desired. May admin as an inj over 3-5 minutes or as an infusion over up to 30 minutes. Max (total cumulative dose limit): $0.9-1 \text{ g/m}^2$. For palliative care: $12.5-25 \text{ mg/m}^2$ once wkly.

Hepatic impairment: Moderate liver dysfunction (serum bilirubin concentrations: $12-30 \text{ mcg/mL}$): Doses should be halved; severe liver impairment (serum bilirubin $>30 \text{ mcg/mL}$): A quarter of the usual dose.

Intravenous

Adjuvant treatment of axillary-node positive breast cancer

mcg/mL): A quarter of the usual dose.

Intravenous

Adjuvant treatment of axillary-node positive breast cancer

Adult: Recommended starting dose: 100-120 mg/m². Dose may be given as a single dose on day 1 or in 2 equally-divided doses on days 1 and 8 of each 28-day cycle. Repeat for 6 cycles. Lower starting doses may be considered in patients with pre-existing bone marrow depression or in the presence of neoplastic bone marrow infiltration.

Renal impairment: Dosage adjustment may be needed in severe impairment.

Hepatic impairment: Moderate liver dysfunction (serum bilirubin concentrations: 12-30 mcg/mL): Doses should be halved; severe liver impairment (serum bilirubin >30 mcg/mL): A quarter of the usual dose.

Intravesical

Local treatment of bladder carcinoma

Adult: As 0.1% solution (in normal saline or sterile water): 50 mg wkly for 8 wk; may reduce to 30 mg in 50 ml if chemical cystitis develops. For carcinoma *in-situ*: *May increase dose to 80 mg in 50 ml wkly. For prevention of recurrence in patients who have undergone transurethral resection: 50 mg wkly for 4 wk, followed by 50 mg once a mth for 11 mth; retain solution in the bladder for 1 hr during each admin.*

Hepatic impairment: Moderate liver dysfunction (serum bilirubin concentrations: 12-30 mcg/mL): Doses should be halved; severe liver impairment (serum bilirubin >30 mcg/mL): A quarter of the usual dose.

Special Populations: Patients with heavy pre-treatment, preexisting bone marrow depression, or the presence of

	Special Populations: Patients with heavy pre-treatment, preexisting bone marrow depression, or the presence of neoplastic bone marrow infiltration: Starting dose of 75-90 mg/m². Dosage modifications after the 1st treatment cycle: Nadir platelet counts < 50,000/mm², ANC < 250/mm², neutropenic fever, or grades 3 or 4 nonhaematogenic toxicity: Reduce day 1 dose in subsequent cycles to 75% of the day 1 dose in the current cycle. Day 1 chemotherapy in subsequent courses of treatment should be delayed until platelet counts are exceeding 100,000/mm³, ANC exceeding 1500/mm³, and nonhaematogenic toxicities have recovered to almost grade 1. In addition, for patients receiving divided dose (day 1 and day 8) regimen: Day 8 platelet counts 75,000-100,000/mm³ and ANC 1000-1499/mm³: dose should be 75% of the day 1 dose. Day 8 platelet counts <75,000/mm³, ANC <1000/mm³ or grade 3 or 4 nonhaematologic toxicity: Omit day 8 dose.
Overdosage	Treatment should be supportive (including antibiotic therapy, blood and platelet transfusions, colony-stimulating factors, and intensive care as needed) until the recovery of toxicities. Delayed CHF may be observed mth after anthracycline admin.
Contraindications	Cardiac impairment, severe or recent MI; previous full cumulative doses of anthracyclines. Hypersensitivity; severe hepatic dysfunction. Not for intravesical use where invasive tumours have penetrated the bladder wall; urinary infections, bladder inflammation or catheterisation problems. Pregnancy, lactation.
Special Precautions	Previous extensive radiotherapy, bone infiltration by tumour, severe renal and hepatic dysfunction. May cause tumor lysis syndrome or radiation recall. Elderly women >70 yr. CV

	Previous extensive radiotherapy, bone infiltration by tumour, severe renal and hepatic dysfunction. May cause tumor lysis syndrome or radiation recall. Elderly women >70 yr. CV disease, hypertensive cardiomyopathy; monitor hematological and cardiac function regularly. Extravasation during IV admin may result in severe local tissue necrosis. Do not give via IM/SC routes as extravasation can lead to severe local necrosis.
Adverse Drug Reactions	Myelosuppression; cardiotoxicity, alopecia; mucositis; hyperpyrexia; lethargy; amenorrhoea; nausea and vomiting; diarrhoea; fever; rash, skin changes, anorexia; anaphylaxis; photosensitivity; premature menopause; skin and nail hyperpigmentation; harmless reddish appearance of urine for 1-2 days.
Drug Interactions	Paclitaxel and other anthracyclines. Cimetidine, heparin. Antineoplastic drugs, cardiotoxic drugs, radiation, hepatotoxic drugs.
Food Interaction	St. John's wort, alcohol, black cohosh, dong quai.
Lab Interference	Increased transaminases.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Refrigerate at 2-8°C. Intravesical: Refrigerate at 2-8°C.
Mechanism of Action	Epirubicin, an anthracycline with cytotoxic properties. It inhibits DNA and RNA synthesis by steric obstruction after intercalating between DNA base pairs that triggers DNA cleavage by topoisomerase II. It also inhibits DNA helicase and generates cytotoxic free radicals.

	intercalating between DNA base pairs that triggers DNA cleavage by by topoisomerase II. It also inhibits DNA helicase and generates cytotoxic free radicals. Distribution: Rapidly and extensively distributed into body tissues. Metabolism: Hepatically metabolised. Excretion: Eliminated mainly in bile. Terminal elimination half-life: About 30-40 hr.
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01DB03 - epirubicin; Belongs to the class of cytotoxic antibiotics, anthracyclines and related substances. Used in the treatment of cancer.

eptifibatide

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
eptifibatide

P - Caution when used during pregnancy
L - Contraindicated in lactation

related eptifibatide information

Indication & Dosage

Intravenous

Unstable angina

Adult: 180 mcg/kg via IV inj followed by 2 mcg/kg/minute by IV infusion for up to 72 hr. If percutaneous coronary intervention is performed during therapy, infusion should be continued for 18-24 hr after procedure, up to a max total duration of 96 hr of therapy.

Renal impairment: Dose reduction may be needed.

CrCl (ml/min)	Dosage Recommendation
<30	Contra-indicated.

Intravenous

Angioplasty

Adult: Initially, 180 mcg/kg via IV inj, to be given immediately before procedure, followed by 2 mcg/kg/minute via IV infusion. A 2nd dose of 180 mcg/kg via IV inj should be given 10 minutes after the 1st dose. Continue infusion until hospital discharge or for up to 18-24 hr (min treatment duration: 12 hr).

	be given 10 minutes after the 1st dose. Continue infusion until hospital discharge or for up to 18-24 hr (min treatment duration: 12 hr). Renal impairment: Dose reduction may be needed. <table><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr><tr><td><30</td><td>Contra-indicated.</td></tr></table>	CrCl (ml/min)	Dosage Recommendation	<30	Contra-indicated.	
CrCl (ml/min)	Dosage Recommendation					
<30	Contra-indicated.					
Contraindications	Active bleeding, increased risk of haemorrhage including hemorrhagic disorders, cerebrovascular disorders, history of stroke, uncontrolled hypertension, severe trauma, severe renal impairment, recent major surgery. Lactation.					
Special Precautions	Discontinue in case of serious uncontrolled bleeding, or if emergency surgery or thrombolytic therapy is required. Hepatic impairment, platelet counts <100,000 mm ³ ; hemorrhagic retinopathy, drugs affecting haemostasis. Check aPTT or ACT prior to sheath removal. Severe renal impairment, vasculitis, haemorrhagic retinopathy, acute pericarditis or aortic dissection. Pregnancy.					
Adverse Drug Reactions	Bleeding, hypotension; localised Inj site reaction; thrombocytopaenia; back pain; anaphylaxis; GI, intracranial or pulmonary haemorrhage.					
Drug Interactions	Increased risk of bleeding with heparin, other anticoagulants, antiplatelet and thrombolytic agents.					
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).					
Mechanism of Action	Eptifibatide is a cyclic heptapeptide which blocks the platelet glycoprotein IIb/IIIa receptor thus preventing platelet aggregation and thrombosis. Onset: Within 1 hr.					

	glycoprotein IIb/IIIa receptor thus preventing platelet aggregation and thrombosis. Onset: Within 1 hr.
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC Classification	B01AC16 - eptifibatide; Belongs to the class of platelet aggregation inhibitors excluding heparin. Used in the treatment of thrombosis.

***eptifibatide information:**

erdosteine

CIMS Class : (Cough & Cold Preparations)
erdosteine

P - Caution when used during pregnancy

L - Caution when used during lactation

related erdosteine information

Indication & Dosage	<i>Oral</i> Mucolytic Adult: 300 mg bid. Max duration: 10 days.
Contraindications	Active peptic ulcer.
Special Precautions	Pregnancy, lactation.
Adverse Drug Reactions	Epigastralgia, nausea, vomiting, loose stools, spasmodic colitis, headache.
Storage	Oral: Store below 25°C.
Mechanism of Action	Erdosteine contains two sulfhydryl groups, which are freed after metabolic transformation in the liver. The liberated sulfhydryl groups break the disulphide bonds, which hold the glycoprotein fibres of mucus together. This makes the bronchial secretions more fluid and enhances elimination. Absorption: Rapid absorption after oral admin. Distribution: Protein binding: 64.5%. Metabolism: Undergoes 1st-pass metabolism to form an active metabolite, N-thiodiglycolyl-homocysteine.

	Distribution: Protein binding: 64.5%. Metabolism: Undergoes 1st-pass metabolism to form an active metabolite, N-thiodiglycolyl-homocysteine. Excretion: Elimination half-life: About 1.46 hr (erdosteine), and about 1.62 hr (metabolite). Mainly via the urine, as metabolites.
CIMS Class	Cough & Cold Preparations
ATC Classification	R05CB15 - erdosteine; Belongs to the class of mucolytics. Used in the treatment of wet cough.

ergometrine

CIMS Class : (Drugs Acting on the Uterus)
ergometrine

P - Contraindicated in pregnancy
L - Caution when used during lactation

related ergometrine information

Indication & Dosage

Oral

Postpartum and post-abortion bleeding

Adult: 0.2-0.4 mg 2-4 times daily until danger of uterine atony and haemorrhage has passed (usually 48 hr). Max duration: 1 wk postpartum.

Intramuscular

Active management of the 3rd stage of labour

Adult: 500 mcg given with 5 units of oxytocin after delivery of the anterior shoulder of the infant or immediately after delivery.

Intravenous

Excessive uterine bleeding

Adult: 200 mcg via IV inj over at least 1 minute. May follow with oral doses of 200-400 mcg 2-4 times daily until the danger of atony or haemorrhage has passed (usually 48 hr).

Intramuscular

Treatment and prophylaxis of postpartum haemorrhage

Adult: 200 mcg, may repeat in severe bleeding every 2-4 hr as needed.

	Treatment and prophylaxis of postpartum haemorrhage Adult: 200 mcg, may repeat in severe bleeding every 2-4 hr as needed.
Overdosage	Symptoms include peripheral vasoconstriction, encephalopathy, convulsions, respiratory failure, acute renal failure and temporary lactose intolerance. Treatment is supportive.
Contraindications	Pregnancy, 1st and 2nd stage of labour, patients with preeclampsia, eclampsia or threatened spontaneous abortion; porphyria.
Special Precautions	Breech and abnormal foetal presentation; hypertension; chronic anaemia; hepatic, renal, respiratory or cardiac impairment; toxemia; lactation; hypocalcaemia. Monitor BP, pulse and uterine response.
Adverse Drug Reactions	Nausea, vomiting, abdominal pain, diarrhoea; headache, dizziness; tinnitus; chest pain, palpitation, bradycardia, transient hypertension and other cardiac arrhythmias; dyspnoea, sometimes rashes, shock. Potentially Fatal: MI, pulmonary oedema.
Drug Interactions	Halothane causes relaxation of uterine muscle and may interfere with ergometrine action. Enhanced uterotonic effect with prostaglandins and oxytocin. Concurrent admin with CYP3A4 inhibitors may lead to vasospasm, cerebral ischaemia and/or ischaemia of extremities. Potentially Fatal: Enhanced vasoconstrictive effects with sympathomimetics and other vasoconstrictors.
Storage	Intravenous: Refrigerate at 2-8°C. Oral: Store below 25°C.
Mechanism of Action	Ergometrine causes contraction of the uterine muscle. At low doses, there is an increase in frequency and amplitude of contractions while at higher doses, the basal tone of the uterus is increased. Ergometrine also causes

	Ergometrine causes contraction of the uterine muscle. At low doses, there is an increase in frequency and amplitude of contractions while at higher doses, the basal tone of the uterus is increased. Ergometrine also causes vasoconstriction of peripheral and cerebral vessels. Onset: 5-15 min (oral); 2-7 min (IM). Absorption: Rapid absorption from the GI tract (oral). Metabolism: Hepatic.
CIMS Class	Drugs Acting on the Uterus
ATC Classification	G02AB03 - ergometrine; Belongs to the class of ergot alkaloids. Used to induce abortion or augment labour and to minimize blood loss from the placental site.

***ergometrine information:**

Note that there are some more drugs interacting with ergometrine

ergotamine

CIMS Class : (Antimigraine Preparations)
ergotamine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related ergotamine information

Indication & Dosage

Oral

Migraine

Adult: As tartrate: 1-2 mg, repeated after 30 minutes if needed. Max.: 6 mg/24 hr, 12 mg/wk. Ensure an interval of at least 4 days between successive 24-hr courses. Not more than 2 courses/mth. May also be given sublingually.

Inhalation

Migraine

Adult: As tartrate: 360 mcg inhaled at the onset of attack and repeated at 5-min intervals, if needed. Max: 6 inhalations/24 hr, 12 inhalations/wk with an interval of at least 4 days between successive 24-hr courses.

Rectal

Migraine

Adult: As tartrate: 2 mg repeated after 1 hr, if needed. Max: 4 mg/24 hr, 8 mg/wk with an interval of at least 4 days between successive 24-hr courses.

Administration

May be taken with or without food.

Administration	May be taken with or without food.
Contraindications	Severe or uncontrolled hypertension, peripheral vascular disease, pregnancy, lactation, septic conditions, ischaemic heart disease, hyperthyroidism, impaired hepatic or renal function, hypersensitivity, cachexia, collagen disease and fibrotic conditions.
Special Precautions	Anaemia. Monitor for signs of ergotism such as numbness or tingling of the extremities.
Adverse Drug Reactions	Muscle cramps, stiffness, tiredness. Numbness and tingling of extremities. Nausea, vomiting, diarrhoea. Ergotism consisting of hypotension and gangrene of extremities, anginal pain and transient tachycardia or bradycardia. Potentially Fatal: Severe peripheral vasoconstriction, CV disturbances. Due to vascular occlusions causing gangrene, MI, bowel necrosis, renal failure. Simultaneous use of oral contraceptives or β -blockers increases the risk.
Drug Interactions	Vasoconstrictor effects enhanced by sympathomimetic agents e.g. adrenaline. Caffeine potentiates the action of ergotamine. Potentially Fatal: Administration within 6 hr of taking serotonin agonist may lead to increased and prolonged vasopastic reactions. May have increased risk of peripheral vasoconstriction with β -blockers. Erythromycin increases plasma conc of ergotamine which may lead to ergotism.
Food Interaction	Beverages containing caffeine e.g. tea, cola and coffee.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly

	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Inhalation: Store below 25°C. Oral: Store below 25°C. Rectal: Store below 25°C.
Mechanism of Action	Ergotamine has marked vasoconstrictor effects and partial agonistic action at serotonin receptors. It causes constriction of peripheral and cranial blood vessels and also has powerful oxytotic action on the uterus. It also reduces hyperperfusion in the basilar artery territory. Absorption: Poorly absorbed from the GI tract (oral, sublingual), decreased further by gastric stasis. Distribution: Enters breast milk. Metabolism: Extensive hepatic first-pass effect. Excretion: Via bile (as metabolites), via urine (4%); elimination $T_{1/2}$ (biphasic): 2 hr (initial phase), 21 hr (terminal phase).
CIMS Class	Antimigraine Preparations
ATC Classification	N02CA02 - ergotamine; Belongs to the class of ergot alkaloids preparations. Used to relieve migraine.

Renal impairment: Severe impairment: Max: 1.5 g daily.

Oral

Acne

Adult: Maintenance: 250 mg daily. Severe cases may require up to 500 mg daily.

Child: Maintenance dose: 250 mg daily, up to 500 mg bid may be used in >12 yr. For infants with acne, 250 mg daily in 1 or 2 divided doses may be used.

Renal impairment: Severe impairment: Max dose of 1.5 g daily.

Oral

Prophylaxis against pneumococcal infections

Adult: For patients who are unable to take penicillins or sulfonamides: 250 mg bid.

Child: For patients who are unable to take penicillins or sulfonamides: 125 mg bid; for older children: 250 mg bid.

Renal impairment: Adult: Severe impairment: Max: 1.5 g daily.

Oral

Prophylaxis of streptococcal infections in patients with evidence of rheumatic fever or heart disease

Adult: For patients who are unable to take penicillins or sulfonamides: 250 mg bid.

Child: For patients who are unable to take penicillins or sulfonamides: 125 mg bid; for older children: 250 mg bid.

Renal impairment: Adult: Severe impairment: Max: 1.5 g daily.

Intravenous

Susceptible infections

Adult: As lactobionate: 15-20 mg/kg/day, up to 4 g/kg/day in severe infections. May be given as a continuous or 6-hrly intermittent infusion over 20-60 min. Replace with oral erythromycin as soon as possible.

Renal impairment: Adult: Severe impairment: Max: 1.5 g daily.

Ophthalmic

	Replace with oral erythromycin as soon as possible. Renal impairment: Adult: Severe impairment: Max: 1.5 g daily. <i>Ophthalmic</i> Treatment and prophylaxis of ophthalmic infections Adult: As 0.5% ophthalmic ointment: Apply to the affected eye(s) up to 6 daily. <i>Ophthalmic</i> Treatment and prophylaxis of neonatal conjunctivitis Child: and neonate: As 0.5% ophthalmic ointment: Apply approximately length into each of the lower conjunctival sac, up to 2-6 times daily depending on the severity of the infection. <i>Topical/Cutaneous</i> Acne Adult: As 2% gel/solution: Apply onto affected areas 1-2 times daily. Discontinue treatment if condition worsens or if there is no improvement after 6-8 wk of continuous usage.
Administration	Erythromycin base: Should be taken on an empty stomach. (Best taken on empty stomach at least ½ hr & preferably 2 hr before meals.)
Overdosage	Treatment is supportive. Erythromycin is not removed by peritoneal dialysis or haemodialysis.
Contraindications	Hypersensitivity; porphyria; hepatic impairment; pregnancy.
Special Precautions	Increased risk of cholestatic hepatitis when treatment is >10 days or in patients with previous history of erythromycin usage. History of hepatic disorders; arrhythmias; prolonged QT interval; lactation. Monitor liver function. Avoid use in liver impairment. Caution when using lactobionate in patients with severe liver impairment. May aggravate muscle weakness in patients with myasthenia gravis.
Adverse Drug Reactions	Rash, urticaria; nausea, vomiting, GI discomfort; ototoxicity; central neurotoxicity; agranulocytosis; arrhythmias; pancreatitis. Potentially Fatal: Hepatotoxicity, cholestatic jaundice; raised serum transaminases; eosinophilia.
Drug Interactions	May antagonise therapeutic effects of lincomycin and clindamycin. Concurrent use with alcohol may lead to increased absorption of alcohol.

	May antagonise therapeutic effects lincomycin and clindamycin. Concomitant use may lead to increased absorption of alcohol. Potentially Fatal: May potentiate actions of neuromuscular blockers, oral anticoagulants, ciclosporin, theophylline. Terfenadine, astemizole, cisapride increased.
Food Interaction	Increased absorption when taken with meals.
Lab Interference	False-positive urinary catecholamines. Falsely elevated serum-aspartate aminotransferase values.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Store at 15-25°C. Oral susp: Refrigerate at 2-8°C. Topical/Cutaneous: Store at 15-25°C. Oral susp: Refrigerate at 2-8°C.
Mechanism of Action	Erythromycin inhibits protein synthesis by irreversibly binding to the 50S ribosomal subunit thus blocking the transpeptidation or translocation reactions of susceptible organisms resulting in stunted cell growth. Absorption: Variable and unreliable due to instability in GI environment; reduced in the presence of food (as the stearate or base). Peak plasma concentrations after 1-4 hr. Distribution: Widely distributed into body tissues and fluids, liver and spleen (high concentrations), polymorphonuclear lymphocytes and macrophages crosses the placenta (5-20% foetal plasma concentrations) and enters the milk. Protein-binding: 70-75% (as the base), 95% (as the propionate ester). Metabolism: Hepatic (demethylation). Excretion: Via the urine (2-5% of the oral dose, 12-15% of the IV dose); 4-6 hr (elimination half-life).
CIMS Class	Macrolides / Eye Anti-infectives & Antiseptics / Acne Treatment Preparations
ATC	D10AF02 - erythromycin; Belongs to the class of topical anti-infective preparations

**ATC
Classification**

D10AF02 - erythromycin; Belongs to the class of topical antiinfective prep used in the treatment of acne.

J01FA01 - erythromycin; Belongs to the class of macrolides. Used in the t of systemic infections.

S01AA17 - erythromycin; Belongs to the class of antibiotics. Used in the t of eye infections.

erythropoietin

CIMS Class : (Haematopoietic Agents)
erythropoietin

P - Caution when used during pregnancy

L - Caution when used during lactation

related erythropoietin information

Indication & Dosage

Parenteral

Anaemia of chronic renal failure

Adult: As epoetin alfa: Initially, 50 U/kg SC/IV 3 times wkly for predialysis and haemodialysis patients and 50 U/kg twice wkly for peritoneal dialysis patients, may increase according to response in steps of 25 U/kg 3 times wkly at 4 wkly intervals.

Child: As epoetin alfa: Initially, 50 U/kg 3 times wkly. May increase dose at 4 wkly intervals in increments of 25 U/kg 3 times wkly until a target haemoglobin concentration of 9.5-11 g/100 mL is reached. Usual maintenance dose: <10 kg: 225-450 U/kg/wk; 10-30 kg: 180-450 U/kg/wk and >30 kg: 90-300 U/kg/wk.

Parenteral

Anaemia in zidovudine-treated HIV-infected patients

Adult: As epoetin alfa: Initially, 100 U/kg SC/IV thrice wkly for 8 wk; increase every 4-8 wk by 50-100 U/kg according to response. Max: 300 U/kg thrice wkly.

Subcutaneous

	Initial: 150 U/kg 3 times wkly; increase every 4-8 wk by 50-100 U/kg according to response. Max: 300 U/kg thrice wkly. <i>Subcutaneous</i> Anaemia related to non-myeloid malignant disease chemotherapy Adult: As epoetin alfa or zeta: Initially, 150 U/kg 3 times wkly. Dose may be increased at 4-8 wk intervals to 300 U/kg 3 times wkly. Stop treatment if response is still inadequate after 4 wk of treatment using this higher dose. <i>Intravenous</i> Increase yield of autologous blood Adult: As epoetin alfa or zeta: 600 U/kg over 2 minutes twice wkly for 3 wk before surgery; in conjunction with iron, folate and B12 supplementation.
Contraindications	Uncontrolled hypertension, hypersensitivity to mammalian cell products and human albumin.
Special Precautions	Chronic renal failure, ischaemic heart diseases, hypertension, pregnancy, seizures, liver dysfunction, lactation.
Adverse Drug Reactions	Hypertension, myalgia, arthralgia, flu-like syndrome, rashes and urticaria. Potentially Fatal: Hypertensive crisis with encephalopathy-like symptoms e.g. headache, confusion, generalised seizures. Thrombosis.
Drug Interactions	Haematinics enhance efficiency. Increased dose of heparin in patients undergoing dialysis.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.

	adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Refrigerate at 2-8°C. Do not freeze. Parenteral: Refrigerate at 2-8°C. Do not freeze. Subcutaneous: Refrigerate at 2-8°C. Do not freeze.
Mechanism of Action	Erythropoietin regulates erythropoiesis by stimulating the differentiation and proliferation of erythroid precursors, stimulating the release of reticulocytes into the circulation, and synthesis of cellular haemoglobin. Recombinant human erythropoietin is available as epoetin alfa and epoetin beta which are used in the management of anaemias associated with CRF, cancer chemotherapy and anti-AIDS drug zidovudine.
CIMS Class	Haematopoietic Agents
ATC Classification	B03XA01 - erythropoietin; Belongs to the class of other preparations used in the treatment of anemia.

escitalopram

CIMS Class : (Antidepressants)
escitalopram

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related escitalopram information

Indication & Dosage

Oral

Depression

Adult: 10 mg once daily, increased if necessary. Max: 20 mg daily.

Elderly: Half the adult dose.

Hepatic impairment: Dosage adjustments may be required.

Oral

Obsessive compulsive disorder

Adult: 10 mg once daily, increased if necessary. Max: 20 mg daily.

Elderly: Half the adult dose.

Hepatic impairment: Dosage adjustments may be required.

Oral

Anxiety

Adult: 10 mg once daily, increased if necessary. Max: 20 mg daily.

Elderly: Half the adult dose.

Hepatic impairment: Dosage adjustments may be required.

	daily. Elderly: Half the adult dose. Hepatic impairment: Dosage adjustments may be required. <i>Oral</i> Panic disorder Adult: Initially, 5 mg daily, increased to 10 mg daily after 7 days. Max: 20 mg daily. Elderly: Half the adult dose. Hepatic impairment: Dosage adjustments may be required.
Administration	May be taken with or without food.
Overdosage	Symptoms include convulsions, coma, dizziness, hypotension, insomnia, nausea, vomiting, sinus tachycardia, somnolence, ECG changes (including QT prolongation and rarely, torsade de pointes). Treatment includes establishing and maintaining an airway to ensure adequate ventilation and oxygenation. Gastric lavage and activated charcoal may be used. Monitor cardiac and vital signs, along with general symptomatic and supportive care. Forced diuresis, dialysis, haemoperfusion, and exchange transfusion may not be useful.
Contraindications	Concomitant use with or within 2 wk of MAOI withdrawal.
Special Precautions	History of mania or seizure disorders; work requiring mental alertness; renal and hepatic impairment; pregnancy, lactation; withdraw gradually. Children and adolescents <18 yr
Adverse Drug Reactions	Nausea, diarrhoea, increased sweating, insomnia, impotence, ejaculation disorder, fatigue, somnolence; postural hypotension, sinusitis, taste disturbances. Increased appetite and wt gain.
Drug Interactions	Increased risk of bleeding when used with aspirin, NSAIDs or drugs that affect coagulation. Serum levels may be reduced

	Increased risk of bleeding when used with aspirin, NSAIDs or drugs that affect coagulation. Serum levels may be reduced by CYP2C19 inducers (e.g. carbamazepine, rifampin, phenytoin) or CYP3A4 inducers (e.g. nafcillin, nevirapine). Serum levels may also be increased by CYP2C19 inhibitors (e.g. fluconazole, fluvoxamine, omeprazole) or CYP3A4 inhibitors (e.g. azole antifungals, clarithromycin). May increase serum levels of desipramine or metoprolol. Increased risk of serotonin syndrome when used with linezolid or sibutramine. Escitalopram may enhance the sedative effects of alcohol. Potentially Fatal: Concomitant administration with MAOIs may lead to serious or fatal reactions; should not be started until at least 2 wk after stopping escitalopram or vice versa. Moclobemide may increase the risk of serotonin syndrome.
Food Interaction	Increased CNS depression with valerian, St John's wort, kava kava and gotu kola.
Storage	Oral: Store at 25°C.
Mechanism of Action	Escitalopram selectively inhibits CNS neuronal re-uptake of serotonin (5-HT) and potentiates serotonergic activity. It has minimal effects on norepinephrine and dopamine neuronal re-uptake. Onset: 1-2 wk. Absorption: Readily absorbed from the GI tract (oral). Distribution: Protein-binding: 56%. Metabolism: Hepatic; converted to metabolites. Excretion: Urine (as unchanged drug); 27-32 hr (elimination half-life).
CIMS Class	Antidepressants

	Antidepressants
ATC Classification	N06AB10 - escitalopram; Belongs to the class of selective serotonin reuptake inhibitors. Used in the management of depression.

esmolol

CIMS Class : (Beta-Blockers)
esmolol

P - Contraindicated in pregnancy
L - Caution when used during lactation

related esmolol information

Indication & Dosage

Intravenous

Rapid temporary control of ventricular rate in supraventricular arrhythmias

Adult: As HCl: Loading dose: 500 mcg/kg over 1 minute followed by a maintenance infusion of 50 mcg/kg/minute for 4 minutes. If response is satisfactory, continue maintenance infusion. If satisfactory response is not achieved within 5 minutes, a 2nd loading dose of 500 mcg/kg may be given over 1 minute followed by maintenance infusion at 100 mcg/kg/minute for 4 minutes. May repeat procedure once or twice more if needed; maintenance infusion can be further increased each time by 50 mcg/kg/minute to a max of 200 mcg/kg/min. Once response is satisfactory, maintain infusion for up to 48 hr, if necessary.

Intravenous

Perioperative hypertension and/or tachycardia

Adult: As HCl: During anaesthesia: loading dose of 80 mg over 15-30 sec, followed by an infusion of 150 mcg/kg/minute, may increase to 300 mcg/kg/minute if

	Adult: As HCl: During anaesthesia: loading dose of 80 mg over 15-30 sec, followed by an infusion of 150 mcg/kg/minute, may increase to 300 mcg/kg/minute if necessary. After anaesthesia: 500 mcg/kg/minute infused for 4 minutes followed by another infusion of 300 mcg/kg/minute as needed. Postoperatively: Loading dose: 500 mcg/kg; Maintenance: 50 mcg/kg/minute for 4 minutes. If response is satisfactory, continue maintenance infusion. If response is unsatisfactory w/in the 1st 5 mins, give 2nd loading dose of 500 mcg/kg, then infuse at 100 mcg/kg/min for 4 mins. May repeat procedure another 1-2 times, if needed. Maintenance infusion can be increased by 50 mcg/kg/min each time up to a max of 300 mcg/kg/min. Once response is satisfactory, maintain infusion for up to 48 hr if needed.
Overdosage	Overdoses can cause cardiac arrest. May also lead to bradycardia, hypotension, electromechanical dissociation and loss of consciousness. Treatment is supportive and symptomatic.
Contraindications	Sinus bradycardia, 2nd and 3rd degree AV block, cardiogenic shock, CHF, concomitant IV calcium channel blockers. Pregnancy (2nd and 3rd trimester).
Special Precautions	Hypotension, tachycardia, PVD, uncompensated heart failure, haemodynamically compromised patients, depressed cardiac contractility, DM, bronchospastic disease, renal impairment. Lactation. Children.
Adverse Drug Reactions	Hypotension, bradycardia, heart failure, local irritation, diaphoresis, peripheral ischaemia, dizziness, somnolence, confusion, fatigue, paraesthesia, peripheral neuropathy, headache, weakness, irritability, dyspnoea, nausea, vomiting, blurred vision, urinary retention, fever, rigor, muscular pain. Potentially Fatal: Profound bradycardia, AV block,

	headache, weakness, irritability, dyspnoea, nausea, vomiting, blurred vision, urinary retention, fever, rigor, muscular pain. Potentially Fatal: Profound bradycardia, AV block, cardiogenic shock, asystole, bronchospasm.
Drug Interactions	Esmolol HCl may increase blood digoxin levels; it may prolong neuromuscular blockade of succinylcholine. Morphine and warfarin may increase steady-state blood esmolol levels. Bradycardia may occur when used concurrently with MAOIs. Esmolol may reduce elimination of theophylline. Potentially Fatal: Increased risk of bradycardia, AV block, hypotension and CHF with IV calcium channel blockers. Increased hypertensive risk with inotropes, adrenaline or noradrenaline. Hypotension or marked bradycardia with catecholamine depletors.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 25°C.
Mechanism of Action	Esmolol HCl is a cardioselective agent, which competitively blocks β_1 adrenergic receptor. At higher doses, it inhibits β_2 receptors located chiefly in the bronchial and vascular musculature. Onset: 2-10 minutes (IV). Duration: 10-30 minutes (IV). Distribution: Protein-binding: 55%. Metabolism: RBC: Metabolised by esterases. Excretion: Via urine (as de-esterified metabolite); 9 minutes (elimination half-life).
CIMS Class	Beta-Blockers

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related esomeprazole information

Indication & Dosage

Oral

Erosive oesophagitis

Adult: 40 mg once daily for 4 wk, extended for another 4 wk if necessary. Maintenance: 20 mg once daily.

Child: <20 kg: 10 mg once daily for 8 wk; ≥20 kg: 10-20 mg once daily for 8 wk.

Hepatic impairment: Severe impairment (Child-Pugh class C): Not more than 20 mg daily.

Oral

Peptic ulcer

Adult: 20 mg bid for 7 days or 40 mg once daily for 10 days given as a triple therapy with amoxicillin and clarithromycin.

Hepatic impairment: Severe impairment (Child-Pugh class C): Not more than 20 mg daily.

Oral

NSAID-associated ulceration

Adult: 20 mg once daily for 4-8 wk.

Oral

NSAID-associated ulceration

Adult: 20 mg once daily for 4-8 wk.

Hepatic impairment: Severe impairment (Child-Pugh class C): Not more than 20 mg daily.

Oral

Zollinger-Ellison syndrome

Adult: Initially, 40 mg twice daily. Usual range: 80-160 mg daily. Doses >80 mg should be given in 2 divided doses.

Hepatic impairment: Severe impairment (Child-Pugh class C): Not more than 20 mg daily.

Oral

Gastro-oesophageal reflux disease

Adult: For patients without erosive oesophagitis: 20 mg once daily for 4 wk. Additional 4 wk may be considered in patients whose symptoms have not fully resolved after the 1st course.

Child: 10 mg once daily for up to 8 wk.

Hepatic impairment: Severe impairment (Child-Pugh class C): Not more than 20 mg daily.

Intravenous

Gastro-oesophageal reflux disease

Adult: For short term treatment only. 20 or 40 mg once daily for ≤10 days. Convert to oral therapy as soon as possible. May be administered by inj over at least 3 minutes, intermittent infusion (10-30 minutes) or continuous infusion (over up to 72 hr).

Hepatic impairment: Severe impairment (Child-Pugh class C): Not more than 20 mg daily.

Reconstitution: Each single-use vial contains 20 or 40 mg of esomeprazole. For IV inj: Reconstitute each vial with 5 ml of normal saline. For IV infusion: Reconstitute each vial with

	Reconstitution: Each single-use vial contains 20 or 40 mg of esomeprazole. For IV inj: Reconstitute each vial with 5 ml of normal saline. For IV infusion: Reconstitute each vial with 5 ml of normal saline, lactated Ringer's inj or dextrose 5% inj, then further dilute the resultant solution to a final volume of 50 ml.
Administration	Tab: May be taken with or without food. Delayed-release cap: Should be taken on an empty stomach. (Take on an empty stomach 1 hr before meals.)
Contraindications	Hypersensitivity.
Special Precautions	Paediatric; pregnancy, lactation. Malignancy and hepatic impairment. Increased risk of developing certain infections such as community-acquired pneumonia.
Adverse Drug Reactions	Headache, diarrhoea, abdominal pain, nausea, flatulence, dry mouth, constipation, hyponatraemia, photosensitivity, angioedema, anaphylaxis.
Drug Interactions	May interfere with the elimination of drugs metabolised by CYP2C19. Changes in gastric pH can affect the bioavailability of ketoconazole and Fe salts. Clarithromycin and amoxicillin may increase plasma level. May cause changes to prothrombin time when used with warfarin. Avoid concurrent use with clopidogrel.
Food Interaction	Absorption delayed with food.
Lab Interference	Increased creatinine, uric acid, bilirubin, alkaline phosphatase, ALT, AST. Altered thyroid function tests.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a

	demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Pwd for inj: Store at 25°C (77°F). Protect from light. Reconstituted solution for inj should be stored at room temperature up to 30°C and administered within 12 hr after preparation. Reconstituted solution for infusion should be stored at room temperature up to 30°C and administered within 12 hr (if normal saline or lactated Ringer's inj is used as the diluent) or 6 hr (if dextrose 5% inj is used as the diluent). Oral: Store at 25°C.
Mechanism of Action	Esomeprazole is a PPI that suppresses gastric acid secretion by specific inhibition of the H⁺/K⁺ ATPase in the gastric parietal cell. Absorption: Rapid (oral). Peak plasma levels after 1-2 hrs; food delays and decreases absorption. Distribution: Protein-binding: 97% Metabolism: Extensively hepatic; converted to hydroxy and desmethyl metabolites. Excretion: Urine (as metabolites); 1.3 hrs (elimination half-life).
CIMS Class	Antacids, Antireflux Agents & Antiulcerants
ATC Classification	A02BC05 - esomeprazole; Belongs to the class of proton pump inhibitors. Used in the treatment of peptic ulcer and gastro-oesophageal reflux disease (GERD).

estradiol

CIMS Class : (Oestrogens & Progesterones & Related Synthetic Drugs)
estradiol

P - Contraindicated in pregnancy
L - Caution when used during lactation
Lab ⚠ - Lab interference
Food ⚠ - Food interaction

related estradiol information

Indication & Dosage

Oral

Prostate cancer

Adult: For androgen-dependent, inoperable and progressing cancer: 10 mg tid for at least 3 mth.

Oral

Moderate to severe vasomotor symptoms associated with menopause

Adult: 1-2 mg/day adjusted as necessary; admin can be cyclical (3 wk on, 1 wk off) or continuous. In conjunction with a progestogen in women with uterus.

Oral

Prophylaxis of osteoporosis in postmenopausal women

Adult: 0.5 mg/day in cyclic regimen (23 days on and 5 days off).

Oral

Hypogonadism

Adult: 1-2 mg/day in a cyclic regimen for 3 wk on drug,

Oral

Hypogonadism

Adult: 1-2 mg/day in a cyclic regimen for 3 wk on drug, followed by 1 wk drug-free.

Intramuscular

Prostate cancer

Adult: As valerate: =30 mg every 1-2 wk.

Intramuscular

Moderate to severe vasomotor symptoms associated with menopause

Adult: As cypionate: 1-5 mg every 3-4 wk; as valerate: 10-20 mg every 4 wk. In conjunction with a progestogen in women with uterus.

Transdermal

Moderate to severe vasomotor symptoms associated with menopause

Adult: Each patch delivers 0.025 mg/day: Initially, apply once wkly, adjust dose as necessary to control symptoms. Attempt to taper or discontinue treatment at 3-6 mth intervals. In conjunction with a progestogen in women with uterus.

Transdermal

Prophylaxis of osteoporosis in postmenopausal women

Adult: Each patch delivers 14 mcg/day. Apply patch once or twice wkly. Adjust dose by monitoring biochemical markers and bone mineral density. A 14-day course of progestogen is required in women with an intact uterus once every 6-12 mth.

Intramuscular

Hypogonadism

Adult: As valerate: 10-20 mg every 4 wk. As cypionate: 1.5-2 mg mthly.

Vaginal

Vulvular and vaginal atrophy

Adult: Insert 2-4 g/day of vag cream intravaginally for 2 wk,

	mg mthly. <i>Vaginal</i> Vulvular and vaginal atrophy Adult: Insert 2-4 g/day of vag cream intravaginally for 2 wk, then reduce gradually to half the initial dose for 2 wk followed by a maintenance dose of 1 g 1-3 times/wk. <i>Vaginal</i> Postmenopausal vaginal atrophy Adult: Insert a vag ring containing 2 mg of estradiol and keep in place for 90 days. <i>Vaginal</i> Urogenital symptoms Adult: Insert a vag ring containing 2 mg of estradiol and keep in place for 90 days. <i>Vaginal</i> Atrophic vaginitis Adult: Initial: Insert 1 tab (20 mcg) once daily for 2 wk. Maintenance: Insert 1 tab twice wkly. Attempt to discontinue or taper medication at 3-6 mthly intervals.
Contraindications	Hypersensitivity; undiagnosed vag bleeding; thrombophlebitis or thromboembolic disorders; breast carcinoma except in selected patients being treated for metastatic disease; oestrogen-dependent tumor; porphyria; pregnancy.
Special Precautions	Conditions exacerbated by fluid retention; hypercalcaemia, cerebrovascular disorders, coronary artery disease, gall bladder diseases; lipid effects; familial defects of lipoprotein metabolism. May increase BP, risk of venous thromboembolism, breast cancer, benign hepatic adenoma, endometrial cancer and size of preexisting uterine leiomyomata. Dosage should be reduced in hepatic impairment. Lactation. Child.

	endometrial cancer and size of preexisting uterine leiomyomata. Dosage should be reduced in hepatic impairment. Lactation. Child.
Adverse Drug Reactions	GI disturbances, genitourinary changes, haematologic disorders, CV and CNS effects, endocrine and metabolic disorders, cholestatic jaundice, local skin reactions, chorea, contact lens intolerance, steeping of corneal curvature, pulmonary thromboembolism, carbohydrate intolerance.
Drug Interactions	CYP1A2 and CYP3A4 inducers e.g. aminoglutethimide, carbamazepine, phenobarbital, and rifampin may decrease the effects of estradiol. May enhance the effects of hydrocortisone and prednisolone when used together.
Food Interaction	Folic acid absorption may be reduced. Ethanol increases the risk of osteoporosis; routine use of ethanol may also increase estrogen level and thus risk of breast cancer. Black cohosh, dong quai, red clover, saw palmetto, ginseng, St John's wort.
Lab Interference	Reduced serum folate concentration and response to metyrapone test. May interfere with thyroid function and glucose tolerance tests.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Intramuscular: Store at room temperature. Oral: Store at room temperature. Transdermal: Store at room temperature. Vaginal: Store at room temperature.
Mechanism of Action	Estradiol is a naturally occurring oestrogen. Oestrogens are responsible for the development and maintenance of the female reproductive system and secondary sexual

	Estradiol is a naturally occurring oestrogen. Oestrogens are responsible for the development and maintenance of the female reproductive system and secondary sexual characteristics. They modulate the pituitary secretion of gonadotrophins, LH and FSH through a negative feedback system. Absorption: Readily absorbed from the GI tract and through the skin or mucous membranes. Distribution: Largely bound to plasma proteins. Metabolism: Partly metabolised hepatically to less active oestrogens such as estriol and estrone.
CIMS Class	Oestrogens & Progesterones & Related Synthetic Drugs
ATC Classification	G03CA03 - estradiol; Belongs to the class of natural and semisynthetic estrogens used in estrogenic hormone preparations.

estrogens

CIMS Class : (Oestrogens & Progesterones & Related Synthetic Drugs)
estrogens

P - Contraindicated in pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related estrogens information

related estrogens information	
Indication & Dosage	<i>Oral</i> Moderate to severe vasomotor symptoms associated with menopause Adult: 0.45 mg/day; may increase up to 1.25 mg/day; attempt to discontinue medication at 3-6-mth intervals. <i>Oral</i> Vulvular and vaginal atrophy Adult: 0.3 mg/day. <i>Oral</i> Female hypogonadism Adult: 0.3-0.625 mg/day given cyclically, may titrate dose in 6-12-mth intervals; add progestin treatment to maintain bone mineral density once skeletal maturity is achieved. <i>Oral</i> Female castration or primary ovarian failure Adult: 1.25 mg/day given cyclically; adjust according to patient response. For maintenance, adjust to the lowest effective dose.

	Adult: 1.25 mg/day given cyclically; adjust according to patient response. For maintenance, adjust to the lowest effective dose. <i>Oral</i> Palliative treatment of prostatic carcinoma Adult: 1.25-2.5 mg 3 times/day. <i>Oral</i> Prophylaxis of osteoporosis in postmenopausal women Adult: Initial: 0.3 mg/day, cyclically or daily, depending on patient's condition. Adjust dose based on bone mineral density and clinical response. Lowest effective dose should be used. <i>Parenteral</i> Abnormal uterine bleeding Adult: 25 mg via IV/IM admin, may repeat in 6-12 hr if needed. Treatment should be followed by a low-dose oral contraceptive.
Contraindications	Severe liver impairment; breast carcinoma; thromboembolic disorders; CV disease; undiagnosed vag bleeding; estrogen-dependent neoplasms; hypersensitivity; pregnancy.
Special Precautions	Asthma, epilepsy, migraine; heart or kidney dysfunction; CV disease; cerebrovascular disorders; diabetes, hypercalcaemia; gall bladder disease; porphyria. Childn. Lactation.
Adverse Drug Reactions	Abnormal bleeding; vomiting, nausea; tender breasts, wt gain, fluid retention; headache, depression. Males: Gynaecomastia, impotence. Potentially Fatal: Unopposed replacement therapy in postmenopausal women associated with increased risk of endometrial and breast cancer.

Drug Interactions	Rifampicin, barbiturates increase rate of metabolism. Potentially Fatal: May reduce the efficacy of anticoagulants.
Lab Interference	Interfere with tests for thyroid function and glucose tolerance.
Storage	Oral: Store at 25°C. Parenteral: Store at 2-8°C. To be used immediately after reconstitution.
Mechanism of Action	Estrogens modulate pituitary secretion of gonadotropins, leutinising hormones and follicle-stimulating hormones through -ve feedback mechanism, thus reducing elevated levels of hormones in postmenopausal women during oestrogen replacement therapy Absorption: Absorbed from the intestines after removal of the sulfate group (oral). Metabolism: Hepatic; undergoes enterohepatic recycling. Excretion: Via the urine and faeces.
CIMS Class	Oestrogens & Progesterones & Related Synthetic Drugs
ATC Classification	G03C - ESTROGENS; Used as estrogenic hormone preparations. L02AA - Estrogens; Used in endocrine therapy.

etamsylate

CIMS Class : (Haemostatics)
etamsylate

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related etamsylate information

Indication & Dosage	<i>Oral</i> Menorrhagia Adult: 500 mg 4 times daily during menstruation. <i>Oral</i> Control of haemorrhage after surgery Adult: 250-500 mg every 4-6 hr as needed. May also be given via IV/IM inj. <i>Parenteral</i> Treatment and prophylaxis of periventricular haemorrhage in low birth-weight neonates Child: Low birth-weight neonate: 12.5 mg/kg IM/IV Inj every 4-6 hr.
Administration	May be taken with or without food. (May be taken w/ meals to minimise GI upset.)
Contraindications	Hypersensitivity. Porphyria. Pregnancy and lactation.
Adverse Drug Reactions	Headache, skin rash, nausea. IV: Transient hypotension.
Storage	Oral: Store below 25°C. Parenteral: Store below 25°C.

	Oral: Store below 25°C. Parenteral: Store below 25°C.
Mechanism of Action	Ethamsylate stops haemorrhage from small blood vessels by stabilising the capillary wall and correcting abnormal platelet adhesion. Absorption: Absorbed from the GI tract (oral). Distribution: Enters breast milk. Excretion: Via urine (as unchanged).
CIMS Class	Haemostatics

ethacridine lactate

CIMS Class : (Drugs Acting on the Uterus)
ethacridine lactate

P - Contraindicated in pregnancy

related ethacridine lactate information

Indication & Dosage	<i>Extra-amniotic</i> Medical termination of pregnancy after 1st 3 months Adult: 10 ml/gestational wk of 0.1% solution (max: 200 ml), to be slowly instilled extra-amniotically using a Foley catheter. Catheter is then clamped at its lower end and left in place for 24 hr unless expelled earlier.
Contraindications	Hypersensitivity, pregnancy.
Adverse Drug Reactions	Hypersensitivity, prolonged use delays wound healing.
Drug Interactions	Activity enhanced by alkaline solutions.
Mechanism of Action	Induces abortion after extra-amniotic instillation.
CIMS Class	Note that there are some more drugs Acting on the Uterus
ATC Classification	B05CA08 - ethacridine lactate; Belongs to the class of antiinfectives used as irrigating solutions. D08AA01 - ethacridine lactate; Belongs to the class of acridine derivative antiseptics and disinfectants. Used in the treatment of dermatological diseases.

ethambutol

CIMS Class : (Anti-TB Agents)
ethambutol

L - Contraindicated in lactation

related ethambutol information

Indication & Dosage	<i>Oral</i> Primary treatment of pulmonary and extrapulmonary tuberculosis Adult: As hydrochloride: Initial 8 wk: 15 mg/kg/day or 30 mg/kg thrice wkly given with isoniazid, rifampicin and pyrazinamide. For patients with history of antimycobacterial therapy: Initial doses: 25 mg/kg/day for 60 days, thereafter reduce to 15 mg/kg/day. Child: For treatment of drug-resistant tuberculosis: 15-25 mg/kg daily or 50 mg/kg twice wkly. For congenitally acquired tuberculosis: Neonates: 15 mg/kg once daily and =1 mth: 15 mg/kg once daily or 30 mg/kg 3 times wkly for 2 mth initial treatment phase. Elderly: Renal impairment: Dose reduction may be required.
Administration	Should be taken with food.
Contraindications	Hypersensitivity; optic neuritis. Lactation.
Special Precautions	Impaired pre-treatment visual acuity, elderly, children. Perform liver, kidney and visual acuity tests regularly.

	Impaired pre-treatment visual acuity, elderly, children. Perform liver, kidney and visual acuity tests regularly. Caution when assessing visual acuity in patients with cataracts, DM, recurrent eye inflammation to make sure that changes are not due to the underlying causes.
Adverse Drug Reactions	Retrobulbar neuritis with a reduction in visual acuity, constriction of visual field, central or peripheral scotoma and green-red colour blindness. Retinal haemorrhage (rare); reduced renal clearance of urates (acute gout); GI disturbances eg, nausea, vomiting, abdominal pain, anorexia; rash, headache, dizziness, confusion, hallucinations, malaise, jaundice; thrombocytopenia; pulmonary infiltrates.
Drug Interactions	Absorption delayed or reduced by aluminum hydroxide. Synergistic effect with other antitubercular agents.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-25°C.
Mechanism of Action	Ethambutol interferes with RNA synthesis, causing suppression of Mycobacteria multiplication. It also has bacteriostatic action against M tuberculosis by acting on rapidly growing pathogens in cavity walls and is also effective in slow-growing pathogens. Has some action against atypical opportunistic Mycobacteria e.g. M kansasii, M avium complex (MAC). Absorption: 80% is absorbed from the GI tract (oral).

	against atypical opportunistic Mycobacteria e.g. M kansasii, M avium complex (MAC). Absorption: 80% is absorbed from the GI tract (oral). Distribution: Lungs, kidneys, erythrocytes, CSF (in meningitis); crosses the placenta and enters breast milk. Metabolism: Hepatic: Converted to the aldehyde and dicarboxylic acid derivatives (inactive). Excretion: Via urine (as unchanged, 8-15% as metabolites), via faeces (20% as unchanged); 3-4 hr (elimination half-life).
CIMS Class	Anti-TB Agents
ATC Classification	J04AK02 - ethambutol; Belongs to the class of other drugs used in the treatment of tuberculosis.

***ethambutol information:**

ethinylestradiol

CIMS Class : (Oestrogens & Progesterones & Related Synthetic Drugs)
ethinylestradiol

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related ethinylestradiol information

Indication & Dosage

Oral

Menopausal hormone replacement therapy

Adult: In menopausal women: 10-20 mcg daily in conjunction with a progestogen in women with uterus.

Oral

Female hypogonadism

Adult: 10-50 mcg daily in a cyclical regimen.

Oral

Palliative treatment of breast carcinoma

Adult: In postmenopausal women: 0.1-1 mg tid.

Oral

Palliative treatment of prostatic carcinoma

Adult: 0.15-3 mg daily.

Oral

As part of combined oral contraceptive

Adult: As the oestrogenic component of combined oral contraceptive: 20-40 mcg/day.

	As part of combined oral contraceptive Adult: As the oestrogenic component of combined oral contraceptive: 20-40 mcg/day.
Contraindications	Uterine, liver and mammary carcinoma, thromboembolic disorders. Pregnancy, lactation, untreated endometriosis, jaundice, undiagnosed vag bleeding.
Special Precautions	Asthma; epilepsy; migraine; DM; cardiac or renal dysfunction; hepatic disease; familial defects of lipoprotein metabolism. Increased risk of endometrial cancer in unopposed oestrogen therapy. Increased risk of gallbladder disease in women on postmenopausal oestrogens. Large doses may increase CV risk, BP, risk of thrombophlebitis and pulmonary embolism.
Adverse Drug Reactions	Oedema, hypertension; dizziness; headache; thromboembolism; cholestatic jaundice; nausea, vomiting; disturbance of menstrual cycle; fluid retention, discomfort in breast, wt gain/loss; increased appetite, increased tendency for vag candidiasis; mental depression; alteration in libido; rashes; alopecia, hirsutism; gynaecomastia and impotence. Potentially Fatal: Endometrial cancer (prolonged use).
Drug Interactions	CYP1A2 and CYP3A4 inducers such as aminoglutethimide, carbamazepine, phenobarbital, and rifampin may decrease the effects of estradiol. May enhance the effects of hydrocortisone and prednisolone when used together. Altered anticoagulant effect when used with dicoumarol. Potentially Fatal: Antibiotics (ampicillin, tetracycline, sulphonamides and chloramphenicol) can cause intermenstrual bleeding or failure of contraception. Reduced efficacy of antihypertensives or hypoglycaemic drugs.
Food Interaction	Folic acid absorption may be decreased. Black cohosh, dong quai, red clover, saw palmetto, ginseng, St John's wort.

	Folic acid absorption may be decreased. Black cohosh, dong quai, red clover, saw palmetto, ginseng, St John's wort.
Lab Interference	Reduced response to metyrapone test.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Mechanism of Action	Oestradiol is the major oestrogen in pre-menopausal women. Ethinylestradiol has similar actions as oestradiol. It is responsible for the development and maintenance of female reproductive system and secondary sexual characteristics. It also inhibits anterior pituitary by negative feedback effect and causes capillary dilation, fluid retention and protein anabolism. Absorption: Rapidly and well absorbed from the GI tract. Systemic bioavailability: About 40%. Distribution: Highly protein bound. Metabolism: Hepatically metabolised. Excretion: Urine and faeces.
CIMS Class	Oestrogens & Progesterones & Related Synthetic Drugs

ethionamide

CIMS Class : (Anti-TB Agents) , (Antileprotics)
ethionamide

P - Caution when used during pregnancy

L - Caution when used during lactation

related ethionamide information

Indication & Dosage	<i>Oral</i> Tuberculosis, Leprosy Adult: 15-20 mg/kg/day. Max: 1 g/day. Child: Tuberculosis: 15-20 mg/kg/day, given in 2-3 divided doses. Max: 1 g/day. Elderly:
Administration	Should be taken with food. (Take at mealtimes.)
Contraindications	Hypersensitivity, severe liver disease, porphyria.
Special Precautions	Difficulty in managing DM. Monitor blood glucose, thyroid and visual function. Perform LFT before and during treatment. Caution in patients with psychiatric illness or depression. Pregnancy, lactation.
Adverse Drug Reactions	Anorexia, excessive salivation, metallic taste, nausea, vomiting, abdominal pain, diarrhoea. Peripheral and/or optic neuritis, psychiatric disturbances eg, depression, anxiety, psychosis, postural hypotension. Jaundice, hepatitis. Thrombocytopenia, skin rashes, stomatitis, gynaecomastia.
Drug Interactions	May increase serum levels of isoniazid and potentiate the

Drug Interactions	May increase serum levels of isoniazid and potentiate the adverse effects of other antituberculous drugs when used concurrently. May cause psychotic reaction when taken with excessive ethanol. Potentially Fatal: Increased incidence of hepatotoxicity with rifampicin. Increase CNS toxicity with cycloserine.
Storage	Oral: Store at 25°C.
Mechanism of Action	Ethionamide inhibits peptide synthesis. It is active against mycobacteria species. Bacteriostatic against <i>M. tuberculosis</i>. Also active against atypical mycobacteria eg, <i>M. kansasii</i>, and some strains of <i>M. avium</i> complex, and <i>M. leprae</i>. Absorption: Readily absorbed from the GIT (oral). Distribution: Body tissues and fluids (wide), CSF (concentrations equiv to serum), crosses the placenta. Protein-binding: 30% Metabolism: Extensive hepatic metabolism; converted to the active sulfide and some inactive metabolites. Excretion: Via urine (<1% as unchanged); 2-3 hrs (elimination half-life).
CIMS Class	Anti-TB Agents / Antileprotics
ATC Classification	J04AD03 - ethionamide; Belongs to the class of thiocarbamide derivative antimycobacterials. Used in the treatment of tuberculosis.

etidronate

CIMS Class : (Agents Affecting Bone Metabolism)
etidronate

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related etidronate information

Indication & Dosage

Oral

Paget's disease of bone

Adult: Initial dose: 5 mg/kg/day up to 6 mth. For severe disease, may use up to 10 mg/kg/day for not >3 mth.

Further treatment should only be given after a drug-free interval of at least 3 mth and after evidence of relapse.

Subsequent treatment period should not exceed initial treatment period. Max dose: 20 mg/kg/day.

Oral

Treatment and prophylaxis of ectopic ossification complicating hip replacement

Adult: 20 mg/kg/day for 1 mth before and 3 mth after the operation. For ectopic ossification due to spinal cord injury: 20 mg/kg daily for 2 wk followed by 10 mg/kg daily for 10 wk.

Oral

Osteoporosis in postmenopausal women

Adult: Given on a cyclic basis: 400 mg/day for 14 days

	<i>Oral</i> Osteoporosis in postmenopausal women Adult: Given on a cyclic basis: 400 mg/day for 14 days followed by the equivalent of 500 mg of elemental calcium for 76 days. Treatment may be continued for up to 3 yr. <i>Intravenous</i> Hypercalcaemia of malignancy Adult: 7.5 mg/kg/day via slow infusion for 3 consecutive days, up to 7 days if necessary. Dose to be diluted in 250 mL of NaCl 0.9% and infused over at least 2 hr. Ensure at least 7-day interval between treatment courses. Maintenance therapy (via oral route): 20 mg/kg/day for 30-90 days, to be started on the day after the last IV dose.
Contraindications	Osteoporosis with hypercalcaemia/hypercalciuria; osteomalacia.
Special Precautions	In paget's disease, ensure 90 day drug-free interval between treatment courses; renal disease, children, malnutrition, patients with fractures (especially of long bones). May exacerbate asthma in asthmatics. Pregnancy, lactation.
Adverse Drug Reactions	GI symptoms like abdominal pain, constipation, diarrhoea and nausea, hypersensitivity reactions including angioedema, urticaria, rash and pruritus, increase or recurrent bone pain at pagetic sites or the onset of pain at previously asymptomatic sites, metallic, altered or loss of taste during or shortly after the treatment. Headache, paraesthesia, leucopenia, agranulocytosis.
Drug Interactions	Calcium, iron and antacids reduce absorption. May increase prothrombin time when used with warfarin. May increase GI and/or renal side effects when used with NSAIDs.
Food Interaction	Food, milk and dairy products interfere with its absorption.
Pregnancy	

Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store below 40°C. Oral: Store below 40°C.
Mechanism of Action	Etidronate is a bisphosphonate which inhibits the growth and dissolution of hydroxyapatite crystals in bone and may also directly impair osteoclast activity. It diminishes bone resorption and thus reduces bone turnover. Absorption: Variable absorption and may be dose dependent. Metabolism: Rapidly cleared from the blood. Excretion: Plasma half-life: 1-6 hr. About 50% is excreted in the urine within 24 hr.
CIMS Class	Agents Affecting Bone Metabolism
ATC Classification	M05BA01 - etidronic acid; Belongs to the class of bisphosphonates. Used in the treatment of bone diseases.

etodolac

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
etodolac

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ✖ - Lab interference

Food ✖ - Food interaction

related etodolac information

Indication & Dosage

Oral

Osteoarthritis

Adult: 600-1000 mg/day in divided doses adjusted according to response.

Max Dosage: 1200 mg daily.

Oral

Rheumatoid arthritis

Adult: 600-1000 mg/day in divided doses adjusted according to response.

Max Dosage: 1200 mg daily.

Oral

Acute pain

Adult: 200-400 mg every 6-8 hr. Max: 1 g/day.

Administration

Should be taken with food. (Take w/ or immediately after meals.)

Contraindications

Peptic ulcer, hypersensitivity to etodolac/NSAIDs. Childn; pregnancy (3rd trimester) and lactation.

	Peptic ulcer, hypersensitivity to etodolac/NSAIDs. Childn; pregnancy (3rd trimester) and lactation.
Special Precautions	CHF, dehydration, impaired renal, hepatic function, history of GI disease. Elderly, patients receiving anticoagulant.
Adverse Drug Reactions	GI disturbances; CNS effects; hypersensitivity reactions. Rash, pruritus; neuromuscular and skeletal weaknesses; blurred vision. Potentially Fatal: Acute renal failure; blood disorder; nephrotoxicity; angioedema, arrhythmia, bone marrow suppression, CHF, dyspnoea, erythema multiforme, exfoliative dermatitis, hepatitis, hypertension, peripheral neuropathy, Stevens-Johnson syndrome, syncope, tachycardia, toxic amblyopia, toxic epidermal necrolysis, urticaria.
Drug Interactions	Increased effect of warfarin, lithium, methotrexate, digoxin, cyclosporin, aspirin. Effect may be reduced with aspirin. Reduced effect of some diuretics and β-blockers. Alcohol enhances gastric mucosal irritation.
Food Interaction	Peak serum levels and GI distress decreased when taken with food. Cat's claw, dong quai, evening primrose, feverfew, ginkgo, red clover, horse chestnut, green tea and ginseng enhance the antiplatelet effect.
Lab Interference	False-positive for urinary bilirubin and ketones. Increased bleeding time.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 3rd trimester or near delivery.

	in 3rd trimester or near delivery. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Etodolac is an NSAID derived from pyrano-indoleacetic acid, inhibits cyclooxygenase 2 (COX-2) resulting in decreased prostaglandin precursor formation. Onset: Analgesic: 2-4 hrs.
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AB08 - etodolac; Belongs to the class of acetic acid derivatives and related substances of non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism.

etoposide

CIMS Class : (Cytotoxic Chemotherapy)
etoposide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related etoposide information

Indication & Dosage

Intravenous

Testicular cancer

Adult: For combination therapy: 50-100 mg/m² BSA/day from days 1-5, or 100 mg/m² on days 1, 3 and 5. May repeat course at 3-4 wkly intervals after recovery from any toxicity. Inj must be diluted with 5% dextrose or normal saline to give a final concentration of 0.2-0.4 mg/ml and injected over 30-60 minutes.

CrCl (ml/min)	Dosage Recommendation
15-50	75% of the recommended dose.

Intravenous

Small cell lung cancer

Adult: 35 mg/m² BSA/day for 4 days to 50 mg/m² BSA/day for 5 days. May repeat course at 3-4 wkly intervals after recovery from any toxicity. Inj must be diluted with 5% dextrose or normal saline to give a final concentration of 0.2-0.4 mg/ml and injected over 30-60 minutes. When given via oral capsules: the recommended dose is twice the IV

	dextrose or normal saline to give a final concentration of 0.2-0.4 mg/ml and injected over 30-60 minutes. When given via oral capsules: the recommended dose is twice the IV dose rounded to the nearest 50 mg.	
Administration	Should be taken on an empty stomach. (Take on an empty stomach.)	
Contraindications	Hypersensitivity, pregnancy, lactation.	
Special Precautions	Skin reactions may occur with accidental exposure; renal or hepatic disease. Periodic CBCs should be done before, during and after therapy. Increased risk of etoposide-toxicity in patients with low serum albumin. Acrylic material has been shown to crack and leak when used with undiluted etoposide inj.	
Adverse Drug Reactions	Nausea, vomiting, anorexia, diarrhoea, stomatitis; reversible alopecia; rarely, disturbances of liver dysfunction, peripheral neuropathy, CNS effects, anaphylactoid reactions; hypotension with IV injection. Local irritation and thrombophlebitis at the site of inj. Potentially Fatal: Severe myelosuppression, characterised by leucopaenia and thrombocytopaenia. Cardiotoxicity. Anaphylaxis.	
Drug Interactions	Synergism with other cytotoxic drugs. Caution when admin with drugs that inhibit phosphatase activity. Cyclosporin A may reduce the clearance of etoposide.	
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).	
Storage	Intravenous: Refrigerate at 2-8°C. Do not freeze. Conc for inj: Store at 15-30°C.	

Mechanism of Action	Etoposide is a derivative of podophyllotoxin that inhibits DNA synthesis resulting in the arrest of the cell cycle. At low doses, it inhibits cells from entering cell cycle and at high doses, cells entering mitosis are lysed. Absorption: Oral admin: 50% absorbed from the GI tract; plasma concentrations peak after 1 hr. Distribution: Rapid distribution but poor penetration of the blood-brain barrier. Protein-binding: 94%. Metabolism: Metabolised by CYP3A4. Excretion: Terminal half-life: 4-11 hr. Excreted in urine and faeces.
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01CB01 - etoposide; Belongs to the class of plant alkaloids and other natural products, podophyllotoxin derivatives. Used in the treatment of cancer.

etoricoxib

CIMS Class : (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
etoricoxib

P - Caution when used during pregnancy
L - Contraindicated in lactation

related etoricoxib information

Indication & Dosage	<i>Oral</i> Osteoarthritis Adult: 60 mg once daily. Hepatic impairment: Mild impairment (Child-Pugh score of 5 or 6): 60 mg once daily; moderate impairment (Child-Pugh 7-9): 60 mg every other day. Avoid in severe hepatic impairment (Child-Pugh =10). <i>Oral</i> Rheumatoid arthritis Adult: 90 mg once daily. Hepatic impairment: Mild impairment (Child-Pugh score of 5 or 6): 60 mg once daily; moderate impairment (Child-Pugh 7-9): 60 mg every other day. Avoid in severe hepatic impairment (Child-Pugh =10). <i>Oral</i> Acute gout Adult: 120 mg once daily. Max duration: 8 days. Hepatic impairment: Mild impairment (Child-Pugh score of 5 or 6): 60 mg once daily; moderate impairment (Child-Pugh

	Adult: 120 mg once daily. Max duration: 8 days. Hepatic impairment: Mild impairment (Child-Pugh score of 5 or 6): 60 mg once daily; moderate impairment (Child-Pugh 7-9): 60 mg every other day. Avoid in severe hepatic impairment (Child-Pugh =10).
Administration	May be taken with or without food.
Contraindications	Inflammatory bowel disease, severe congestive heart failure, active peptic ulceration, cerebrovascular disease, CrCL <30 ml/min; lactation. Children and adolescent < 16 yr.
Special Precautions	Allergic disorders, coagulation defects; history of cardiac failure, left ventricular dysfunction, hypertension, or in patients with oedema due to other reasons; elderly, renal, cardiac or hepatic impairment. Withdraw treatment if GI lesions develop; caution when admin to dehydrated patients. Regular BP monitoring is advisable. May mask fever and other signs of infection. Pregnancy.
Adverse Drug Reactions	GI disorders; ischemic cardiac events; hypersensitivity reactions, headache, dizziness, nervousness, depression, drowsiness, insomnia, vertigo, tinnitus, photosensitivity; blood disorders, fluid retention, hypertension; dry mouth, taste disturbance, mouth ulcers; appetite and wt changes; chest pain, fatigue, paraesthesia, influenza-like syndrome, myalgia. Renal toxicity.
Drug Interactions	CYP3A4 inhibitors or inducers; rifampicin, ethinylloestradiol; oral salbutamol and minoxidil. Antidepressant SSRIs and venlafaxine may increase risk of bleeding. Risk of side effects increased with concomitant use of aspirin, ciclosporin, ketorolac or other NSAIDs. Lithium and methotrexate, coumarins, phenindione, phenytoin and sulphonylureas.
Mechanism of	Etoricoxib selectively inhibits cyclooxygenase 2 (COX-2).

Mechanism of Action	Etoricoxib selectively inhibits cyclooxygenase 2 (COX-2).
CIMS Class	Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AH05 - etoricoxib; Belongs to the class of non-steroidal antiinflammatory and antirheumatic products, coxibs. Used in the treatment of inflammation and rheumatism.

exemestane

CIMS Class : (Cytotoxic Chemotherapy)
exemestane

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related exemestane information

Indication & Dosage	<i>Oral</i> Advanced or locally advanced breast cancer Adult: In women who are no longer responsive to anti-oestrogen therapy: 25 mg once daily.
Administration	Should be taken with food. (Take after a meal.)
Contraindications	Hypersensitivity. Premenopausal women. Pregnancy and lactation.
Special Precautions	Hepatic and renal impairment. Monitor bone mineral density at regular intervals especially in patients at risk of osteoporosis.
Adverse Drug Reactions	Hot flushes; nausea; fatigue; increased sweating; dizziness; headache; insomnia; skin rash; abdominal pain; anorexia, vomiting (less frequently), dyspepsia, depression, alopecia, peripheral oedema, constipation, dyspepsia. Rarely thrombocytopenia, leucopenia.
Drug Interactions	May result in reduced plasma levels of exemestane when used with CYP3A4 enzyme inducers. Oestrogen-containing drugs; St. John's wort, black cohosh, dong quai.

	May result in reduced plasma levels of exemestane when used with CYP3A4 enzyme inducers. Oestrogen-containing drugs; St. John's wort, black cohosh, dong quai.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Exemestane is an irreversible selective aromatase inhibitor which acts as a false substrate for the aromatase enzyme, forming an intermediate that binds irreversibly to the active site causing its inactivation. It also lowers circulating oestrogens in estrogen-dependent breast carcinoma. Absorption: Rapidly absorbed. Distribution: Widely distributed and extensively bound to plasma proteins. Metabolism: Metabolised via oxidation by CYP3A4, and via reduction by aldoketoreductase Excretion: Metabolites are excreted in urine and faeces, less than 1% excreted unchanged in the urine.
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L02BG06 - exemestane; Belongs to the class of enzyme inhibitors. Used in endocrine therapy.

***exemestane information:**

ezetimibe

CIMS Class : (Dyslipidaemic Agents)
ezetimibe

L - Contraindicated in lactation

related ezetimibe information

Indication & Dosage	<i>Oral</i> Hyperlipidaemias, Homozygous familial sitosterolaemia Adult: 10 mg once daily.
Administration	May be taken with or without food.
Contraindications	Hypersensitivity; moderate to severe liver disease or unexplained serum transaminase elevation. Children <10 yr, lactation.
Special Precautions	Renal or mild hepatic impairment. Monitor LFTs. Immediately discontinue ezetimibe and any HMG-CoA reductase inhibitor or fibrate if myopathy is diagnosed or suspected. Exclude or treat secondary causes of dyslipidaemia prior to initiating therapy.
Adverse Drug Reactions	Abdominal discomfort, headache, dizziness, sinusitis, pharyngitis; diarrhoea, chest pain, arthralgia, myalgia, resp infection and fatigue.
Drug Interactions	Concomitant admin of ezetimibe with cholestyramine may decrease serum levels of ezetimibe resulting in lower efficacy. Concurrent use of ezetimibe and cyclosporine may

	Concomitant admin of ezetimibe with cholestyramine may decrease serum levels of ezetimibe resulting in lower efficacy. Concurrent use of ezetimibe and cyclosporine may lead to increased exposure to both drugs, thus caution should be exercised.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 25°C.
Mechanism of Action	Ezetimibe localises at the brush border of the small intestine where it inhibits the absorption of cholesterol, thus decreasing its delivery to the liver. This results in decrease in cholesterol stores within the liver and an increase in cholesterol clearance from the blood. Absorption: Peak plasma concentrations after 4-12 hr. Distribution: Protein-binding: >90%. Metabolism: Undergoes conjugation in small intestines and liver. Excretion: Faeces (69% unchanged drug); urine (9% metabolite); 22 hr (elimination half-life).
CIMS Class	Dyslipidaemic Agents
ATC Classification	C10AX09 - ezetimibe; Belongs to the class of other cholesterol and triglyceride reducers. Used in the treatment of hyperlipidemia.

famciclovir

CIMS Class : (Antivirals)
famciclovir

P - Caution when used during pregnancy

L - Contraindicated in lactation

related famciclovir information

Indication & Dosage

Oral

Herpes zoster (shingles)

Adult: 250 mg tid or 750 mg once daily for 7 days. In immunocompromised patients, 500 mg tid for 10 days.

Renal impairment: For immunocompromised patients: CrCl >40 ml/min: 500 mg tid; 30-39 ml/min: 250 mg tid; 10-29 ml/min: 125 mg tid.

CrCl (ml/min)	Dosage Recommendation
30-59	For immunocompetent patients: 250 mg bid.
10-29	For immunocompetent patients: 250 mg once daily.

Oral

Acute treatment of recurrent episodes of genital herpes

Adult: 125 mg bid for 5 days. In immunocompromised patients, 500 mg bid for 7 days. Initiate treatment in the prodromal period as soon as the first signs or symptoms appear.

CrCl (ml/min)	Dosage Recommendation
---------------	-----------------------

prodromal period as soon as the first signs or symptoms appear.

CrCl (ml/min)	Dosage Recommendation
10-29	For immunocompetent patients: 125 mg once daily.

Oral

Suppression of recurrent episodes of genital herpes

Adult: 250 mg bid. For HIV patients, 500 mg bid. Interrupt treatment at every 6-12 mth intervals to observe for possible changes in the natural history of the disease.

CrCl (ml/min)	Dosage Recommendation
>30	For immunocompetent patients: 250 mg bid.
10-29	For immunocompetent patients: 125 mg bid

Oral

Acute treatment of recurrent mucocutaneous herpes in HIV-infected patients

Adult: 500 mg bid for 7 days.

Renal impairment: Dose reduction may be needed.

Oral

Genital herpes

Adult: For first episodes: 250 mg tid for 5 days. In immunocompromised patients, 500 mg bid for 7 days.

CrCl (ml/min)	Dosage Recommendation
30-59	For immunocompetent patients: 250 mg bid.
10-29	For immunocompetent patients: 250 mg once daily.

Oral

Recurrent herpes labialis

Adult: 1.5 g as a single dose, initiate at 1st sign or symptom such as burning or tingling.

Administration

May be taken with or without food.

Administration	May be taken with or without food.
Contraindications	Hypersensitivity. Lactation.
Special Precautions	Renal impairment. Pregnancy.
Adverse Drug Reactions	Dizziness, headache, diarrhoea, constipation, nausea, vomiting, hallucinations, confusion, pruritus, abdominal pain, fever.
Drug Interactions	Increase effect/toxicity of cimetidine, probenecid, theophylline.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Famciclovir rapidly undergoes biotransformation to penciclovir, which has inhibitory activity against HSV types 1 (HSV-1) and 2 (HSV-2) varicella-zoster virus (VZV). Thymidine kinase then phosphorylates penciclovir to a monophosphate form, which is then converted to penciclovir triphosphate. This inhibits HSV-2 DNA polymerase by competing with deoxyguanosine triphosphate, thus inhibiting herpes viral DNA synthesis and replication. Absorption: Rapidly absorbed from the GI tract (oral); peak plasma concentrations after 1 hr. Delayed by the presence of food. Metabolism: Converted to penciclovir. Excretion: Via urine (as metabolite and 6-deoxypericiclovir); reduced in patients with renal impairment.

	Metabolism: Converted to penciclovir. Excretion: Via urine (as metabolite and 6-deoxypenciclovir); reduced in patients with renal impairment.
CIMS Class	Antivirals
ATC Classification	J05AB09 - famciclovir; Belongs to the class of nucleosides and nucleotides excluding reverse transcriptase inhibitors. Used in the systemic treatment of viral infections. S01AD07 - famciclovir; Belongs to the class of anti-infectives, antivirals. Used in the treatment of eye infections.

famotidine

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants)
famotidine

P - Caution when used during pregnancy

L - Contraindicated in lactation

related famotidine information

Indication & Dosage

Oral

Benign gastric and duodenal ulceration

Adult: 40 mg daily at bedtime for 4-8 wk or 20 mg bid. To prevent recurrence of duodenal ulceration: 20 mg at bedtime may be taken.

CrCl (ml/min)	Dosage Recommendation
<50	Halve the dose or increase dosing interval to 36-48 hr.

Oral

Gastro-oesophageal reflux disease

Adult: 20 mg bid for 6-12 wk or up to 40 mg bid if there is oesophageal ulceration. Maintenance dose: 20 mg bid may be given to prevent recurrence.

Child: 1-16 yr: 1-2 mg/kg/day divided bid up to 40 mg bid.

CrCl (ml/min)	Dosage Recommendation
<50	Halve the dose or increase dosing interval to 36-48 hr.

Oral

Zollinger-Ellison syndrome

Adult: Initially, 20 mg every 6 hr, up to 800 mg daily if necessary.

Child: 1-16 yr: 0.5-1 mg/kg/day up to 40 mg/day, given once at bedtime or taken bid.

CrCl (ml/min)	Dosage Recommendation
<50	Halve the dose or increase dosing interval to 36-48 hr.

Oral

Non-ulcer dyspepsia

Adult: 10 mg bid.

CrCl (ml/min)	Dosage Recommendation
<50	Halve the dose or increase dosing interval to 36-48 hr.

Oral

Heartburn

Adult: 10 mg bid.

CrCl (ml/min)	Dosage Recommendation
<50	Halve the dose or increase dosing interval to 36-48 hr.

Intravenous

Benign gastric and duodenal ulceration

Adult: 20 mg every 12 hr, as an inj over at least 2 minutes or as an infusion over 15-30 minutes.

CrCl (ml/min)	Dosage Recommendation
<50	Halve the dose or increase dosing interval to

	or as an infusion over 15-30 minutes. <50 Halve the dose or increase dosing interval to 36-48 hr.
Administration	May be taken with or without food.
Contraindications	Hypersensitivity; lactation.
Special Precautions	Impaired renal function, liver cirrhosis; pregnancy. Possibility of malignancy should be considered prior to initiating treatment as drug may mask symptoms and delay diagnosis. No safety and efficacy data is available for children <1 yr.
Adverse Drug Reactions	Headache, dizziness, constipation, diarrhoea, nausea, rash, GI discomfort, fatigue, gynaecomastia, impotence.
Drug Interactions	Reduced absorption of famotidine with antacids hence admin should be separated by 2 hr. Reduced absorption of ketoconazole and itraconazole. Avoid ethanol (may cause gastric mucosal irritation).
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Refrigerate at 2-8°C. Do not freeze. Oral: Store below 25°C.
Mechanism of Action	Famotidine competitively blocks histamine H₂-receptors thus reducing basal, nocturnal and stimulated gastric acid secretion. Pepsin secretion is reduced resulting in decreased peptic activity. It effectively heals duodenal and gastric ulcers and prevents recurrence. Absorption: Readily but incompletely absorbed from the GI tract; peak plasma concentrations after 1-3 hr (oral).

	gastric ulcers and prevents recurrence. Absorption: Readily but incompletely absorbed from the GI tract; peak plasma concentrations after 1-3 hr (oral). Distribution: Enters the breast milk. Protein-binding: 15-20%. Metabolism: Hepatic (small proportion); converted to famotidine S-oxide. Excretion: Urine (as unchanged) within 24 hr; 2.5-3.5 hr (elimination half-life).
CIMS Class	Antacids, Antireflux Agents & Antiulcerants
ATC Classification	A02BA03 - famotidine; Belongs to the class of H2-receptor antagonists. Used in the treatment of peptic ulcer and gastro-oesophageal reflux disease (GERD).

felodipine

CIMS Class : (Calcium Antagonists) , (Anti-Anginal Drugs)
felodipine

P - Contraindicated in pregnancy

L - Caution when used during lactation

Food α - Food interaction

related felodipine information

Indication & Dosage

Oral

Hypertension

Adult: As modified-release preparation: Initially, 5 mg once daily in the morning, adjust dose according to patient's response. Maintenance: 2.5-10 mg daily. Up to 20 mg daily may be used if needed.

Renal impairment: Dose reduction may be required.

Oral

Angina pectoris

Adult: Initially, 5 mg daily, increased to 10 mg daily if necessary.

Renal impairment: Dose reduction may be required.

Administration

May be taken with or without food. (Take without food or w/ a light meal.)

Overdosage

Overdosage may cause excessive peripheral vasodilation with marked hypotension and bradycardia. Treatment is symptomatic. Patient should be placed supine with the legs

	Overdosage may cause excessive peripheral vasodilation with marked hypotension and bradycardia. Treatment is symptomatic. Patient should be placed supine with the legs elevated. IV fluids may be given to treat hypotension due to overdosage with calcium antagonists. IV atropine (0.5-1 mg) should be given if there is bradycardia.
Contraindications	Hypersensitivity. Pregnancy.
Special Precautions	Impaired renal or hepatic function, CHF, sick-sinus syndrome, severe left ventricular dysfunction, hypertrophic cardiomyopathy. May cause hypotension with reflex tachycardia resulting in MI in susceptible patients; severe liver disease. Elderly, children. Lactation.
Adverse Drug Reactions	Flushing, headache, peripheral oedema, tachycardia, palpitation, dizziness, fatigue. Ankle swelling may occur. Hyperplasia, rash, pruritus. Gingival enlargement, angina, angioedema, decreased libido, insomnia, irritability in patients with pronounced gingivitis or periodontitis.
Drug Interactions	Increased absorption with ethanol. Plasma levels increased by enzyme inhibitors e.g. cimetidine. Plasma levels reduced by enzyme inducers e.g. phenytoin, carbamazepine and barbiturates. Potentially Fatal: Additive hypotensive effect with sildenafil and vardenafil. Increased conc with ciclosporin. Increases plasma digoxin concentrations by approximately 40%.
Food Interaction	Grapefruit juice significantly increase bioavailability. High fat and carbohydrate meals.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.

Storage	Oral: Store below 30°C.
Mechanism of Action	Felodipine relaxes coronary vascular smooth muscles by inhibiting calcium ions from entering the 'slow channels' or voltage-sensitive areas of vascular smooth muscles and myocardium during depolarisation. It also increases myocardial O₂ delivery in patients with vasospastic angina. Absorption: Almost completely absorbed from the GI tract (oral). Distribution: Protein-binding: 99%. Metabolism: Gut and liver (extensive 1st pass effect). Excretion: Via urine (70% as metabolites), via faeces (remaining dose); 11-16 hr (elimination half-life).
CIMS Class	Calcium Antagonists / Anti-Anginal Drugs
ATC Classification	C08CA02 - felodipine; Belongs to the class of selective dihydropyridine derivative calcium-channel blockers with mainly vascular effects. Used in the treatment of cardiovascular diseases.

fenofibrate

CIMS Class : (Dyslipidaemic Agents)
fenofibrate

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related fenofibrate information

Indication & Dosage

Oral

Hyperlipidaemias

Adult: Dose depends on the formulation used. For standard micronised formulations: Initially, 67 mg tid or 200 mg once daily, may reduce to 67 mg bid or increase to 67 mg 4 times daily. For non-micronised formulations: Initially, 200-300 mg daily in divided doses. Usual range: 200-400 mg daily. For formulations with improved bioavailability, doses between 40-160 mg daily may be used.

Child: 5 mg/kg daily.

Renal impairment: Dose reduction is necessary.

Administration

Should be taken with food.

Contraindications

Hypersensitivity; severe hepatic and renal impairment.
Unexplained persistent liver function abnormality and primary biliary cirrhosis; preexisting gall bladder disease.
Pregnancy, lactation.

Special Precautions	Renal or hepatic impairment. Monitor LFTs and blood counts regularly. Increased risk of cholelithiasis, pancreatitis, skeletal muscle effects. Withdraw treatment if no adequate response after 2 mth of treatment at max recommended dose.
Adverse Drug Reactions	Headache, dizziness, asthaenia, fatigue, arrhythmia, photosensitivity, eczema, dizziness, vaginitis, paraesthesia, rhinitis, cough, sinusitis, allergic pulmonary alveolitis, polyuria, myopathy, myositis, arthralgia, myalgia, myasthenia. Potentially Fatal: Hepatitis, cholecystitis.
Drug Interactions	Resins impede the absorption of fenofibrate. May increase ciclosporin concentration and associated nephrotoxicity when used together. Potentially Fatal: Statins increase the risk of rhabdomyolysis and myopathy with renal failure. May increase the effects of oral anticoagulants.
Food Interaction	Food increases the bioavailability of fenofibrate.
Lab Interference	Increased creatinine and gamma glutamyl transpeptidase.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 25°C.
Mechanism of Action	Fenofibrate lowers plasma TG by activating lipoprotein lipase thus increasing catabolism of very low-density lipoprotein with consequent increase in high-density

	Fenofibrate lowers plasma TG by activating lipoprotein lipase thus increasing catabolism of very low-density lipoprotein with consequent increase in high-density lipoprotein levels. Absorption: Readily absorbed from the GI tract (oral); reduced if taken after an overnight fast. Distribution: >99% bound to plasma albumin. Metabolism: Rapidly via hydrolysis; converted to fenofibric acid. Excretion: Urine (60% metabolite, glucuronide conjugate); faeces (25%); 20 hr (elimination half-life).
CIMS Class	Dyslipidaemic Agents
ATC Classification	C10AB05 - fenofibrate; Belongs to the class of fibrates. Used in the treatment of hyperlipidemia.

fenoverine

CIMS Class : (Antispasmodics)
fenoverine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related fenoverine information

Indication & Dosage	<i>Oral</i> Antispasmodic Adult: 100 mg tid or 200 mg bid for not >6 wk. Elderly: Max: 100 mg tid.
Administration	Should be taken with food.
Contraindications	Hypersensitivity, chronic liver disease, history of hyperthermia during or after anaesthesia or after physical effort, renal insufficiency, mitochondrial myopathy, pregnancy, lactation.
Special Precautions	In patients with renal or hepatic insufficiency and in patients >60 yr or with multiple drug therapy, in case of unexplained muscular pain or if myopathy is diagnosed.
Adverse Drug Reactions	Myalgias, reversible rhabdomyolysis, gastric upset.
Storage	Oral: Store below 25°C.
Mechanism of Action	Fenoverine is a non-anticholinergic synchronizer of smooth muscle motility. It modulates calcium gradient across the muscular cell membrane by regulating the influx of the

	Fenoverine is a non-anticholinergic synchronizer of smooth muscle motility. It modulates calcium gradient across the muscular cell membrane by regulating the influx of the extracellular calcium and/or release of the intracellular pool. Therefore, fenoverine effectively inhibits the asynchronous spasmodic contractions without appreciable interferences with the physiological synchronous motility of the intestine. Absorption: Oral: Well absorbed.
CIMS Class	Antispasmodics
ATC Classification	A03AX05 - fenoverine; Belongs to the class of other drugs used for functional bowel disorders.

fentanyl

CIMS Class : (Analgesics (Opioid))
fentanyl

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ∇ - Food interaction

related fentanyl information

Indication & Dosage

Oral

Breakthrough cancer pain

Adult: For patients who are already receiving and tolerant to opioid treatment: As a loz: Initially, 200 mcg over 15 minutes for an episode of breakthrough pain; may repeat once after 15 minutes if needed. Titrate subsequent doses based on response up to 1.6 mg per dose. Once the effective dose has been identified, no more than 4 unit doses should be taken daily.

Elderly: and debilitated patients: Dose reduction may be needed.

Intravenous

Adjunct to general anaesthesia

Adult: For patients with spontaneous respiration: Initially, 50-200 mcg followed by supplements of 50 mcg. To be injected over 3-5 minutes. Possible increased risk of resp depression following doses >200 mcg. For patients with assisted ventilation: Initially, 300-3,500 mcg (up to 50

injected over 3-5 minutes. Possible increased risk of resp depression following doses >200 mcg. For patients with assisted ventilation: Initially, 300-3,500 mcg (up to 50 mcg/kg) followed by supplements of 100-200 mcg depending on the patient's response. To be injected over 3-5 minutes.

Child: For patients with spontaneous respiration: >2 yr: 3-5 mcg/kg IV, supplements of 1 mcg/kg may be given. For patients with assisted ventilation: >2 yr: Initially, 15 mcg/kg with supplements of 1-3 mcg/kg.

Elderly: and debilitated patients: Dose reduction may be needed.

Transdermal

Intractable chronic pain

Adult: Patches deliver fentanyl in doses that range from 12-100 mcg/hr. Doses should be individually titrated based on previous use of opioids. For opioid-naïve patients: Initiate with patches that deliver not more than 25 mcg/hr of fentanyl. Recommended for opioid-naïve patients to start with low doses of short-acting opioids before starting on fentanyl patches. For patients who have been receiving a strong opioid, the initial dose should be based on the previous 24-hr opioid requirement. During transfer to fentanyl patches, previous opioid treatment should be phased out gradually. If patient requires doses >100 mcg/hr, >1 patch may be used; consider alternative or additional therapy if doses >300 mcg/hr are required. Replace patch every 72 hr and apply the new patch to a different site; avoid using the same area of skin for a few days.

Elderly: and debilitated patients: Dose reduction may be needed.

Intramuscular

Premedication before anaesthesia

	needed. <i>Intramuscular</i> Premedication before anaesthesia Adult: 50-100 mcg, to be given 30-60 minutes before induction of anaesthesia. Elderly: and debilitated patients: Dose reduction may be needed. Incompatibility: Thiopental sodium and methohexital sodium.
Contraindications	Hypersensitivity.
Special Precautions	Myasthenia gravis. Head injury; increased intracranial pressure; intracranial lesions; renal or hepatic impairment; neonates; opioid-intolerant patients. Increased risk of respiratory depression in elderly, debilitated patients, patient with hypoxia or hypercapnia. Hypothyroidism, prostatic hyperplasia, inflammatory bowel disorders, bradycardia or bradyarrhythmias. Rapid IV infusion may cause skeletal muscle and chest wall rigidity, impaired ventilation or respiratory distress/arrest. Prolonged use may cause tolerance, psychological and physical dependence. Abrupt withdrawal after prolonged admin may lead to withdrawal symptoms. Lactation. Pregnancy (avoid high doses or prolonged usage).
Adverse Drug Reactions	Nausea, vomiting; bradycardia, oedema, CNS depression, confusion, dizziness, drowsiness, headache, sedation, transient hypotension, peripheral vasodilation; increased intracranial pressure. High IV dose may cause chest wall rigidity. Transdermal: Rash, erythema and itching. Potentially Fatal: Respiratory depression, trunk rigidity, laryngospasm, bronchoconstriction.
Drug Interactions	Depressant effects may be enhanced by other CNS

Drug Interactions	Depressant effects may be enhanced by other CNS depressants e.g. alcohol, anaesthetics, anxiolytics, hypnotics, TCAs and antipsychotics. Ammonium chloride may increase excretion of fentanyl. Phenothiazines may increase hypotensive effect of opioid analgesics. Serum levels may be increased by CYP3A4 inhibitors (e.g. azole antifungals, clarithromycin, diclofenac, doxycycline, erythromycin, imatinib, isoniazid, nefazodone, nicardipine, propofol, protease inhibitors, quinidine, telithromycin and verapamil). May reduce the efficacy of pegvisomant. Serum levels may be reduced by rifamycin derivatives. May increase serotonergic effect of SSRIs and sibutramine.
Food Interaction	Avoid valerian, kava-kava and gotu kola. Serum levels may be reduced by St John's wort.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. if used for prolonged periods or in high doses at term. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intramuscular: Store between 20-25°C. Intravenous: Store

Storage	Intramuscular: Store between 20-25°C. Intravenous: Store between 20-25°C. Oral: Store between 20-25°C. Transdermal: Store between 20-25°C.
Mechanism of Action	Fentanyl is a potent opioid analgesic that increases pain threshold, alters pain reception and inhibits ascending pain pathways by binding to stereospecific receptors within the CNS. Onset: Rapid. Duration: Short. Distribution: Rapidly into tissues; appears in the CSF, crosses the placenta and small amounts enter the breast milk. Protein-binding: 80% Metabolism: Hepatic via N-dealkylation and hydroxylation. Excretion: Urine (as metabolites and unchanged drug); 4 hrs (elimination half-life).
CIMS Class	Analgesics (Opioid)
ATC Classification	N01AH01 - fentanyl; Belongs to the class of opioid anesthetics. Used as general anesthetics. N02AB03 - fentanyl; Belongs to the class of phenylpiperidine derivative opioids. Used to relieve pain.

ferrous fumarate

CIMS Class : (Vitamins & Minerals (Pre & Post Natal) / Antianemics)
ferrous fumarate

P - Caution when used during pregnancy

related ferrous fumarate information

Indication & Dosage	<i>Oral</i> Iron-deficiency anaemia Adult: Usual dose range: Up to 600 mg daily. May increase up to 1.2 g daily if necessary. Child: As syrup containing 140 mg(45 mg iron)/5ml. Preterm neonate: 0.6–2.4 ml/kg daily; up to 6 yr: 2.5–5 ml bid.
Administration	Should be taken on an empty stomach. (Best taken on an empty stomach. May be taken w/ meals to reduce GI discomfort.)
Overdosage	Symptoms: Nausea, vomiting, abdominal pain, diarrhoea, haematemesis and rectal bleeding. Hypotension, coma and hepatocellular necrosis may occur later. Treatment: Empty stomach contents by gastric lavage within 1 hr of ingestion. In severe toxicity, IV desferrioxamine may be given. Whole bowel irrigation may also be considered in severe poisoning.
Special Precautions	Patients with intestinal strictures and diverticular disease. May worsen diarrhoea in patients with inflammatory bowel disease. May cause constipation and faecal impaction in elderly. Avoid prolonged admin (>6 mth) except in patients with continued

	worsen diarrhoea in patients with inflammatory bowel disease. May cause constipation and faecal impaction in elderly. Avoid prolonged admin (>6 mth) except in patients with continued bleeding, menorrhagia or repeated pregnancies. Not for routine use in treatment of haemolytic anaemia unless an iron-deficient state exists. Parenteral iron should not be used concurrently with oral iron treatment. Avoid use in patients receiving repeated blood transfusions. Pregnancy.
Adverse Drug Reactions	GI disturbance including constipation, diarrhoea, dark stools. Nausea and epi-gastric pain.
Drug Interactions	Oral absorption of iron may be increased when taken with ascorbic acid. May reduce the absorption of quinolones and tetracyclines when taken concurrently via the oral route. Concurrent admin with antacids may reduce the absorption of ferrous fumarate from the GI tract. May reduce the absorption of penicillamine in the gut when taken concurrently.
Mechanism of Action	Ferrous fumarate is an iron preparation that is used in the prevention and treatment of iron deficiency. The amount of elemental iron is 330 mg/g of ferrous fumarate. Absorption: GI iron absorption depends on the amount of stored iron in the body; absorption is higher when stored iron is low. Distribution: Ferrous iron passes through the GI mucosal cells, bind to transferrin and is then transported to the bone marrow and incorporated into haemoglobin. Excretion: Mainly through the faeces and desquamation of cells e.g. skin, hair or GI mucosa.
CIMS Class	Vitamins & Minerals (Pre & Post Natal) / Antianemics
ATC Classification	B03AA02 - ferrous fumarate; Belongs to the class of oral iron bivalent preparations. Used in the treatment of anemia. B03AD02 - ferrous fumarate; Belongs to the class of iron in

B03AA02 - ferrous fumarate; Belongs to the class of oral iron bivalent preparations. Used in the treatment of anemia.

B03AD02 - ferrous fumarate; Belongs to the class of iron in combination with folic acid. Used in the treatment of anemia.

ferrous fumarate + folic acid

CIMS Class : (Vitamins & Minerals (Pre & Post Natal) / Antianemics)
ferrous fumarate + folic acid

P - Caution when used during pregnancy

related ferrous fumarate + folic acid information

Indication & Dosage	<i>Oral</i> Prophylaxis of iron deficiency in pregnancy Adult: Each tablet containing ferrous fumarate 322 mg and folic acid 0.35 mg. For pregnant women from 13th wk of gestation onwards: 1 tablet daily.
Overdosage	Acute poisoning in young children is especially dangerous. Symptoms: Abdominal pain, vomiting and diarrhoea. CV collapse with coma may follow. In severe cases, deterioration may occur involving diffuse vascular congestion, pulmonary oedema, convulsions, anuria, hypothermia, severe shock and metabolic acidosis. Treatment includes inducing vomiting and gastric lavage. In severe cases, parenteral desferrioxamine may be used.
Contraindications	Paroxysmal nocturnal haemoglobinuria, haemosiderosis, haemochromatosis.
Special Precautions	Avoid use in patients with active peptic ulcer, repeated blood transfusion, regional enteritis and ulcerative colitis. Caution when used in patients with folate-dependent tumours. Not recommended for use during 1st trimester of pregnancy.

	transfusion, regional enteritis and ulcerative colitis. Caution when used in patients with folate-dependent tumours. Not recommended for use during 1st trimester of pregnancy.
Adverse Drug Reactions	GI discomfort, anorexia, nausea, vomiting, constipation, diarrhoea. Stool darkening may occur.
Drug Interactions	Concurrent admin may reduce the efficacy of fluoroquinolones, levodopa, carbidopa, thyroxine and bisphosphonates. Iron may reduce the absorption of penicillamine by forming complexes. Concurrent admin with tetracycline may lead to reduced absorption of tetracycline and iron. Antacids may reduce the absorption of iron. Serum levels of anticonvulsants may be reduced by folic acid.
Storage	Oral: Store <25°C.
Mechanism of Action	Ferrous fumarate is an iron compound that is used in the prevention and treatment of iron-deficient anaemia. Folic acid is a vitamin B that is used in the prevention and treatment of folate-deficient state. They are used together in pregnant women (2nd and 3rd trimesters) for the prevention of iron deficiency and megaloblastic anaemia of pregnancy. Absorption: Ferrous fumarate: Absorption takes place mainly in the duodenum and jejunum; aided by gastric acid secretion. Folic acid: Absorption takes place mainly in the proximal part of the small intestine. Distribution: Ferrous fumarate: Ferrous iron passes through the GI mucosal cells, bind to transferrin and is then transported to the bone marrow and incorporated into haemoglobin. Folic acid: Extensively bound to plasma proteins. Metabolism: Folic acid: Largely metabolised in the liver. Excretion: Ferrous fumarate: Mainly through the faeces and

	proteins. Metabolism: Folic acid: Largely metabolised in the liver. Excretion: Ferrous fumarate: Mainly through the faeces and desquamation of cells e.g. skin, hair or GI mucosa. Folic acid: Mainly excreted in the urine.
CIMS Class	Vitamins & Minerals (Pre & Post Natal) / Antianemics
ATC Classification	B03AA02 - ferrous fumarate; Belongs to the class of oral iron bivalent preparations. Used in the treatment of anemia. B03AD02 - ferrous fumarate; Belongs to the class of iron in combination with folic acid. Used in the treatment of anemia. B03BB01 - folic acid; Belongs to the class of folic acid and derivatives. Used in the treatment of anemia.

fexofenadine

CIMS Class : (Antihistamines & Antiallergics)
fexofenadine

P - Caution when used during pregnancy

L - Caution when used during lactation

Food $\square$ - Food interaction

related fexofenadine information

Indication & Dosage

Oral

Seasonal allergic rhinitis

Adult: 120 mg once daily.

Child: 6-11 yr: 30 mg bid.

Renal impairment: Adult: Initially, 60 mg once daily. Child: 6 mth-<2 yr: 15 mg once daily and 2-11 yr: 30 mg once daily.

Oral

Chronic idiopathic urticaria

Adult: 180 mg once daily.

Child: 6 mth-<2 yr: 15 mg bid; $\geq$ 2 yr: 30 mg bid.

Renal impairment: Adult: Initially, 60 mg once daily. Child: 6 mth-<2 yr: 15 mg once daily and 2-11 yr: 30 mg once daily.

Administration

May be taken with or without food.

Contraindications

Hypersensitivity.

Special Precautions

Renal impairment. Pregnancy, lactation; children <6 yr.

Special Precautions	Renal impairment. Pregnancy, lactation; children <6 yr.
Adverse Drug Reactions	Viral infection (cold/flu); headache, dizziness, drowsiness, fatigue; nausea, dyspepsia, dysmenorrhoea.
Drug Interactions	Co-admin with ketoconazole or erythromycin may increase plasma levels of fexofenadine. May increase adverse effects of other anticholinergics and CNS depressants. May increase arrhythmogenic effect of antipsychotic agents (phenothiazines); avoid concurrent usage. May reduce the efficacy of betahistine. Pramlintide may increase the anticholinergic effect of fexofenadine. Bioavailability may be increased by verapamil. Efficacy may be reduced by rifampin.
Food Interaction	Decreased levels with St John's wort. Fruit juice (apple, grapefruit, orange) may reduce bioavailability of fexofenadine by about 36%. Possible increased risk of sedation with ethanol.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 20-25°C.
Mechanism of Action	Fexofenadine, an active metabolite of terfenadine, is a competitive peripheral histamine H₁-receptor antagonist on effector cells in the GI tract, blood vessels and respiratory tract. Absorption: Absorbed rapidly from the GI tract (oral); peak plasma concentrations after 2-3 hr. Distribution: Enters breast milk. 60-70% bound to plasma

	Absorption: Absorbed rapidly from the GI tract (oral); peak plasma concentrations after 2-3 hr. Distribution: Enters breast milk. 60-70% bound to plasma proteins. Metabolism: Intestinal mucosa (5% of total dose); hepatic (0.5-1.5% of dose). Excretion: Mainly via faeces, via urine (10% of dose); 14 hr (elimination half-life; may be prolonged in renal impairment).
CIMS Class	Antihistamines & Antiallergics
ATC Classification	R06AX26 - fexofenadine; Belongs to the class of other agents used as systemic antihistamines.

filgrastim

CIMS Class : (Haematopoietic Agents)
filgrastim

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related filgrastim information

Indication & Dosage

Parenteral

Adjunct to antineoplastic therapy

Adult: 5 mcg/kg daily as a single daily SC inj, as a continuous IV or SC infusion, or as a daily IV infusion over 15-30 minutes, starting not <24 hr after the last dose of antineoplastic. Continue treatment until neutrophil count has stabilised within the normal range which may take up to 14 days or more.

Parenteral

Bone marrow transplantation

Adult: 10 mcg/kg daily by IV infusion over 30 min or 4 hr or continuous IV or SC infusion over 24 hr. Adjust according to response.

Subcutaneous

Mobilisation of peripheral blood progenitor cells for autologous peripheral blood stem cell transplantation

Adult: 10 mcg/kg daily, as a single inj or by continuous infusion, for 4-7 days until the last leucapheresis procedure.

	autologous peripheral blood stem cell transplantation Adult: 10 mcg/kg daily, as a single inj or by continuous infusion, for 4-7 days until the last leucapheresis procedure. If it is given after myelosuppressive chemotherapy: 5 mcg/kg daily by inj; given from the 1st day after chemotherapy completion until expected neutrophil nadir is passed and neutrophil count has returned to normal range, so that leucapheresis can be performed. <i>Subcutaneous</i> Congenital neutropenia Adult: 12 mcg/kg daily in single or divided doses. Adjust according to response. In patients with cyclic or idiopathic neutropenia: 5 mcg/kg daily in single or divided doses. Adjust according to response. <i>Subcutaneous</i> HIV infection and persistent neutropenia Adult: Initially, 1 mcg/kg daily. Dose may be increased to 4 mcg/kg daily until normal neutrophil count is achieved. Maintenance: 300 mcg daily. Max: 4 mcg/kg daily.
Contraindications	Myeloid malignancies. Not to be used within 24 hr of cytotoxic chemotherapy admin due to the sensitivity of rapidly dividing myeloid cells. Severe congenital neutropaenia (Kostman's syndrome) with abnormal cytogenetics.
Special Precautions	Premalignant or malignant myeloid condition; sickle-cell disease; osteoporotic bone disease; withdraw treatment if there are signs of pulmonary infiltrates. Fluid retention or heart failure. Monitor CBC and platelet count during therapy. Monitor bone density in patients with osteoporosis (long-term treatment). Regular morphological and cytogenic bone-marrow examinations in severe congenital neutropenia. Pregnancy and lactation.

	treatment). Regular morphological and cytogenic bone-marrow examinations in severe congenital neutropenia. Pregnancy and lactation.
Adverse Drug Reactions	Musculoskeletal pain, bone pain, hypersensitivity reactions, splenic enlargement, hepatomegaly, thrombocytopaenia, anaemia, epistaxis, headache, nausea, vomiting, diarrhoea, urinary abnormalities (dysuria, proteinuria, haematuria), osteoporosis, exacerbation of rheumatoid arthritis, transient decrease in blood glucose, raised uric acid, cutaneous vasculitis, transient hypotension. Potentially Fatal: Pulmonary infiltrates leading to resp failure or acute resp distress syndrome.
Drug Interactions	Myelosuppressive antineoplastic agents. Drugs which may potentiate the release of neutrophils e.g. lithium.
Lab Interference	May lead to transient positive bone imaging changes.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Parenteral: Refrigerate at 2-8°C. Do not freeze. Subcutaneous: Refrigerate at 2-8°C. Do not freeze.
Mechanism of Action	Filgrastim is a granulocyte-colony stimulating factor which binds to cell surface receptors on haemetopoietic cells thus stimulating the development of granulocytes to increase their migration and cytotoxicity. Onset: Approximately 24 hr. Absorption: Serum concentrations peak about 8 hr after SC admin. Excretion: Elimination half-life: About 3.5 hr. Mainly eliminated by neutrophil-mediated clearance.

	admin. Excretion: Elimination half-life: About 3.5 hr. Mainly eliminated by neutrophil-mediated clearance.
CIMS Class	Haematopoietic Agents
ATC Classification	L03AA02 - filgrastim; Belongs to the class of colony stimulating factors. Used as immunostimulants.

finasteride

CIMS Class : (Drugs for Bladder & Prostate Disorders) , (Other Dermatologicals)
finasteride

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ✖ - Lab interference

Food ✖ - Food interaction

related finasteride information

Indication & Dosage	<i>Oral</i> Benign prostatic hyperplasia Adult: 5 mg once daily for =6 mth, if necessary. <i>Oral</i> Male pattern baldness Adult: 1 mg once daily.
Administration	May be taken with or without food.
Contraindications	Children, exposure of pregnant women to finasteride either via direct contact with crushed tab or through semen of male sexual partners who are taking finasteride; pregnancy, lactation.
Special Precautions	Undiagnosed prostate cancer, liver dysfunction, obstructive uropathy.
Adverse Drug Reactions	Gynaecomastia, decreased libido, impotence, reduction in the volume of ejaculate, testicular pain. Hypersensitivity reactions e.g. swelling of lips and face, urticaria, rashes.

	Gynaecomastia, decreased libido, impotence, reduction in the volume of ejaculate, testicular pain. Hypersensitivity reactions e.g. swelling of lips and face, urticaria, rashes.
Food Interaction	Food may delay the rate and reduce the extent of oral absorption
Lab Interference	May mask serum markers (PSA) for prostate cancer.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Finasteride is a competitive inhibitor of the enzyme 5-α reductase which converts testosterone to dihydrotestosterone (DHT), thus resulting in decreased serum levels of DHT. Absorption: Absorbed from the GI tract (oral); peak plasma concentrations after 1-2 hr. Distribution: Protein-binding: 90%. Metabolism: Hepatic. Excretion: Urine and faeces (as metabolites); <60 yr: 6 hr; >70 yr: 8 hr (elimination half-life).
CIMS Class	Drugs for Bladder & Prostate Disorders / Other Dermatologicals
ATC Classification	D11AX10 - finasteride; Belongs to the class of other dermatologicals. Used in the treatment of dermatological diseases. G04CB01 - finasteride; Belongs to the class of testosterone-5-alpha reductase inhibitors. Used in the treatment of benign prostatic hypertrophy.

G04CB01 - finasteride; Belongs to the class of testosterone-5-alpha reductase inhibitors. Used in the treatment of benign prostatic hypertrophy.

finasteride + tamsulosin

CIMS Class : (Drugs for Bladder & Prostate Disorders)
finasteride + tamsulosin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related finasteride + tamsulosin information

Indication & Dosage	<i>Oral</i> Benign prostatic hyperplasia Adult: Each capsule contains finasteride 5 mg and tamsulosin 0.4 mg: 1 capsule once daily.
Contraindications	Hypersensitivity, pregnancy, lactation. Women and children.
Special Precautions	Avoid exposure of pregnant women to finasteride, either via direct contact with crushed tab or through semen of male sexual partners who are on this drug. Undiagnosed prostate cancer, liver diseases. Prostate carcinoma should be ruled out before starting the therapy. Hepatic impairment.
Adverse Drug Reactions	Gynaecomastia, decreased libido, impotence, reduction in the vol of ejaculate, genital abnormalities in the male foetus of pregnant women exposed to finasteride. Hypersensitivity reactions such as swelling of lips and rashes, postural hypotension, dizziness and vertigo; headache, infection, asthenia, back pain, chest pain, dizziness, somnolence,

	reactions such as swelling of lips and rashes, postural hypotension, dizziness and vertigo; headache, infection, asthenia, back pain, chest pain, dizziness, somnolence, insomnia, decreased libido, rhinitis, pharyngitis, cough, sinusitis, diarrhoea, nausea, tooth disorder, amblyopia.
Drug Interactions	Caution when used with cimetidine or warfarin. Not to be used with other alpha-adrenergic blocking agents.
Food Interaction	Food may delay the rate and reduce the extent of oral absorption, delaying in the time to reach max concentration.
Lab Interference	Finasteride may mask or reduce serum markers (PSA) for prostate cancer.
Mechanism of Action	Finasteride is a competitive inhibitor of the 5-alpha reductase, an enzyme which converts testosterone to dihydrotestosterone (DHT). Conversion of testosterone to DHT by 5-alpha reductase is essential for prostatic hyperplasia. Tamsulosin is a selective alpha-1 adrenoceptor blocker, which blocks the adrenoceptors leading to the relaxation of smooth muscles in the bladder neck and prostate to relax, resulting in an improvement in urine flow rate and a reduction in symptoms of BPH. Absorption: Finasteride: Mean bioavailability: 63%. Tamsulosin: >90% absorbed after oral admin. Distribution: Finasteride: About 90% bound to plasma proteins; crosses blood brain barrier. Tamsulosin: 94-99% bound to plasma proteins, mainly alpha-1 acid glycoprotein. Metabolism: Finasteride: Largely via hepatic metabolism, mainly via CYP3A4 enzyme subfamily. Tamsulosin: Mainly by hepatic CYP450 enzymes. Excretion: Finasteride: Excreted in urine (about 39%) and faeces (57%); mean elimination half-life in plasma: 6 hr. Tamsulosin: Mainly removed in the urine (76%), some in faeces (21%).

	faeces (57%); mean elimination half-life in plasma: 6 hr. Tamsulosin: Mainly removed in the urine (76%), some in faeces (21%).
CIMS Class	Drugs for Bladder & Prostate Disorders
ATC Classification	D11AX10 - finasteride; Belongs to the class of other dermatologicals. Used in the treatment of dermatological diseases. G04CA02 - tamsulosin; Belongs to the class of alpha-adrenoreceptor antagonists. Used in the treatment of benign prostatic hypertrophy. G04CB01 - finasteride; Belongs to the class of testosterone-5-alpha reductase inhibitors. Used in the treatment of benign prostatic hypertrophy.

flavoxate

CIMS Class : (Drugs for Bladder & Prostate Disorders)
flavoxate

P - Caution when used during pregnancy

L - Caution when used during lactation

related flavoxate information

Indication & Dosage	<i>Oral</i> Urinary incontinence, urgency and frequency, Bladder spasms due to catheterisation, Dysuria <i>Adult:</i> Usual dose: 200 mg tid.
Administration	Should be taken on an empty stomach. (May be taken w/ meals to reduce GI discomfort.)
Contraindications	Pyloric or duodenal obstruction; obstructive intestinal lesions or ileus; achalasia; GI haemorrhage or obstructive uropathies of the lower urinary tract; myasthenia gravis; severe ulcerative colitis; toxic megacolon; glaucoma; children <12.
Special Precautions	May affect ability to drive or operate machinery. May worsen hyperthyroidism, coronary artery disease, congestive heart failure, prostatic hypertrophy, arrhythmias, tachycardia. Pregnancy; lactation; elderly; autonomic neuropathy; hiatus hernia with reflux esophagitis, hepatic and renal impairment.
Adverse Drug Reactions	Increased intraocular pressure; difficulty in ocular accommodation; blurred vision; dry mouth and throat; GI

	Increased intraocular pressure; difficulty in ocular accommodation; blurred vision; dry mouth and throat; GI disturbances; nervousness; vertigo; headache; fatigue; confusion; hypersensitivity reactions; dysuria; tachycardia; palpitation; hyperpyrexia; eosinophilia; leukopenia, abdominal pain, constipation and difficulty in concentrating.
Drug Interactions	Amantadine, some antihistamines, phenothiazine antipsychotics, tricyclic antidepressants, MAOIs; parasympathomimetics. May decrease gastric motility thus decreasing absorption of certain drugs. May antagonise the GI effects of cisapride, domperidone, metoclopramide.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Flavoxate is a tertiary amine that acts as a smooth muscle relaxant; it also has antimuscarinic effects. It exhibits local anaesthetic, analgesic and spasmolytic effects. Onset: 55 minutes. Absorption: Readily absorbed from the GI tract after oral admin. Metabolism: Rapidly metabolised. Excretion: About 50-60% of a dose is excreted in the urine as methyl flavone carboxylic acid.
CIMS Class	Drugs for Bladder & Prostate Disorders
ATC Classification	G04BD02 - flavoxate; Belongs to the class of urinary antispasmodics. Used in the treatment of urological problems.

G04BD02 - flavoxate; Belongs to the class of urinary antispasmodics. Used in the treatment of urological problems.

fluconazole

CIMS Class : (Antifungals)
fluconazole

P - Caution when used during pregnancy
L - Caution when used during lactation

related fluconazole information

Indication & Dosage	<i>Oral</i>	
	Superficial mucosal candidiasis	
	Adult: (Except genital candidiasis) Usual dose: 50 mg daily, may increase to 100 mg daily if needed. Recommended treatment duration: 7-14 days (oropharyngeal candidiasis, except in severely immunocompromised patients), 14 days (atrophic oral candidiasis associated with dentures), 14-30 days (other mucosal candidiasis including oesophagitis).	
	Child: >4 wk: Loading dose: 6 mg/kg followed by 3 mg/kg daily.	
	Renal impairment: Normal initial doses; adjust subsequent doses based on CrCl. Patients on dialysis: Single recommended dose after each session.	
	CrCl (ml/min)	Dosage Recommendation
	<50 and not receiving dialysis	Maintenance dose: 50% of the recommended doses.
	<i>Oral</i>	
	Vaginal candidiasis	
	Adult: 150 mg as a single dose.	

Oral

Vaginal candidiasis

Adult: 150 mg as a single dose.

Oral

Candidal balanitis

Adult: 150 mg as a single dose.

Oral

Dermatophytosis

Adult: 50 mg daily for up to 6 wk.

Renal impairment: Normal initial doses; adjust subsequent doses based on CrCl. Patients on dialysis: Single recommended dose after each session.

CrCl (ml/min)	Dosage Recommendation
<50 and not receiving dialysis	Maintenance dose: 50% of the recommended doses.

Oral

Cutaneous candidiasis

Adult: 50 mg daily for up to 6 wk.

Renal impairment: Normal initial doses; adjust subsequent doses based on CrCl. Patients on dialysis: Single recommended dose after each session.

CrCl (ml/min)	Dosage Recommendation
<50 and not receiving dialysis	Maintenance dose: 50% of the recommended doses.

Oral

Pityriasis versicolor

Adult: 50 mg daily for up to 6 wk.

Renal impairment: Normal initial doses; adjust subsequent doses based on CrCl. Patients on dialysis: Single recommended dose after each session.

CrCl (ml/min)	Dosage Recommendation
<50 and not	Maintenance dose: 50% of the

adjust based on CrCl. Patients on dialysis: Single

recommended dose after each session.

<50 and not receiving dialysis	Maintenance dose: 50% of the recommended doses.
--------------------------------	---

Oral

Systemic candidiasis

Adult: Initially, 400 mg followed by 200-400 mg daily. Max: 800 mg daily in severe infections. Treatment duration is based on clinical and mycological response but is usually at least 6-8 wk in cryptococcal meningitis. May also be given via IV infusion. To prevent relapse after a primary course of treatment for acute cryptococcal meningitis in AIDS patients: 100-200 mg daily, may also be given via IV admin.

Child: >4 wk: 6-12 mg/kg daily; same doses may given every 72 hr in neonates up to 2 wk and every 48 hr in neonates 2-4 wk. Max: 400 mg daily.

Renal impairment: Normal initial doses; adjust subsequent doses based on CrCl. Patients on dialysis: Single recommended dose after each session.

CrCl (ml/min)	Dosage Recommendation
<50 and not receiving dialysis	Maintenance dose: 50% of the recommended doses.

Oral

Cryptococcal infections

Adult: Initially, 400 mg followed by 200-400 mg daily. Max: 800 mg daily in severe infections. Treatment duration is based on clinical and mycological response but is usually at least 6-8 wk in cryptococcal meningitis. May also be given via IV infusion. To prevent relapse after a primary course of treatment for acute cryptococcal meningitis in AIDS patients: 100-200 mg daily, may also be given via IV admin.

Child: >4 wk: 6-12 mg/kg daily; same doses may given every

	treatment for acute cryptococcal meningitis in AIDS patients: 100-200 mg daily, may also be given via IV admin. Child: >4 wk: 6-12 mg/kg daily; same doses may given every 72 hr in neonates up to 2 wk and every 48 hr in neonates 2-4 wk. Max: 400 mg daily. Renal impairment: Normal initial doses; adjust subsequent doses based on CrCl. Patients on dialysis: Single recommended dose after each session.	
	CrCl (ml/min)	Dosage Recommendation
	<50 and not receiving dialysis	Maintenance dose: 50% of the recommended doses.
	<i>Oral</i> Prophylaxis of fungal infections in immunocompromised patients Adult: 50-400 mg daily. May also be given via IV infusion. Child: 3-12 mg/kg daily; may also be given via IV infusion. For infants <2 wk, doses should be given every 72 hr; 2-4 wk, doses should be given every 48 hr. Max: 400 mg daily, or 12 mg/kg at recommended intervals in infants. Renal impairment: Normal initial doses; adjust subsequent doses based on CrCl. Patients on dialysis: Single recommended dose after each session.	
	CrCl (ml/min)	Dosage Recommendation
	<50 and not receiving dialysis	Maintenance dose: 50% of the recommended doses.
Administration	May be taken with or without food.	
Overdosage	Treatment is symptomatic and supportive, gastric lavage may be used if needed.	
Contraindications	Hypersensitivity.	
Special Precautions	Renal or hepatic impairment. May prolong QT interval. Pregnancy, lactation.	
Adverse Drug	Nausea, abdominal pain, vomiting, diarrhoea, flatulence;	

Adverse Drug Reactions	Nausea, abdominal pain, vomiting, diarrhoea, flatulence; elevated liver function values; headache; rash, exfoliative dermatitis. Rarely, angioedema, anaphylactic reactions and thrombocytopenia. Potentially Fatal: Hepatotoxicity; rarely anaphylaxis; Stevens-Johnson syndrome.
Drug Interactions	Rifampicin reduces fluconazole levels. Reduces theophylline clearance. Affects efficacy of oral contraceptives. May increase serum levels of alprazolam, triazolam, midazolam, diazepam. May raise serum concentrations and efficacy of oral sulphonylureas, phenytoin, ciclosporin, calcium channel blockers, tacrolimus, HMG-CoA reductase inhibitors (except pravastatin and fluvastatin), warfarin and other anticoagulants. May reduce metabolism of caffeine. Avoid concurrent use with clopidogrel. Potentially Fatal: Increased risk of cardiac arrhythmias with astemizole, cisapride or terfenadine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store below 30°C.
Mechanism of Action	Fluconazole decreases ergosterol synthesis by interfering with cytochrome P450 activity, thus inhibiting cell membrane formation of susceptible fungi including B dermatitidis, Candida spp, C immitis, C neoformans, Epidermophyton spp, H capsulatum, Mycosporum spp, Trichophyton spp, thus

	formation of susceptible fungi including B dermatitidis, Candida spp, C immitis, C neoformans, Epidermophyton spp, H capsulatum, Mycosporum spp, Trichophyton spp, thus leading to cell death. Absorption: Well absorbed after oral admin; peak plasma concentrations after 1-2 hr (oral), may be increased with multiple dosing. Distribution: Widely distributed. Protein-binding: 12%. Excretion: Via urine (80% as unchanged, 11% as metabolites); 30 hr (elimination half-life); increased in renal impairment. Removed by dialysis.
CIMS Class	Antifungals
ATC Classification	D01AC15 - fluconazole; Belongs to the class of imidazole and triazole derivatives for topical use. Used in the treatment of fungal infection. J02AC01 - fluconazole; Belongs to the class of systemic triazole derivative antimycotics. Used in the treatment of mycotic infections.

fludarabine phosphate

CIMS Class : (Cytotoxic Chemotherapy)
fludarabine phosphate

P - Contraindicated in pregnancy
L - Contraindicated in lactation

related fludarabine phosphate information				
Indication & Dosage	<i>Oral</i>			
	Chronic lymphocytic leukaemia			
	Adult: 40 mg/m ² BSA daily for 5 consecutive days. Courses may be repeated every 28 days, usually for up to 6 cycles.			
	Renal impairment: Avoid in severe impairment.			
	<table><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr><tr><td>30-70</td><td>May reduce doses by up to 50%.</td></tr></table>	CrCl (ml/min)	Dosage Recommendation	30-70
CrCl (ml/min)	Dosage Recommendation			
30-70	May reduce doses by up to 50%.			
	<i>Intravenous</i>			
	Chronic lymphocytic leukaemia			
	Adult: 25 mg/m ² BSA daily given by bolus inj or by IV infusion over 30 minutes for 5 consecutive days. Courses may be repeated every 28 days, usually for up to 6 cycles.			
	Renal impairment: Avoid in severe impairment.			
	<table><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr><tr><td>30-70</td><td>May reduce doses by up to 50%.</td></tr></table>	CrCl (ml/min)	Dosage Recommendation	30-70
CrCl (ml/min)	Dosage Recommendation			
30-70	May reduce doses by up to 50%.			
Administration	May be taken with or without food. (Swallow whole, do not break/chew/crush.)			
Contraindications	Renal impairment (CrCl <30 mL/min); decompensated			

	Renal impairment (CrCl <30 mL/min); decompensated haemolytic anaemia. Pregnancy and lactation. Concomitant use of live vaccines.
Special Precautions	Routine monitoring of blood counts and Hb conc. Monitor for signs of autoimmune haemolytic anaemia; elderly. Avoid contact with skin and eyes; avoid inhalation. Myelosuppression may be cumulative and severe increasing risk of opportunistic infections. Increased risk of tumour lysis syndrome in patients with high tumour burden.
Adverse Drug Reactions	Fever, chills, cough, dyspnoea, pneumonia; GI disturbances, stomatitis; oedema; tumour lysis syndrome; skin rashes; haemolytic anaemia, haemorrhagic cystitis; neurological disturbances including peripheral neuropathy, agitation, confusion, visual disturbances and coma. Progressive encephalopathy and blindness (high doses). Potentially Fatal: Myelosuppression. Fatal autoimmune haemolytic anemia.
Drug Interactions	Co-administration with pentostatin may lead to pulmonary toxicity. Reduced metabolic activation of fludarabine with cytarabine. Reduced therapeutic efficacy with dipyridamole and other adenosine uptake inhibitors.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Refrigerate at 2-8°C. Oral: Refrigerate at 2-8°C.
Mechanism of Action	Fludarabine is rapidly dephosphorylated to 2-fluoro-ara-A and then phosphorylated intracellularly by deoxycytidine

	Fludarabine is rapidly dephosphorylated to 2-fluoro-ara-A and then phosphorylated intracellularly by deoxycytidine kinase to the active triphosphate, 2-fluoro-ara-ATP which inhibits DNA polymerase and ribonucleotide reductase resulting in inhibition of DNA synthesis leading to cell death. Metabolism: IV: Fludarabine phosphate is rapidly dephosphorylated in the serum to fludarabine which enters the tumor cells to be rephosphorylated to the active triphosphate derivative. Excretion: Mostly in the urine, about 60% of dose is excreted within 24 hr.
CIMS Class	Cytotoxic Chemotherapy

fludrocortisone

CIMS Class : (Corticosteroid Hormones)
fludrocortisone

P - Caution when used during pregnancy

L - Caution when used during lactation

related fludrocortisone information

Indication & Dosage	<i>Oral</i> Primary adrenocortical insufficiency Adult: 50-300 mcg daily, may range from 100 mcg 3 times/wk to 200 mcg/day. In Addison's disease, initiate with 100 mcg daily, may reduce dose to 50 mcg daily if hypertension occurs; to be used in combination with cortisone or hydrocortisone. Child: 50-100 mcg daily. <i>Oral</i> Salt-losing adrenogenital hyperplasia Adult: Up to 200 mcg daily.
Administration	Should be taken with food.
Contraindications	Hypersensitivity. Hyperalbuminaemia; hypertension, systemic fungal infections.
Special Precautions	Addison's disease, fluid retention and hypokalaemia. Pregnancy, lactation, children and elderly.
Adverse Drug Reactions	Hypertension, sodium and water retention, potassium loss, dizziness, itching, skin rash, headache, convulsions, CHF,

	Hypertension, sodium and water retention, potassium loss, dizziness, itching, skin rash, headache, convulsions, CHF, muscle weakness, hyperglycaemia, HPA and growth suppression, peptic ulcer, cataracts, raised intraocular pressure and reduced visual acuity.
Drug Interactions	May decrease salicylate levels. Anticholinesterase effects are antagonised. Decreased effects with rifampin, barbiturates, hydantoins and phenytoin. Oral contraceptives or ritonavir may increase the plasma concentrations of fludrocortisone. Increased potassium loss with potassium-depleting drugs e.g. thiazides, furosemide or amphotericin B. Increased risk of GI bleeding or ulceration with NSAIDs. May alter efficacy of anticoagulants when used concurrently.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 2-8°C.
Mechanism of Action	Fludrocortisone promotes reabsorption of sodium and urinary excretion of potassium and hydrogen ions from renal distal tubules. Absorption: Rapid and complete (oral). Peak plasma concentrations after 1.7 hr. Distribution: Protein-binding: 42%. Metabolism: Hepatic. Excretion: Elimination half-life: >3.5 hr (plasma); 18-36 hr (biological).
CIMS Class	Corticosteroid Hormones

CIMS Class	Corticosteroid Hormones
ATC Classification	H02AA02 - fludrocortisone; Belongs to the class of mineralocorticoids. Used in systemic corticosteroid preparations.

flunarizine

CIMS Class : (Antimigraine Preparations)
flunarizine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related flunarizine information

Indication & Dosage	<i>Oral</i> Prophylaxis of migraine, Prophylaxis of vertigo and vestibular disorders, Prophylaxis of peripheral and cerebrovascular disorders Adult: 5-10 mg daily at bedtime.
Administration	May be taken with or without food.
Contraindications	Pregnancy, lactation, GI or urinary tract obstruction, acute porphyrias.
Special Precautions	Driving or operating machinery, epilepsy, elderly, CVS disease, glaucoma.
Adverse Drug Reactions	Drowsiness. Rarely wt gain, headache, depression, gastric pain, dry mouth, insomnia, extrapyramidal reactions, galactorrhoea.
Drug Interactions	Plasma levels reduced by phenytoin, carbamazepine, valproic acid.
Storage	Oral: Store below 25°C.
Mechanism of Action	Flunarizine has H ₁ -receptor blocking action and

Mechanism of Action	Flunarizine has H₁-receptor blocking action and calcium-channel blocking effect. It has also been used as an adjunct epileptic therapy for patients refractory to standard treatment regimens. Absorption: Absorbed well from the GI tract (oral). Distribution: Highly lipophilic. Protein-binding: >90%. Metabolism: Extensive. Excretion: Via bile (as metabolites); 18 days (elimination half-life).
CIMS Class	Antimigraine Preparations
ATC Classification	N07CA03 - flunarizine; Belongs to the class of preparations used in the treatment of vertigo.

fluocinolone

CIMS Class : (Topical Corticosteroids)
fluocinolone

P - Caution when used during pregnancy

L - Caution when used during lactation

related fluocinolone information

Indication & Dosage	<i>Topical/Cutaneous</i> Corticosteroid-responsive dermatoses Adult: As 0.0025-0.025% cream/gel/lotion/ointment/scalp lotion: Apply onto affected area(s) 3-4 times daily.
Contraindications	Primary infectious (bacterial, viral, fungal) ulcers, hypersensitivity, acne vulgaris. Neonates.
Special Precautions	Children, elderly, hepatic failure. Prolonged use on the face; contact with eyes. Pregnancy, lactation.
Adverse Drug Reactions	Prolonged admin causes epidermal thinning, telangiectasia and striae (especially face and flexures). Application on eyelid and surrounding skin can cause raised intraocular pressure, cataracts, glaucoma, corneal ulcers and raised intracranial pressure. Systemic absorption with adrenal suppression may be seen when applied over large areas, when skin is broken or under occlusive dressing. Contact dermatitis, perioral dermatitis, papular disorder, mild depigmentation.
Pregnancy	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Topical/Cutaneous: Store at 15-25°C.
Mechanism of Action	Fluocinolone has local anti-inflammatory action, immunosuppressant and antimitotic actions. <1% of the applied steroid is absorbed. The rest is stored in the dermis which acts as a reservoir.
CIMS Class	Topical Corticosteroids

fluorometholone

CIMS Class : (Eye Corticosteroids)
fluorometholone

P - Caution when used during pregnancy
L - Caution when used during lactation

related fluorometholone information

Indication & Dosage	<i>Ophthalmic</i> Allergic and inflammatory conditions of the eye Adult: As 0.1% ointment: Apply 1/2 inch ribbon to the conjunctival sac 1-3 times daily. As 0.1% solution: Instil 1-2 drops into the conjunctival sac 2-4 times daily. Dosage may be increased to every 4 hr in severe cases during the initial 24-48 hr. Re-evaluate if no signs of improvement after 48 hr of treatment. Child: >2 yr: As 0.1% ointment: Apply 1/2 inch ribbon to the conjunctival sac 1-3 times daily. As 0.1% solution: Instil 1-2 drops into the conjunctival sac 2-4 times daily. Dosage may be increased to every 4 hr in severe cases during the initial 24-48 hr. Re-evaluate if no signs of improvement after 48 hr of treatment.
Contraindications	Viral diseases of the cornea and conjunctiva, including epithelial herpes simplex keratitis (dendritic keratitis), Vaccinia and Varicella, mycobacterial eye infection, ocular fungal infections, untreated eye infections; hypersensitivity.

	epithelial herpes simplex keratitis (dendritic keratitis), Vaccinia and Varicella, mycobacterial eye infection, ocular fungal infections, untreated eye infections; hypersensitivity.
Special Precautions	Glaucoma (check intraocular pressure periodically), history of herpes simplex fungal or bacterial infections. Not to be used in mustard gas keratitis and Sjogren's keratoconjunctivitis. May cause corneal and scleral thinning which may lead to perforation in serious cases. Use of steroids after cataract surgery may prolong healing time and increase bleb formation. Pregnancy, lactation; children <2 yr.
Adverse Drug Reactions	Elevated intraocular pressure, optic nerve damage, postsubcapsular cataract formation, delayed wound healing, uveitis, perforation of the globe, keratitis, conjunctivitis, corneal ulcers, loss of accommodation, secondary ocular infections, rarely systemic hypercorticism.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Ophthalmic: Store below 25°C.
Mechanism of Action	Fluorometholone suppresses the migration of polymorphonuclear leukocytes and reversal of increased capillary permeability thus decreasing inflammation. Absorption: Into aqueous humor; slight systemic absorption.
CIMS Class	Eye Corticosteroids
ATC Classification	C05AA06 - fluorometholone; Belongs to the class of products containing corticosteroids for topical use. Used in the treatment of hemorrhoids. D07AB06 - fluorometholone; Belongs to the class of

products containing corticosteroids for topical use. Used in the treatment of hemorrhoids.

D07AB06 - fluorometholone; Belongs to the class of moderately potent (group II) corticosteroids. Used in the treatment of dermatological diseases.

D07XB04 - fluorometholone; Belongs to the class of moderately potent (group II) corticosteroids in other combinations. Used in the treatment of dermatological diseases.

D10AA01 - fluorometholone; Belongs to the class of topical corticosteroids used in the treatment of acne.

S01BA07 - fluorometholone; Belongs to the class of corticosteroids. Used in the treatment of inflammation of the eye.

S01CB05 - fluorometholone; Belongs to the class of corticosteroids/antiinfectives/mydriatics combinations. Used in the treatment of eye diseases.

fluorouracil

CIMS Class : (Cytotoxic Chemotherapy)
fluorouracil

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related fluorouracil information

Indication & Dosage	<i>Oral</i> Palliative treatment of carcinoma of the colon, rectum, breast, stomach or pancreas Adult: 15 mg/kg (max: 1 g/day), may be given once wkly for maintenance. Max Dosage: 1 g/wk. Renal impairment: Dose reduction may be required. Hepatic impairment: Dose reduction may be required. <i>Intravenous</i> Palliative treatment of carcinoma of the colon, rectum, breast, stomach or pancreas Adult: 12 mg/kg/day (max 0.8-1g/day) for 3-4 days, if no toxicity occurs, may follow after 1 day with 6 mg/kg on alternate days for another 3-4 doses. Course may be repeated after 4-6 wk or maintenance doses of 5-15 mg/kg/wk (max 1g/wk) may be given. As an infusion, 15 mg/kg/day (max: 1 g daily) in 500 ml normal saline or 5% glucose over 4 hr, repeated on successive days until toxicity occurs or a total of 12-15 g is given. May repeat course after

mg/kg/wk (max 1g/wk) may be given. As an infusion, 10 mg/kg/day (max: 1 g daily) in 500 ml normal saline or 5% glucose over 4 hr, repeated on successive days until toxicity occurs or a total of 12-15 g is given. May repeat course after 4-6 wk.

Renal impairment: Dose reduction may be required.

Hepatic impairment: Dose reduction may be required.

Intra-arterial

Palliative treatment of carcinoma of the colon, rectum, breast, stomach or pancreas

Adult: 5-7.5 mg/kg daily as continuous infusion (regional perfusion).

Renal impairment: Dose reduction may be required.

Hepatic impairment: Dose reduction may be required.

Topical/Cutaneous

Actinic keratoses

Adult: As 0.5-5% cream or 1-5% solution in propylene glycol: Apply once or twice daily for 2-4 wk. Higher strengths may be used for at least 3-6 wk in superficial basal cell carcinoma.

Topical/Cutaneous

Superficial basal cell carcinoma

Adult: As 0.5-5% cream or 1-5% solution in propylene glycol: Apply once or twice daily for 2-4 wk. Higher strengths may be used for at least 3-6 wk in superficial basal cell carcinoma.

Special Populations: Dose should be halved in patients with poor nutritional status, impaired bone marrow, and within 30 days of major surgery.

Contraindications

Topical application on mucous membranes, exposure to sunlight, hypersensitivity. Depressed bone marrow function, poor nutritional status, potentially serious infections.

	Topical application on mucous membranes, exposure to sunlight, hypersensitivity. Depressed bone marrow function, poor nutritional status, potentially serious infections. Pregnancy and lactation.
Special Precautions	Regular monitoring of blood counts. History of heart disease, hepatic or renal insufficiency, weak or malnourished patients, patients who with history of high-dose pelvic radiation or use of alkylating agents. Patients with widespread metastases to the bone marrow.
Adverse Drug Reactions	Leucopenia, thrombocytopaenia, stomatitis, GI ulceration, bleeding and diarrhoea, haemorrhage from any site (stop treatment). Nausea, vomiting, rashes, hyperpigmentation, alopecia. Topical: Local inflammatory and photosensitivity reactions. Dermatitis and erythema multiforme (rare). Potentially Fatal: Central neurotoxicity, myocardial ischaemia.
Drug Interactions	May increase warfarin effects. May reduce response to vaccines; possibility of generalized infection with live vaccines. Action may be modified by allopurinol. Leucovorin calcium may enhance the toxicity of fluorouracil.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Intra-arterial: Store at 25°C. Intravenous: Store at 25°C. Oral: Store at 25°C.
Mechanism of Action	Fluorouracil interferes with DNA synthesis by blocking the conversion of deoxyuridylic acid to thymidylic acid. It also interferes with RNA synthesis. This results in an unbalanced

	Fluorouracil interferes with DNA synthesis by blocking the conversion of deoxyuridylic acid to thymidylic acid. It also interferes with RNA synthesis. This results in an unbalanced growth of the cells. Fluorouracil exerts greater effect on rapidly growing cells as they take up the drug at a faster rate. Absorption: Unpredictable (oral); small amounts (topical). Distribution: Body tissues and fluids, including blood-brain barrier. Metabolism: Hepatic; catabolysed via dihydropyrimidine dehydrogenase. Excretion: Urine (as unchanged drug); lungs (large amounts as carbon dioxide).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01BC02 - fluorouracil; Belongs to the class of antimetabolites, pyrimidine analogues. Used in the treatment of cancer.

fluoxetine

CIMS Class : (Antidepressants)
fluoxetine

P - Caution when used during pregnancy
L - Contraindicated in lactation

related fluoxetine information

Indication & Dosage

Oral

Depression

Adult: 20-40 mg daily. Max: 80 mg daily.

Child: 8-18 yr: 10-20 mg daily; initiate at 10 mg daily for lower-wt children, may increase to 20 mg/day after 1 wk if necessary.

Elderly: Initially, 10 mg daily, may increase by 10-20 mg every few wk as tolerated.

Max Dosage:

Hepatic impairment: Dose adjustments may be needed.

Oral

Bulimia nervosa

Adult: 60 mg daily.

Hepatic impairment: Dose adjustments may be needed.

Oral

Obsessive compulsive disorder

Adult: Initially, 20 mg daily increased up to 60 mg daily after several wk if unresponsive. Max: 80 mg daily.

Child: 7-18 yr: Initially, 10 mg daily; may increase to 20 mg

Excessive symptomatic disorder:

Adult: Initially, 20 mg daily increased up to 60 mg daily after several wk if unresponsive. Max: 80 mg daily.

Child: 7-18 yr: Initially, 10 mg daily; may increase to 20 mg daily after 2 wk in adolescents and higher-wt children. Usual range: 10-60 mg daily.

Hepatic impairment: Dose adjustments may be needed.

Oral

Premenstrual dysmorphic disorder

Adult: 20 mg daily continuously. Alternatively, 20 mg daily, to be started 14 days before onset of menstruation and continue until 1st day of menses. May repeat with each cycle, if needed.

Hepatic impairment: Dose adjustments may be needed.

Oral

Panic disorder

Adult: Initial dose: 10 mg daily, may increase to 20 mg daily after a wk. May increase to 60 mg daily after a few wk, if needed.

Hepatic impairment: Dose adjustments may be needed.

Administration

May be taken with or without food.

Overdosage

Symptoms include abnormal accommodation, abnormal gait, confusion, unresponsiveness, nervousness, pulmonary dysfunction, vertigo, tremor, increased BP, impotence, movement disorder and hypomania. Treatment is supportive, activated charcoal may be used to remove unabsorbed drug.

Contraindications

Severe renal or hepatic failure; hypersensitivity; lactation; concomitant MAOIs or within 2 wk of MAOI withdrawal.

Special Precautions

Unstable epilepsy, liver and renal impairment, cardiac disease, diabetes, electroconvulsive therapy, bleeding disorders, closed-angle glaucoma; pregnancy. May impair

	Unstable epilepsy, liver and renal impairment, cardiac disease, diabetes, electroconvulsive therapy, bleeding disorders, closed-angle glaucoma; pregnancy. May impair performance of skilled tasks; withdraw gradually. Close monitoring of clinical worsening and behavioural changes during the 1st few mth of treatment or when there are dose changes.
Adverse Drug Reactions	Nervousness, insomnia, anxiety, headache, tremor, drowsiness, dry mouth, nausea, vomiting, sweating, diarrhoea. Seizures, mania, hypomania or mixed manic states reported. Hyponatraemia; elevation of hepatic enzymes. Potentially Fatal: Rarely, systemic events possibly related to vasculitis have been reported in patients with rash but may be serious involving lungs, kidney and liver.
Drug Interactions	May cause transient shift in plasma conc of tightly protein bound drugs e.g. warfarin and digoxin, resulting in adverse effects. $T_{1/2}$ of diazepam is prolonged. Avoid concurrent use with clopidogrel. Potentially Fatal: Serious reactions when combined with MAOIs; at least 14 days should elapse after MAOIs withdrawal before starting fluoxetine treatment or at least 5 wk should elapse after fluoxetine treatment before starting MAOIs therapy. Two-fold increase in plasma levels of other antidepressants when combined with fluoxetine. Monitor lithium levels when combined.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C.

Storage	Oral: Store at 15-30°C.
Mechanism of Action	Fluoxetine is a potent and highly selective inhibitor of serotonin (5-HT) re-uptake. No affinity for adrenoceptors or histamine, GABA-B, or muscarinic receptors. Absorption: Oral admin: Readily absorbed from the GI tract; peak plasma concentrations after 6-8 hr. Distribution: Widely distributed; enters breast milk. Protein-binding: 95%. Metabolism: Extensively hepatic by demethylation to norfluoxetine. Excretion: Urine. Elimination half-life: 1-3 days (fluoxetine), 4-16 days (norfluoxetine).
CIMS Class	Antidepressants
ATC Classification	N06AB03 - fluoxetine; Belongs to the class of selective serotonin reuptake inhibitors. Used in the management of depression.

flupentixol

CIMS Class : (Antipsychotics)
flupentixol

P - Caution when used during pregnancy
L - Contraindicated in lactation

related flupentixol information

Indication & Dosage	<i>Oral</i>
	Psychoses
	Adult: Initially, 3-9 mg bid, adjusted according to response. Max: 18 mg daily.
	Elderly: Initial dose: $\frac{1}{4}$ or $\frac{1}{2}$ of the usual initial dose.
	<i>Oral</i>
	Depression with or without anxiety
	Adult: Initially, 1 mg daily increased after 1 wk to 2 mg daily and then to a max of 3 mg daily, last dose should be given not later than 4 p.m. Doses >2 mg should be given in 2 divided doses. Discontinue treatment if there is no improvement within 1 wk of using the max dose.
	Elderly: Initially, 0.5 mg daily increased after 1 wk to 1 mg daily with the last dose given not later than 4 p.m. Max: 2 mg daily in 2 divided doses.
	Max Dosage:
	<i>Intramuscular</i>
	Psychoses
	Adult: As decanoate: Initially, 20 mg (1 ml of a 2% oily

	<i>Intramuscular</i> Psychoses Adult: As decanoate: Initially, 20 mg (1 ml of a 2% oily solution) is given as test dose. After at least 7 days and depending on the response, subsequent doses of 20-40 mg may be given at intervals of 2-4 wk. Usual maintenance dose: 50 mg every 4 wk to 300 mg every 2 wk. Up to 400 mg wkly may be used in severe or resistant cases. Elderly: Initial dose: $\frac{1}{4}$ or $\frac{1}{2}$ of the usual initial dose.
Contraindications	Hypersensitivity. Extremely excitable and overactive patients; mania; porphyria; coma; preexisting CNS depression; bone-marrow suppression; phaeochromocytoma. Lactation.
Special Precautions	Patients with convulsive disorders; advanced hepatic, renal, CV or resp disease; tasks requiring mental alertness; elderly (especially with dementia), and debilitated patients; neuroleptics with sedative effect must be withdrawn gradually; history of angle-closure glaucoma; urinary retention; prostatic hyperplasia; breast cancer, prolactin dependent tumours; parkinsonism; myasthenia gravis; pregnancy; Avoid direct sunlight.
Adverse Drug Reactions	Rigidity, tremors, restlessness, tardive dyskinesia, insomnia, dryness of mouth, wt gain, sexual dysfunction, galactorrhoea and menstrual disturbances. Potentially Fatal: Neuroleptic malignant syndrome (hyperthermia, hypertonicity of skeletal muscles, unconsciousness and autonomic nervous system instability).
Drug Interactions	May potentiate the adverse effects of drugs with antimuscarinic effects e.g. TCAs. Reduced efficacy of levodopa. Increases adverse extrapyramidal symptoms with dopamine antagonists (metoclopramide and

	antimuscarinic effects e.g. TCAs. Reduced efficacy of levodopa. Increases adverse extrapyramidal symptoms with dopamine antagonists (metoclopramide and prochlorperazine). Potentially Fatal: Potentiates CNS effects of alcohol, general anaesthetics, hypnotics, anxiolytics and opioids. Blocks antihypertensive effect of guanethidine.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intramuscular: Store below 25°C. Oral: Store below 25°C.
Mechanism of Action	Flupentixol is a thioxanthene antipsychotic that inhibits dopamine-mediated effects by blocking postsynaptic dopamine receptors in the CNS. Onset: 24-72 hr (IM). Duration: 2-4 wk (IM). Absorption: Readily absorbed from the GI tract, peak plasma concentrations after 3-8 hr (oral); slowly absorbed from the inj site, peak plasma concentrations after 4-7 days (IM). Distribution: Crosses the blood-brain barrier and placenta; enters breast milk. >95% bound to plasma proteins. Metabolism: Extensively hepatic via sulfoxidation, side-chain N-dealkylation and glucuronic acid conjugation. Excretion: Urine and faeces (as metabolites).
CIMS Class	Antipsychotics

flupentixol + melitracen

CIMS Class : (Antidepressants)
flupentixol + melitracen

related flupentixol + melitracen information

Indication & Dosage

Oral

Depression

Adult: Per tablet contains flupentixol 0.5 mg and melitracen 10 mg: 1 tablet in the morning and at midday. May double morning dose in severe cases. Not to exceed 4 tablets daily.

Elderly: Per tablet contains flupentixol 0.5 mg and melitracen 10 mg: 1 tablet in the morning. For severe cases: 1 tablet in the morning and at midday.

Contraindications

Circulatory collapse, depressed level of consciousness due to any cause, coma. Severe depressing requiring hospitalisation or electroconvulsive therapy. Not recommended for use in states of excitement or overactivity.

Special Precautions

Unsafe in porphyria. Caution when used in patients with epilepsy; Parkinson's disease; narrow angle glaucoma; prostatic hypertrophy; hypothyroidism; hyperthyroidism; liver disease; cardiac disease or arrhythmias; severe respiratory disease; renal failure; myasthenia gravis; phaeochromocytoma. Patients with hypersensitivity to thioxanthenes or other antipsychotics. Close monitoring for changes in behaviour, suicidal thoughts or clinical worsening

	phaeochromocytoma. Patients with hypersensitivity to thioxanthenes or other antipsychotics. Close monitoring for changes in behaviour, suicidal thoughts or clinical worsening during the initial part of the treatment is recommended. May impair control of diabetes; monitor blood glucose in diabetics. Withdrawal should be gradual.
Adverse Drug Reactions	Drowsiness, dry mouth, constipation, vomiting, dyspepsia, diarrhoea, abdominal pain, nausea, flatulence. Extrapyramidal effects, especially in the initial phase of the treatment. Tachycardia, palpitations, prolonged QT interval, hypotension. Thrombocytopenia, neutropenia, leukopenia, agranulocytosis. Dyspnoea, myalgia, muscle rigidity, micturition disorder, urinary retention. Increased appetite and wt. Abnormal glucose tolerance and LFTs. Insomnia, depression, nervousness, agitation, libido decreased.
Drug Interactions	Increased risk of adverse effects when used with alcohol. May potentiate the effects of general anaesthetics and anticoagulants, and prolong the action of neuromuscular blockers. May increase anticholinergic effects of atropine and drugs with anticholinergic activity. May increase risk of neurotoxicity when used with sibutramine or lithium. Avoid concurrent usage with drugs that cause QT prolongation or cardiac arrhythmias. May inhibit metabolism of TCAs. May antagonise effects of adrenaline and sympathomimetics, and reverse antihypertensive effects of guanethidine.
Mechanism of Action	Flupentixol inhibits dopamine-mediated effects by blocking postsynaptic dopamine receptors in the CNS. Melitracen is a TCA with anxiolytic properties. At low doses, it has activating properties. It is also a bipolar thymoleptic. Absorption: Flupentixol: Readily absorbed in the GI tract. Distribution: Flupentixol: >95% bound to plasma proteins; widely distributed in the body and crosses the blood brain

	properties. It is also a bipolar thymoreptic. Absorption: Flupentixol: Readily absorbed in the GI tract. Distribution: Flupeentixol: >95% bound to plasma proteins; widely distributed in the body and crosses the blood brain barrier. Metabolism: Flupentixol: Extensively hepatic metabolism. Excretion: Flupentixol: Excreted in urine and faeces in the form of many metabolites.
CIMS Class	Antidepressants
ATC Classification	N06AA14 - melitracen; Belongs to the class of non-selective monoamine reuptake inhibitors. Used in the management of depression.

fluphenazine

CIMS Class : (Antipsychotics)
fluphenazine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related fluphenazine information

Indication & Dosage

Oral

Psychoses

Adult: Initially, 2.5-10 mg daily in 2-3 divided doses, increased according to reponse. Maintenance: 1-5 mg daily.

Max Dosage: Adult: 20 mg/day. Elderly: 10 mg/day.

Oral

Mania

Adult: Initially, 2.5-10 mg daily in 2-3 divided doses, increased according to reponse. Maintenance: 1-5 mg daily.

Max Dosage: Adult: 20 mg/day. Elderly: 10 mg/day.

Oral

Schizophrenia

Adult: Initially, 2.5-10 mg daily in 2-3 divided doses, increased according to reponse. Maintenance: 1-5 mg daily.

Max Dosage: Adult: 20 mg/day. Elderly: 10 mg/day.

Oral

Short-term adjunct in severe anxiety or behavioral disturbances

Adult: 1 mg bid increased to 2 mg bid if necessary.

	Short-term adjunct in severe anxiety or behavioral disturbances Adult: 1 mg bid increased to 2 mg bid if necessary. <i>Intramuscular</i> Psychoses Adult: As decanoate: Initially, 12.5 mg adjusted according to response. Maintenance: 12.5-100 mg at intervals of 2-6 wk. For doses >50 mg, increments should be made slowly in steps of 12.5 mg. The enantate ester can be given in similar doses at intervals of 1-3 wk. Elderly: 6.25 mg adjusted according to response. <i>Intramuscular</i> Mania Adult: As decanoate: Initially, 12.5 mg adjusted according to response. Maintenance: 12.5-100 mg at intervals of 2-6 wk. For doses >50 mg, increments should be made slowly in steps of 12.5 mg. The enantate ester can be given in similar doses at intervals of 1-3 wk. Elderly: 6.25 mg adjusted according to response. <i>Intramuscular</i> Schizophrenia Adult: As decanoate: Initially, 12.5 mg adjusted according to response. Maintenance: 12.5-100 mg at intervals of 2-6 wk. For doses >50 mg, increments should be made slowly in steps of 12.5 mg. The enantate ester can be given in similar doses at intervals of 1-3 wk. Elderly: 6.25 mg adjusted according to response.
Administration	May be taken with or without food.
Contraindications	Hypersensitivity; comatose or severely depressed states; blood dyscrasias; liver disease; bone marrow depression; phaeochromocytoma; suspected or established subcortical brain damage with or without hypothalamic damage;

	hypersensitivity; comatose or severely depressed states; blood dyscrasias; liver disease; bone marrow depression; phaeochromocytoma; suspected or established subcortical brain damage with or without hypothalamic damage; pregnancy (3rd trimester), lactation.
Special Precautions	Presence of convulsive disorders; hepatic, renal, cerebrovascular, resp and CV diseases; elderly or debilitated patients. May elevate prolactin levels which may persist after chronic admin. May exacerbate depression. Closed-angle glaucoma. History of jaundice, parkinsonism, DM, hypothyroidism, myasthenia gravis, paralytic ileus, prostatic hyperplasia or urinary retention. Regular eye examinations in patients receiving long term therapy. Avoid direct sunlight exposure.
Adverse Drug Reactions	Tardive dyskinesia, sedation, mental confusion; hypotension; hyperprolactinaemia leading to galactorrhoea and amenorrhoea in women; loss of libido, impotence and sterility in males. Allergic reactions, cholestatic jaundice, corneal and lens deposits, skin pigmentation. Potentially Fatal: Agranulocytosis; neuroleptic malignant syndrome.
Drug Interactions	Reduces antihypertensive effects of guanethidine, methyldopa and clonidine. Lithium toxicity. Reduced bioavailability with antacids. Increased risk of arrhythmia when used with drugs that prolong QT interval. May cause electrolyte disturbance when used with diuretics. Potentially Fatal: Additive CNS depressant effects with alcohol, barbiturates, hypnotics, sedatives, opiates and antihistamines.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or

	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intramuscular: Store at 15-30°C. Oral: Store at 15-30°C.
Mechanism of Action	Fluphenazine blocks postsynaptic dopamine D₁ and D₂ receptors in the mesolimbic system and decreases the release of hypothalamic and hypophyseal hormones. It reduces aggressiveness with disappearance of hallucinations and delusions. Onset: 1-3 days. Duration: 2-4 days. Absorption: Absorbed as HCl from the GI tract (oral); slowly absorbed as decanoate and enantate (SC/IM). Distribution: Crosses the placenta; enters breast milk. Protein-binding: 91-99%. Metabolism: Hepatic. Excretion: Urine (as metabolites); 14.7 hr (elimination half-life).
CIMS Class	Antipsychotics
ATC Classification	N05AB02 - fluphenazine; Belongs to the class of phenothiazine antipsychotics with piperazine structure. Used in the management of psychosis.

flurazepam

CIMS Class : (Hypnotics & Sedatives)
flurazepam

P - Contraindicated in pregnancy
L - Caution when used during lactation
Food ⚠ - Food interaction

related flurazepam information

Indication & Dosage	<i>Oral</i> Short-term management of insomnia Adult: 15-30 mg once at night. Child: ≥15 yr: 15 mg at bedtime. Elderly: Max initial dose: 15 mg at night.
Administration	May be taken with or without food.
Overdosage	Overdosage may lead to somnolence, confusion and coma. Treatment is supportive. Monitor respiration, pulse and BP. Gastric lavage may be used. Administer IV fluids and maintain an adequate airway. Flumazenil may be used as an adjunct to the proper management of benzodiazepine overdose.
Contraindications	Hypersensitivity; porphyria. Pregnancy (3 rd trimester); neonates.
Special Precautions	Chronic pulmonary insufficiency; elderly or debilitated patients; muscle weakness, impaired liver or kidney function; drowsiness may affect skilled tasks; monitor

	Chronic pulmonary insufficiency; elderly or debilitated patients; muscle weakness, impaired liver or kidney function; drowsiness may affect skilled tasks; monitor cardio-respiratory function when used for deep sedation; personality disorders or organic brain changes; history of alcohol or drug addiction. Respiratory depression and hypotension with parenteral admin. Dependence; lactation. Safety and efficacy are not proven in children <15 yr.
Adverse Drug Reactions	Drowsiness and lightheadedness, sedation, muscle weakness and ataxia; less frequently vertigo, headache, confusion, depression, slurred speech, changes in libido, tremor, visual disturbances, urinary retention, GI disturbances, changes in salivation and amnesia.
Drug Interactions	Antidepressants, antihistamines, antipsychotics, general anesthetics, other hypnotics or sedatives, opioid analgesics and cisapride. Increased toxicity by amprenavir, cimetidine, ciprofloxacin, clarithromycin, clozapine, CNS depressants, diltiazem, disulfiram, digoxin, erythromycin, ethanol, levodopa, loxapine, metoprolol, metronidazole, miconazole, nefazodone, nelfinavir, omeprazole, phenytoin, rifabutin, rifampicin, ritonavir, troleandomycin, valproic acid and verapamil. Effect is decreased by carbamazepine, rifampicin and rifabutin. Alcohol.
Food Interaction	Serum levels increased by grapefruit juice. Herbs such as valerian, St John's wort, kava kava, gotu kola may increase CNS depression.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.

Storage	Oral: Store at 15-30°C.
Mechanism of Action	Flurazepam is a long-acting benzodiazepine. It binds to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron within the CNS, including the limbic system, reticular formation. It enhances the inhibitory effect of GABA on neuronal excitability by increasing neuronal membrane permeability to chloride ions, thus resulting in hyperpolarisation and stabilisation. Onset: Hypnotic: 15-20 minutes. Duration: 7-8 hr. Absorption: Readily absorbed from the GI tract. Metabolism: Metabolised in the liver to N-desalkylflurazepam (active) and N-hydroxyethylflurazepam. Excretion: Elimination half-life: 2.3 hr (parent drug). Urine, mainly as conjugated metabolites.
CIMS Class	Hypnotics & Sedatives
ATC Classification	N05CD01 - flurazepam; Belongs to the class of benzodiazepine derivatives used as hypnotics and sedatives.

flurbiprofen

CIMS Class : (Other Eye Preparations) , (Mouth/Throat Preparations) , (Nonsteroidal Anti-inflammatory Drugs (NSAIDs))
flurbiprofen

P - Contraindicated in pregnancy
L - Contraindicated in lactation

related flurbiprofen information

Indication & Dosage	<i>Oral</i> Pain and inflammation associated with musculoskeletal and joint disorders Adult: 150-200 mg daily in divided doses, increased to 300 mg daily in acute or severe conditions if necessary.
	<i>Oral</i> Dysmenorrhoea Adult: Initially, 100 mg followed by 50-100 mg every 4-6 hr. Max: 300 mg/day.
	<i>Oral</i> Sore throat Adult: 1 lozenge (8.75 mg) every 3-6 hr. Max: 5 lozenges/day. Max treatment duration: 3 days. Child: <12 yr: Not recommended.
	<i>Ophthalmic</i> Prophylaxis of miosis during ocular surgery Adult: As sodium: Instill 1 drop of a 0.03% solution into the eye every 30 minutes starting 2 hr before and ending not <

	Prophylaxis of miosis during ocular surgery Adult: As sodium: Instill 1 drop of a 0.03% solution into the eye every 30 minutes starting 2 hr before and ending not < 30 minutes before the surgery. <i>Ophthalmic</i> Postoperative ocular inflammation Adult: Instill 1 drop of a 0.03% solution into the eye 4 times daily for 1-3 wk starting at 24 hr after surgery.
Administration	Should be taken with food.
Contraindications	Peptic ulcer, GI haemorrhage, asthma, bronchospasm, rhinitis, angioedema, hypersensitivity; aspirin intolerance; pregnancy (3 rd trimester); lactation.
Special Precautions	Hypertension; impaired renal function.
Adverse Drug Reactions	Fluid retention, oedema; allergic nephritis, allergic reactions; GI upsets; dizziness, tinnitus, blurring of vision; local irritation, transient burning and stinging (ophthalmic). Potentially Fatal: Peptic ulceration, haemorrhage and perforation.
Drug Interactions	Increases serum concentrations of digoxin; may enhance effects of anticoagulants.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters). in 3rd trimester or near delivery. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed

	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Ophthalmic: Store at 15-25°C. Oral: Store at 15-25°C.
Mechanism of Action	Flurbiprofen inhibits prostaglandin synthesis by decreasing the activity of cyclooxygenase resulting in reduced prostaglandin levels. It is also a potent inhibitor of platelet aggregation. Onset: 1-2 hrs. Absorption: Readily absorbed from the GIT (oral); peak plasma concentrations after 1-2 hrs. Distribution: Small amounts enter breast milk. Protein-binding: 99% Metabolism: Hepatic via hydroxylation and conjugation. Excretion: Urine (as metabolites); 3-6 hrs (elimination half-life).
CIMS Class	Other Eye Preparations / Mouth/Throat Preparations / Nonsteroidal Anti-inflammatory Drugs (NSAIDs)
ATC Classification	M01AE09 - flurbiprofen; Belongs to the class of propionic acid derivatives of non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism. M02AA19 - flurbiprofen; Belongs to the class of non-steroidal antiinflammatory preparations for topical use. Used in the treatment of joint and muscular pains. S01BC04 - flurbiprofen; Belongs to the class of non-steroidal antiinflammatory agents. Used in the treatment of inflammation of the eye.

S01BC04 - flurbiprofen; Belongs to the class of non-steroidal antiinflammatory agents. Used in the treatment of inflammation of the eye.

flutamide

CIMS Class : (Hormonal Chemotherapy)
flutamide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related flutamide information

Indication & Dosage	<i>Oral</i> Palliative treatment of prostatic carcinoma Adult: 250 mg tid preferably at least 3 days before gonadorelin analogue treatment.
Administration	May be taken with or without food.
Contraindications	Hypersensitivity, severe hepatic impairment, pregnancy and lactation.
Special Precautions	Perform liver function tests before starting treatment and at regular intervals. Treatment is not recommended in patients whose ALT values exceed twice the upper limit of normal. Regular assessment of prostate specific antigen level may help to monitor disease progression. Advise patient against discontinuing drug on their own. Exercise caution in patients with cardiac disease.
Adverse Drug Reactions	Hot flushes, loss of libido, impotence, gynaecomastia, nausea, vomiting, diarrhoea, increased appetite, sleep disturbances, skin reactions, anaemias, headache, dizziness, malaise, anxiety, hypertension, gastric and chest

	nausea, vomiting, diarrhoea, increased appetite, sleep disturbances, skin reactions, anaemias, headache, dizziness, malaise, anxiety, hypertension, gastric and chest pain, oedema, blurred vision, hepatitis, jaundice, rash, thirst, pruritus, SLE-like syndrome, drowsiness, confusion, depression, nervousness.
Drug Interactions	Increased prothrombin time in patients on long-term warfarin treatment.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 25°C.
Mechanism of Action	Flutamide is a nonsteroidal 'pure' antiandrogen which acts directly on the target tissues either by blocking androgen uptake or by inhibiting cytoplasmic and nuclear binding of androgen. Distribution: Protein-binding: 90% Metabolism: Rapid and extensive; converted to hydroxyflutamide. Excretion: Urine, faeces (small amounts); 2 hrs (elimination half-life, metabolite).
CIMS Class	Hormonal Chemotherapy
ATC Classification	L02BB01 - flutamide; Belongs to the class of anti-androgens. Used in endocrine therapy.

fluticasone

CIMS Class : (Antiasthmatic & COPD Preparations) , (Topical Corticosteroids) , (Nasal Decongestants & Other Nasal Preparations)
fluticasone

P - Caution when used during pregnancy

L - Caution when used during lactation

related fluticasone information

Indication & Dosage

Nasal

Treatment and prophylaxis of allergic rhinitis

Adult: 100 mcg into each nostril once daily, increased to 100 mcg bid.

Child: >4 yr: 50 mcg into each nostril once daily, increased to 50 mcg bid.

Nasal

Nasal polyps

Adult: As propionate: 200 mcg to be instilled into each nostril 1-2 times daily for at least 4-6 wk.

Inhalation

Asthma prophylaxis

Adult: As powder or aerosol: 100-250 mcg bid in mild cases, up to 500-1000 mcg bid in severe cases.

Child: As powder or aerosol: >4 yr: Initially, 50-100 mcg bid. May increase to 200 mcg, if necessary.

Inhalation

Severe asthma

	May increase to 200 mcg, if necessary. <i>Inhalation</i> Severe asthma Adult: As nebuliser: 0.5-2 mg bid. Child: As nebuliser: 4-16 yr: 1 mg bid. <i>Inhalation</i> Chronic obstructive pulmonary disease Adult: As powder or aerosol: 500 mcg bid. <i>Topical/Cutaneous</i> Corticosteroid-responsive dermatoses Adult: As propionate: Apply a 0.05 or 0.005% cream/ointment onto affected area.
Contraindications	Hypersensitivity. Acne vulgaris, rosacea, perioral dermatitis, skin atrophy; hypersensitivity. Primary cutaneous viral infections (e.g. herpes simplex, chicken pox), perianal and genital pruritus, primary fungal or bacterial skin infections. Inhalation: Status asthmaticus.
Special Precautions	Children, pregnancy, lactation, concomitant skin infections. Concomitant skin/lung/systemic infections. Advised to rinse mouth with water every time after inhalation. Application to large areas, broken skin or under occlusive dressings.
Adverse Drug Reactions	Topical: Pruritus, hypertrichosis, dryness, numbness of fingers, burning, eruptions, hypopigmentation, allergic contact dermatitis, secondary infection, skin atrophy, Cushing's syndrome, reversible HPA-axis suppression. Inhalation: Oropharyngeal candidiasis, pharyngitis, dysphoria, cough, rhinitis, nasal congestion and headache. Systemic absorption may be seen when applied to large areas, when skin is broken or under occlusive dressings. Potentially Fatal: Suppression of immune system.
Drug Interactions	May lead to increased plasma concentrations of fluticasone when used with CYP4503A4 inhibitors such as ritonavir.

	May lead to increased plasma concentrations of fluticasone when used with CYP4503A4 inhibitors such as ritonavir.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Inhalation: Store at 25°C. Nasal: Store at 4-30°C. Topical/Cutaneous: Store at 15-30 °C.
Mechanism of Action	Fluticasone utilises a fluorocarbothioate ester linkage at the C17 position. It has potent vasoconstrictive and anti-inflammatory activity, but weak HPA inhibitory effect when applied topically. Absorption: Poorly absorbed from the GI tract (oral). Distribution: Protein-binding: 91%. Metabolism: Extensively hepatic; converted to 17β-carboxylic acid. Excretion: Faeces (as unchanged drug and metabolites), urine (as metabolites).
CIMS Class	Antiasthmatic & COPD Preparations / Topical Corticosteroids / Nasal Decongestants & Other Nasal Preparations
ATC Classification	D07AC17 - fluticasone; Belongs to the class of potent (group III) corticosteroids. Used in the treatment of dermatological diseases. R01AD08 - fluticasone; Belongs to the class of topical corticosteroids used as nasal decongestants. R03BA05 - fluticasone; Belongs to the class of other inhalants used in the treatment of obstructive airway diseases, glucocorticoids.

R03BA05 - fluticasone; Belongs to the class of other inhalants used in the treatment of obstructive airway diseases, glucocorticoids.

fluvoxamine

CIMS Class : (Antidepressants)
fluvoxamine

P - Caution when used during pregnancy
L - Contraindicated in lactation

related fluvoxamine information

Indication & Dosage

Oral

Depression

Adult: Initially, 50-100 mg daily, may increase gradually up to 300 mg daily, if necessary. Doses >150 mg should be given in 2 or 3 divided doses.

Oral

Obsessive compulsive disorder

Adult: 50 mg once daily; may increase by 50 mg every 4-7 days. Daily doses >100 mg should be given in 2 divided doses. As modified-release preparation: Initial: 100 mg once daily. Max: 300 mg daily.

Child: ≥8 yr: 25 mg once daily, may increase by 25 mg every 4-7 days. Doses >50 mg should be given in 2 divided doses. Reassess if no improvement after 10 wk of treatment. Max: 200 mg daily.

Oral

Social anxiety disorder

Adult: As modified-release preparation: Initial: 100 mg once daily. Max: 300 mg daily.

	Social anxiety disorder Adult: As modified-release preparation: Initial: 100 mg once daily. Max: 300 mg daily.
Administration	May be taken with or without food.
Overdosage	Symptoms include nausea, vomiting, diarrhoea, coma, hypokalemia, hypotension, respiratory difficulties, somnolence, tachycardia, bradycardia, ECG abnormalities (e.g. heart arrest, QT interval prolongation, 1st degree AV block, bundle branch block and junctional rhythm), convulsions, dizziness. Treatment includes general supportive measures. Ensure adequate airway, oxygenation and ventilation. Monitor cardiac rhythm and vital signs. Activated charcoal may be used.
Contraindications	Hypersensitivity. Not to be used with thioridazine, terfenadine, astemizole, cisapride, pimozide, aloestron, tizanidine. Lactation.
Special Precautions	History of mania or seizures; liver dysfunction; presence of depressive symptoms; smokers. Treatment with MAOI should only be started at least 2 wk after stopping fluvoxamine treatment. Increased risk of suicidal ideation and behaviour when used in children, adolescents and young adults <24 yr. Pregnancy, elderly; operating hazardous machinery; withdraw gradually. Monitor prothrombin time in patients who are taking oral anticoagulants concurrently.
Adverse Drug Reactions	Headache, asthenia, tremor, palpitations, nausea, diarrhoea, constipation, anorexia, vomiting, flatulence, somnolence, insomnia, dry mouth, nervousness, dizziness, tremor, anxiety, agitation, decreased libido, depression, CNS stimulation, dyspnoea, yawn, sweating, abnormal ejaculation, urinary frequency, anorgasmia, urinary retention.

	anxiety, agitation, decreased libido, depression, CNS stimulation, dyspnoea, yawn, sweating, abnormal ejaculation, urinary frequency, anorgasmia, urinary retention.
Drug Interactions	Co-admin with fluvoxamine may increase carbamazepine toxicity and serum levels of theophylline. Lithium enhances the serotonergic effects of fluvoxamine. Anticoagulants may require dosage adjustments. Diltiazem with fluvoxamine may lead to bradycardia. Avoid alcohol. Potentially Fatal: Fluvoxamine should not be used in combination with MAOIs, or within 14 days of discontinuing treatment with MAOIs.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Fluvoxamine, derived from aralkylketone, inhibits the re-uptake of serotonin in brain neurons. Absorption: Readily absorbed from the GI tract (oral). Distribution: Protein-binding: 80%. Metabolism: Extensively hepatic by oxidative demethylation and deamination to inactive metabolites. Excretion: Urine; 15 hr (elimination half-life).
CIMS Class	Antidepressants
ATC Classification	N06AB08 - fluvoxamine; Belongs to the class of selective serotonin reuptake inhibitors. Used in the management of depression.

folic acid

CIMS Class : (Vitamins & Minerals (Pre & Post Natal) / Antianemics)
folic acid

related folic acid information

Indication & Dosage

Oral

Folate-deficient megaloblastic anaemia

Adult: 5 mg daily for 4 mth, up to 15 mg daily in malabsorption states. Continued dosing at 5 mg every 1-7 days may be needed in chronic haemolytic states, depending on the diet and rate of haemolysis.

Oral

Prophylaxis of megaloblastic anaemia in pregnancy

Adult: 0.2-0.5 mg daily.

Oral

Prophylaxis of neural tube defect in pregnancy

Adult: 4 or 5 mg daily starting before pregnancy and continued through the 1st trimester.

Oral

As supplement for women of child-bearing potential

Adult: 0.4 mg daily.

Administration

May be taken with or without food.

Contraindications

Undiagnosed megaloblastic anaemia; pernicious, aplastic or normocytic anaemias.

Special

Treatment resistance may occur in patients with depressed

Special Precautions	Treatment resistance may occur in patients with depressed haematopoiesis, alcoholism, deficiencies of other vitamins. Neonates.
Adverse Drug Reactions	GI disturbances, hypersensitivity reactions; bronchospasm.
Drug Interactions	Antiepileptics, oral contraceptives, anti-TB drugs, alcohol, aminopterin, methotrexate, pyrimethamine, trimethoprim and sulphonamides may result to decrease in serum folate contrations. Decreases serumphenytoin concentrations.
Pregnancy Category (US FDA)	Category A: Controlled studies in women fail to demonstrate a risk to the foetus in the 1st trimester (and there is no evidence of a risk in later trimesters), and the possibility of foetal harm remains remote. if dose > 0.8 mg/day. Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Folic acid is essential for the production of certain coenzymes in many metabolic systems such as purine and pyrimidine synthesis. It is also essential in the synthesis and maintenance of nucleoprotein in erythropoiesis. It also promotes WBC and platelet production in folate-deficiency anaemia. Onset: Peak effect: Oral: 0.5-1 hr.

	promotes WBC and platelet production in folate-deficiency anaemia. Onset: Peak effect: Oral: 0.5-1 hr. Absorption: Rapidly absorbed mainly from the duodenum and jejunum. Distribution: Extensively bound to plasma protein. Principal site of storage is the liver. It is also concentrated in the CSF and enters the breast milk. Metabolism: Undergoes conversion in the plasma and liver to the metabolically active 5-methyltetrahydrofolate. Excretion: Via urine (as unchanged drug and metabolites). Removed by haemodialysis.
CIMS Class	Vitamins & Minerals (Pre & Post Natal) / Antianemics
ATC Classification	B03BB01 - folic acid; Belongs to the class of folic acid and derivatives. Used in the treatment of anemia.

formoterol

CIMS Class : (Antiasthmatic & COPD Preparations)
formoterol

P - Caution when used during pregnancy

L - Caution when used during lactation

related formoterol information

Indication & Dosage	<i>Oral</i>
	Reversible airways obstruction
	Adult: 80 mcg bid.
	Child: >6 mth: 4 mcg/kg/day, given in 2-3 divided doses.
	<i>Oral</i>
	Acute bronchospasm
	Adult: 80 mcg bid.
	Child: >6 mth: 4 mcg/kg/day, given in 2-3 divided doses.
	<i>Inhalation</i>
	Acute bronchospasm
	Adult: As inhalational capsule: 12 mcg bid; up to 24 mcg bid in severe cases. As dry powder inhaler: 6 or 12 mcg 1-2 times daily, up to 24 mcg bid in severe cases. As metered doses from aerosol inhaler (per inhalation into mouthpiece contains 12 mcg): 1-2 inhalations bid. As nebuliser: 20 mcg bid.
	Child: As inhalational capsule: =5 yr: 12 mcg bid. As dry powder inhaler: =6 yr: 6 or 12 mcg 1-2 times daily; up to 48 mcg/day; max: 12 mcg/dose.

	Child: As inhalational capsule: =5 yr: 12 mcg bid. As dry powder inhaler: =6 yr: 6 or 12 mcg 1-2 times daily; up to 48 mcg/day; max: 12 mcg/dose. <i>Inhalation</i> Reversible airways obstruction Adult: As inhalational capsule: 12 mcg bid; up to 24 mcg bid in severe cases. As dry powder inhaler: 6 or 12 mcg 1-2 times daily, up to 24 mcg bid in severe cases. As metered doses from aerosol inhaler (per inhalation into mouthpiece contains 12 mcg): 1-2 inhalations bid. As nebuliser: 20 mcg bid. Child: As inhalational capsule: =5 yr: 12 mcg bid. As dry powder inhaler: =6 yr: 6 or 12 mcg 1-2 times daily; up to 48 mcg/day; max: 12 mcg/dose. <i>Inhalation</i> Prophylaxis of exercise-induced bronchospasm Adult: 6 or 12 mcg at least 15 minutes before exercise. Additional dose should only be given after 12 hr; not to be used in patients who are already using it for asthma maintenance. Child: As fumarate: =5 yr: 6 or 12 mcg at least 15 minutes before exercise. Additional dose should only be given after 12 hr; not to be used in patients who are already using it for asthma maintenance.
Overdosage	Symptoms include angina, hypertension or hypotension, tachycardia, with rates up to 200 beats/minute, arrhythmias, nervousness, headache, tremor, seizures, muscle cramps, dry mouth, palpitation, nausea, dizziness, fatigue, malaise, hypokalemia, hyperglycaemia, insomnia, metabolic acidosis. Treatment is symptomatic and supportive. Cardiac monitoring is recommended.
Contraindications	Hypersensitivity.

Contraindications	Hypersensitivity.
Special Precautions	Thyrotoxicosis; severe CV disorders e.g. ischaemic heart disease, tachyarrhythmias or severe heart burn; prolonged QT-interval. DM; pregnancy; lactation; children <5 yr; do not initiate or increase the dose during an exacerbation. May produce paradoxical bronchospasm.
Adverse Drug Reactions	Tremor, headache, tiredness, restlessness, dizziness, dry mouth, palpitation, tachycardia, muscle cramps, nausea.
Drug Interactions	Concomitant treatment with xanthine derivatives, steroids or diuretics may potentiate a possible hypokalaemic effect of β -agonists. Increased susceptibility to cardiac arrhythmias in patients treated with digitalis. Concomitant use with quinidine, disopyramide, procainamide, phenothiazines, antihistamines, MAOI or TCAs can prolong the QT-interval and increase the risk of ventricular arrhythmias. L-dopa, L-thyroxine, oxytocin and alcohol can impair cardiac tolerance towards β_2 -sympathomimetics. β -adrenergic blockers can inhibit the effect of formoterol. Increased risk of arrhythmias in patients receiving concomitant anaesthesia with halogenated hydrocarbons.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Inhalation: Store below 25°C. Oral: Store below 25°C.
Mechanism of Action	Formoterol relaxes the bronchial smooth muscle by selectively acting on β_2 -receptors with minimal effect on heart rate. It has a long-acting effect.

	Formoterol relaxes the bronchial smooth muscle by selectively acting on β_2 -receptors with minimal effect on heart rate. It has a long-acting effect.
CIMS Class	Antiasthmatic & COPD Preparations
ATC Classification	R03AC13 - formoterol; Belongs to the class of adrenergic inhalants, selective beta-2-adrenoreceptor agonists. Used in the treatment of obstructive airway diseases.

fosinopril

CIMS Class : (ACE Inhibitors)
fosinopril

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related fosinopril information

Indication & Dosage

Oral

Hypertension

Adult: Initially, 10 mg once daily at bedtime. Maintenance: 10-40 mg once daily. In patients on diuretic therapy, diuretic should be withdrawn, if possible, a few days before starting fosinopril and restarted later if needed.

Oral

Heart failure

Adult: Initially, 10 mg once daily. May increase gradually. Max: 40 mg once daily. For patients at high risk of hypotension, 5 mg once daily may be given as an initial dose.

Administration

Should be taken on an empty stomach. (Best taken 1 hr before meals. May be taken w/ meals to reduce GI discomfort.)

Contraindications

Hypersensitivity, idiopathic or hereditary angioedema, history of angioedema related to previous treatment with an

	Hypersensitivity, idiopathic or hereditary angioedema, history of angioedema related to previous treatment with an ACE inhibitor. Bilateral renal artery stenosis. Pregnancy (2nd and 3rd trimesters), lactation.
Special Precautions	Severely impaired renal function; hyperkalaemia, hypovolaemia, collagen vascular diseases, valvular stenosis; before, during or immediately after anaesthesia, unilateral renal artery stenosis.
Adverse Drug Reactions	Dizziness, orthostatic hypotension, palpitation, headache, weakness, fatigue, hyperkalaemia, chest pain, musculoskeletal pain, dry cough, nausea, vomiting, dyspepsia, diarrhoea. Potentially Fatal: Cerebrovascular accident, rhythm disturbances, palpitations, hypotension, syncope, rashes, oedema, hypersensitivity reactions, angioedema.
Drug Interactions	Co-admin with diuretics may cause an excessive reduction of BP. Antacids may impair absorption of fosinopril. Potentially Fatal: Potassium loss caused by potassium-sparing diuretics or potassium supplements can increase the risk of hyperkalaemia. Increased serum lithium levels and toxicity.
Lab Interference	False-positive Coombs' test and urine-acetone determination. False low measurement of serum digoxin levels with some laboratory kits.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 2nd & 3rd trimesters.

	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Oral: Store at 20-25°C.
Mechanism of Action	Fosinopril competitively inhibits ACE from converting angiotensin I to angiotensin II resulting in decreased levels of angiotensin II which causes increased plasma renin activity and reduced aldosterone secretion. It also reduces sodium and water retention. By these mechanisms, fosinopril produces hypotensive effect. Absorption: 36% is absorbed from the GI tract (oral); peak plasma concentrations after 3 hr (fosinoprilat). Distribution: Protein-binding: >95% (fosinoprilat). Metabolism: Rapidly and completely hydrolysed to fosinoprilat (active metabolite) in GI mucosa and liver. Excretion: Urine and faeces. Elimination half-life: 11.5 hr (hypertensive patients), 14 hr (patients with heart failure).
CIMS Class	ACE Inhibitors
ATC Classification	C09AA09 - fosinopril; Belongs to the class of ACE inhibitors. Used in the treatment of cardiovascular disease.

fosphenytoin

CIMS Class : (Anticonvulsants)
fosphenytoin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ⚠ - Lab interference

related fosphenytoin information

Indication & Dosage

Parenteral

Tonic-clonic status epilepticus

Adult: As Phenytoin sodium equivalents (PSE): Loading dose: 15 mg/kg, given via IV infusion at a rate of 100-150 mg/minute. Maintenance: Initially, 4-5 mg PSE/kg/day by IM inj or IV infusion at a rate of 50-100 mg PSE/minute; subsequent doses depend on patient's response and trough-plasma phenytoin levels.

Child: ≥5 yr: As Phenytoin sodium equivalents (PSE): Loading dose: 15 mg/kg, given via IV infusion at a rate of 2-3 mg/kg/minute. Maintenance: Initially, 4-5 mg/kg/day by IM inj or IV infusion at a rate of 1-2 mg/kg/minute; subsequent doses depend on patient's response and trough-plasma phenytoin levels.

Renal impairment: Dose reduction or slower infusion may be needed.

Hepatic impairment: Dose reduction or slower infusion may be needed.

Parenteral

Seizures

Adult: Except status epilepticus: As Phenytoin sodium equivalents (PSE): Loading dose: 10-15 mg/kg, given via IM inj or IV infusion at a rate

	Seizures Adult: Except status epilepticus: As Phenytoin sodium equivalents (PSE): Loading dose: 10-15 mg/kg, given via IM inj or IV infusion at a rate of 50-100 mg/minute. Maintenance: Initially, 4-5 mg/kg/day by IM inj or IV infusion at a rate of 50-100 mg/minute; subsequent doses depend on patient's response and trough-plasma phenytoin levels. Child: =5 yr: As Phenytoin sodium equivalents (PSE): Loading dose: 10-15 mg/kg, given via IM inj or IV infusion at a rate of 1-2 mg/kg/minute. Maintenance: Initially, 4-5 mg/kg/day by IM inj or IV infusion at a rate of 1-2 mg/kg/minute; subsequent doses depend on patient's response and trough-plasma phenytoin levels. Renal impairment: Dose reduction or slower infusion may be needed. Hepatic impairment: Dose reduction or slower infusion may be needed.
Overdosage	Symptoms include nausea, vomiting, lethargy, tachycardia, bradycardia, asystole, cardiac arrest, hypotension, syncope, hypocalcemia, metabolic acidosis and death. Treatment is supportive and symptomatic. Haemodialysis may be considered.
Contraindications	Porphyria; sinus bradycardia; SA block; 2nd- and 3rd-degree heart block; Stokes-Adams syndrome; pregnancy, lactation.
Special Precautions	Hepatic or renal impairment; hypoalbuminaemia; elderly; patients requiring phosphate restriction; resuscitation facilities must be available. Monitor ECG, BP and respiratory function during infusion; observe patient for at least 30 minutes after infusion. IV infusion rate should not exceed 150 mg PSE/minute in adults or 3 mg PSE/kg/minute in children =5 yr.
Adverse Drug Reactions	Burning, itching and paraesthesia in the groin area following IV admin; asystole, ventricular fibrillation, hypotension, bradycardia, heart block. Potentially Fatal: Severe CV reactions.
Drug Interactions	Concurrent use may affect the efficacy of anticoagulants, corticosteroids, coumarin, digitoxin, doxycycline, oestrogens, furosemide, oral contraceptives, rifampin, quinidine, theophylline and vitamin

	Concurrent use may affect the efficacy of anticoagulants, corticosteroids, coumarin, digitoxin, doxycycline, oestrogens, furosemide, oral contraceptives, rifampin, quinidine, theophylline and vitamin D. Amiodarone, chloramphenicol, chlordiazepoxide, cimetidine, diazepam, dicumarol, disulfiram, oestrogens, ethosuximide, fluoxetine, H₂-antagonists, halothane, isoniazid, methylphenidate, phenothiazines, phenylbutazone, salicylates, succinimides, sulfonamides, tolbutamide and trazodone may increase the plasma levels of phenytoin. Carbamazepine and reserpine may reduce serum levels of phenytoin. TCAs may increase the risk of seizures in susceptible patients.
Lab Interference	May decrease serum concentrations of T ₄ . May also increase serum concentrations of glucose, alkaline phosphatase, GGT. Produce artificially low results in dexamethasone or metyrapone tests.
Storage	Parenteral: Store at 2-8°C.
Mechanism of Action	Fosphenytoin is converted to phenytoin in the body. It modulates voltage-dependent Na channels of neurons. Absorption: Plasma concentrations peak after 30 minutes (IM). Distribution: Displaces phenytoin from binding sites. Protein-binding: 95-99%. Metabolism: Complete; hydrolysed to phenytoin, phosphate and formaldehyde. Excretion: Urine (as inactive metabolites).
CIMS Class	Anticonvulsants
ATC Classification	N03AB05 - fosphenytoin; Belongs to the class of hydantoin derivatives antiepileptics. Used in the management of epilepsy.

framycetin

CIMS Class : (Eye Anti-infectives & Antiseptics) , (Ear Anti-infectives & Antiseptics) , (Topical Antibiotics)
framycetin

P - Caution when used during pregnancy

related framycetin information

Indication & Dosage

Otic/Aural

Posttraumatic or pre- and postoperative otitis externa

Adult: As 0.5% drops: Use as directed.

Ophthalmic

Conjunctivitis, blepharitis and blepharoconjunctivitis

Adult: As 0.5% ointment. Apply 2-3 times daily into the affected eyes.

Topical/Cutaneous

Skin infections

Adult: As sulfate: Apply 1% dressing onto affected area.

Contraindications

Hypersensitivity, perforated ear drums (ear drops), fungal/viral or resistant bacterial eye infections (eye drops with steroids).

Special Precautions

If large areas of skin are being treated, ototoxicity may be a hazard, particularly in children, elderly and those with renal impairment. Pregnancy.

Adverse Drug Reactions

Ototoxicity, if large areas used in high-risk groups; sensitisation, contact dermatitis, local irritation and itching.

	Ototoxicity, if large areas used in high-risk groups; sensitisation, contact dermatitis, local irritation and itching.
Drug Interactions	Co-admin of gramicidin with framycetin reduces the risk of selecting resistant bacteria.
Mechanism of Action	Framycetin is an aminoglycoside antibiotic which is the major component of neomycin. Susceptible organisms include many gram-negative bacteria (but not Pseudomonas) and many strains of Staphylococcus. Used topically in the treatment of skin, eye and ear infections often in combination with steroids and other antimicrobials.
CIMS Class	Eye Anti-infectives & Antiseptics / Ear Anti-infectives & Antiseptics / Topical Antibiotics
ATC Classification	D09AA01 - framycetin; Belongs to the class of ointment dressings with anti-infectives. Used in treatment of wounds. R01AX08 - framycetin; Belongs to the class of other topical preparations used as nasal decongestants. S01AA07 - framycetin; Belongs to the class of antibiotics. Used in the treatment of eye infections.

furazolidone

CIMS Class : (Other Antiprotozoal Agents)
furazolidone

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related furazolidone information

Indication & Dosage

Oral

Giardiasis, Cholera

Adult: 100 mg 4 times daily. Usual duration: 2-5 days, up to 7 days in some patients or 10 days for giardiasis.

Child: 1.25 mg/kg 4 times daily, usually given for 2-5 days or up to 10 days for giardiasis.

Administration

Should be taken with food. (Avoid food & beverage containing tyramine or tryptophan, eg alcohol, beer (incl alcohol-free beer), cheese, yoghurt. See lit for complete list.)

Contraindications

Hypersensitivity, infants <1 mth. Alcohol.

Special Precautions

Pregnancy, lactation, G6PD deficiency.

Adverse Drug Reactions

Hypersensitivity, hypoglycaemia, orthostatic hypotension, dizziness, drowsiness, headache, malaise, nausea, vomiting, rash, fever, arthralgia, brown urine, haemolytic anaemia.

Potentially Fatal: Agranulocytosis. Hypertensive crisis with MAOIs.

	vomiting, rash, fever, arthralgia, brown urine, haemolytic anaemia. Potentially Fatal: Agranulocytosis. Hypertensive crisis with MAOIs.
Drug Interactions	Disulfiram-like reaction with alcohol. Potential hypertensive crisis with sympathomimetics, tyramine-containing foods, levodopa. Potentially Fatal: Potentiation of MAOIs. Toxic psychosis with amitriptyline.
Food Interaction	Reaction with foods rich in tyramine.
Mechanism of Action	Furazolidone has a broad antibacterial spectrum which is active against susceptible organisms including E. coli, staphylococci, Giardia sp. and against salmonella, shigella, proteus, and V. cholerae. Its bactericidal action is by interfering with bacterial enzyme systems. Absorption: Poor (oral). Excretion: Urine (as active drug and metabolites).
CIMS Class	Other Antiprotozoal Agents
ATC Classification	G01AX06 - furazolidone; Belongs to the class of other anti-infectives and antiseptics. Used in the treatment of gynecological infections.

furosemide

CIMS Class : (Diuretics)
furosemide

P - Caution when used during pregnancy

L - Caution when used during lactation

related furosemide information

Indication & Dosage	<i>Oral</i>
	Hypertension
	Adult: 40-80 mg daily, alone or in conjunction with other antihypertensives.
	<i>Oral</i>
	Oedema associated with heart failure
	Adult: Initially, 20 mg daily or 40 mg every other day for mild cases, or 40 mg once daily adjusted according to response. In some cases, 80 mg or more daily as a single dose or in 2 divided doses may be required. Max: 600 mg daily in severe cases.
	Child: 1-3 mg/kg daily. Max: 40 mg daily.
	<i>Parenteral</i>
	Oedema associated with heart failure
	Adult: 20-50 mg IM or slow IV Inj increased by 20-mg increments every 2 hr. Doses >50 mg must be given as IV infusion.
	Child: 0.5-1.5 mg/kg daily. Max: 20 mg daily.
	<i>Intravenous</i>

	increments every 2 hr. Doses > 50 mg must be given as iv infusion. Child: 0.5-1.5 mg/kg daily. Max: 20 mg daily. <i>Intravenous</i> Pulmonary oedema Adult: 40 mg via slow inj. If no adequate response within 1 hr, a further 80 mg may be given via infusion. <i>Intravenous</i> Oliguria in acute or chronic renal failure Adult: GFR: 5-20 ml/min: 250 mg diluted to 250 ml in a suitable diluent to be infused over 1 hr. If urine output is insufficient within the next hr, may follow by 500 mg added to an appropriate infusion fluid to be infused over 2 hr, total volume depends on the patient's state of hydration. If urine output is still unsatisfactory within 1 hr after the 2nd infusion then a 3rd dose of 1 g may be infused over 4 hr. Rate of infusion: =4 mg/min. For patients with significant fluid overload, inj may be given without dilution directly into the vein, rate of admin =4 mg/min. Patients who do not respond to a dose of 1 g may need dialysis. If the response is satisfactory, the effective dose (of up to 1 g) may be repeated every 24 hr. Subsequently, adjust dose according to patient's response.
Administration	May be taken with or without food. (May be taken w/ meals to reduce GI discomfort.)
Overdosage	Symptoms include dehydration, blood volume reduction, hypotension, electrolyte imbalance, hypokalaemia and hypochloraemic alkalosis. Treatment is supportive and consists of replacement of excessive fluid and electrolyte losses. Monitor serum electrolytes, carbon dioxide level and BP regularly. Ensure adequate drainage in patients with urinary bladder outlet obstruction.
	Severe sodium and water depletion, hypersensitivity to

Contraindications	Severe sodium and water depletion, hypersensitivity to sulphonamides and furosemide, hypokalaemia, hyponatraemia, precomatose states associated with liver cirrhosis, anuria or renal failure. Addison's disease.
Special Precautions	Prostatic hyperplasia. Hepatic or renal impairment, gout, DM, impaired micturition. Infusion rate should not exceed 4 mg/min to reduce the risk of ototoxicity. Monitor fluid and electrolyte balance and renal function. May lower serum levels of calcium and magnesium, thus serum levels should be monitored. Pregnancy and lactation.
Adverse Drug Reactions	Fluid and electrolyte imbalance. Rashes, photosensitivity, nausea, diarrhoea, blurred vision, dizziness, headache, hypotension. Bone marrow depression (rare), hepatic dysfunction. Hyperglycaemia, glycosuria, ototoxicity. Potentially Fatal: Rarely, sudden death and cardiac arrest. Hypokalaemia and magnesium depletion can cause cardiac arrhythmias.
Drug Interactions	Analgesics reduce natriuretic action of furosemide. Antagonises hypoglycaemic agents and drugs used for gout. Hyperglycaemia with antihypertensive agent diazoxide. Antagonises muscle relaxants. Increased risk of ototoxicity when used with aminoglycosides especially in renal impairment. May enhance nephrotoxicity of cephalosporins. Effects of antihypertensives enhanced. Action antagonised by corticosteroids. Phenytoin and indometacin may reduce effects of furosemide. Potentially Fatal: May provoke severe hypotensive response with ACE inhibitors. NSAIDs inhibit diuretic and antihypertensive effects. Increased incidence of premature

	Potentially Fatal: May provoke severe hypotensive response with ACE inhibitors. NSAIDs inhibit diuretic and antihypertensive effects. Increased incidence of premature beats with cardiac glycosides.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. if used in pregnancy-induced hypertension Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 15-30°C. Oral: Store at 15-30°C. Parenteral: Store at 15-30°C.
Mechanism of Action	Furosemide inhibits reabsorption of Na and chloride mainly in the medullary portion of the ascending Loop of Henle. Excretion of potassium and ammonia is also increased while uric acid excretion is reduced. It increases plasma-renin levels and secondary hyperaldosteronism may result. Furosemide reduces BP in hypertensives as well as in normotensives. It also reduces pulmonary oedema before diuresis has set in. Absorption: Fairly rapidly absorbed from the GI tract (oral). Distribution: Crosses the placenta and enters breast milk. Protein-binding: 99%. Excretion: Via urine (as unchanged); 2 hr (elimination half-life), may be prolonged in neonates and renal and

	Protein-binding: 99%. Excretion: Via urine (as unchanged); 2 hr (elimination half-life), may be prolonged in neonates and renal and hepatic impairment.
CIMS Class	Diuretics
ATC Classification	C03CA01 - furosemide; Belongs to the class of high-ceiling sulfonamide diuretics. Used to promote excretion of urine.

furosemide + amiloride

CIMS Class : (Diuretics)
furosemide + amiloride

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related furosemide + amiloride information

Indication & Dosage	<i>Oral</i> Hypertension, Oedema Adult: Per tablet contains furosemide 40 mg and amiloride 5 mg: 1-2 tablets daily, preferably in the morning.
Contraindications	Severe Na and water depletion, hypersensitivity to sulphonamides and furosemide, hypokalaemia, hyponatremia, precomatose states associated with liver cirrhosis, Addison's disease, K sparing agents, K supplements, impaired renal function, hyperkalaemia, anuria, hypersensitivity.
Special Precautions	Hepatic or renal impairment, pregnancy, lactation, gout, diabetes, impaired micturition and metabolic or resp acidosis.
Adverse Drug Reactions	nausea, diarrhoea, blurred vision, dizziness, headache, photosensitivity, hypotension, bone marrow depression (rare), hepatic dysfunction, hyperglycaemia, glycosuria, ototoxicity, hyponatraemia, idiosyncratic hypersensitivity, dry

	photosensitivity, hypotension, bone marrow depression (rare), hepatic dysfunction, hyperglycaemia, glycosuria, ototoxicity, hyponatraemia, idiosyncratic hypersensitivity, dry mouth, fatigue, muscle cramps, nausea, impotence, raised blood levels of glucose, urates, lipids, calcium, reduced levels of K and magnesium, raised CPK levels. Potentially Fatal: Fluid and electrolyte imbalance, hypersens.
Drug Interactions	Phenytoin and indometacin may reduce effects of furosemide. May provoke severe hypotensive response with ACE inhibitors. NSAIDs inhibit diuretic and antihypertensive effects. Effects of antihypertensive drugs are enhanced. Increased incidence of premature beats with cardiac glycosides. Action antagonized by corticosteroids. Diuretic induced vol depletion can potentiate aminoglycoside nephrotoxicity. Impairs action of oral hypoglycaemic agents. Enhances digitalis toxicity due to hypokalaemia. vol depletion enhances lithium toxicity; conversely sudden stopping of diuretic may result in subtherapeutic levels of circulating lithium. Prolonged paralysis with tubocurarine due to hypokalaemia. NSAIDs antagonize hypotensive action. Suppresses action of oral anticoagulants due to reduced prothrombin activity. Increased risk of hypokalaemia when corticosteroids given concurrently. Potentially Fatal: Furosemide may enhance nephrotoxicity co-administered with cephalosporins, aminoglycosides and ototoxicity of aminoglycosides. Amiloride potentiates bone marrow suppression caused by anticancer drugs.
Food Interaction	False lower urinary glucose values with diastix
Lab Interference	Reduced bioavailability.
Mechanism of Action	Furosemide is a sulfonamide diuretic. It inhibits reabsorption of Na and chloride mainly in the medullary portion of the

	Furosemide is a sulfonamide diuretic. It inhibits reabsorption of Na and chloride mainly in the medullary portion of the ascending limb of the Loop of Henle. Excretion of K and ammonia is also increased while uric acid excretion is reduced. It increases plasma renin levels and secondary hyperaldosteronism may result. Furosemide reduces BP in hypertensives as well as in normotensives. Amiloride is a potassium-sparing drug that possesses weak (compared with thiazide diuretics) natriuretic, diuretic, and antihypertensive activity. Amiloride exerts its potassium-sparing effect through the inhibition of Na reabsorption at the distal convoluted tubule, cortical collecting tubule and collecting duct; this decreases the net -ve potential of the tubular lumen and reduces both K and hydrogen secretion and their subsequent excretion.
CIMS Class	Diuretics
ATC Classification	C03CA01 - furosemide; Belongs to the class of high-ceiling sulfonamide diuretics. Used to promote excretion of urine. C03DB01 - amiloride; Belongs to the class of other potassium-sparing agents. Used as diuretics.

furosemide + spironolactone

CIMS Class : (Diuretics)
furosemide + spironolactone

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab ⚠ - Lab interference

Food ⚠ - Food interaction

related furosemide + spironolactone information

Indication & Dosage	<i>Oral</i> Hypertension, Ascites due to congestive heart failure, Oedema Adult: Per tab contains furosemide 20 mg and spironolactone 50 mg. 1-4 tabs/day.
Contraindications	Hypersensitivity, anuria or severe oliguria, hypovolaemia, hyponatraemia, hypotension, urinary retention due to prostatic hypertrophy, Addison's disease, renal impairment, hyperkalaemia, acute or severe liver failure. Pregnancy and lactation.
Special Precautions	Concomitant use with ACE inhibitors, monitor fluids and electrolytes including changes in serum K levels. Dilutional hyponatraemia or even a true low-salt syndrome may develop. General anaesthesia.
Adverse Drug Reactions	Fluid and electrolyte imbalance, nausea, diarrhoea, blurred vision, headache, dizziness, hypotension, photosensitisation,

	Fluid and electrolyte imbalance, nausea, diarrhoea, blurred vision, headache, dizziness, hypotension, photosensitisation, hepatic dysfunction, hyperglycaemia and glycosuria, rarely bone marrow depression, gynaecomastia, hirsutism, hoarseness, menstrual irregularities, loss of libido, impotence. Potentially Fatal: Severe hyperkalaemia in patients with preexisting renal impairment or taking ACE inhibitors, agranulocytosis, cardiac arrhythmias.
Drug Interactions	Aminoglycosides and ethacrynic acid (increased ototoxicity), tubocurazine, succinylcholine (effects enhanced). Sucralfate reduces effects of furosemide. Should be given 2 hr apart. NSAIDs reduce natriuretic and antihypertensive effects of furosemide. Corticosteroids may antagonise action. Digoxin levels may be increased. Warfarin effects may be reduced. Potentially Fatal: Potassium supplements or potassium-rich diet, ACE inhibitors, general anaesthetics (reduced vascular responsiveness to catecholamines), lithium toxicity.
Food Interaction	Bioavailability of frusemide reduced but absorption of spironolactone improved.
Lab Interference	Frusemide produces falsely low urinary sugar values by clinistix or diastrix method.
Mechanism of Action	Furosemide inhibits reabsorption of Na^+, Cl^- and K^+. Continuous use may also lead to secondary hyperaldosteronism. Spironolactone is a specific antagonist of aldosterone. It increases Na and water excretion but retains K^+. Thus it acts both as diuretic and an antihypertensive. It reduces oedema and counteracts secondary aldosteronism caused by vol depletion Na loss. K loss is reduced.

	antihypertensive. It reduces oedema and counteracts secondary aldosteronism caused by vol depletion Na loss. K loss is reduced.
CIMS Class	Diuretics
ATC Classification	C03CA01 - furosemide; Belongs to the class of high-ceiling sulfonamide diuretics. Used to promote excretion of urine. C03DA01 - spironolactone; Belongs to the class of potassium-sparing agents, aldosterone antagonists. Used as diuretics.

fusidic acid

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ✖ - Food interaction

related fusidic acid information

Indication & Dosage	<i>Oral</i>
	Susceptible infections
	Adult: 500 mg tid. May increase to 1 g tid in fulminating infections.
	Child: <1 yr: About 15 mg/kg; 1-5 yr: 250 mg; 5-12 yr: 500 mg. Doses to be taken tid.
	<i>Intravenous</i>
	Susceptible infections
	Adult: >50 kg: 500 mg tid; may increase to 1 g tid in fulminating infections. <50 kg: 6-7 mg/kg tid. To be given by slow IV infusion over at least 2 hr; should be given via a large vein with good blood flow.
	Child: 20 mg/kg daily in 3 divided doses. To be given by slow IV infusion over at least 2 hr; should be given via a large vein with good blood flow.
	<i>Ophthalmic</i>
	Conjunctivitis

large vein with good blood flow.

Ophthalmic

Conjunctivitis

Adult: As 1% eye drops: Instill 1 drop into the affected eye every 12 hr for 7 days.

Child: =2 yr: As 1% eye drops: Instill 1 drop into the affected eye every 12 hr for 7 days.

Topical/Cutaneous

Skin infections

Adult: As a 2% ointment/cream/gel: Apply onto affected area 3-4 times daily until there is improvement. If gauze dressing is used, then frequency of application may be reduced to 1-2 times daily.

Child: As a 2% ointment/cream/gel: Apply onto affected area 3-4 times daily until there is improvement. If gauze dressing is used, then frequency of application may be reduced to 1-2 times daily.

Reconstitution: Each 500 mg dose is given as a buffered solution (pH 7.4-7.6) diluted to 500 ml with sodium chloride or other suitable IV solution.

Incompatibility: Incompatible with amino acid solutions or whole blood. Admixture incompatibility: Carbenicillin, kanamycin, gentamicin, calcium solutions.

Administration

Fusidic acid: Should be taken with food.

Contraindications

Hypersensitivity.

Special Precautions

Hepatic disease; monitor liver function. Neonates; pregnancy, lactation.

Adverse Drug Reactions

Jaundice and liver dysfunction (reversible); GI disturbances. IV: Venospasm, thrombophlebitis and haemolysis; hypocalcaemia. SC/IM: Tissue necrosis. Topical: Rashes and irritation.

	IV: Venospasm, thrombophlebitis and haemolysis; hypocalcaemia. SC/IM: Tissue necrosis. Topical: Rashes and irritation.
Drug Interactions	Synergistic action with antistaphylococcal penicillin. Antagonism with ciprofloxacin.
Food Interaction	Delays absorption for oral preparations.
Storage	Intravenous: Store below 25°C. Ophthalmic: Store between 2-25°C. Discard 1 mth after opening. Oral: Store below 25°C. Topical/Cutaneous: Store below 25°C.
Mechanism of Action	Fusidic acid disrupts translocation of peptide subunits and elongating the peptide chain of susceptible bacteria, thus inhibiting protein synthesis. Absorption: Well-absorbed from the GI tract (oral); mean plasma concentrations of 30 mcg/ml after 2-4 hr (500-mg dose). More rapid absorption in children than in adults. Distribution: Widely distributed into tissues and body fluids including bone, pus and synovial fluid; crosses the placenta and enters breast milk. Protein-binding: 95%. Metabolism: Hepatic; converted to multiple metabolites. Excretion: Bile (mainly as metabolites), faeces (2% as unchanged drug), urine; 5-6 hr (elimination half-life).
CIMS Class	Eye Anti-infectives & Antiseptics / Other Antibiotics / Topical Antibiotics
ATC Classification	D06AX01 - fusidic acid; Belongs to the class of other topical antibiotics used in the treatment of dermatological diseases. D09AA02 - fusidic acid; Belongs to the class of ointment dressings with anti-infectives. Used in treatment of wounds. J01XC01 - fusidic acid; Belongs to the class of steroid antibacterials. Used in the treatment of systemic infections. S01AA13 - fusidic acid; Belongs to the class of antibiotics. Used in the treatment of eye infections.

antibacterials. Used in the treatment of systemic infections.

Indication & Dosage

Oral

Epilepsy

Adult: Initially, 300 mg on the 1st day, 300 mg bid on the 2nd day and 300 mg tid on the 3rd day. Thereafter, may increase dose until effective antiepileptic control is achieved. Usual maintenance range: 0.9-3.6 g daily; daily dose to be taken in 3 equally divided doses and max dosing interval: 12 hr. Max: 4.8 g daily.

Child: 6-12 yr: Initially, 10 mg/kg on the 1st day, 20 mg/kg on the 2nd day and 25-35 mg/kg on the 3rd day.

Maintenance: 1200 mg daily (37-50 kg); 900 mg daily (26-36 kg). Total daily dose to be taken in 3 equally divided doses.

Renal impairment: Total daily doses to be taken as 3 divided doses. Haemodialysis: Loading dose: 300-400 mg followed by 200-300 mg after each 4 hr of haemodialysis.

CrCl (ml/min)	Dosage Recommendation
50-79	600-1200 mg daily.
30-49	300-600 mg daily.
15-29	300 mg on alternate days to 300 mg daily.

15-29	300 mg on alternate days to 300 mg daily.
<15	300 mg on alternate days.

Oral

Neuropathic pain

Adult: Titrate to a max of 1.8 g daily in 3 divided doses.

Renal impairment: Total daily doses to be taken as 3 divided doses. Haemodialysis: Loading dose: 300-400 mg followed by 200-300 mg after each 4 hr of haemodialysis.

CrCl (ml/min)	Dosage Recommendation
50-79	600-1200 mg daily.
30-49	300-600 mg daily.
15-29	300 mg on alternate days to 300 mg daily.
<15	300 mg on alternate days.

Administration

May be taken with or without food.

Contraindications

Hypersensitivity. Lactation.

Special Precautions

Discontinuation or transfer from other antiepileptics, history of psychotic illness; renal impairment; pregnancy. Gradual withdrawal over at least 7 days to prevent an increase in seizure frequency.

Adverse Drug Reactions

Somnolence, dizziness, ataxia, weakness, paraesthesia, fatigue, headache; nystagmus, diplopia; nausea, vomiting, wt gain, dyspepsia; rhinitis; tremor; leucopenia; altered LFTs; Stevens-Johnson syndrome.

Drug Interactions

Cimetidine may reduce gabapentin clearance. Absorption reduced with antacids.

Lab Interference

False-positive readings with some urinary protein tests.

Pregnancy Category (US FDA)

Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or

	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 20-25°C. Oral solution: Refrigerate at 2-8°C.
Mechanism of Action	Gabapentin is structurally related to the neurotransmitter GABA but is neither a GABA agonist nor antagonist. Gabapentin-binding sites have been identified throughout the brain tissues e.g. neocortex and hippocampus. However, the exact mechanism of action is still unknown. Absorption: 50-60% absorbed (oral); peak plasma concentrations after 2 hr. Distribution: Widely distributed; enters breast milk. Protein-binding: Minimal. Metabolism: Poor. Excretion: Urine and faeces; 5-7 hr (elimination half-life).
CIMS Class	Anticonvulsants / Drugs For Neuropathic Pain
ATC Classification	N03AX12 - gabapentin; Belongs to the class of other antiepileptics. Used in the management of epilepsy.

ganciclovir

CIMS Class : (Antivirals)
ganciclovir

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related ganciclovir information

Indication & Dosage

Intravenous

Cytomegaloviral infections

Adult: Induction: 5 mg/kg every 12 hr for 14-21 days.

Maintenance: 5 mg/kg once daily for 7 days per wk or 6 mg/kg once daily for 5 days per wk. Dose to be given by IV infusion.

Renal impairment: For dialysis patients: 1.25 mg/kg for induction or 0.625 mg/kg for maintenance, to be given postdialysis on days when dialysis is performed.

CrCl (ml/min)	Dosage Recommendation
≥70	5 mg/kg every 12 hr for induction, then 5 mg/kg every 24 hr for maintenance.
50-69	2.5 mg/kg every 12 hr for induction, then 2.5 mg/kg every 24 hr for maintenance.
25-49	2.5 mg/kg every 24 hr for induction, then 1.25 mg/kg every 24 hr for maintenance.
10-24	1.25 mg/kg every 24 hr for induction, then 0.625 mg/kg every 24 hr for maintenance .

Intravenous

Prophylaxis of cytomegaloviral infections in

Intravenous

Prophylaxis of cytomegaloviral infections in immunocompromised patients

Adult: For patients receiving immunosuppressants after organ transplant: Initially, 5 mg/kg every 12 hr for 7-14 days followed by maintenance therapy: 5 mg/kg/day as a single dose for 7 days per wk or 6 mg/kg/day for 5 days per wk.

Dose to be given as IV infusion.

Renal impairment: For dialysis patients: 1.25 mg/kg for induction or 0.625 mg/kg for maintenance, to be given postdialysis on days when dialysis is performed.

CrCl (ml/min)	Dosage Recommendation
≥70	5 mg/kg every 12 hr for induction, then 5 mg/kg every 24 hr for maintenance.
50-69	2.5 mg/kg every 12 hr for induction, then 2.5 mg/kg every 24 hr for maintenance.
25-49	2.5 mg/kg every 24 hr for induction, then 1.25 mg/kg every 24 hr for maintenance .
10-24	1.25 mg/kg every 24 hr for induction, then 0.625 mg/kg every 24 hr for maintenance .

Ophthalmic

Cytomegaloviral retinitis

Adult: Intravitreal implant: Each implant can last for 5-8 mth; implant may be removed and replaced upon depletion of ganciclovir as evidenced by disease progression.

Renal impairment: Dose reduction may be needed.

Administration

Should be taken with food.

Contraindications

Hypersensitivity; absolute neutrophil count <500 cells/mm³; platelet count $<25,000$ /mm³; pregnancy, lactation. Not to be used as a bolus inj.

Special Precautions

Renal impairment; preexisting cytopenias or history of cytopenic reactions to drugs; child; contraceptive precautions

	Renal impairment; preexisting cytopenias or history of cytopenic reactions to drugs; child; contraceptive precautions to be followed during and at least 90 days thereafter; care in administering only into veins with good blood flow. Avoid contact with the skin and eyes. Maintain adequate hydration during infusion. Monitor WBC and platelet counts regularly during treatment. Eye examinations should be conducted at least once every 4-6 wk during treatment for CMV retinitis.
Adverse Drug Reactions	Haematological disturbances; marrow depression; GI disturbances; fever, rash and abnormal LFTs; irritation and phlebitis at inj site. Less frequent: CV, CNS, metabolic, musculoskeletal, respiratory, urogenital, ocular effects, cutaneous symptoms and increased serum-creatinine and BUN concentration. Potential risk of testicular effects and female fertility.
Drug Interactions	Renal clearance reduced by probenecid; imipenem cilastatin (generalised seizures); zidovudine; didanosine; additive toxic effects with myelosuppressants; oral mycophenolate mofetil.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 15-25°C. Ophthalmic: Store at 15-25°C.
Mechanism of Action	Ganciclovir is a synthetic guanine nucleoside analogue with activity against cytomegalovirus (CMV). It competitively inhibits the binding of deoxyguanosine triphosphate to DNA polymerase, thus inhibiting viral DNA synthesis.

	activity against cytomegalovirus (CMV). It competitively inhibits the binding of deoxyguanosine triphosphate to DNA polymerase, thus inhibiting viral DNA synthesis. Absorption: Poor absorption after oral admin. Distribution: Widely distributed to body tissues and fluids after IV admin. Excretion: Excreted unchanged in the urine mainly via glomerular filtration and active tubular secretion. Elimination half-life: 2.5-4.5 hr after IV admin; increased in renal impairment.
CIMS Class	Antivirals
ATC Classification	J05AB06 - ganciclovir; Belongs to the class of nucleosides and nucleotides excluding reverse transcriptase inhibitors. Used in the systemic treatment of viral infections. S01AD09 - ganciclovir; Belongs to the class of antiinfectives, antivirals. Used in the treatment of eye infections.

Renal impairment: Patients on haemodialysis or continuous peritoneal dialysis: Initially, 400 mg/day. Maintenance dose: 200 mg daily.

CrCl (ml/min)	Dosage Recommendation
<40	Initially, 400 mg/day. Maintenance dose: 200 mg daily.

Ophthalmic

Conjunctivitis

Adult: As a 0.3% solution: Instill 1 drop 2 hrly into affected

	<i>Ophthalmic</i> Conjunctivitis Adult: As a 0.3% solution: Instill 1 drop 2 hrly into affected eye(s) up to 8 times daily for the 1st 2 days, then reduce to 1 drop 4 times daily on days 3-7.
Contraindications	Hypersensitivity; children <18 yr; concurrent use of class IA or III antiarrhythmics, QT-prolongation drugs; diabetics; pregnancy, lactation.
Special Precautions	May prolong QT interval; uncorrected hypokalaemia; known or suspected CNS disorders, renal and hepatic impairment. Elderly.
Adverse Drug Reactions	Rapid heartbeat, mental confusion, hallucinations, agitation, nightmares, depression; photophobia; tendon rupture; headache, dizziness, insomnia, chills, fever; back pain, abdominal pain; constipation, nausea, vomiting, diarrhoea, inflammation of the tongue, mouth sores; abnormal vision, ringing in the ears, vaginitis. Potentially Fatal: Hyperosmolar nonketotic hyperglycaemic coma, diabetic ketoacidosis, hypoglycaemic coma, convulsions and mental status changes.
Drug Interactions	Antacids, ferrous salts, bismuth subsalicylate, sucralfate and zinc salts reduce bioavailability of gatifloxacin. May increase digoxin plasma levels. Probenecid, cimetidine and loop diuretics increase gatifloxacin levels. NSAIDs may increase the risk of CNS stimulation and convulsions. Concurrent use of bepridil, cisapride, erythromycin, pentamidine, phenothiazines, or TCAs may prolong QT interval. Concurrent corticosteroid therapy may increase the risk of tendon rupture. Increased risk of hypoglycaemia when used with oral antidiabetic agents. May enhance hypoprothrombinaemic effects of oral anticoagulants.

	Concurrent corticosteroid therapy may increase the risk of tendon rupture. Increased risk of hypoglycaemia when used with oral antidiabetic agents. May enhance hypoprothrombinaemic effects of oral anticoagulants. Potentially Fatal: Increased risk of adverse CV reactions when used with class IA or III antiarrhythmics e.g. disopyramide and amiodarone.
Storage	Intravenous: Store at 25°C. Ophthalmic: Store at 15-25°C. Oral: Store at 25°C.
Mechanism of Action	Gatifloxacin promotes breakage of double-stranded DNA in susceptible organisms and inhibits DNA gyrase, which is essential in reproduction of bacterial DNA. Absorption: Absorbed readily from the GI tract (oral); peak plasma concentrations after 1-2 hr. Bioavailability: 96%. Distribution: Widely distributed into body tissues. Protein-binding: 20%. Metabolism: Limited metabolism. Excretion: Via the urine (as unchanged and 1% metabolite); via the faeces (5% as unchanged). Limited metabolism; 7-14 hr (elimination half-life).
CIMS Class	Quinolones / Eye Anti-infectives & Antiseptics
ATC Classification	J01MA16 - gatifloxacin; Belongs to the class of quinolones, fluoroquinolone. Used in the treatment of systemic infections. S01AX21 - gatifloxacin;

gefitinib

CIMS Class : (Targeted Cancer Therapy)
gefitinib

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related gefitinib information

Indication & Dosage	<i>Oral</i> Locally advanced or metastatic non small cell lung carcinoma <i>Adult:</i> 250 mg once daily. <i>Special Populations:</i> For patients on potent CYP3A4 inducer: 500 mg daily if tolerated. For patients with poorly tolerated diarrhoea or skin ADR: Up to 14 days therapy interruption followed by reinstatement of the 250 mg daily dose.
Administration	Film-coated tab: May be taken with or without food. (May also be dispersed in ½ glass of plain, non-carbonated water. No other liqds should be used. Drop the tab in water & stir without crushing until it disperses (approx 10 mins). Drink immediately. Rinse glass w/ another ½ glass of water & drink. Dispersed liqd may also be administered via NG tube.)
Contraindications	Hypersensitivity; pregnancy; lactation.
Special	Severe renal or hepatic impairment; idiopathic pulmonary

Special Precautions	Severe renal or hepatic impairment; idiopathic pulmonary fibrosis; acute onset or worsening of pulmonary or eye symptoms. Monitor hepatic function periodically. Monitor regularly for changes in prothrombin time or International Normalized Ratio in patients on warfarin treatment.
Adverse Drug Reactions	GI disturbances, anorexia; hepatotoxicity; rash, acne, dry skin, skin blemishes; weakness; peripheral oedema; amblyopia; cough, dyspnoea; conjunctivitis; mouth ulceration; eye irritation, corneal membrane sloughing, ocular ischaemia or haemorrhage; pancreatitis; toxic epidermal necrolysis; erythema multiforme; hypersensitivity reactions. Potentially Fatal: Interstitial lung disease.
Drug Interactions	CYP3A4 inducers and H₂-receptor antagonists decrease effectiveness of gefitinib. CYP3A4 inhibitors increase efficacy of gefitinib. Increased metoprolol concentrations. INR elevations and/or bleeding events with warfarin. Increased plasma concentrations of metoprolol when used with gefitinib.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Mechanism of Action	Gefitinib is an anilinoquinazoline. Gefitinib generally attaches to epidermal growth factor receptors (EGFRs), thereby blocking the attachment of EGF and the activation of tyrosine kinase. It is used as monotherapy for the treatment of locally advanced or metastatic nonsmall cell lung cancer after failure of both platinum-based and docetaxel

	tyrosine kinase. It is used as monotherapy for the treatment of locally advanced or metastatic nonsmall cell lung cancer after failure of both platinum-based and docetaxel chemotherapies.
CIMS Class	Targeted Cancer Therapy
ATC Classification	L01XE02 - gefitinib;

gemcitabine

CIMS Class : (Cytotoxic Chemotherapy)
gemcitabine

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related gemcitabine information

Indication & Dosage

Intravenous

Advanced non-small cell lung cancer

Adult: 1000 mg/m² on days 1, 8 and 15 of each 28-day cycle; or 1250 mg/m² on days 1 and 8 of each 21-day cycle.

Intravenous

Pancreatic cancer

Adult: 1000 mg/m² once wkly for up to 7 wk followed by 1 wk of rest. Continue thereafter with once wkly infusions for 3 consecutive wk out of 4.

Intravenous

Bladder cancer

Adult: To be given before cisplatin. 1000 mg/m² on days 1, 8 and 15 of each 28-day cycle.

Intravenous

Breast cancer

Adult: Usually in combination with a taxane such as paclitaxel: 1250 mg/m² on days 1 and 8 of each 21-day cycle.

	Adult: Usually in combination with a taxane such as paclitaxel: 1250 mg/m² on days 1 and 8 of each 21-day cycle. <i>Intravenous</i> Ovarian carcinoma Adult: To be given before carboplatin: 1000 mg/m² on days 1 and 8 of each 21-day cycle.
Contraindications	Concurrent radical radiotherapy; pregnancy, lactation; hypersensitivity.
Special Precautions	Children, hepatic and renal impairment. May impair ability to drive or operate machinery. Discontinue on 1st sign of microangiopathic haemolytic anaemia. Prolonged infusion time (>60 minutes) and more frequent than wkly dosing may increase toxicity. Monitor CBC before every dose. Increased risk of haemolytic uraemic syndrome and/or thrombocytopenic purpura which may lead to irreversible renal failure.
Adverse Drug Reactions	Bone marrow suppression as manifested by leukopenia, thrombocytopenia, anaemia and myelosuppression. Mild GI effects; rashes; renal impairment, pulmonary toxicity, influenza-like symptoms; interstitial pneumonia, pulmonary oedema. Proteinuria, haematuria and haemolytic uraemic syndrome. Elevation of serum transaminase. Potentially Fatal: Oesophagitis and pneumonitis when given with radical radiotherapy to the thorax.
Drug Interactions	May increase the anticoagulant effect of warfarin when used together.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which

	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intravenous: Store at 25°C.
Mechanism of Action	Gemcitabine is a synthetic pyrimidine nucleoside and cytarabine analogue which is metabolised intracellularly to active diphosphate and triphosphate nucleosides. It inhibits DNA synthesis by inhibiting DNA polymerase and ribonucleotide reductase. It also induces apoptosis and is primarily active against cells in the S-phase, but may also arrest cells at the G1-S border. Metabolism: Rapidly cleared from the blood and metabolised by cytidine deaminase in the liver, kidney, blood, and other tissues after IV admin. Excretion: Mainly excreted in the urine. Half life ranges from 42-94 minutes.
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01BC05 - gemcitabine; Belongs to the class of antimetabolites, pyrimidine analogues. Used in the treatment of cancer.

gemfibrozil

CIMS Class : (Dyslipidaemic Agents)
gemfibrozil

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related gemfibrozil information

Indication & Dosage	<i>Oral</i> Hyperlipidaemias Adult: 1.2 g daily in 2 divided doses. Maintenance: 0.9-1.5 g daily.
Administration	Should be taken on an empty stomach. (Take ½ hr before meals.)
Contraindications	Hypersensitivity. Severe hepatic or renal dysfunction; gall stones; neonates, children, pregnancy, lactation.
Special Precautions	Causes of secondary hyperlipidaemia such as hypothyroidism and diabetes must be treated before initiating therapy. Renal impairment; blood disorders. Periodic monitoring of the serum lipids should be done; if no adequate response after 3 mth, treatment should be withdrawn. May increase risk of cholelithiasis.
Adverse Drug Reactions	Myositic syndrome, cholelithiasis, GI disturbances, rash, headache, blood dyscrasias, myalgia. Impotence, painful extremities, blurred vision; pruritus, urticaria; impotence;

	Myositic syndrome, cholelithiasis, GI disturbances, rash, headache, blood dyscrasias, myalgia. Impotence, painful extremities, blurred vision; pruritus, urticaria; impotence; dizziness; cholestatic jaundice. Potentially Fatal: Bone marrow hypoplasia; intracranial haemorrhage; nephrotoxicity; peripheral neuritis.
Drug Interactions	Co-admin with repaglinide may increase serum levels of repaglinide. May enhance effects of oral anticoagulants. May also increase the plasma concentrations of ciclosporin and associated nephrotoxicity when used concurrently. Potentially Fatal: Increased risk of myopathy and rhabdomyolysis when used with HMG-CoA reductase inhibitors.
Lab Interference	May cause elevations of AST, ALT, bilirubin, and alkaline phosphatase.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store below 30°C.
Mechanism of Action	Gemfibrozil exhibits its action by inhibition of lipolysis and reduction of hepatic fatty acid uptake. It also inhibits secretion of VLDL from the liver. Absorption: Readily absorbed from the GI tract (oral); peak plasma concentrations after 1-2 hr. Distribution: Protein-binding: 80%. Metabolism: Hepatic via oxidation; undergoes enterohepatic recirculation. Excretion: Urine (70% glucuronide conjugates and

	Metabolism: Hepatic via oxidation; undergoes enterohepatic recirculation. Excretion: Urine (70% glucuronide conjugates and metabolites); faeces (small amounts); 1.5 hr (elimination half-life).
CIMS Class	Dyslipidaemic Agents
ATC Classification	C10AB04 - gemfibrozil; Belongs to the class of fibrates. Used in the treatment of hyperlipidemia.

gemifloxacin

CIMS Class : (Quinolones)
gemifloxacin

P - Caution when used during pregnancy

L - Caution when used during lactation

related gemifloxacin information

Indication & Dosage	<i>Oral</i>	
	Acute bacterial exacerbation of chronic bronchitis	
	Adult: 320 mg once daily for 5 days.	
	CrCl (ml/min)	Dosage Recommendation
	=40	160 mg every 24 hr.
	<i>Oral</i>	
	Community-acquired pneumonia	
	Adult: 320 mg once daily for 7 days.	
	CrCl (ml/min)	Dosage Recommendation
	=40	160 mg every 24 hr.
Administration	May be taken with or without food.	
Overdosage	Treatment is symptomatic. Stomach may be emptied by inducing vomiting or gastric lavage.	
Contraindications	Hypersensitivity. Patients receiving class IA or III antiarrhythmics.	
Special Precautions	History of prolongation of QT interval, uncorrected electrolyte disorders, CNS diseases such as epilepsy. Maintain adequate hydration. Increased risk of rash when treatment	

	History of prolongation of QT interval, uncorrected electrolyte disorders, CNS diseases such as epilepsy. Maintain adequate hydration. Increased risk of rash when treatment duration is prolonged. Children <18 yr. Pregnancy, lactation.
Adverse Drug Reactions	Diarrhoea, nausea, vomiting; headache, dizziness; rash, urticaria. May cause elevation of liver enzymes.
Drug Interactions	Lower bioavailability if coadministered with multivalent cation preparations e.g. aluminum, magnesium, or iron salts. May potentiate QT prolongation when used with drugs that affect the QT interval e.g. cisapride, erythromycin, antipsychotics and TCAs. May increase prothrombin time when used with warfarin or its derivatives. Increased plasma levels when used with probenecid.
Storage	Oral: Store between 15-30°C.
Mechanism of Action	Gemifloxacin inhibits DNA gyrase and DNA topoisomerase IV. DNA gyrase is needed for DNA replication and transcription, DNA repair, recombination and transposition. Topoisomerase IV facilitates separation of intertwined, replicated DNA before cell division occurs. Gemifloxacin forms a ternary complex with gyrase and topoisomerase IV, which blocks DNA replication, thus resulting in DNA release, chromosomal disruption and cell death. Absorption: Rapidly absorbed from the GI tract; absolute bioavailability: About 71%. Distribution: Widely distributed into body tissues including bronchial mucosa and lungs. 55-73% bound to plasma proteins. Metabolism: Limited hepatic metabolism. Excretion: Elimination half-life: 7 hr. As unchanged drug and metabolites in the faeces and urine.
CIMS Class	Quinolones

CIMS Class	Quinolones
ATC Classification	J01MA15 - gemifloxacin; Belongs to the class of quinolones, fluoroquinolone. Used in the treatment of systemic infections.

20-40	Administer every 24 hr.
<20	Loading dose, monitor levels.

Intramuscular

Prophylaxis of surgical infections

Adult: 120 mg before induction of anaesthesia, in combination with penicillin, vancomycin or teicoplanin .

Renal impairment: Haemodialysis: Administer dose after dialysis session and monitor levels.

CrCl (ml/min)	Dosage Recommendation
≥60	Administer every 8 hr.
40-60	Administer every 12 hr.
20-40	Administer every 24 hr.
<20	Loading dose, monitor levels.

Ophthalmic

	<i>Ophthalmic</i> Superficial ophthalmic infections Adult: Instil 1-2 drops of a 0.3% soln into the infected eye/s every 4 hr or up to 2 drops every hr in severe infections. Alternatively, apply a small amount of 0.3% oint bid-tid into the affected eye. <i>Topical/Cutaneous</i> Bacterial skin infections Adult: As a 0.1% cream; Apply to the affected area 3-4 times daily.	
Overdosage	Haemodialysis may be useful in the removal of gentamicin from the blood, and is important if renal function is, or becomes compromised. Rate of removal is lower by peritoneal dialysis compared to haemodialysis.	
Contraindications	History of hypersensitivity to aminoglycoside pregnancy; hepatic impairment, perforated ear drum.	
Special Precautions	Concurrent use of neuromuscular blocking agents; myasthenia gravis, parkinsonism; conditions predisposing to ototoxicity and nephrotoxicity; lactation. Monitor plasma concentrations of gentamicin in patients receiving high doses or prolonged courses, in infants, elderly, patients with renal impairment, cystic fibrosis or significant obesity. Monitor auditory and renal functions.	
Adverse Drug Reactions	Dizziness or vertigo; acute renal failure, interstitial nephritis, acute tubular necrosis; electrolyte imbalances; transient elevation of serum bilirubin and aminotransferases; purpura; nausea, vomiting; convulsions, mental depression, hallucinations. Atrophy or rat necrosis at inj sites. Potentially Fatal: Nephrotoxicity, ototoxicity and neuromuscular blockade (may unmask or aggravate	

	nausea, vomiting, convulsions, mental depression, hallucinations. Atrophy or rat necrosis at inj sites. Potentially Fatal: Nephrotoxicity, ototoxicity and neuromuscular blockade (may unmask or aggravate myasthaenia gravis).
Drug Interactions	Synergistic with ampicillin, benzylpenicillin and other β-lactam antibiotics. Increased risk of severe respiratory depression when used concurrently with anaesthetics or opioids. May reduce renal clearance of zalcitabine and induce hypocalcaemia when used with biphosphonates. Not to be used with agalsidase alfa or beta as it may inhibit α-galactosidase activity. Potentially Fatal: Increased incidence of ototoxicity when combined with ethacrynic acid and furosemide. Cephalosporins, ciclosporin, cisplatin, vancomycin, hydrocortisone and indometacin potentiate nephrotoxicity. Potentiates neuromuscular blocking agents.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intramuscular: Store at 15-30°C. Ophthalmic: Store at 2-30°C. Topical/Cutaneous: Store at 2-30°C.
Mechanism of Action	Gentamicin is an aminoglycoside that binds to 30s and 50s ribosomal subunits of susceptible bacteria disrupting protein synthesis, thus rendering the bacterial cell membrane defective. Absorption: Poorly absorbed from the GI tract (oral); rapid (IM); systemic absorption from denuded skin and burns (topical) and from wounds, body cavities, joints (instillation, irrigation).

	(IM); systemic absorption from denuded skin and burns (topical) and from wounds, body cavities, joints (instillation, irrigation). Distribution: Diffuse mainly into the extracellular fluids; but only small amounts enter the CSF even when the meninges are inflamed. Poorly diffused (Ophthalmic), readily diffused (perilymph of the inner ear). Crosses the placenta and enters the breast milk. Accumulates mainly in the kidneys. Excretion: Via the urine by glomerular filtration (virtually unchanged); 2-3 hr (elimination half-life).
CIMS Class	Aminoglycosides / Eye Anti-infectives & Antiseptics / Ear Anti-infectives & Antiseptics / Topical Antibiotics
ATC Classification	D06AX07 - gentamicin; Belongs to the class of other topical antibiotics used in the treatment of dermatological diseases. J01GB03 - gentamicin; Belongs to the class of other aminoglycosides. Used in the treatment of systemic infections. S01AA11 - gentamicin; Belongs to the class of antibiotics. Used in the treatment of eye infections. S02AA14 - gentamicin; Belongs to the class of anti-infectives used in the treatment of ear infections. S03AA06 - gentamicin; Belongs to the class of anti-infectives used in ophthalmologic and otologic preparations.

related ginkgo biloba information

Indication & Dosage	<i>Oral</i> Cerebrovascular and peripheral activator Adult: 40 mg of extr tid. <i>Oral</i> Dementia Adult: 120-240 mg daily in divided doses.
Administration	Should be taken with food. (Take before meals.)
Special Precautions	Patients receiving anticoagulants or drugs that may affect platelet aggregation.
Adverse Drug Reactions	Headaches, dizziness, palpitations, GI disturbances, bleeding disorders, skin hypersensitivity reactions.
Mechanism of Action	It has been postulated that the extract Ginkgo biloba leaves may be used in cerebrovascular and peripheral vascular disorders.
CIMS Class	Supplements & Adjuvant Therapy
ATC Classification	N06DX02 - ginkgo biloba; Belongs to the class of other agents used in the management of dementia.

glibenclamide

CIMS Class : (Antidiabetic Agents)
glibenclamide

P - Contraindicated in pregnancy
L - Contraindicated in lactation

related glibenclamide information

Indication & Dosage	<i>Oral</i> Type 2 diabetes mellitus Adult: Initially, 2.5-5 mg daily, may increase wkly by increments of 2.5 mg daily, up to 15 mg daily. Doses >10 mg daily should be given in 2 divided doses. Max: 20 mg daily. Elderly: Initially, 1.25-2.5 mg daily, may increase by 1.25-2.5 mg daily every 1-3 wk, if needed.
Administration	Glibenclamide: Should be taken with food.
Contraindications	Severe or life-threatening hyperglycaemia, severe liver or renal failure, type 1 diabetes, diabetic ketoacidosis with or without coma, patients with severe infection or trauma.
Special Precautions	Elderly; malnourished; mild to moderate renal and hepatic disorders. Impaired alertness. Avoid alcohol. Careful monitoring of blood-glucose concentration. Adrenocortical insufficiency. Changes in diet or prolonged exercise may also provoke hypoglycaemia. Increased risk of hypoglycaemia due to its long half-life. Avoid in severe hepatic impairment. Pregnancy, lactation.

	provoke hypoglycaemia. Increased risk of hypoglycaemia due to its long half-life. Avoid in severe hepatic impairment. Pregnancy, lactation.
Adverse Drug Reactions	Hypoglycaemia; cholestatic jaundice; agranulocytosis; aplastic anaemia; haemolytic anaemia. Blood dyscrasias (reversible), liver dysfunction, hypoglycaemia, GI symptoms, allergic skin reactions. Potentially Fatal: Prolonged hypoglycaemia seen in elderly or debilitated patients with hepatic or renal diseases.
Drug Interactions	Increased risk of hypoglycaemia when used with β-blockers. Additive hypoglycaemic effect with insulin and other antidiabetic drugs. Metabolism may be reduced by chloramphenicol and cimetidine. Increased hypoglycemic effect when used with cyclic antidepressants, pegvisomant, corticosteroids, salicylates, sulfonamide derivatives (except sulfacetamide) or fibric acid derivatives. Concurrent use may increase serum levels of ciclosporin. Increased serum levels when used with fluconazole. Metabolism of glibenclamide may be increased when used with rifampin. Concurrent use with coumarin derivatives may cause changes in INR. Concurrent admin with cholestyramine resin may lead to reduced absorption of glibenclamide. Serum levels may be reduced by colestesvelam. Therapeutic efficacy may be diminished by luteinizing-hormone releasing hormone analogs. Concurrent use may increase adverse effects of phenytoin. Quinolone antibiotics may affect the efficacy of glibenclamide; monitor blood sugar levels. Hypoglycaemic effect may be reduced by somatropin. Potentially Fatal: Increased risk of liver toxicity when used with bosentan; avoid concurrent use.
Pregnancy Category (US FDA)	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Glibenclamide exerts pancreatic and extrapancreatic actions. It stimulates an increase in insulin release by the pancreatic β-cells. It may also reduce hepatic gluconeogenesis and glycogenolysis. Increased glucose uptake in the liver and utilization in the skeletal muscles. Duration: 24 hr. Absorption: Readily absorbed from the GI tract (oral); peak plasma concentrations after 2-4 hr. Distribution: Protein-binding: Extensive. Metabolism: Hepatic; converted to very weakly active metabolite. Excretion: Urine (50%); faeces (50%).
CIMS Class	Antidiabetic Agents
ATC Classification	A10BB01 - glibenclamide; Belongs to the class of sulfonamides, urea derivatives. Used in the treatment of diabetes.

glibenclamide + metformin

CIMS Class : (Antidiabetic Agents)
glibenclamide + metformin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related glibenclamide + metformin information

Indication & Dosage

Oral

Type 2 diabetes mellitus

Adult: Per tablet contains glibenclamide 1.25 mg and metformin 250 mg. As initial therapy: Start with 1 tablet once or twice daily. May increase in steps of 1 tablet/day every 2 wk to the lowest effective dose need to achieve effective control of blood glucose. For patients previously treated with glibenclamide/sulphonylurea or metformin alone: Initiate with 2-4 tablets daily in divided doses; starting doses should not exceed the daily doses of glibenclamide or metformin already being taken; max: 8 tablets/day.

Contraindications

Severe or life-threatening hyperglycaemia; liver disease; severe renal failure; juvenile diabetes, ketoacidosis, pre-coma and diabetic coma; adrenocortical insufficiency. Pregnancy and lactation. Hypersensitivity, cardiac failure, recent MI, CHF. IDDM; severe infection; acute or chronic metabolic acidosis with or without coma; stress, trauma; severe impairment of thyroid function; dehydration, acute or chronic alcoholism.

	recent MI, CHF. IDDM; severe infection; acute or chronic metabolic acidosis with or without coma; stress, trauma; severe impairment of thyroid function; dehydration, acute or chronic alcoholism.
Special Precautions	Overdosage; elderly; dietary errors; mild to moderate renal and hepatic disorders. Impaired alertness. Avoid alcohol. Carefully monitor blood-glucose concentration.
Adverse Drug Reactions	Hypoglycaemia; cholestatic jaundice; agranulocytosis; aplastic anaemia; haemolytic anaemia. Blood dyscrasias (reversible), liver dysfunction, hypoglycaemia, GI symptoms, allergic skin reactions. Metformin: Lactic acidosis with alcohol and potentiation of hypoglycaemic effect. Cimetidine and furosemide may increase plasma-metformin levels. Drugs eliminated via renal tubular secretion may increase metformin levels. Potentially Fatal: Glibenclamide: Prolonged hypoglycaemia seen in elderly or debilitated patients with hepatic or renal diseases. Metformin: Lactic acidosis in presence of renal failure and alcoholism.
Drug Interactions	Glibenclamide: Adrenaline, aminogluthethimide, chlorpromazine, corticosteroids, diazoxide, OC and thiazide diuretics diminish hypoglycaemic effect of glibenclamide. ACE inhibitors, alcohol, some analgesics, azole antifungals, coumarin, MAOIs, octreotide, tetracyclines, tricyclic antidepressants increase hypoglycaemic effects of glibenclamide. Metformin: Additive effect with sulphonylureas. Antagonistic effects with diuretics, corticosteroids, phenothiazines, thyroid products, oestrogens, oral contraceptives, phenytoin, nicotinic acid, sympathomimetics, Ca channel blockers and isoniazid. Potentially Fatal: Glibenclamide: Warfarin, salicylates, sulphonamides and alcohol potentiate hypoglycaemic effect.

	sympathomimetics, Ca channel blockers and isoniazid. Potentially Fatal: Glibenclamide: Warfarin, salicylates, sulphonamides and alcohol potentiate hypoglycaemic effect. Glucocorticoids, diuretics and oestrogen reduce hypoglycaemic effect. Beta-blockers mask early symptoms of hypoglycaemia.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1st trimester (and there is no evidence of a risk in later trimesters).
Mechanism of Action	Glibenclamide stimulates insulin secretion from pancreatic β-cells, reduces hepatic gluconeogenesis and lowers blood-glucose concentrations. Metformin improves glucose tolerance in patients with type 2 DM, lowering both basal and postprandial blood glucose. It decreases hepatic gluconeogenesis, decreases intestinal absorption of glucose, and improves insulin sensitivity by increasing peripheral glucose uptake and utilisation. Distribution: Glibenclamide: Extensively bound to serum proteins. Metformin: Negligible binding to serum proteins. Excretion: Glibenclamide: Terminal half-life: About 10 hr; excreted in urine and bile (approx 50% by each route).
CIMS Class	Antidiabetic Agents
ATC Classification	A10BA02 - metformin; Belongs to the class of biguanides. Used in the treatment of diabetes. A10BB01 - glibenclamide; Belongs to the class of sulfonamides, urea derivatives. Used in the treatment of diabetes.

gliclazide

CIMS Class : (Antidiabetic Agents)
gliclazide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related gliclazide information

Indication & Dosage	<i>Oral</i> Type 2 diabetes mellitus Adult: Initially, 40-80 mg daily gradually increased to 320 mg daily if necessary. Doses >160 mg daily may be given in 2 divided doses. For modified release tab: Initially, 30 mg once daily, may increase up to 120 mg daily.
Administration	Should be taken with food.
Contraindications	Type 1 DM, diabetes complicated with ketoacidosis; hypersensitivity; severe renal and hepatic impairment. Pregnancy and lactation.
Special Precautions	Monitor blood glucose concentration. May require insulin during metabolic stress. Care when transferring from combination therapy. Increased risk of severe hypoglycaemia in elderly, debilitated patients, patients with hepatic or renal impairment. Risk of hypoglycaemia when caloric intake is deficient, after strenuous exercise, when taken with ethanol or when >1 antidiabetic drug is used.
Adverse Drug	GI disturbances, skin reaction, leucopenia,

Adverse Drug Reactions	GI disturbances, skin reaction, leucopenia, thrombocytopenia, agranulocytosis, haemolytic anaemia, cholestatic jaundice, vomiting, diarrhoea, gastritis, increased transaminases.
Drug Interactions	Nausea and flushing with alcohol. Hypoglycaemic effect increased by salicylates, phenylbutazone, clofibrate, sulphonamides, oral anticoagulants and MAOIs. Hypoglycaemic effect diminished by rifampicin, barbiturates, alcohol, diuretics, diazoxide, corticosteroids, β -blockers, oestrogens and sympathomimetic drugs; dose adjustment may be required.
Mechanism of Action	Gliclazide stimulates insulin secretion from pancreatic β -cells, reduces hepatic gluconeogenesis, and lowers blood glucose concentrations. It also inhibits platelet aggregation at therapeutic doses. Duration: =12 hr. Absorption: Readily absorbed from the GI tract (oral). Distribution: Protein-binding: 94%. Metabolism: Extensively hepatic; converted to inactive metabolites. Excretion: Urine (60-70% metabolites and small amounts of unchanged drug); faeces (10-20%); 10-12 hr (elimination half-life).
CIMS Class	Antidiabetic Agents
ATC Classification	A10BB09 - gliclazide; Belongs to the class of sulfonamides, urea derivatives. Used in the treatment of diabetes.

glimepiride

CIMS Class : (Antidiabetic Agents)
glimepiride

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related glimepiride information

Indication & Dosage

Oral

Type 2 diabetes mellitus

Adult: Initially, 1-2 mg daily. Maintenance: 4 mg daily. Max: 6 mg daily.

Renal impairment: Initiate at 1 mg daily; subsequent increments should be based on fasting blood glucose levels.

Administration

Should be taken with food. (Take immediately before the 1st main meal of the day. Do not skip meals.)

Overdosage

Overdosage can cause hypoglycaemia. Treat mild hypoglycemic symptoms (without loss of consciousness or neurologic findings) with oral glucose and adjustments in drug dosage and/or meal patterns. Continue close monitoring until patient is out of danger. Severe hypoglycaemic reactions with coma, seizure, or other neurological impairment require immediate hospitalisation. Give patient rapid IV inj of 50% glucose solution, followed by continuous infusion of 10% glucose solution at a rate to maintain blood glucose level

	immediate hospitalisation. Give patient rapid IV inj of 50% glucose solution, followed by continuous infusion of 10% glucose solution at a rate to maintain blood glucose level >100 mg/dL. Monitor closely for at least 24-48 hr, because hypoglycaemia may recur after apparent clinical recovery.
Contraindications	Diabetic ketoacidosis with or without coma.
Special Precautions	Increased risk of CV mortality. Elderly; hepatic and renal impairment. Syndrome of inappropriate secretion of antidiuretic hormone (SIADH) in patients with CHF or hepatic cirrhosis. Monitor blood-glucose concentration. Pregnancy, lactation.
Adverse Drug Reactions	Vomiting, GI pain, diarrhoea; pruritus, erythema, urticaria, morbilliform, maculopapular eruptions; leukopenia, agranulocytosis, thrombocytopenia, haemolytic anaemia, aplastic anaemia and pancytopenia; hyponatraemia; changes in accommodation, blurred vision, jaundice.
Drug Interactions	NSAIDs, salicylates, sulphonamides, chloramphenicol, coumarin, probenecid, CYP2C9 inhibitors, fibric acid derivatives, pegvisomant, TCAs, MAOIs and β-adrenergic blockers may potentiate the hypoglycaemic action of glimepiride. Thiazides and other diuretics, corticosteroids, phenothiazines, thyroid products, oestrogens, oral contraceptives, phenytoin, nicotinic acid, sympathomimetics, rifampicin, CYP2C9 inducers and isoniazid may reduce hypoglycaemic effect of glimepiride. May increase the serum levels of ciclosporin. Serum levels may be increased by fluconazole.
Food Interaction	May cause disulfiram-like reaction and hypoglycaemia when used with ethanol. Hypoglycaemic risk when used with chromium, garlic, gymnema.
Pregnancy Category (US)	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Glimepiride stimulates the insulin release from functioning pancreatic β-cells and inhibits gluconeogenesis at hepatic cells. It also increases insulin sensitivity at peripheral target sites. Onset: Peak effect: 2-3 hr. Duration: 24 hr. Absorption: Completely absorbed from the GI tract after oral admin. Distribution: Highly protein bound. Metabolism: Metabolised hepatically to 2 main metabolites. Excretion: 60% excreted in urine and 40% in faeces (as metabolites); about 9 hr (elimination half-life).
CIMS Class	Antidiabetic Agents
ATC Classification	A10BB12 - glimepiride; Belongs to the class of sulfonamides, urea derivatives. Used in the treatment of diabetes.

glimepiride + metformin

CIMS Class : (Antidiabetic Agents)
glimepiride + metformin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related glimepiride + metformin information

Indication & Dosage	<i>Oral</i> Type 2 diabetes mellitus Adult: Per tablet contains glimepiride 1 mg and metformin 250 mg or glimepiride 2 mg and metformin 500 mg: Take as directed. Titrate according to response.
Contraindications	Hypersensitivity diabetic ketoacidosis (DKA); renal dysfunction; CHF (CHF), patients undergoing radiological studies; acute or chronic metabolic acidosis. Pregnancy, lactation.
Special Precautions	Renal and hepatic impairment. Avoid alcohol consumption. Hypoglycaemic episodes.
Adverse Drug Reactions	Diarrhoea, vomiting, metallic taste, rash, isolated transaminase elevations, cholestatic jaundice, allergic skin reactions, photosensitivity reactions, leukopaenia, agranulocytosis, thrombocytopaenia, haemolytic anaemia, aplastic anaemia, pancytopaenia, blurred vision. Potentially Fatal: Lactic acidosis.
Drug Interactions	Concomitant admin with propranolol increases C _{max} , AUC,

Drug Interactions	Concomitant admin with propranolol increases C_{max}, AUC, and T_{1/2} of glimepiride. Aspirin increases the mean AUC of glimepiride. Furosemide increases the C_{max} of metformin. Potentially Fatal: NSAIDS, salicylates, sulfonamides, chloramphenicol, coumarins, probenecid, MAOs, and beta blockers potentiate the hypoglycemic action of glimepiride.
Mechanism of Action	Glimepiride stimulates the insulin release from functioning pancreatic β-cells and inhibits gluconeogenesis at hepatic cells. It also increases insulin sensitivity at peripheral target sites. Metformin decreases hepatic gluconeogenesis, decreases intestinal absorption of glucose and improves insulin sensitivity (increases peripheral glucose uptake and utilisation).
CIMS Class	Antidiabetic Agents
ATC Classification	A10BA02 - metformin; Belongs to the class of biguanides. Used in the treatment of diabetes. A10BB12 - glimepiride; Belongs to the class of sulfonamides, urea derivatives. Used in the treatment of diabetes.

glipizide

CIMS Class : (Antidiabetic Agents)
glipizide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related glipizide information

Indication & Dosage	<i>Oral</i> Type 2 diabetes mellitus Adult: Initially, 2.5-5 mg daily as a single dose, increased gradually at increments of 2.5-5 mg daily after several days. Doses >15 mg may be given in 2 divided doses. Max: 40 mg daily.
Administration	Extended-release: Should be taken with food. (Swallow whole, do not chew/ crush/ divide.) Immediate-release: Should be taken on an empty stomach. (Take ½ hr before meals.)
Overdosage	Mild hypoglycaemic symptoms may be treated with oral glucose and adjustments in drug dosage and/or meal patterns. Monitor closely until patient is out of danger. Severe hypoglycaemic reactions with coma, seizure, or other neurological impairment may occur requiring immediate hospitalisation. If hypoglycaemic coma is diagnosed or suspected, patient may be given rapid IV inj of concentrated (50%) glucose solution, followed by continuous infusion of a

	hospitalisation. If hypoglycaemic coma is diagnosed or suspected, patient may be given rapid IV inj of concentrated (50%) glucose solution, followed by continuous infusion of a more dilute (10%) glucose solution at a rate that will maintain the blood glucose level >100 mg/dL. Close monitoring for the next 24-48 hr is advisable as hypoglycemia may recur.
Contraindications	Hypersensitivity. Type 1 DM; ketoacidosis; severe renal or hepatic insufficiency. Pregnancy, lactation.
Special Precautions	Hypoglycaemia, stress, elderly. Thyroid impairment; moderate hepatic or renal impairment. Monitor blood glucose concentration.
Adverse Drug Reactions	GI upsets, diarrhoea, nausea; allergic skin reactions, leucopenia, thrombocytopenia, agranulocytosis, hyponatraemia; jaundice; haemolytic anaemia, pancytopenia. Potentially Fatal: Hypoglycaemia in presence of renal or hepatic damage and alcohol.
Drug Interactions	Decreased effect with β-blockers, cholestyramine, hydantoins, thiazide diuretics and urinary alkalinizers. Increased hypoglycaemic effects with H_2 antagonists, anticoagulants, androgens, cimetidine, salicylates, TCAs, fluconazole, gemfibrozil, ketoconazole, NSAIDs, pioglitazone, sulfonamides, probenecid, MAOIs, methyl dopa, digitalis glycosides and urinary acidifiers.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Glipizide stimulates insulin release from pancreatic β-cells and reduces gluconeogenesis in liver cells. It also increases insulin sensitivity at target sites.

	Glipizide stimulates insulin release from pancreatic β-cells and reduces gluconeogenesis in liver cells. It also increases insulin sensitivity at target sites. Duration: 24 hr. Absorption: Readily absorbed from the GI tract (oral); peak plasma concentrations after 1-3 hr. Distribution: Protein-binding: Extensive. Metabolism: Hepatic. Excretion: Urine (as inactive metabolites); faeces; 2-4 hr (elimination half-life).
CIMS Class	Antidiabetic Agents
ATC Classification	A10BB07 - glipizide; Belongs to the class of sulfonamides, urea derivatives. Used in the treatment of diabetes.

glipizide + metformin

CIMS Class : (Antidiabetic Agents)
glipizide + metformin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Food ⚠ - Food interaction

related glipizide + metformin information

Indication & Dosage	<i>Oral</i> Type 2 diabetes mellitus Adult: Per tablet contains glipizide 2.5 mg and metformin 250 mg. As initial therapy: Start with 1 tablet once daily. May increase in steps of 1 tablet/day every 2 wk to lowest effective dose to a max of 4 tablets/day in divided doses. For patients previously treated with glibenclamide/sulphonylurea or metformin alone: Recommended starting dose: 2 tablets twice daily; starting dose should not exceed the daily doses of glipizide or metformin already being taken. Titrate subsequent doses based on blood glucose levels and patient's response. Daily max: 20 mg glipizide/2000 mg metformin.
Administration	Should be taken with food.
Contraindications	Hypersensitivity. Type 2 diabetes mellitus; ketoacidosis; severe renal or hepatic insufficiency, diabetic coma, cardiac failure, recent MI, CHF. IDDM; severe infection; acute or

	Hypersensitivity. Type 2 diabetes mellitus; ketoacidosis; severe renal or hepatic insufficiency, diabetic coma, cardiac failure, recent MI, CHF. IDDM; severe infection; acute or chronic metabolic acidosis with or without coma; stress, trauma; severe impairment of thyroid function; dehydration, acute or chronic alcoholism. Pregnancy, lactation.
Special Precautions	Hypoglycaemia, stress, elderly. Thyroid impairment, monitor blood-glucose conc and renal function regularly.
Adverse Drug Reactions	Glipizide: GI upsets, diarrhoea, nausea; allergic skin reactions, leucopaenia, thrombocytopaenia, agranulocytosis, hyponatraemia; jaundice; haemolytic anaemia, pancytopaenia. Metformin: Anorexia, nausea, vomiting, diarrhoea, wt loss, flatulence, occasional metallic taste; weakness; hypoglycaemia; rash, malabsorption of Vitamin Potentially Fatal: Glipizide: Hypoglycaemia in presence of renal or hepatic damage and alcohol. Metformin: Lactic acidosis in presence of renal failure and alcoholism.
Drug Interactions	Glipizide: Decreased effect with beta-blockers, cholestyramine, hydantoins, thiazide diuretics and urinary alkalinizers. Metformin: Additive effect with sulphonylureas. Antagonistic effects with diuretics, corticosteroids, phenothiazines, thyroid products, oestrogens, oral contraceptives, phenytoin, nicotinic acid, sympathomimetics, Ca channel blockers and isoniazid. Potentially Fatal: Glipizide: Increased glipizide levels and effects with fluconazole, gemfibrozil, ketoconazole, NSAIDs, pioglitazone and sulfonamides. Increased hypoglycaemic effects with H₂ antagonists, anticoagulants, androgens, cimetidine, salicylates, tricyclic antidepressants, probenecid, MAOIs, methyl dopa, digitalis glycosides and urinary acidifiers.

	androgens, cimetidine, salicylates, tricyclic antidepressants, probenecid, MAOIs, methyl dopa, digitalis glycosides and urinary acidifiers. Metformin: Lactic acidosis with alcohol and potentiation of hypoglycaemic effect. Cimetidine and furosemide may increase plasma-metformin levels. Drugs eliminated via renal tubular secretion may increase metformin levels.
Food Interaction	Absorption delayed.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Glipizide stimulates insulin release from pancreatic β -cells and reduces gluconeogenesis in liver cells. It also increases insulin sensitivity at target sites. Metformin decreases hepatic gluconeogenesis, decreases intestinal absorption of glucose and improves insulin sensitivity (increases peripheral glucose uptake and utilisation).
CIMS Class	Antidiabetic Agents
ATC Classification	A10BA02 - metformin; Belongs to the class of biguanides. Used in the treatment of diabetes. A10BB07 - glipizide; Belongs to the class of sulfonamides, urea derivatives. Used in the treatment of diabetes.

glucagon

CIMS Class : (Other Agents Affecting Metabolism)
glucagon

P - Caution when used during pregnancy

related glucagon information

Indication & Dosage	<i>Parenteral</i> Severe hypoglycaemia Adult: 1 mg (0.5 mg for patients <25 kg) given as SC, IM or IV. If no response within 10 minutes, then IV glucose should be given. Glucagon dose may be repeated if necessary. <i>Parenteral</i> As a diagnostic aid in the radiologic examination of the gastrointestinal tract Adult: 1-2 mg IM or 0.2-2 mg IV inj.
Contraindications	Phaeochromocytoma; hypersensitivity.
Special Precautions	Ineffective in chronic hypoglycaemia, alcohol-induced hypoglycaemia, starvation and adrenal insufficiency; diagnostic aid in diabetic patients or in elderly with heart disease. Insulinoma; glucagonoma. Monitor prothrombin time and adjust oral anticoagulant dosage. Pregnancy.
Adverse Drug Reactions	Nausea, vomiting, diarrhoea. Potentially Fatal: Hypokalaemia.
Drug Interactions	May enhance anticoagulant effect of oral anticoagulants e.g. warfarin.

	May enhance anticoagulant effect of oral anticoagulants e.g. warfarin.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Parenteral: Store at 20-25°C.
Mechanism of Action	Glucagon is a polypeptide that is produced by a cells of islets of Langerhans in the pancreas. It acts by stimulating adenylate cyclase to produce cAMP thus promoting hepatic glycogenolysis and gluconeogenesis causing an increase in blood-glucose levels. Onset: 5-20 minutes (IV); 30 minutes (IM); 30-45 minutes (SC). Duration: 30 minutes (IV); 60-90 minutes (SC). Metabolism: Mainly hepatic; some inactivation in kidneys and plasma. Excretion: 8-18 minutes (plasma half-life).
CIMS Class	Other Agents Affecting Metabolism
ATC Classification	H04AA01 - glucagon; Belongs to the class of glycogenolytic hormones. Used in the treatment of hypoglycemia.

glucosamine

CIMS Class : (Supplements & Adjuvant Therapy)
glucosamine

P - Caution when used during pregnancy

L - Caution when used during lactation

related glucosamine information

Indication & Dosage	<i>Oral</i> Rheumatoid arthritis, Osteoarthritis Adult: 500 mg 3-4 times daily. Max Dosage: 1500 mg/day.
Administration	Should be taken with food. (Preferably taken at meals.)
Contraindications	Allergy to shellfish.
Special Precautions	Diabetic patients, patients on heparin. Pregnancy and lactation.
Adverse Drug Reactions	Heart burn, epigastric pain/tenderness, diarrhoea, nausea, dyspepsia, constipation, abdominal pain, palpitations, drowsiness, skin reaction, headache, indigestion.
Mechanism of Action	Glucosamine stimulates the production of proteoglycans and increases sulfate uptake by articular cartilage.
CIMS Class	Supplements & Adjuvant Therapy
ATC Classification	M01AX05 - glucosamine; Belongs to the class of other non-steroidal antiinflammatory and antirheumatic products. Used in the treatment of inflammation and rheumatism.

M01AX05 - glucosamine; Belongs to the class of other non-steroidal antiinflammatory and antirheumatic products.

glyceryl trinitrate

CIMS Class : (Anti-Anginal Drugs) , (Anorectal Preparations)
glyceryl trinitrate

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related glyceryl trinitrate information

Indication & Dosage

Oral

Management of stable angina

Adult: As modified-release preparation: Up to 12.8 mg tid.

Sublingual

Acute angina

Adult: As tablet: 300-600 mcg, repeated if necessary. Seek medical help if pain persists after a total of 3 doses within 15 minutes. As aerosol spray: 1-2 sprays of 400 mcg each directed onto or under the tongue, closing the mouth after spraying. No more than 3 metered-doses to be taken at any one time and min of 15 minutes interval between consecutive treatments.

Buccal

Acute angina

Adult: 2-5 mg tid, placed between the gum and upper lip, increased if necessary. If the buccal tablet is accidentally swallowed, place another tablet in the buccal cavity.

Buccal

increased if necessary. If the buccal tablet is accidentally swallowed, place another tablet in the buccal cavity.

Buccal

Heart failure

Adult: 5 mg placed between the gum and upper lip, repeated until symptoms are controlled. For chronic heart failure: 5-10 mg tid may be used.

Transdermal

Management of stable angina

Adult: Apply 1 patch (releasing 2.5-20 mg/24 hr) onto the chest, upper arms, thigh, abdomen or shoulder. Replace with a new patch every 24 hr and rotate sites of application with every new patch. Max: 20 mg daily.

Transdermal

Prophylaxis of phlebitis and extravasation secondary to venous cannulation

Adult: Apply one 5-mg patch distal to the IV site, replace patch at a different skin site either daily or after 3-4 days depending on the patch; continue for as long as the IV infusion is maintained.

Intravenous

Unstable angina

Adult: Initially, 5-10 mcg/minute. Usual range: 10-200 mcg/minute.

Intravenous

Heart failure

Adult: Initially, 5-25 mcg/minute.

Intravenous

Acute myocardial infarction

Adult: Initially, 5-25 mcg/minute, adjust according to patient's response. Usual range: 10-200 mcg/minute. Max: 400 mcg/minute.

	Adult: Initially, 5-25 mcg/minute, adjust according to patient's response. Usual range: 10-200 mcg/minute. Max: 400 mcg/minute. <i>Intravenous</i> Induction of hypotension or control of hypertension during surgery Adult: Initially, 5-25 mcg/minute, adjust according to patient's response. Usual range: 10-200 mcg/minute. Max: 400 mcg/minute. <i>Topical/Cutaneous</i> Management of stable angina Adult: As 2% ointment: Apply 0.5-2 inches (to the chest, arm, thigh or back) 3-4 times daily or every 3-4 hr, if necessary. <i>Rectal</i> Pain due to chronic anal fissure Adult: As a 0.4% ointment: Apply 1.5 mg intra-anally every 12 hr for up to 8 wk. Incompatibility: Y-site admin: Alteplase, levofloxacin. Admixture: Hydralazine, phenytoin.
Overdosage	Symptoms include vasodilatation, venous pooling, reduced cardiac output and hypotension. May also include increased intracranial pressure, throbbing headache, confusion and moderate fever; vertigo; palpitation; visual disturbances; nausea, vomiting; syncope; air hunger and dyspnoea.
Contraindications	Hypersensitivity. Severe hypotension, heart failure, marked anaemia, hypertrophic obstructive cardiomyopathy, cerebral haemorrhage or head trauma, low cardiac output secondary to hypovolaemia, inferior MI with right ventricular involvement, raised intracranial pressure. Concomitant use with phosphodiesterase type-5 inhibitors.

	to hypovolaemia, inferior MI with right ventricular involvement, raised intracranial pressure. Concomitant use with phosphodiesterase type-5 inhibitors.
Special Precautions	Severe hepatic or renal impairment, hypothyroidism, malnutrition, hypothermia. Cerebrovascular disease, lung disease or cor pulmonale. Pregnancy, lactation, glaucoma, mitral valve prolapse, cardiac tamponade, syncope. Gradual withdrawal in patients who have received prolonged high dose infusions. Avoid prolonged excessive hypotension. Nitrate-free interval is recommended in patients on continuous treatment with nitrates to reduce risk of tolerance.
Adverse Drug Reactions	Facial flushing, dizziness, tachycardia, throbbing headache and tolerance. Large doses can cause vomiting, restlessness, hypotension, syncope, rarely cyanosis and methaemoglobinaemia, impaired respiration, bradycardia. IV admin: IV preparation contains substantial quantities of alcohol and alcohol intoxication can occur. Sublingual Tabs/Spray: Dry mouth, localised burning sensation. Topical: Contact dermatitis, erythema, local irritation. Transdermal patches: Contact dermatitis, metal-containing patches should be removed before cardioversion, defibrillation, diathermy. Buccal tablets: Delayed dissolution, may be swallowed by mistake. Potentially Fatal: Hypotension, paradoxical bradycardia, impaired respiration, syncope and collapse.
Drug Interactions	Enhances bioavailability of dihydroergotamine. Glyceryl trinitrate infusion may prolong pancuronium-induced neuromuscular blockade. May reduce the efficacy of heparin, alteplase and noradrenaline when used together. Efficacy of buccal and sublingual preparations may be reduced by drugs that can cause dry mouth due to decreased dissolution. Aspirin and other NSAIDs may reduce

	Efficacy of buccal and sublingual preparations may be reduced by drugs that can cause dry mouth due to decreased dissolution. Aspirin and other NSAIDs may reduce the therapeutic response to glyceryl trinitrate. Potentially Fatal: Orthostatic hypotension may be produced by combined use of calcium channel blockers, antihypertensives, phenothiazines and TCAs. Alcohol may cause severe hypotension and collapse.
Lab Interference	May interfere with Zlatkis-Zak colour reaction, resulting in false report of decreased serum cholesterol.
Storage	Buccal: Store at 15-30°C. Intravenous: Store at 15-30°C. Oral: Store at 15-30 °C. Rectal: Store at 15-30°C. Sublingual: Store at 15-30 °C. Topical/Cutaneous: Store at 15-30°C. Transdermal: Store at 15-30°C.
Mechanism of Action	Glyceryl trinitrate acts on the enzyme nitric oxide stimulating guanylate cyclase in the vascular smooth muscle cells resulting in the relaxation of smooth muscles. It reduces venous return (preload) and facilitates subendocardial blood flow with redistribution into ischaemic areas. It relieves coronary vasospasm and dilates arterioles reducing afterload. It is useful for relief and prevention of anginal attacks. Onset: 1-3 minutes (sublingual, buccal); 30-60 minutes (transdermal, topical); 1-2 minutes (IV). Duration: 30-60 minutes (sublingual); 3-5 hr (buccal, as modified-release preparations); 24 hr (transdermal); 8 hr (topical, as ointment); 3-5 minutes (IV). Absorption: Rapidly absorbed from oral mucosa (sublingual), well absorbed from the GI tract (oral), well absorbed from the skin (topical, transdermal). Distribution: Widely distributed: Smooth muscles of the

	(sublingual), well absorbed from the GI tract (oral), well absorbed from the skin (topical, transdermal). Distribution: Widely distributed: Smooth muscles of the blood vessels. Metabolism: Extensive hepatic 1st pass metabolism by glutathione-organic nitrate reductase (yielding dinitrates and mononitrates); also undergoes hydrolysis in the plasma. Excretion: Urine (as inactive metabolites).
CIMS Class	Anti-Anginal Drugs / Anorectal Preparations
ATC Classification	C01DA02 - glyceryl trinitrate; Belongs to the class of organic nitrate vasodilators. Used in the treatment of cardiac disease. C05AE01 - glyceryl trinitrate;

glycopyrronium bromide

CIMS Class : (Muscle Relaxants)
glycopyrronium bromide

P - Caution when used during pregnancy

L - Caution when used during lactation

related glycopyrronium bromide information

Indication & Dosage	<i>Oral</i>
	Peptic ulcer
	Adult: 1-2 mg bid-tid.
	<i>Parenteral</i>
	Reduction of secretions
	Adult: Preoperative: 4 mcg/kg via IM admin 30-60 minutes before procedure. Intraoperative: 0.1 mg via IV admin, repeat at 2-3 minute intervals when needed.
	Child: Preoperative: IM admin: <2 yr: 4-9 mcg/kg; >2 yr: 4 mcg/kg, dose to be given 30-60 minutes before procedure. Intraoperative: IV admin: 4 mcg/kg (Max: 0.1 mg); repeat at 2-3-minute intervals as needed.
	Max Dosage: Adult: 400 mcg/dose. Child >1 mth: 200 mcg/dose.
	<i>Intravenous</i>
	Reversal of neuromuscular blockade
	Adult: 200 mcg for each 1 mg of neostigmine or 5 mg of pyridostigmine. Alternatively, 5-15 mcg/kg with 50 mcg/kg neostigmine with 25-70 mcg/kg of neostigmine or 0.1-0.3

	Reversal of neuromuscular blockade Adult: 200 mcg for each 1 mg of neostigmine or 5 mg of pyridostigmine. Alternatively, 5-15 mcg/kg with 50 mcg/kg neostigmine with 25-70 mcg/kg of neostigmine or 0.1-0.3 mg/kg of pyridostigmine. Child: 10 mcg/kg with 50 mcg/kg neostigmine. <i>Parenteral</i> Peptic ulcer Adult: 0.1-0.2 mg 3-4 times daily via IM/IV admin.
Contraindications	Hypersensitivity. Glaucoma; obstructive uropathy; obstructive GI diseases; intestinal atony; paralytic ileus; pyloric stenosis; myasthenia gravis. Unstable CV status in acute haemorrhage. Injectable not recommended in new borns =1 mth if benzyl alcohol is present in the preparation.
Special Precautions	Pregnancy, lactation. CV disease, hyperthyroidism, hepatic or renal impairment. Enlarged prostate, diarrhoea, fever. May cause ileus or megacolon in patients with ulcerative colitis. Children and elderly.
Adverse Drug Reactions	Xerostomia; loss of taste, nausea, vomiting, constipation, reduced sweating; urinary hesitancy and retention; blurred vision; cycloplegia; increased ocular tension; tachycardia; palpitation; headache, anxiety, bloated feeling, impotence, skin reactions. Potentially Fatal: Severe anaphylaxis.
Drug Interactions	Decreases levodopa effects. Effects may be enhanced by using drugs with antimuscarinic properties or MAOIs concurrently. May antagonise the GI effects of cisapride, metoclopramide and domperidone. Potentially Fatal: IV admin in the presence of cyclopropane anesth can result in ventricular arrhythmias.
Storage	Intravenous: Store at 20-25°C. Oral: Store at 20-25°C. Parenteral: Store at 20-25°C.

	Intravenous: Store at 20-25°C. Oral: Store at 20-25°C. Parenteral: Store at 20-25°C.
Mechanism of Action	Glycopyrronium bromide is a quaternary ammonium antimuscarinic. It blocks acetylcholine at parasympathomimetic sites and induces smooth muscle relaxation. It also reduces gastric acid secretions and controls pharyngeal, tracheal and bronchial secretions. It antagonises muscarinic symptoms such as bronchorrhoea, bronchospasm, bradycardia and intestinal hypermotility induced by anticholinesterases. Onset: 15-30 minutes (IM), 1 minutes (IV). Duration: 2-3 hr (vagal blocking effect), 7 hr (sialogogue effects). Absorption: Poorly absorbed from the GI tract (oral); about 10-25% is absorbed after an oral dose. Distribution: Blood-brain barrier (poor penetration). Excretion: Via bile and urine.
CIMS Class	Muscle Relaxants

goserelin

CIMS Class : (Hormonal Chemotherapy) , (Tropic Hormones & Related Synthetic Drugs)
goserelin

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related goserelin information

Indication & Dosage

Subcutaneous

Palliative treatment of prostatic carcinoma

Adult: 3.6 mg injected into the anterior abdominal wall every 28 days or 10.8 mg every 12 wk. An anti-androgen is given several days before beginning of the treatment and continued for at least 3 wk to prevent disease flare.

Subcutaneous

Pituitary desensitisation before ovulation induction with gonadotrophins

Adult: 3.6 mg as a depot inj. Monitor serum-oestradiol concentrations until they decline to levels similar to those in the early follicular phase which takes about 7-21 days.

Contraindications

Hypersensitivity; pregnancy, lactation.

Special Precautions

Urinary tract obstruction or spinal cord compression (when used for prostate cancer); decreased bone density in women. Contraceptive measures should be taken to protect against pregnancy. Monitor men at risk from tumour flare during the 1st mth of therapy. Safety and efficacy on the

	used for prostate cancer), decreased bone density in women. Contraceptive measures should be taken to protect against pregnancy. Monitor men at risk from tumour flare during the 1 st mth of therapy. Safety and efficacy on the usage of the 10.8 mg implant in women is not established.
Adverse Drug Reactions	Vaginal bleeding and dryness, arthralgia, paraesthesias, increase in menstrual bleeding, hot flushes, sexual dysfunction. Headache, emotional lability, depression, insomnia, diaphoresis, dizziness, breast swelling/tenderness, Inj site reactions. Anaphylaxis.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Storage	Subcutaneous: Store below 25°C.
Mechanism of Action	Goserelin is a potent inhibitor of pituitary gonadotrophin secretion. Initially, it causes an increase in the serum levels of FSH and LH but chronic admin will lead to sustained suppression of the pituitary gonadotrophin release causing regression of the sex organs. Absorption: Almost complete (SC). Excretion: >90% excreted in urine (as unchanged drug and metabolites); 2-4 hr (elimination half-life).
CIMS Class	Hormonal Chemotherapy / Trophic Hormones & Related Synthetic Drugs
ATC Classification	L02AE03 - goserelin; Belongs to the class of gonadotropin releasing hormone analogues. Used in endocrine therapy.

granisetron

CIMS Class : (Supportive Care Therapy) , (Antiemetics)
granisetron

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related granisetron information

Indication & Dosage

Oral

Nausea and vomiting associated with cancer chemotherapy

Adult: 1-2 mg within 1 hr before the start of chemotherapy, then 2 mg daily in 1-2 divided doses during treatment.

Child: 1 mth–12 yr: 20 mcg/kg (max: 1 mg) within 1 hr before chemotherapy, then 20 mcg/kg (max: 1 mg) bid for up to 5 days during treatment.

Oral

Prophylaxis of nausea and vomiting associated with radiation therapy

Adult: 2 mg daily within 1 hr of irradiation.

Intravenous

Nausea and vomiting associated with cancer chemotherapy

Adult: 3 mg diluted to 20-50 ml with a suitable infusion solution, given over 5 minutes before the start of chemotherapy. Alternatively, 3 mg given in 15 ml of infusion

	Adult: 3 mg diluted to 20-50 ml with a suitable infusion solution, given over 5 minutes before the start of chemotherapy. Alternatively, 3 mg given in 15 ml of infusion solution given as bolus over at least 30 sec. May repeat dose up to twice within 24 hr. Doses should be given at least 10 minutes apart. Max: 9 mg daily. Child: 40 mcg/kg (max 3 mg), in 10-30 ml of infusion fluid given over 5 minutes, may repeat once within 24 hr, at least 10 minutes apart from the 1st dose. 1st dose should be given within 1 hr of the start of chemotherapy. <i>Intravenous</i> Treatment and prophylaxis of postoperative nausea and vomiting Adult: 1 mg diluted to 5 ml, injected over 30 sec. To be completed before induction of anaesthesia. May be given up to bid for the treatment of postoperative nausea and vomiting.
Administration	May be taken with or without food. (Take up to 1 hr before chemotherapy.)
Overdosage	Treatment is symptomatic.
Contraindications	Hypersensitivity.
Special Precautions	Subacute intestinal obstruction or ileus. Moderate to severe hepatic impairment. Congenital long QT syndrome or other risk factors for QT prolongation (e.g. electrolyte abnormalities and cumulative high-dose anthracycline therapy). Pregnancy, lactation.
Adverse Drug Reactions	Headache; sensation of flushing; constipation; hypersensitivity reactions; chest pain; CV disturbances; dizziness; transient visual disturbances. Rarely, liver disorders; development of seizures; extrapyramidal reactions.

	dizziness; transient visual disturbances. Rarely, liver disorders; development of seizures; extrapyramidal reactions.
Drug Interactions	Phenobarbital may induce metabolism of granisetron.
Lab Interference	Transient rise in liver enzymes.
Pregnancy Category (US FDA)	Category B: Either animal-reproduction studies have not demonstrated a foetal risk but there are no controlled studies in pregnant women or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the 1 st trimester (and there is no evidence of a risk in later trimesters).
Storage	Intravenous: Store at 25°C. Oral: Store at 25°C.
Mechanism of Action	Granisetron is a selective 5-HT₃-receptor antagonist with little or no affinity for other serotonin receptors. It blocks serotonin in the chemoreceptor zone. Duration: 24 hr. Absorption: Rapidly absorbed after oral admin. Oral bioavailability: About 60%. Distribution: Protein binding: About 65%. Metabolism: Hepatically metabolised, mainly by N-demethylation. Excretion: IV admin: Elimination half-life: 4-5 hr in healthy subjects; 9-12 hr in cancer patients.
CIMS Class	Supportive Care Therapy / Antiemetics
ATC Classification	A04AA02 - granisetron; Belongs to the class of serotonin (5HT ₃) antagonists. Used for the prevention of nausea and vomiting.

griseofulvin

CIMS Class : (Antifungals)
griseofulvin

P - Contraindicated in pregnancy
L - Caution when used during lactation
Food ⚠ - Food interaction

related griseofulvin information

Indication & Dosage	<i>Oral</i> Dermatophytosis Adult: 0.5-1 g daily in single or divided doses for 2-8 wk in hair and skin infections, 6 mth in fingernail infections and 12 mth or more for toenail infections. Child: 10 mg/kg daily.
Administration	Should be taken with food. (Take immediately after meals.)
Contraindications	Severe liver disease; porphyria; monilial infection; SLE; pregnancy.
Special Precautions	Lactation; may impair ability to drive or operate machinery; avoid exposure to intense sunlight or artificial light. Regular monitoring of the renal, hepatic and blood tests should be done.
Adverse Drug Reactions	Oral thrush; GI distress, taste perversion; dizziness, confusion, headache, depression, insomnia, fatigue; peripheral neuritis, photosensitivity; skin rashes, urticaria, erythema multiforme; leucopenia, proteinuria.

	confusion, headache, depression, insomnia, fatigue; peripheral neuritis, photosensitivity; skin rashes, urticaria, erythema multiforme; leucopenia, proteinuria. Potentially Fatal: Hepatotoxicity; angioedema.
Drug Interactions	Antagonises oral anticoagulants and oral contraceptives. Decreased GI absorption with phenobarbital. Reduced plasma concentrations with enzyme inducers e.g. phenylbutazone and hypnotics. Potentially Fatal: Enhances effects of alcohol and causes disulfiram-like reaction.
Food Interaction	High-fat meal enhances absorption.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Griseofulvin is a fungistatic antibiotic that inhibits fungal cell division at metaphase and binds to human keratin making it resistant to fungal infections. It has activity against common dermatophytes including epidermophyton, Microsporum, or Trichophyton spp. Absorption: Variably and incompletely absorbed from the GI tract (oral), may be increased by decreasing particle size and admin with fatty meals; peak plasma concentrations after 4 hrs. Distribution: Keratin precursor cells, stratum corneum of the skin and nails. Protein-binding: 84%. Metabolism: Hepatic; converted to 6-demethylgriseofulvin and few glucuronide conjugates. Excretion: Via urine (<1% as unchanged;

	Metabolism: Hepatic; converted to 6-demethylgriseofulvin and few glucuronide conjugates. Excretion: Via urine (<1% as unchanged; 6-demethylgriseofulvin, and glucuronide conjugates), via faeces (large amount of reduced particle size), via sweat; 9-24 hr (elimination half-life).
CIMS Class	Antifungals
ATC Classification	D01AA08 - griseofulvin; Belongs to the class of antibiotics for topical use. Used in the treatment of fungal infection. D01BA01 - griseofulvin; Belongs to the class of antifungals for systemic use. Used in the treatment of fungal infection.

guaifenesin

CIMS Class : (Cough & Cold Preparations)
guaifenesin

P - Caution when used during pregnancy

L - Caution when used during lactation

Lab α - Lab interference

related guaifenesin information

Indication & Dosage	<i>Oral</i> Cough Adult: 200-400 mg every 4 hr. Max: 2.4 g/day. Child: 6-12 yr: 100-200 mg; 2-6 yr: 50-100 mg; 6 mth-2 yr: 25-50 mg. To be given every 4 hr. Max: 6-12 yr: 1.2 g/day; 2-5 yr: 600 mg/day.
Contraindications	Hypersensitivity.
Special Precautions	Persistent cough e.g. occurs with smoking, asthma, chronic bronchitis, or emphysema; cough accompanied by excessive secretions; cough with a fever, rash, or persistent headache; Pregnancy, lactation. Porphyria.
Adverse Drug Reactions	GI discomfort, nausea and vomiting; dizziness, drowsiness, headache; rash; decreased uric acid levels; urinary calculi (large doses).
Lab Interference	Possible color interference with determination of 5-HIAA and VMA; discontinue for 49 hrs prior to test.
Pregnancy	

Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Mechanism of Action	Guaifenesin increases the volume and reduce the viscosity of tenacious sputum and is used as an expectorant for productive cough. Absorption: Well absorbed in the GI tract. Excretion: Urine.
CIMS Class	Cough & Cold Preparations
ATC Classification	R05CA03 - guaifenesin; Belongs to the class of expectorants. Used in the treatment of wet cough.

guar gum

CIMS Class : (Antidiabetic Agents)

Food ⚠ - Food interaction

related guar gum information

Indication & Dosage	<i>Oral</i> Adjunct in diabetes mellitus Adult: 5 g tid. Dose to be taken with at least 200 ml of fluid. Lower initial doses may be used to reduce GI adverse effects.
Administration	Should be taken with food. (Take w/ or immediately before meals.)
Contraindications	In cases of oesophageal diseases or difficulty in swallowing, intestinal obstruction, ingestion of dry granules.
Special Precautions	Not recommended for children, monitor blood glucose levels. Hypoglycaemia.
Adverse Drug Reactions	Hypoglycaemia, GI disturbances (flatulence, diarrhoea and nausea), reduced appetite.
Drug Interactions	Absorption of orally administered drugs may be affected.
Food Interaction	Reduces absorption of glucose and possibly lipids.
Mechanism of Action	Guar gum is a soluble fibre which reduces postprandial and fasting blood glucose concentrations in diabetic patients. It may also slow gastric emptying in dumping syndrome.

	Guar gum is a soluble fibre which reduces postprandial and fasting blood glucose concentrations in diabetic patients. It may also slow gastric emptying in dumping syndrome.
CIMS Class	Antidiabetic Agents
ATC Classification	A10BX01 - guar gum; Belongs to the class of other oral blood glucose lowering drugs. Used in the treatment of diabetes.

halcinonide

CIMS Class : (Topical Corticosteroids)
halcinonide

P - Caution when used during pregnancy

L - Caution when used during lactation

related halcinonide information

Indication & Dosage	<i>Topical/Cutaneous</i> Corticosteroid-responsive dermatoses Adult: Apply as a 0.1% cream/lotion/ointment onto affected area.
Contraindications	Primary infectious (viral, fungal, bacterial) ulcers, hypersensitivity, acne vulgaris.
Special Precautions	Neonates, childn, elderly, hepatic failure. Not to be applied over large areas under occlusive dressings. Caution when applied to areas of broken skin. Pregnancy, lactation.
Adverse Drug Reactions	Prolonged application causes epidermal thinning, contact dermatitis, perioral dermatitis, papular disorder, mild depigmentation; telangiectasia, striae (especially face and flexures). Application on eyelids and surrounding skin can raise intraocular pressure, cataracts, glaucoma, corneal ulcers and raised intracranial pressure. Systemic absorption with adrenal suppression may be seen when applied to large areas, when skin is broken or under occlusive dressing. Potentially Fatal: HPA suppression; suppression of immune

	with adrenal suppression may be seen when applied to large areas, when skin is broken or under occlusive dressing. Potentially Fatal: HPA suppression; suppression of immune system.
Storage	Topical/Cutaneous: Store below 40°C.
Mechanism of Action	Halcinonide exerts anti-inflammatory, antipruritic and vasoconstrictor actions.
CIMS Class	Topical Corticosteroids
ATC Classification	D07AD02 - halcinonide; Belongs to the class of very potent (group IV) corticosteroids. Used in the treatment of dermatological diseases.

haloperidol

CIMS Class : (Antipsychotics) , (Antivertigo Drugs)
haloperidol

P - Caution when used during pregnancy

L - Contraindicated in lactation

related haloperidol information

Indication & Dosage

Oral

Psychoses

Adult: 0.5-5 mg bid/tid, may increase up to 100 mg daily in severe or resistant cases. Usual maintenance: 3-10 mg daily.

Child: >3 yr: Initially, 25-50 mcg/kg daily in 2 divided doses, increased gradually if necessary. Max: 10 mg/day.

Oral

Tourette's syndrome

Adult: Initially, 0.5-1.5 mg tid. Up to 30 mg daily may be required in Tourette's syndrome; adjust dose carefully to obtain optimum response; usual maintenance: 4 mg daily.

Oral

Severe tics

Adult: Initially, 0.5-1.5 mg tid. Up to 30 mg daily may be required in Tourette's syndrome; adjust dose carefully to obtain optimum response; usual maintenance: 4 mg daily.

Oral

Short-term adjunct in severe anxiety or behavioral

	required in Tourette's syndrome, adjust dose carefully to obtain optimum response; usual maintenance: 4 mg daily. <i>Oral</i> Short-term adjunct in severe anxiety or behavioral disturbances <i>Adult:</i> 0.5 mg bid. <i>Oral</i> Restlessness and confusion <i>Adult:</i> 1-3 mg every 8 hr. <i>Oral</i> Intractable hiccup <i>Adult:</i> 1.5 mg tid, adjust according to response. <i>Intramuscular</i> Acute psychosis <i>Adult:</i> Doses range from 2-10 mg, may be given every hr or at intervals of 4-8 hr, until symptoms are controlled. Max: 18 mg/day. For emergency control of severely disturbed patients: Up to 18 mg may be given IV/IM. <i>Intramuscular</i> Nausea and vomiting <i>Adult:</i> 0.5-2 mg daily. In palliative care, 1.5 mg 1-2 times daily via oral admin or 2.5-10 mg over 24 hr by SC infusion (via a syringe driver). <i>Subcutaneous</i> Restlessness and confusion <i>Adult:</i> 5-15 mg via SC infusion over 24 hr.
Administration	May be taken with or without food. (May be taken w/ meals to minimise GI irritation.)
Overdosage	Symptoms of overdosage in children include drowsiness, restlessness, confusion, marked extrapyramidal symptoms and hypothermia. Torsade de pointes may occur in adults. Supportive treatment is recommended. Maintain a patent airway by using an oropharyngeal airway or endotracheal

	restlessness, confusion, marked extrapyramidal symptoms and hypothermia. Torsade de pointes may occur in adults. Supportive treatment is recommended. Maintain a patent airway by using an oropharyngeal airway or endotracheal tube or, in prolonged cases of coma, by tracheostomy. Counteract respiratory depression by artificial respiration and mechanical respirators. Hypotension and circulatory collapse may be counteracted by using IV fluids, plasma, or concentrated albumin, and vasopressor agents such as metaraminol, phenylephrine and norepinephrine. Epinephrine should not be used. For severe extrapyramidal reactions, antiparkinson medication should be admin. Monitor ECG and vital signs especially for signs of QT prolongation or dysrhythmias. Continue monitoring until ECG is normal. Treat severe arrhythmias with appropriate anti-arrhythmic measures.
Contraindications	Severe toxic CNS depression; preexisting coma; Parkinson's disease; lactation.
Special Precautions	Parkinsonism; epilepsy, allergy, angle-closure glaucoma, benign prostatic hyperplasia; severe cardiac or hepatic disease; extremes in temp (hot and cold weather); presence of acute infections or leucopenia; hyperthyroidism; pregnancy, elderly, children. Patients receiving anticoagulants. Discontinue upon signs of neurological toxicity in patients taking haloperidol and lithium.
Adverse Drug Reactions	Tardive dyskinesia; extrapyramidal reactions. Anxiety, drowsiness, depression, anorexia, transient tachycardia, postural hypotension, leukopenia; anticholinergic side effects. Potentially Fatal: Neuroleptic malignant syndrome.
Drug Interactions	Carbamazepine and rifampicin reduce plasma concentrations. Symptoms of CNS depression may be enhanced by CNS depressants e.g. alcohol, hypnotics,

	Carbamazepine and rifampicin reduce plasma concentrations. Symptoms of CNS depression may be enhanced by CNS depressants e.g. alcohol, hypnotics, general anaesthetics, anxiolytics and opioids. May reduce antihypertensive action of guanethidine. May increase risk of arrhythmia when used with drugs that prolong QT interval or diuretics that can cause electrolyte imbalance. May increase plasma levels of haloperidol when used with clozapine or chlorpromazine. Potentially Fatal: Increases lithium blood levels and may predispose to neuroleptic malignant syndrome.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intramuscular: Store at 15-30°C. Oral: Store at 15-30°C. Subcutaneous: Store at 15-30°C.
Mechanism of Action	Haloperidol blocks postsynaptic dopamine D₁ and D₂ receptors in the mesolimbic system and decreases the release of hypothalamic and hypophyseal hormones. It produces calmness and reduces aggressiveness with disappearance of hallucinations and delusions. Absorption: Readily absorbed from the GI tract (oral). Distribution: Crosses the blood-brain barrier; enters breast milk. Protein-binding: 92%. Metabolism: Hepatic via oxidative N-dealkylation and reduction of the ketone group; undergoes enterohepatic recycling. Excretion: Urine and faeces; 12-38 hr (elimination half-life).
CIMS Class	Antipsychotics / Antivertigo Drugs
ATC	N05AD01 - haloperidol; Belongs to the class of

ATC
Classification

N05AD01 - haloperidol; Belongs to the class of butyrophenone derivatives antipsychotics. Used in the management of psychosis.

halothane

CIMS Class : (Anaesthetics - Local & General)
halothane

P - Caution when used during pregnancy

related halothane information

Indication & Dosage

Inhalation

Induction and maintenance of general anaesthesia

Adult: Induction: 2-4% v/v of halothane in O₂ or mixtures of nitrous oxide and O₂. Alternatively, 0.5% v/v of halothane may be used for induction and gradually increased to the required level for maintenance of anaesthesia.

Maintain anaesthesia at 0.5-2% v/v depending on the flow rate used.

Child: Induction: 1.5-2% v/v. Maintenance of anaesthesia: 0.5-2% v/v depending on the flow rate used.

Incompatibility: Reacts with many metals when in contact with moisture. Rubber and some plastics deteriorate when in contact with halothane vapour or liquid.

Overdosage

Bradycardia and profound hypotension.

Contraindications

Obstetrics; malignant hyperthermia; porphyria.

Special Precautions

Phaeochromocytoma; poor cardiac/liver function, early pregnancy. Premedication with atropine is recommended to decrease vagal tone and prevent bradycardia and severe

	Phaeochromocytoma; poor cardiac/liver function, early pregnancy. Premedication with atropine is recommended to decrease vagal tone and prevent bradycardia and severe hypotension. May trigger malignant hyperthermia and increase intracranial pressure. Increased risk of hyperkalaemia in paediatrics with underlying neuromuscular disorders. May reduce hepatic, renal and splenic blood flow.
Adverse Drug Reactions	Bradycardia, hypotension, cardiac arrhythmias, respiratory depression, shivering during recovery (occasional), hepatitis (multiple exposure). Potentially Fatal: Fulminant hepatic failure, malignant hyperpyrexia and pulmonary oedema.
Drug Interactions	Adrenaline, other sympathomimetics, and theophylline can produce cardiac arrhythmias. Morphine and chlorpromazine may increase depressant effects of halothane on respiration. Increased risk of phenytoin intoxication when used together. Midazolam may potentiate the anaesthetic action of halothane. Potentially Fatal: Dopaminergics increase the risk of ventricular arrhythmias. Neuromuscular blocking drugs are potentiated by halothane.
Storage	Inhalation: Store at 15-25°C.
Mechanism of Action	Halothane causes reversible CNS depression; sympathetic system is more depressed than the parasympathetic. Respiration is progressively depressed. BP, heart rate, cardiac output and coronary blood flow are reduced. Absorption: Well absorbed (inhalation). Distribution: Soluble in the neutral fats of adipose tissue. Crosses the placenta and enters breast milk. Metabolism: Hepatic; converted to trifluoroacetic acid,

	Distribution: Soluble in the neutral fats of adipose tissue. Crosses the placenta and enters breast milk. Metabolism: Hepatic; converted to trifluoroacetic acid, bromide and chloride salts (oxidative pathway) and fluoride salts (reductive pathway). Excretion: Lungs (as unchanged drug).
CIMS Class	Anaesthetics - Local & General
ATC Classification	N01AB01 - halothane; Belongs to the class of halogenated hydrocarbons. Used as general anesthetics.

heparin

CIMS Class : (Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics))
heparin

P - Caution when used during pregnancy

related heparin information

related heparin information	
Indication & Dosage	<i>Subcutaneous</i> Venous thromboembolism Adult: 15,000 u injected every 12 hr. Child: 250 u/kg every 12 hr. <i>Subcutaneous</i> Prophylaxis of postoperative venous thromboembolism Adult: 5000 u given 2 hr before surgery then every 8-12 hr for 7 days or until the patient is ambulant, may increase to 10,000 u every 12 hr during the 3rd trimester of pregnancy. <i>Subcutaneous</i> Prophylaxis of mural thrombosis Adult: 12,500 u every 12 hr for at least 10 days. <i>Intravenous</i> Peripheral arterial embolism Adult: 5000 u (10,000 u in severe pulmonary embolism) IV loading dose followed by 1000-2000 u/hr continuous infusion. Alternatively, intermittent inj of 5000-10,000 u every 4-6 hr. Child: Administer a lower loading dose. Maintenance: 15-25 u/kg/hr continuous infusion. <i>Intravenous</i>

Alternatively, intermittent inj of 5000-10,000 u every 4-6 hr.

Child: Administer a lower loading dose. Maintenance: 15-25 u/kg/hr continuous infusion.

Intravenous

Venous thromboembolism

Adult: 5000 u (10,000 u in severe pulmonary embolism) IV loading dose followed by 1000-2000 u/hr continuous infusion.

Alternatively, intermittent inj of 5000-10,000 u every 4-6 hr.

Child: Administer a lower loading dose. Maintenance: 15-25 u/kg/hr continuous infusion.

Intravenous

Unstable angina

Adult: 5000 u (10,000 u in severe pulmonary embolism) IV loading dose followed by 1000-2000 u/hr continuous infusion.

Alternatively, intermittent inj of 5000-10,000 u every 4-6 hr.

Child: Administer a lower loading dose. Maintenance: 15-25 u/kg/hr continuous infusion.

Intravenous

Prophylaxis of re-occlusion of the coronary arteries following thrombolytic therapy in myocardial infarction

Adult: 5000 u IV followed by 1000 u/hr IV with alteplase.

Incompatibility: Heparin calcium or sodium is reported to be incompatible with alteplase, reteplase, amikacin sulfate, amiodarone hydrochloride, ampicillin sodium, aprotinin, benzylpenicillin potassium or sodium, cefalotin sodium, ciprofloxacin lactate, cytarabine, dacarbazine, daunorubicin hydrochloride, diazepam, dobutamine hydrochloride, doxorubicin hydrochloride, droperidol, erythromycin lactobionate, gentamicin sulfate, haloperidol lactate, hyaluronidase, hydrocortisone sodium succinate, kanamycin sulfate, meticillin sodium, netilmicin sulfate, some opioid analgesics, oxytetracycline hydrochloride, some

	hyaluronidase, hydrocortisone sodium succinate, kanamycin sulfate, meticillin sodium, netilmicin sulfate, some opioid analgesics, oxytetracycline hydrochloride, some phenothiazines, polymyxin B sulfate, streptomycin sulfate, tetracycline hydrochloride, tobramycin sulfate, vancomycin hydrochloride and vinblastine sulfate. Heparin sodium has also been reported to be incompatible with cisatracurium besilate, labetalol hydrochloride, levofloxacin, nicardipine hydrochloride and vinorelbine tartrate.
Overdosage	Slight haemorrhage can be treated by withdrawing heparin. Severe bleeding may be treated with IV protamine sulfate.
Contraindications	Patients predisposed to active bleeding including thrombocytopenia, peptic ulcer disease, cerebrovascular disorders, haemorrhagic blood disorders, bacterial endocarditis, severe hypertension, oesophageal varices. Recent surgery at sites where haemorrhage would be an especial risk. Severe renal and hepatic impairment. Cerebral or subarachnoid haemorrhage, abdominal or thoracic bleeding into closed space, severe traumatic bleed, hepatic, renal, splenic or arterial injury, severe haemostatic defect, arterial thrombosis with heparin-associated thrombocytopenia. IM admin.
Special Precautions	Monitor platelet counts. Discontinue treatment if thrombocytopenia occurs. Hypersensitivity, elderly, pregnancy.
Adverse Drug Reactions	Slight fever, headache, chills, nausea, vomiting, constipation, epistaxis, bruising, slight haematuria, skin necrosis (SC inj), osteoporosis, alopecia. Hypersensitivity reactions include urticaria, conjunctivitis, rhinitis, asthma, angioedema and anaphylactic shock. Priapism. Potentially Fatal: Heparin-induced thrombocytopenia with or without thrombosis; bleeding.

	urticaria, conjunctivitis, rhinitis, asthma, angioedema and anaphylactic shock. Priapism. Potentially Fatal: Heparin-induced thrombocytopenia with or without thrombosis; bleeding.
Drug Interactions	Inhibited by zinc. Antiplatelet drugs e.g. aspirin and dipyridamole may precipitate bleeding. Potentially Fatal: NSAIDs may increase risk of haemorrhage. Effect increased by dextrans, high doses of penicillin and cephalosporins, phenylbutazone, asparaginase. streptokinase and some contrast media.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Intravenous: Store at 15-30°C. Subcutaneous: Store at 15-30°C.
Mechanism of Action	Heparin increases the inhibitory action of antithrombin III (AT III) on clotting factors XIIa, XIa, IXa, Xa and thrombin. This inhibits the conversion of prothrombin to thrombin and fibrinogen to fibrin. It also inhibits platelet function. It may reduce the activity of ATIII at very high doses. Absorption: Absorbed from systemic circulation (IV, SC). Distribution: Reticuloendothelial system. Protein-binding: Extensive. Excretion: Via urine (as metabolites, or up to 50% as unchanged after admin of large doses); 1-6 hr (elimination half-life), prolonged in renal impairment, decreased in pulmonary embolism, increased or decreased in hepatic impairment.
CIMS Class	Anticoagulants, Antiplatelets & Fibrinolytics (Thrombolytics)
ATC	B01AB01 - heparin; Belongs to the class of heparin group.

**ATC
Classification**

B01AB01 - heparin; Belongs to the class of heparin group.

Used in the treatment of thrombosis.

C05BA03 - heparin; Belongs to the class of heparins or heparinoids used topically in antivaricose therapy.

S01XA14 - heparin; Belongs to the class of other agents used as ophthalmologicals.

Lab α - Lab interference

related human albumin information

related human albumin information	
Indication & Dosage	<i>Intravenous</i> Acute hypovolaemic shock Adult: Initially, 25 g of albumin, adjusted according to patient's response. Usual rates of infusion: Up to 5 ml/minute (5% solution) or 1-2 ml/minute (20% solution). Child: Up to 1 g/kg, adjusted according to patient's response. Usual rates of infusion: Up to 5 ml/minute (5% solution) or 1-2 ml/minute (20% solution). <i>Intravenous</i> Hypoproteinaemia Adult: Up to 2 g/kg daily. Usual rates of infusion: Up to 5 ml/minute (5% solution) or 1-2 ml/minute (20% solution). <i>Intravenous</i> Neonatal hyperbilirubinaemia Child: 1 g/kg of albumin before exchange transfusion. Usual rates of infusion: Up to 5 ml/minute (5% solution) or 1-2 ml/minute (20% solution).

	rates of infusion: Up to 5 ml/minute (5% solution) or 1-2 ml/minute (20% solution). Incompatibility: Dilution with water will produce a hypo-osmolar solution that may cause severe haemolysis and renal failure. Y-site admin: Midazolam, vancomycin, verapamil. Admixture: Verapamil.
Contraindications	Cardiac failure, severe anaemia, history of hypersensitivity, parenteral nutrition.
Special Precautions	Hypertension or low cardiac reserve; additional fluids for dehydrated patients. Monitor for signs of cardiac overload in injured or postoperative patients. May carry risk of viral transmission. Volume admin and rate of infusion must always be individualised according to situation and response. Pregnancy, lactation.
Adverse Drug Reactions	Allergic reactions, nausea, vomiting, increased salivation, fever and chills; vascular overload, haemodilution and pulmonary oedema. Potentially Fatal: Anaphylactic shock.
Drug Interactions	Albumin solution should not be mixed by protein hydrolysates or alcoholic solutions. Risk of atypical reactions to ACE inhibitors in patients undergoing therapeutic plasma exchange with albumin human replacement.
Lab Interference	False elevations of serum alkaline phosphatase concentrations may occur.
Storage	Intravenous: Store below 30°C. Do not freeze.
Mechanism of Action	Human albumin increases intravascular oncotic pressure and causes movement of fluids from interstitial into intravascular space. Human albumin solutions are available in various concentrations. Solutions containing 5% human albumin are usually used in hypovolemic patients, whereas more

	causes movement of fluids from interstitial into intravascular space. Human albumin solutions are available in various concentrations. Solutions containing 5% human albumin are usually used in hypovolemic patients, whereas more concentrated 25% solutions are recommended in patients in whom fluid and sodium intake must be minimised e.g. patients with hypoproteinaemia or cerebral oedema or in paediatric patients.
CIMS Class	Intravenous & Other Sterile Solutions

human menopausal gonadotrophins

CIMS Class : (Trophic Hormones & Related Synthetic Drugs)
human menopausal gonadotrophins

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related human menopausal gonadotrophins information

Indication &
Dosage

Parenteral

Female infertility

Adult: 75-150 units of FSH daily via IM or SC inj; adjust gradually until adequate response is achieved. Treatment is stopped and followed after 1 or 2 days by single dose of chorionic gonadotrophin 5000-10,000 units. In menstruating patients, start within the 1st 7 days of menstrual cycle. Alternatively, 3 equal doses IM or SC, each providing 225-375 units of FSH on alternate days followed by chorionic gonadotrophin 1 wk after the 1st dose. Stop treatment if no response is seen in 3 wk. Course may be repeated twice more, if necessary.

Parenteral

Male infertility

Adult: Stimulate spermatogenesis with chorionic gonadotrophin, then with human menopausal gonadotrophin in a dose of 75 or 150 units of FSH 2 or 3 times wkly by IM or SC. Treatment should be continued for at least 3 or 4 mth.

	gonadotrophin, then with human menopausal gonadotrophin in a dose of 75 or 150 units of FSH 2 or 3 times wkly by IM or SC. Treatment should be continued for at least 3 or 4 mth. <i>Parenteral</i> In vitro fertilisation procedures or other assisted conception techniques Adult: (In conjunction with chorionic gonadotrophin and sometimes clomiphene citrate or a gonadorelin analogue.) 75-300 units of FSH daily via IM or SC inj usually beginning on the 2nd or 3rd day of menstrual cycle. Combined regimen: 100 mg clomiphene citrate on days 2-6, with human menopausal gonadotrophins beginning on day 5 in a dose providing 150-225 units of FSH daily. Continue until an adequate response is obtained; final inj of human menopausal gonadotrophins is followed 1-2 days later with up to 10,000 units of chorionic gonadotrophin.
Contraindications	Ovarian cysts or enlargement not caused by polycystic ovarian syndrome; tumors of breast, uterus, ovaries, testes or prostate; vaginal bleeding of unknown cause; pregnancy and lactation.
Special Precautions	Hyperprolactinemia or tumors of the pituitary or hypothalamus. Ovarian enlargement at risk of rupture, care in pelvic examinations. Risk of multiple births.
Adverse Drug Reactions	Ovarian hyperstimulation, risk of multiple pregnancy and miscarriage, hypersensitivity and local reactions at Inj site, nausea, vomiting, joint pain, fever. In men, gynecomastia, acne, weight gain. Potentially Fatal: Rupture of ovarian cysts and intraperitoneal haemorrhage.
Drug Interactions	Drugs with luteinising hormone activity may increase risk of ovarian hyperstimulation syndrome.

	Drugs with luteinising hormone activity may increase risk of ovarian hyperstimulation syndrome.
Pregnancy Category (US FDA)	Category X: Studies in animals or human beings have demonstrated foetal abnormalities or there is evidence of foetal risk based on human experience or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.
Mechanism of Action	Human menopausal gonadotrophins possess both follicle-stimulating hormone (FSH) and luteinizing hormone (LH) activities.
CIMS Class	Trophic Hormones & Related Synthetic Drugs
ATC Classification	G03GA02 - human menopausal gonadotrophin; Belongs to the class of gonadotropins. Used as ovulation stimulants.

Lab α - Lab interference

related human normal immunoglobulin information

related human normal immunoglobulin information	
Indication & Dosage	<i>Intramuscular</i> Control outbreaks of hepatitis A Adult: Recommended dose: 500 mg via deep IM inj. Child: Recommended dose: <10 yr: 250 mg; =10 yr: 500 mg, to be given as deep IM inj. <i>Intramuscular</i> Prophylaxis against hepatitis A in immunocompromised patients Adult: Recommended dose: 500 mg via deep IM inj. Child: Recommended dose: <10 yr: 250 mg; =10 yr: 500 mg, to be given as deep IM inj. <i>Intramuscular</i> Prevent or modify measles attack in immunocompromised patients Adult: For prevention of an attack: 750 mg as an IM inj; to be given within 6 days after exposure (better efficacy if given within 72 hr). To modify an attack: 250 mg as an IM inj. Child: For prevention of an attack: <1 yr: 250 mg; 1-2 yr: 500

given within 6 days after exposure (better efficacy if given within 72 hr). To modify an attack: 250 mg as an IM inj.

Child: For prevention of an attack: <1 yr: 250 mg; 1-2 yr: 500 mg; ≥3 yr: 750 mg, as a single IM inj. Dose should be given within 6 days after exposure (better efficacy if given within 72 hr). To modify an attack: <1 yr: 100 mg and ≥1 yr: 250 mg, as a single IM inj.

Intramuscular

Primary rubella in pregnant women whereby pregnancy termination is unacceptable

Adult: 750 mg as an IM inj.

Parenteral

Immunocompromised patients or patients with primary antibodies deficiency

Adult: IV admin: Initially, 400-800 mg/kg, then 200 mg/kg every 3 wk, adjust according to trough-immunoglobulin levels; maintenance dose: 200-800 mg/kg/mth. In patients with secondary immunodeficiency syndromes: 200-400 mg/kg every 3-4 wk may be used. Alternatively, dose may be given via SC admin: Initial loading dose of 200-500 mg/kg (divided over several days), followed by maintenance doses at repeated intervals to achieve a cumulative mthly dose of 400-800 mg/kg.

Intravenous

Prophylaxis of infections after bone marrow transplantation

Adult: 500 mg/kg/wk, adjust dose according to response.

Intravenous

Raise platelet count in patients with idiopathic thrombocytopenic purpura

Adult: 400 mg/kg/day for 2-5 consecutive days. Alternatively, a dose of 800-1000 mg/kg may be given on day 1 and

	thrombocytopenic purpura Adult: 400 mg/kg/day for 2-5 consecutive days. Alternatively, a dose of 800-1000 mg/kg may be given on day 1 and repeated on day 3 if needed. Doses to be given via IV infusion. Treatment may be repeated if relapse occurs. <i>Intravenous</i> Kawasaki disease Adult: 1.6-2 g/kg in divided doses over 2-5 days, or 2 g/kg given as a single dose. To be used in conjunction with acetylsalicylic acid. <i>Intravenous</i> Guillain-Barre syndrome Adult: 400 mg/kg daily for 5 consecutive days, may repeat every 4 wk if needed. <i>Intravenous</i> Allogenic bone marrow transplantation Adult: As part of the conditioning regimen and after transplantation: 500 mg/kg/wk, starting 7 days before transplantation and for up to 3 mth after transplantation. In cases of persistent lack of antibody production, 500 mg/kg/mth may be used to normalise the antibody level.
Contraindications	Patients with selective immunoglobulin A deficiency. Prior anaphylactic reactions to immunoglobulin, blood or other blood-derived preparations.
Special Precautions	Increased risk of acute renal failure in patients with renal impairment, DM, hypovolaemia, overweight, concomitant nephrotoxic medicinal products or >65 yr. High infusion rate may increased risk of adverse reactions. Ensure adequate hydration prior to IV infusion of immunoglobulin. Monitor urine output and serum creatinine levels during treatment. Avoid concurrent use of loop diuretics during IV infusion of immunoglobulin. Live vaccines should generally be given 3

	urine output and serum creatinine levels during treatment. Avoid concurrent use of loop diuretics during IV infusion of immunoglobulin. Live vaccines should generally be given 3 wk before or 3 mth after admin of normal immunoglobulin. Different formulations and brands of human normal immunoglobulins may not be equivalent, thus individual literature should be consulted. Pregnancy and lactation.
Adverse Drug Reactions	Dizziness, light-headedness, nausea, vomiting, allergic and cutaneous reactions. Local pain and tenderness at the site of inj. IV admin may lead to systemic effects such as headache, chills and fever.
Drug Interactions	May interfere with the immune response to live measles vaccine, live mumps vaccine, live rubella vaccine and live varicella vaccine, therefore these vaccines should be given at least 3 wk before or 3 mth after the admin of the immunoglobulins.
Lab Interference	May affect Coomb's test results used in haematologic studies or transfusion cross-matching procedures. IV immunoglobulin preparations containing maltose may falsely elevate blood glucose tests that use nonspecific methods based on glucose dehydrogenase pyrroloquinolinequinone (GDH-PQQ) or glucose-dye oxidoreductase.
Storage	Intramuscular: Store at 2-8°C. Intravenous: Store at 2-8°C. Parenteral: Store at 2-8°C.
Mechanism of Action	Human normal immunoglobulin is derived from donations of pooled human plasma. It contains antibodies, mainly immunoglobulin G (IgG), to various bacteria and viruses present in the general population such as hepatitis A, measles, mumps, rubella and varicella. It has a distribution of IgG subclasses that is very close to that of the normal human plasma. It is therefore, used to provide passive immunisation against such diseases.

	measles, mumps, rubella and varicella. It has a distribution of IgG subclasses that is very close to that of the normal human plasma. It is therefore, used to provide passive immunisation against such diseases. Absorption: Levels usually take about 2 days to peak after SC admin. Metabolism: IgG and IgG-complexes are broken down in the cells of the reticuloendothelial system.
CIMS Class	Vaccines, Antisera & Immunologicals

hyaluronidase

CIMS Class : (Miscellaneous)
hyaluronidase

P - Caution when used during pregnancy

L - Caution when used during lactation

related hyaluronidase information

Indication & Dosage

Parenteral

Adjunct in hypodermoclysis

Adult: 1500 units for every 500-1000 ml of fluid for SC admin.

Parenteral

Facilitate SC/IM injections

Adult: 1500 units directly added to the inj.

Parenteral

Aid in the dispersal of extravasated fluids or blood

Adult: 1500 units in 1 ml of water for inj or normal saline is injected into the affected area.

Parenteral

Aid in the diffusion of local anaesthetic in ophthalmology

Adult: 15 units/ml of local anaesthetic solution.

Incompatibility: Physical incompatibility has been reported with heparin and adrenaline, frusemide, benzodiazepines and phenytoin.

	Incompatibility: Physical incompatibility has been reported with heparin and adrenaline, frusemide, benzodiazepines and phenytoin.
Overdosage	Symptoms include hypotension, tachycardia, headache and generalised skin flushing. Other complications may include myocardial ischaemia and subsequent MI, cardiac arrhythmia and profound shock. Treatment is supportive and symptomatic.
Contraindications	Hypersensitivity, malignancy. Direct application to the cornea, reduction of swelling of bites or stings. Inj into or around infected area. IV admin; unexplained premature labour.
Special Precautions	Impaired renal function. Infants, elderly. Patients with infections. Pregnancy, lactation.
Adverse Drug Reactions	Urticaria, occasional severe allergy. Potentially Fatal: Hypersensitivity and anaphylaxis.
Drug Interactions	Action potentiated by urokinase especially in the treatment of MI. May increase absorption and toxicity of local anaesthetics. Heparin, salicylates and NSAIDs may inhibit the spreading action and efficacy of hyaluronidase.
Storage	Parenteral: Refrigerate at 2-8°C.
Mechanism of Action	Hyaluronidase is an enzyme which reduces the viscosity of ground substance, thus making the tissues more permeable to injected fluids. It facilitates distribution and absorption of locally injected substances. It also promotes resorption of excess fluids and extravasated blood in the tissues.
CIMS Class	Miscellaneous
ATC Classification	B06AA03 - hyaluronidase; Belongs to the class of enzymes used as hematological agent.

***hyaluronidase information:**

hydrochlorothiazide

CIMS Class : (Diuretics)
hydrochlorothiazide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related hydrochlorothiazide information

Indication & Dosage

Oral

Hypertension

Adult: Initially, 12.5 mg daily. Usual dose: 25-50 mg daily, either alone or combined with other antihypertensives, up to 100 mg daily, if necessary.

CrCl (ml/min)	Dosage Recommendation
<10	Avoid.

Oral

Oedema associated with heart failure

Adult: Usual dosage: 25-100 mg daily in the morning, may reduce to 25-50 mg daily or intermittently. Up to 200 mg daily may be used as initial doses in severe cases.

CrCl (ml/min)	Dosage Recommendation
<10	Avoid.

Oral

Nephrogenic diabetes insipidus

Adult: Initial dose: Up to 100 mg daily.

Child: Initially, 1-2 mg/kg/day in 1-2 divided doses; <6 mth:

	Nephrogenic diabetes insipidus Adult: Initial dose: Up to 100 mg daily. Child: Initially, 1-2 mg/kg/day in 1-2 divided doses; <6 mth: up to 3 mg/kg/day. <table><tr><th>CrCl (ml/min)</th><th>Dosage Recommendation</th></tr><tr><td><10</td><td>Avoid.</td></tr></table>	CrCl (ml/min)	Dosage Recommendation	<10	Avoid.	
CrCl (ml/min)	Dosage Recommendation					
<10	Avoid.					
Administration	Should be taken with food.					
Overdosage	Lethargy, nausea, weakness and electrolyte imbalance, possibly progress to coma within a few hr with minimal depression of respiratory and CV function and with no evidence of dehydration or serum electrolyte changes. GI irritation and hypermotility, temporary elevation of the BUN, serum electrolyte changes (e.g., hypokalemia, hypochloremia, hyponatremia) may occur in renally impaired patients. Empty stomach by inducing vomiting with ipecac syrup If patient is conscious. Cathartics should not be admin as they may promote loss of fluid and electrolytes. Supportive and symptomatic treatment with monitoring of serum electrolytes, renal, respiratory, and CV function. Replace fluid and electrolytes where necessary.					
Contraindications	Severe hepatic and renal impairment, Addison's disease, preexisting hypercalcaemia, anuria, sulphonamide allergy. Pregnancy, lactation.					
Special Precautions	Existing electrolyte disturbances, hepatic cirrhosis, severe heart failure, oedema, elderly, renal impairment. Monitor for signs of fluid and electrolyte disturbance. Hepatic impairment, DM, gout, hyperlipidaemia, hypercalcaemia, hyperuricaemia; ECG: LVH and/or ventricular ectopics (extrasystoles). May exacerbate or activate SLE in susceptible patients.					
Adverse Drug Reactions	Volume depletion and electrolyte imbalance, dry mouth,					

Adverse Drug Reactions	Volume depletion and electrolyte imbalance, dry mouth, thirst, lethargy, drowsiness, muscle pain and cramps, hypotension, hypersensitivity reactions e.g. rashes, photosensitivity, thrombocytopenia, jaundice, pancreatitis; fatigue, weakness; may precipitate an attack of gout; impotence, hyperglycaemia; anorexia, gastric irritation, nausea, vomiting, constipation, diarrhoea, sialadenitis, dizziness, raised Ca concentration. Potentially Fatal: Hypersensitivity reactions.
Drug Interactions	May cause hyponatraemia when used with carbamazepine. May increase risk of toxicity when used with allopurinol or tetracyclines. Potentiates hypotensive effect of α-blockers and ACE inhibitors. Diuretic-induced hypokalaemia may increase the toxicity of digitalis glycosides and risk of arrhythmias when used with drugs that prolong QT interval. May increase serum concentrations of lithium when used together. Concurrent use with alcohol, barbiturates and opioids may enhance diuretic-enhanced orthostatic hypotension. Antihypertensive effect may be reduced by corticosteroids, NSAIDs or carbenoxolone. May enhance the nephrotoxicity of NSAIDs. Potentially Fatal: Enhances neuromuscular blocking action of competitive muscle relaxants. Impaired control of diabetes by oral hypoglycaemic agents.
Storage	Oral: Store at 15-30°C.
Mechanism of Action	Hydrochlorothiazide inhibits the reabsorption of Na and chloride at the beginning of the distal convoluted tubule. It causes natriuretic effect mainly by decreasing Na and chloride reabsorption in the cortical segment of the ascending limb of the loop of Henle by inhibition of a specific

	causes natriuretic effect mainly by decreasing Na and chloride reabsorption in the cortical segment of the ascending limb of the loop of Henle by inhibition of a specific Na^+Cl^- co-transporter. Onset: 2 hr (oral). Duration: 6-12 hr (oral). Absorption: Fairly absorbed from the GI tract; peak plasma concentrations after 4 hr (oral). Distribution: Crosses the placenta; enters the breast milk; bound to RBCs. Excretion: Urine (as unchanged drug); 5-15 hr (elimination half-life).
CIMS Class	Diuretics
ATC Classification	C03AA03 - hydrochlorothiazide; Belongs to the class of low-ceiling thiazide diuretics. Used to promote excretion of urine.

hydrocortisone

CIMS Class : (Corticosteroid Hormones) , (Eye Corticosteroids) , (Topical Corticosteroids)
hydrocortisone

P - Caution when used during pregnancy

L - Caution when used during lactation

Food ⚠ - Food interaction

related hydrocortisone information

Indication & Dosage	<i>Oral</i>
	Replacement therapy in adrenocortical insufficiency
	Adult: 20-30 mg daily in 2 divided doses.
	Child: 400-800 mcg/kg/day, in 2-3 divided doses.
	<i>Intravenous</i>
	As supplement in adrenal insufficiency during minor surgery under general anaesthesia
	Adult: In patients taking >10 mg of prednisolone or its equivalent by mouth daily. 25-50 mg at induction. Resume with usual oral corticosteroid after surgery.
	<i>Intravenous</i>
	As supplement in adrenal insufficiency during moderate or major surgery
	Adult: In patients taking >10 mg of prednisolone or its equivalent by mouth daily. Usual oral corticosteroid dose on the morning of the surgery followed by 25-50 mg at induction, then similar doses of hydrocortisone tid for 24 hr after

equivalent by mouth daily. Usual oral corticosteroid dose on the morning of the surgery followed by 25-50 mg at induction, then similar doses of hydrocortisone tid for 24 hr after moderate surgery or 48-72 hr after major surgery. Resume oral therapy once injections are stopped.

Intravenous

Acute adrenocortical insufficiency

Adult: 100-500 mg 3-4 times/24 hr according to the severity of the condition and patient response. Fluids and electrolytes should be administered as needed to correct any metabolic disorder. Doses may also be given via IM inj but the response may be slower.

Child: <1 yr: 25 mg; 1-5 yr: 50 mg; 6-12 yr: 100 mg. Fluids and electrolytes should be administered as needed to correct any metabolic disorder. Doses may also be given via IM inj but the response may be slower.

Injection

Soft tissue inflammation

Adult: As Na phosphate or Na succinate esters: 100-200 mg as local inj.

Intra-articular

Joint inflammations

Adult: As acetate: 5-50 mg depending on size of affected joint.

Topical/Cutaneous

Corticosteroid-responsive dermatoses

Adult: Apply a 0.1-2.5% cream/ointment/lotion onto affected area.

Administration

Should be taken with food.

Contraindications

Viral/fungal infections, tubercular or syphilitic lesions, bacterial infections unless used in conjunction with appropriate chemotherapy.

	Viral/fungal infections, tubercular or syphilitic lesions, bacterial infections unless used in conjunction with appropriate chemotherapy.
Special Precautions	CHF, hypertension, DM, epilepsy, elderly, patients on prolonged therapy. Gradual withdrawal, pregnancy and lactation.
Adverse Drug Reactions	Sodium and fluid retention. Potassium and calcium depletion. Muscle wasting, weakness, osteoporosis. GI disturbances and bleeding. Increased appetite and delayed wound healing. Bruising, striae, hirsutism, acne, flushing. Raised intracranial pressure, headache, depression, psychosis, menstrual irregularities. Hyperglycaemia, glycosuria, DM, obesity, moon-face, buffalo hump. Suppression of pituitary-adrenocortical system. Growth retardation in children (prolonged therapy). Increased susceptibility for infection. Topical use: Dermal atrophy, local irritation, folliculitis, hypertrichosis. Inhaled corticosteroids: May cause hoarseness, candidiasis of mouth and throat. Topical application to the eye: Can produce corneal ulcers, raised IOP and reduced visual function. Intralesional injection: Local hypopigmentation of deeply pigmented skin. Intra-articular injection: Joint damage, fibrosis esp in load bearing joints. Potentially Fatal: Abrupt withdrawal leading to acute adrenal insufficiency. Rapid IV Inj may cause CV collapse.
Drug Interactions	Thiazides may enhance hyperglycaemia and hypokalaemia caused by corticosteroids. Increased incidence of peptic ulcer or GI bleeding with concurrent NSAIDs admin. Response to anticoagulants altered. Dose of antidiabetics and antihypertensives needs to be increased. Decreases serum conc of salicylates and antimuscarinic agents. Ethanol may enhance gastric mucosal irritation. Reduced efficacy with concurrent use of carbamazepine, phenytoin, primidone,

	conc of salicylates and antimuscarinic agents. Ethanol may enhance gastric mucosal irritation. Reduced efficacy with concurrent use of carbamazepine, phenytoin, primidone, barbiturates and rifampicin. Mutual inhibition of metabolism between cyclosporin and corticosteroids increase plasma conc of both drugs. Enhanced effect in women taking oestrogens or oral contraceptives.
Food Interaction	Interferes with calcium absorption.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus. in 1st trimester. Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Injection: Store at 15-30°C. Intra-articular: Store at 15-30°C. Intravenous: Store at 15-30°C. Oral: Store at 15-30°C. Topical/Cutaneous: Store at 15-30°C.
Mechanism of Action	Hydrocortisone is a corticosteroid used for its anti-inflammatory and immunosuppressive effects. Its anti-inflammatory action is due to the suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability. It may also be used as replacement therapy in adrenocortical insufficiency. Absorption: Readily absorbed from the GI tract (oral); sodium phosphate and sodium succinate esters are rapidly

	replacement therapy in adrenocortical insufficiency. Absorption: Readily absorbed from the GI tract (oral); sodium phosphate and sodium succinate esters are rapidly absorbed but the free alcohol and its lipid soluble ester are slowly absorbed (IM); Acetate is slowly absorbed (intra-articular inj); absorbed from the skin (denuded areas). Distribution: Crosses the placenta. Protein-binding: >90%. Metabolism: Hepatic (metabolised to hydrogenated and degraded forms). Excretion: Via urine (as conjugates and glucuronide, with small portion as unchanged drug).
CIMS Class	Corticosteroid Hormones / Eye Corticosteroids / Topical Corticosteroids
ATC Classification	A01AC03 - hydrocortisone; Belongs to the class of local corticosteroid preparations. Used in the treatment of diseases of the mouth. A07EA02 - hydrocortisone; Belongs to the class of corticosteroids acting locally. Used in the treatment of intestinal inflammation. C05AA01 - hydrocortisone; Belongs to the class of products containing corticosteroids for topical use. Used in the treatment of hemorrhoids. D07AA02 - hydrocortisone; Belongs to the class of weak (group I) corticosteroids. Used in the treatment of dermatological diseases. D07XA01 - hydrocortisone; Belongs to the class of weak (group I) corticosteroids in other combinations. Used in the treatment of dermatological diseases. H02AB09 - hydrocortisone; Belongs to the class of glucocorticoids. Used in systemic corticosteroid preparations. S01BA02 - hydrocortisone; Belongs to the class of corticosteroids. Used in the treatment of inflammation of the

glucocorticoids. Used in systemic corticosteroid preparations.

S01BA02 - hydrocortisone; Belongs to the class of corticosteroids. Used in the treatment of inflammation of the eye.

S01CB03 - hydrocortisone; Belongs to the class of corticosteroids/antiinfectives/mydriatics combinations. Used in the treatment of eye diseases.

S02BA01 - hydrocortisone; Belongs to the class of corticosteroids used in the treatment of inflammation of the ear.

hydroquinone

CIMS Class : (Other Dermatologicals)
hydroquinone

P - Caution when used during pregnancy

L - Caution when used during lactation

related hydroquinone information

Indication & Dosage	<i>Topical/Cutaneous</i> Hyperpigmentated skin conditions Adult: Apply and rub in a thin layer of 2-4% preparation to affected area bid.
Overdosage	Tremors, seizures, and occasionally severe hemolytic anemia. Administration of activated charcoal and gastric lavage, followed by supportive therapy.
Contraindications	Hypersensitivity. Sunburn or depilatory usage. Children <12 yr.
Special Precautions	Pregnancy, lactation. Avoid contact with eyes and on abraded or sunburnt skin. Avoid unnecessary exposure to sunlight. Limit application to area no larger than face and neck or hands and arms. Not advised to use when itching, vesicle formation, or excessive inflammation occurs. Discontinue application if there is no improvement after 2 mth of treatment.
Adverse Drug Reactions	Transient erythema, mild burning sensations; hyperpigmentation. Staining and corneal opacities. Tremors

	Transient erythema, mild burning sensations; hyperpigmentation. Staining and corneal opacities. Tremors and convulsions after systemic absorption. Occasionally, hypersensitivity.
Mechanism of Action	Hydroquinone is a topical depigmentating agent used in hyperpigmentation conditions by suppressing melanocyte metabolic processes. It also increases melanin excretion from melanocytes and prevents its production.
CIMS Class	Other Dermatologicals
ATC Classification	D11AX11 - hydroquinone; Belongs to the class of other dermatologicals. Used in the treatment of dermatological diseases.

hydrotalcite

CIMS Class : (Antacids, Antireflux Agents & Antiulcerants)
hydrotalcite

P - Caution when used during pregnancy

related hydrotalcite information

Indication & Dosage	<i>Oral</i> Dyspepsia Adult: As suspension containing 500 mg/5 ml: 10 ml to be taken between meals and at bedtime. Child: 6-12 yr: As suspension containing 500 mg/5 ml: 5 ml to be taken between meals and at bedtime.
Special Precautions	Pregnancy.
Adverse Drug Reactions	Diarrhoea and vomiting.
Drug Interactions	May interfere with absorption of tetracyclines.
Storage	Oral: Store between 4-25°C.
Mechanism of Action	Hydrotalcite is an antacid that is used in the treatment of dyspepsia.
CIMS Class	Antacids, Antireflux Agents & Antiulcerants
ATC Classification	A02AD04 - hydrotalcite; Belongs to the class of combinations and complexes of aluminium, calcium and magnesium-containing antacids. Used for the treatment of acid-related disorders.

hydroxyapatite compound

CIMS Class : (Agents Affecting Bone Metabolism)
hydroxyapatite compound

related hydroxyapatite compound information

Indication & Dosage	<i>Oral</i> Prophylaxis of postmenopausal osteoporosis Adult: As ossein-hydroxyapatite compound: 1660 mg bid.
Contraindications	Hypersensitivity. Children <6 yr. Prolonged immobilization accompanied by hypercalciuria.
Special Precautions	Monitor serum calcium level during treatment. To be taken with vitamin D for maximal benefit. Caution when used in renally impaired patients.
Adverse Drug Reactions	Risk of hypercalciuria.
Drug Interactions	Biphosphonates may increase the osteoconductive and regenerative properties of hydroxyapatite when used together.
Mechanism of Action	Hydroxyapatite is a natural mineral with composition similar to that of the mineral in bone. It is prepared from bovine bone and contains calcium, phosphate, trace elements, fluoride and other ions, proteins and glycosaminoglycans.
CIMS Class	Agents Affecting Bone Metabolism

hydroxycarbamide

CIMS Class : (Cytotoxic Chemotherapy)
hydroxycarbamide

P - Contraindicated in pregnancy

L - Contraindicated in lactation

related hydroxycarbamide information

Indication & Dosage

Oral

Malignancies

Adult: Treatment of chronic myeloid leukaemia: 20-30 mg/kg/day in single doses. Treatment of solid tumours: Single doses of 80 mg/kg every 3rd day. If used with radiotherapy, treatment should be started 7 days before initiation of radiotherapy.

Renal impairment: Dose reduction may be needed.

Oral

Sickle-cell disease

Adult: Initially, 15 mg/kg daily, increased by 5 mg/kg/day every 12 wk according to response and blood counts. Max: 35 mg/kg daily.

Child: 1-18 yr: 10-20 mg/kg daily, increased by 5 mg/kg/day every 12 wk according to response and blood counts.

Max Dosage:

CrCl (ml/min)	Dosage Recommendation
<60	Initially, 7.5 mg/kg daily.

	<i>Oral</i> Essential thrombocythaemia Adult: 15 mg/kg daily. Adjust subsequent doses based on platelet counts.	
Overdosage	Acute mucocutaneous toxicity, soreness, stomatitis, violet erythema, oedema on palms and soles followed by scaling of hands and feet and severe generalised hyperpigmentation of the skin.	
Contraindications	Severe bone-marrow suppression, severe anaemia, WBC $<3000/\text{mm}^3$ or platelet count $<100,000/\text{mm}^3$. Pregnancy and lactation. Hypersensitivity.	
Special Precautions	Regular monitoring of uric acid concentrations, blood counts, renal and hepatic function is recommended. Prior irradiation therapy. Elderly. Avoid use of live vaccines.	
Adverse Drug Reactions	GI disturbances, renal impairment, pulmonary oedema, dermatological reactions, headache, dizziness. Disorientation, drowsiness, hallucinations, convulsions, alopecia. Potentially Fatal: Bone marrow suppression.	
Drug Interactions	Impairs immune response to vaccines; possible infection with live vaccines, zidovudine, zalcitabine. May alter action of oral anticoagulants and phenytoin. Potentially Fatal: Fluorouracil may increase potential for neurotoxicity. Modulates metabolism and cytotoxicity of cytarabine. May precipitate didanosine- or stavudine-induced pancreatitis, hepatotoxicity or neuropathy.	
Storage	Oral: Store at 25°C.	
Mechanism of	Hydroxycarbamide causes inhibition of DNA synthesis	

Mechanism of Action	Hydroxycarbamide causes inhibition of DNA synthesis during the S-phase of cell division by acting as a ribonucleotide reductase inhibitor resulting to cell death. It is S-phase specific. Absorption: Readily absorbed from the GI tract; peak plasma concentrations after 2 hr (oral). Distribution: Throughout the body; crosses the placenta; enters breast milk. Metabolism: Hepatic. Excretion: Urine; lungs (small amounts as carbon dioxide).
CIMS Class	Cytotoxic Chemotherapy
ATC Classification	L01XX05 - hydroxycarbamide; Belongs to the class of other antineoplastic agents. Used in the treatment of cancer.

hydroxychloroquine

CIMS Class : (Antimalarials)
hydroxychloroquine

P - Caution when used during pregnancy

L - Caution when used during lactation

related hydroxychloroquine information

Indication & Dosage

Oral

Rheumatoid arthritis

Adult: Initially, 400 mg daily in divided doses. Maintenance: 200-400 mg/day. Max: 6.5 mg/kg/day or 400 mg/day whichever is lower.

Child: Up to 6.5 mg/kg/day or 400 mg/day whichever is lower. Lowest effective dose should be used.

Renal impairment: Estimation of plasma hydroxychloroquine levels to be undertaken in patients with severely compromised function and dosage adjusted accordingly.

Hepatic impairment: Estimation of plasma hydroxychloroquine levels to be undertaken in patients with severely compromised function and dosage adjusted accordingly.

Oral

Systemic lupus erythematosus

Adult: Initially, 400 mg daily in divided doses. Maintenance: 200-400 mg/day. Max: 6.5 mg/kg/day or 400 mg/day

Oral

Systemic lupus erythematosus

Adult: Initially, 400 mg daily in divided doses. Maintenance: 200-400 mg/day. Max: 6.5 mg/kg/day or 400 mg/day whichever is lower.

Child: Up to 6.5 mg/kg/day or 400 mg/day whichever is lower. Lowest effective dose should be used.

Renal impairment: Estimation of plasma hydroxychloroquine levels to be undertaken in patients with severely compromised function and dosage adjusted accordingly.

Hepatic impairment: Estimation of plasma hydroxychloroquine levels to be undertaken in patients with severely compromised function and dosage adjusted accordingly.

Oral

Prophylaxis of malaria

Adult: 400 mg every 7 days. Begin 2 wk before exposure, continue for 4-6 wk after leaving the endemic area.

Child: 6.5 mg/kg once wkly. Max: 400 mg/dose.

Oral

Acute malaria

Adult: Initially, 800 mg followed by 400 mg 6-8 hr later, then a further 400 mg on each of the succeeding 2 days.

Child: 13 mg/kg; followed by 6.5 mg/kg 6 hr later and repeat dose on the 2nd and 3rd days.

Administration

Should be taken with food.

Overdosage

Headache, visual disturbances, cardiovascular collapse, convulsions, hypokalaemia, and rhythm and conduction disorders, followed by sudden and early respiratory and cardiac arrest. Treatment should be prompt and symptomatic as symptoms appear quickly.. Empty stomach contents either by emesis or by gastric lavage. If within 30

	disorders, followed by sudden and early respiratory and cardiac arrest. Treatment should be prompt and symptomatic as symptoms appear quickly.. Empty stomach contents either by emesis or by gastric lavage. If within 30 min of overdose, introduce activated charcoal in a dose at least five times of the overdose into the stomach by tube following lavage to inhibit further absorption. Admin of parenteral diazepam may be beneficial in reversing chloroquine cardiotoxicity. Respiratory support and shock management should be instituted as needed.
Contraindications	Retinal or visual field changes, known hypersensitivity. Long-term use in children.
Special Precautions	Impaired liver or renal function, severe GI disorders, porphyria, psoriasis, neurological disorders especially a history of epilepsy, myasthenia gravis, G6PD deficiency, pregnancy, lactation. Monitor CBC in patients receiving prolonged therapy. Perform baseline and periodic 6-mth eye exams, test periodically for muscle weakness.
Adverse Drug Reactions	Retinopathy, hair loss, photosensitivity, tinnitus, myopathy (long-term therapy). Psychosis, seizures, leucopenia and rarely aplastic anaemia, hepatitis, GI upsets, dizziness, hypokalaemia, headache, pruritus, urticaria, difficulty in visual accommodation. Loss of hair, bleaching of hair pigment, bluish-black pigmentation of the mucous membranes and skin, photosensitivity, tinnitus, reduced hearing, nerve deafness, neuromyopathy, and myopathy, including cardiomyopathy.
Drug Interactions	Cimetidine may increase serum levels of hydroxychloroquine. Its absorption may be decreased by kaolin or Mg trisilicate. Avoid digoxin and alcohol. Increased risk of ventricular arrhythmias when used with halofantrine. Concurrent use with mefloquine may increase the risk of

	kaolin or Mg trisilicate. Avoid digoxin and alcohol. Increased risk of ventricular arrhythmias when used with halofantrine. Concurrent use with mefloquine may increase the risk of convulsions.
Pregnancy Category (US FDA)	Category C: Either studies in animals have revealed adverse effects on the foetus (teratogenic or embryocidal or other) and there are no controlled studies in women or studies in women and animals are not available. Drugs should be given only if the potential benefit justifies the potential risk to the foetus.
Storage	Oral: Store below 30°C.
Mechanism of Action	Hydroxychloroquine is a 4-aminoquinoline antimalarial with actions similar to those of chloroquine but is mainly used in the treatment of SLE and rheumatoid arthritis. It interferes with digestive vacuole function within susceptible malarial parasites by increasing pH and interrupting with lysosomal degradation of Hb thus impeding normal cell function of sensitive parasites. Onset: Rheumatic disease: 4-6 wk may be needed for response to be observed. Absorption: Oral absorption is rapid and complete. Distribution: Protein binding: 55%. Metabolism: Via liver. Excretion: Via urine as metabolites and unchanged drug. Half-life elimination: 32-50 days.
CIMS Class	Antimalarials
ATC Classification	P01BA02 - hydroxychloroquine; Belongs to the class of aminoquinoline antimalarials. Used in the management of malarial infections.

hydroxyprogesterone caproate

CIMS Class : (Oestrogens & Progesterones & Related Synthetic Drugs)
hydroxyprogesterone caproate

P - Contraindicated in pregnancy

L - Contraindicated in lactation

Lab α - Lab interference

related hydroxyprogesterone caproate information

related hydroxyprogesterone caproate information	
Indication & Dosage	<i>Intramuscular</i> Recurrent miscarriage Adult: 250-500 mg wkly during the 1st half of pregnancy. <i>Intramuscular</i> Amenorrhoea Adult: Single dose of 375 mg; may repeat at 4-wkly intervals if needed. After 4 days of desquamation, or if there is no bleeding within 21 days after admin of the drug, may initiate cyclic therapy that includes an oestrogen. For cyclic treatment (28-day cycle): Administer 20 mg of estradiol valerate on day 1, and on day 15, administer 250 mg of hydroxyprogesterone caproate and 5 mg of estradiol valerate. May repeat cyclic therapy at 4-wkly intervals as needed. <i>Intramuscular</i> Abnormal uterine bleeding Adult: Single dose of 375 mg; may repeat at 4-wkly intervals if needed. After 4 days of desquamation, or if there is no

	Abnormal uterine bleeding Adult: Single dose of 375 mg; may repeat at 4-wkly intervals if needed. After 4 days of desquamation, or if there is no bleeding within 21 days after admin of the drug, may initiate cyclic therapy that includes an oestrogen. For cyclic treatment (28-day cycle): Administer 20 mg of estradiol valerate on day 1, and on day 15, administer 250 mg of hydroxyprogesterone caproate and 5 mg of estradiol valerate. May repeat cyclic therapy at 4-wkly intervals as needed. <i>Intramuscular</i> Palliative treatment of advanced, inoperable endometrial carcinoma Adult: Usual dose: =1 g, may repeat once or more times wkly. Usual range: 1-7 g/wk. Discontinue treatment if relapse occurs or if the objective response is not achieved after 12 wk of treatment.
Contraindications	Undiagnosed vaginal bleeding, breast cancer, pregnancy, lactation. Thrombophlebitis, thromboembolic disorders, cerebral apoplexy or a history of these conditions. Markedly impaired liver function.
Special Precautions	Physical examination is advised prior to starting therapy. Hepatic impairment, mental depression. Monitor blood glucose in diabetic patients. Discontinue treatment upon signs of thromboembolic and thrombotic disorders. Discontinue treatment if unexplained, sudden or gradual, partial or complete loss of vision, protopsis, diplopia or papilledema, retinal vascular lesions or migraine occur. Caution when used in patients with conditions that might be worsened by fluid retention (e.g. asthma, seizure disorders, migraine, cardiac or renal dysfunction).
Adverse Drug	GI disturbances, increased appetite, wt gain or loss,

Adverse Drug Reactions	GI disturbances, increased appetite, wt gain or loss, oedema, acne, allergic skin rashes, urticaria, mental depression, discomfort in breast; cough, dyspnoea, circulatory disturbances. Pain at site of inj.
Drug Interactions	Increased clearance when used with enzyme inducers e.g. carbamazepine and phenytoin. May inhibit metabolism of ciclosporin.
Lab Interference	May cause abnormal thyroid function test results. May alter metyrapone test and LFT.
Pregnancy Category (US FDA)	Category D: There is positive evidence of human foetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (e.g., if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
Storage	Intramuscular: Store at 15-30 °C.
Mechanism of Action	Hydroxyprogesterone caproate stimulates luteal actions, changes in uterus and vagina as seen in early pregnancy. It also has prolonged uterotrophic effect. Contractile response of the myometrium to oxytocin is inhibited. Duration: 7-14 days.
CIMS Class	Oestrogens & Progesterones & Related Synthetic Drugs
